In the United States, the Trafficking Victims Protection Act (TVPA) was passed in 2000 and reauthorized in 2003 and 2005. This legislation addresses human trafficking in the United States through prevention, prosecution, and protection. Since the enactment of this policy, however, it has actually helped very few trafficked persons in the United States. One criticism of the TVPA is that it focuses on a law enforcement approach rather than the needs of the trafficked person. Many of the provisions in the TVPA seek to protect the witness primarily so that law enforcement can successfully prosecute the case. Some trafficked persons who cannot provide evidence or refuse to cooperate out of fear are deported rather than helped. Further, this law requires that the trafficked person cooperate with law enforcement immediately and provide detailed accounts of the trafficking. Trafficked persons may be distrustful of law enforcement or traumatized, particularly when first released from trafficking. If law enforcement cannot determine that the person has been trafficked, the person is then deported. Although the TVPA sought to end deportation of trafficked persons, this practice continues to be common.

Despite estimates of up to 17,500 persons trafficked into the United States every year, since 2000 only 675 have been counted as such. This low number accounts only for the number of people who met the definition of a trafficked person within the TVPA and received a T visa, which is a temporary visa granted upon cooperation with law enforcement. Excluded from this count are those who do not report to or assist law enforcement, those who do not require immigration relief, those who are U.S. citizens, those who cannot meet the requirements for a T visa, and those denied a T visa because law enforcement refused to offer support for the application. Although prosecution of traffickers is a worthy goal, the needs of trafficked persons should also be addressed in a way that helps restore their humanity and reintegrates them into society.

A more balanced global approach is needed to address the imbalance of wealth and poverty and labor supply and demand. In particular, social scientists believe that governments in the developed world of destination countries such as the United States need to take a more proactive approach to address the confluence of unstable global economies, lack of labor laws protecting low-skilled workers’ rights, lack of availability of living wages, and restrictive immigration policies.

**Hypersegregation**

When a group is so segregated that its members have little chance of contact with outsiders, that group is hypersegregated. In the case of residential location, hypersegregation means that the members of different groups are extremely unlikely to live together. U.S. experts primarily pay attention to the spatial distances between whites and blacks, with increasing attention
also paid to the residential patterns of growing Asian and Latino/a populations (some studies have also examined the segregation of Native Americans). Of key concern has been the fact that many whites do not live in neighborhoods with members of other groups, a form of urban segregation documented also in other countries, including Canada, England, France, and Germany.

**Identifying Hypersegregation**

In an often-cited 1988 study, Douglas Massey and Nancy Denton compiled 20 existing segregation measures and identified five dimensions of residential segregation: evenness, exposure, concentration, centralization, and clustering. *Evenness* refers to the distribution of groups across neighborhoods according to their proportion of the population. Thus, if 10 percent of the population of a given city is Asian, then 10 percent of each neighborhood should be Asian for there to be no segregation. *Exposure* refers to the probability that members of a group will have any form of interaction with other groups. *Concentration* refers to how much space a minority group occupies; if a minority group lives primarily in a few neighborhoods, they are very concentrated. *Centralization* refers to how close to the center of an urban area a group lives. In many U.S. metropolitan areas, living in the suburbs (as opposed to the central city) is associated with a higher standard of living and better access to high-quality schools and amenities. *Clustering* refers to the extent to which a group lives in contiguous or adjoining neighborhoods.

Researchers typically use census data to measure segregation, mainly because such measures require geographically detailed population counts (such as in neighborhoods) that are collected in decennial censuses. More specifically, segregation measures usually take into account the distribution of various groups in particular neighborhoods in a metropolitan area relative to their numbers in the total metropolitan population. Neighborhoods are most often defined in terms of “census tracts,” which contain 1,500 to 8,000 people, though sometimes in smaller geographic units, such as blocks or block groups. The statistical indexes developed to measure each of these dimensions typically range from 0 to 1, with 0 indicating complete integration on a particular dimension and 1 indicating complete apartheid or segregation on a particular dimension. Massey and Denton (1989) defined hypersegregated metropolitan areas as those where indexes exceed .60 on at least four of the five dimensions of segregation.

To date, hypersegregation appears to be a phenomenon that applies almost exclusively to blacks who reside in certain U.S. metropolitan areas. Although blacks are also segregated from whites in other countries, the levels are not as high as they are in many U.S. metropolitan areas. Table 1 provides a list of U.S. metropolitan areas where blacks are hypersegregated from whites, by year. In 2000, Chicago, Cleveland, Detroit, Milwaukee, Newark, and Philadelphia had segregation scores above .60 on all five dimensions of segregation. Also worth noting are the metropolitan areas where African Americans were persistently hypersegregated for several decades: Baltimore, Buffalo, Chicago, Cleveland, Detroit, Gary, Los Angeles, New York, and St. Louis. Two metropolitan areas in 2000 also had Hispanic-white hypersegregation (Los Angeles and New York).

**Causes and Effects of Hypersegregation**

The hypersegregation of African Americans in so many U.S. metropolitan areas is largely the result of racism and discrimination by whites (though other groups may also engage in similar practices). In addition to their reticence to move into neighborhoods where blacks reside, whites also move out of neighborhoods when they believe too many blacks are moving in. Other practices that have historically served to segregate and thus hypersegregate blacks include discriminatory mortgage lending practices (e.g., some banks will not provide mortgages to black customers with the same income as white customers), neighborhood redlining (mortgages cannot be obtained for certain neighborhoods—usually those deemed “black”), telling potential renters who are black that apartments in white neighborhoods have been taken, and violently attacking and threatening blacks who attempt to move into white neighborhoods. Although racial and ethnic discrimination in the housing market was outlawed with the passage of the Fair Housing Act in 1968, research has documented the persistence, even if at somewhat diminished levels, of discrimination against minorities in the United States.

Larger metropolitan areas, those where blacks make up a large percentage of the population, as well as those in the Midwest, are more likely to be hypersegregated.

*Also had Hispanic–white hypersegregation in 2000.

To date, the known metropolitan characteristics associated with lower levels of black hypersegregation are the proportion of new housing in a metropolitan area and the proportion of the workforce employed by the military. Why might these two metropolitan characteristics reduce hypersegregation? Some older neighborhoods
have a predominantly black population. Others are predominantly white and have a reputation of being unwelcoming or hostile to blacks. Newer neighborhoods do not have this type of preexisting reputation and hence attract a more mixed group of potential residents, which leads to lower levels of segregation. The presence of a large military population also lowers segregation because the military often selects housing for its members, and race plays little role in where people are assigned to live.

In 2000, the combined African American population of the metropolitan areas listed in Table 1 was 13.3 million. This amounts to approximately 38.5 percent of the total black population in all of the United States. Thus hypersegregation clearly affects a very large proportion of the African American population in the United States. Hypersegregation increases the isolation of African Americans from other members of society. It concentrates African Americans in neighborhoods that often have a host of issues associated with poverty, including exposure to crime, poorer access to health care, inadequate access to public transit, poor policing, dilapidated and substandard housing, and poor schools with few resources.

IDENTITY POLITICS

Identity politics refers to political activism of various social movements including, but not limited to, the civil rights movement, feminist movements, gay and lesbian movements, ethnic separatist movements for political recognition, self-determination, and elimination of discrimination. The term suggests that people who have suffered from actual or perceived social injustice can share a collective consciousness that stimulates them to take further action to advance their particular group’s interests. In the social sciences, identity politics refers to any social mobilization related to politics, identity, and culture. Depending on the school of thought, the term sometimes means cultural activism, other times political activism, and sometimes both. In any case, however, identity politics focuses on the contrast between the assumed social, political, and occupational privileges of the dominant group as compared with perceived discrimination against the oppressed group.

Historical Synopsis

During the 1960s, unprecedented large-scale political movements—such as second wave feminism, civil rights movements, gay and lesbian liberation activism, and the American Indian movements—launched their attack on the systemic injustices and inequalities that alienated them. These social movements developed a rich literature of questions about the nature, origin, and future of the particular identities traditionally left out of studies. Identity politics as a base for collective behavior was closely connected to the idea that some social groups were historically oppressed because of their particular identities; for example, one’s identity as a woman or as a Native American made him or her vulnerable to cultural imperialism (including stereotyping, stigmatizing, erasure, or labeling), violence, exploitation, marginalization, or powerlessness.

Defenders of identity politics called for new analyses of oppression and gave voice to those long silenced as they sought to reconstruct, redescribe, and transform the dominant discourse that stigmatized particular minority group(s). Intersections of race, gender, class, sexual orientation, and ethnicity were the bases of new identities that began to draw the attention of social scientists. Although the description of identity politics goes back to intellectual writings of famous critics such as Mary Wollstonecraft and Frantz Fanon, sociologist Renee R. Anspach first employed the term in 1979. For the past several decades, however, the phenomenon of identity politics attracted numerous scholars. This focus on cultural identities marked a significant shift from the economically and politically based analyses that had long dominated the social sciences. Identity-based movements became the “new social movements” in sociology literature and drew the interest of both U.S. and European scholars. Works of Alain Touraine and Alberto Melucci, for example, hypothesized that the new social movements were “identity oriented” rather than “strategy oriented,” and these “expressive” movements were partially a product of the information age and postindustrial era of the Western, developed societies.
Critics of Identity Politics

Identity politics as a base for organized behavior and a set of political philosophical positions draws criticism from various divergent schools of thought, including liberalism, Marxism, and post-structuralism. Criticism of identity politics dates back to the 1970s when scholars began systematically outlining and defending the philosophical underpinnings of identity politics.

Obscurity of the Term

Critics argue that use of the phrase *identity politics* as popular rhetoric belies more possible analytical explanatory power of the term. Because the term is primarily descriptive rather than explanatory, rigorous empirical analyses of identity politics are absent in the field. Using or misusing *identity politics* as a blank term invokes a range of tacit political implications, making identity claims by some early political activists seem lacking in analytical content, misleadingly totalizing, and un-nuanced. As the notion of identity has become indispensable in contemporary political discourse, even as the public rhetoric of identity politics empowered the new social movement activism, it failed to produce coherent theoretical analyses on political inclusiveness and models of the self. In this regard, identity politics increasingly became a derogatory synonym for anti-racism, feminism, and anti-heterosexism.

Critics From the Right

Critics from the political right claim that it is inappropriate for an identity-based group to expect an enumeration of unprecedented rights. Particularly for Enlightenment liberal democratic theory, if a “right” extends to only a portion of society, it is no longer a right but a “privilege.” Thus, from the point of view of the political right, identity politics does not contend for “rights” as certain minority groups claim; instead, it functions as rhetoric to strengthen the discourses of some interest groups that demand special privileges.

Critics From the Left

Marxists, both orthodox and revisionist, often interpret the perceived ascendancy of identity politics as representing the end of radical materialist critique. For these critics, identity politics is factionalizing and depoliticizing, drawing attention away from the ravages of late capitalism toward superstructural cultural accommodations that hinder the reality of unchanged economic structures. A parallel criticism of identity politics comes from the radical leftists, who argue that identity politics unnecessarily divides the working class, who are the agents of the revolution against capitalism. As a result, identities are pitted against identities, creating an ideal condition for the ruling class.

“Queer” Dissent

Some lesbian, gay, bisexual, and transgender (LGBT) activists criticize the identity politics approach on the basis of the argument that identity politics has marginalized LGBT people rather than emancipating them. Although LGBT activists employed an “identity politics” approach to gain mainstream culture’s full recognition of sexual orientation freedom, their strategy essentially declared themselves as outside of the mainstream. These activists contend that identity politics is a counterproductive strategy, perpetuating discrimination and societal prejudices against LGBT people.

Post-Structuralist Challenge

Post-structuralist criticism of identity politics is perhaps the most philosophically developed and profound challenge to date. Post-structuralists claim that identity politics fallaciously regards actors as metaphysics of substance; that is, cohesive, self-identical subjects that can be identified and reclaimed from oppression. This essentialist position, they suggest, misrepresents both the psychology of identity and its political significance.

The alternative view offered by post-structuralists is that the subject is constantly reconstructed and redefined as a product of discourse. The post-structuralist view of agency reiterates the mutual construction of the opposites, as self versus other and identity versus difference. The danger of identity politics, then, is that it reifies “self” as a category of analysis, which is, rather, a category of practice, fluid, and always subject to interpretation.

Future Directions

Research on identity politics raises significant questions on individual experiences, cultural mobilization, and sociopolitical movements. Scholars of collective
action have recently paid more attention to the complex nature of relationships between actors’ perceptions, preferences, and strategies and their identities. Analysts of identity politics, as Mary Bernstein suggests, should be careful when they assume that social movement actors’ strategic deployment of their identities shows the revelation of the identity in essentialist ways. The depiction and reconstruction of essentialist identities might not indicate that the actors are naive to realize that these identities are socially constructed; rather, it can reveal the dynamic of relationship between identities and strategies. In this regard, post-structuralist criticism of identity politics is in need of reassessment. In any case, the debate over identity politics invites scholars of all sorts to investigate how local discourses are produced, perceived, and consequently realized in the actors’ lifeworlds, which only in-depth case studies can explore.

IDENTITY THEFT

Although identity theft is often heralded as a new crime threat, the phenomenon itself is by no means unique to the information age. Throughout history, criminals have used false identities to commit their crimes. However, as identity theft emerges as a growing crime problem in the 21st century, it has new characteristics which are closely linked with the features of a global and technologically advanced society. The Internet, e-mail, and mobile phone technology have transformed the ways in which we live our everyday lives and, in many ways, have facilitated the criminal enterprise. With all of these changes come new risks and, with them, new challenges. Increasingly, we are required to prove our identities as we interact with others in both real and virtual environments, and the identification process is more important now than it has ever been. Consequently, different aspects of an individual’s identity have themselves become attractive commodities in the criminal world. The emergence of identity theft as a recognized social problem shows how the changing value of personal data in modern society has had an impact on the nature of crime.

Definitions of Identity Theft

There is no single accepted definition of identity theft, and it is common to find broad definitions presented in the media and policy documents. Broadly defined, identity theft occurs when a criminal uses another person’s personal information (such as name, address, social security number, or credit card details) without permission to commit fraud or other crimes. It is often, therefore, referred to as an “enabling offense”—the identifying information is a tool that the criminal needs to commit the “target offense.” The problem with broad definitions, however, is that they ignore the important fact that the target offense can range from simple credit card fraud to the permanent adoption of a false identity and the more complex activities of organized criminal networks. As a result, by treating all offenses where an identity has been misused under one category, we fail to properly understand the motivations and methods of identity thieves. Moreover, there is a danger that we will confuse the quite different impacts on the victims of the enabling versus target offenses.

A better approach is to distinguish between two different types of identity theft. Identity frauds are temporary offenses in which personal data are borrowed to commit a fraudulent offense. Here, the identifying information serves merely as a tool for the criminal to use to commit another offense. The motivation for these offenses tends to be financial, either to obtain goods or services or to establish credit or a loan, and the impersonation is temporary. Identity

Identity
thefts are cases in which the victim’s entire identity is permanently appropriated (often referred to as “Day of the Jackal” cases). The identity of another individual is “hijacked” by the fraudster with the aim of a permanent appropriation. This may be for financial reasons, for example, to escape an existing record of bankruptcy, or it may be to hide a criminal record or escape a previous life.

**Extent of the Problem**

Despite repeated claims that identity theft is one of the world’s fastest-growing crimes, relatively little is known about the true extent of identity theft and identity fraud when compared with other crimes. The best estimates come from the United States, which recognized identity theft as a statutory offense in 1998 with passage of the Identity Theft and Assumption Deterrence Act and where a number of national surveys on the subject have been conducted. The Federal Trade Commission administers a central repository for identity theft complaints and, in 2005, reported 255,565 incidences of identity theft, totaling losses of $56.6 billion. However, victim surveys (including the National Crime Victimization Survey) estimate the victimization of between 3 and 4 percent of Americans annually.

In Europe, where identity theft is not yet considered to be a widespread problem, data are scarce. The exception is the United Kingdom, which has recently prioritized identity theft as a serious and fast-growing crime problem in need of urgent addressing. Early estimates from the Home Office suggest that 137,000 people are “affected” by identity theft each year, costing £1.7 billion annually, but there is little evidence to support these claims. Other studies suggest the victimization of 1 in 10 people and as many as 1 in 4 experiencing identity theft (either directly or indirectly).

Studies on both sides of the Atlantic suggest that young people are most vulnerable. The 2004 National Crime Victimization Survey conducted by the U.S. Bureau of Justice Statistics, households where the head was between age 18 and 24 were significantly more likely to be victimized, as were high-income households. Rural households were less likely to be victimized. U.K. studies concur that people under the age of 30 are most vulnerable.

**Impact on the Victims**

For each episode of identity theft or fraud, there are multiple victims: the individual whose information is borrowed or appropriated (the primary victim) and any individual, business, or institution that is subsequently defrauded or duped by the perpetrator (the secondary victim or victims).

The primary victim may experience a range of different forms of harm. Although the immediate loss of large sums of money is a commonly held fear, it is actually quite unlikely for the primary victim to be held liable for hefty debts incurred where an identity theft has taken place. More likely is the damage caused to the victim’s credit history, which will have a negative impact on his or her future financial autonomy. Also, the primary victim of identity theft faces the challenge of restoring his or her personal identity profile, a process that can be costly in terms of time and effort. Research shows that the loss of control of personal information is potentially damaging to an individual’s sense of self and quality of life. For the secondary victims, the loss suffered will, more often than not, be directly financial. Indeed, members of the retail, communications, and finance industries are the ones absorbing the costs of identity theft.

**Responses**

In the mid-1990s the United States became the first country to formally recognize identity theft as a crime; other countries have been slow to follow suit. Although identity theft swiftly emerged as a key issue on the crime agendas of governments across the Western world, few have followed the U.S. lead on policy. In the current climate of fear of terrorism, the urgent need for reliable processes and methods of identification is apparent. Government agencies and businesses around the world need to work together to examine the practices of document-issuing authorities and those who are involved in the processing of personal data.

It is important for the responses to the problem to be designed and applied in the appropriate context. In the United States, for example, many tailored responses address the vulnerabilities emanating from an over-reliance on the social security number, which is used as a key identifier in a wide range of public and private transactions. In contrast, the United Kingdom does not currently operate a single-identifier system, and therefore the identity theft problem is more strongly associated with extremely high rates of credit or debit card fraud.

On both sides of the Atlantic, significant efforts have been made to provide education and guidance to
citizens and consumers in the fight against identity theft and fraud. Increasingly, individuals are encouraged to develop a more responsible attitude toward their personal data. Credit card holders, for example, repeatedly hear that they should keep their card details and personal identification number (PIN) confidential and to shred or burn their statements and receipts. Businesses, too, receive admonitions to think more seriously about the threat of identity theft and the safety of their customers.

**Illegitimate Opportunity Structures**

During the 1950s two predominant theories of criminal behavior were Edwin H. Sutherland’s differential association theory and Robert K. Merton’s anomie theory. Sutherland argued that criminal behavior is learned in the same manner as other behaviors; people who are socialized to sanction criminal behavior are likely to become criminals. Merton suggested that criminal behavior results when there is a discrepancy between the goals reinforced by society (e.g., earn a good income) and the institutionalized means for attaining these goals (e.g., complete a good education). Those whose access to legitimate opportunities is blocked in some way, perhaps due to poverty or the unavailability of good schools, may use illegal means to reach culturally valued goals. Richard A. Cloward and Lloyd E. Ohlin agreed that both theories had merit but added that a key channel of access to culturally valued goals was through illegitimate opportunity structures, especially in impoverished inner-city communities where legitimate means may be scarce.

This notion of illegitimate opportunity structures elaborates the notion that differential access to legitimate opportunities explains why some people are more successful than others. Rather than focusing on how access to wealth or social capital leads to financial success, Cloward and Ohlin argued that some people engage in crime and deviance because they have relatively greater access to illegitimate opportunities. These opportunities imply (a) a learning environment in which particular skills and values are acquired, and (b) opportunities to engage in criminal roles. For example, youth may find legitimate opportunities blocked, but those who have learned methods of delinquency and who have opportunities to engage in such practices—perhaps because their peers are delinquent—become delinquents. In the absence of illegitimate opportunity structures, people with blocked opportunities may experience problems of adjustment (e.g., anxiety or depression), withdraw from society, or turn to risky sexual behavior or drug use in an attempt to find other avenues of self-acceptance or peer-evaluated success. Some researchers argued that illegitimate opportunity structures became more prevalent in the 1980s and 1990s as many inner-city areas experienced a concentration of poverty due to the loss of skilled jobs in urban centers. Others pointed out that crime may also result in the attenuation of legitimate opportunities, such as when conventional residents flee high-crime neighborhoods. Hence, residents may be left with few options other than illegitimate opportunities.

In their seminal works, Cloward and Ohlin focused primarily on inner-city gangs and how their members accessed illegitimate opportunity structures as they engaged in particular forms of delinquency. Their studies have been criticized because they describe deviant subcultures with norms that are opposed to the
widely accepted norms of the broader culture and focus on gangs as the main facilitator of delinquent behavior. Yet, even members of these presumed subcultures tend to sanction the legitimate norms of society, and most delinquency is not the result of gang behavior. Critics claim that delinquents who maintain that legitimate opportunities are blocked, whereas illegitimate opportunities are not, are engaging in rationalization for their failure to sufficiently inculcate the norms and practices of conventional society.

The notion of illegitimate opportunity structures may be used to account for various types of illegal or deviant activities. For example, transnational criminal organizations may search for porous borders, lax enforcement efforts, or bribery opportunities as they engage in drug trafficking, human trafficking, or money laundering. Hence, they tend to ply their trade in nations that afford ready access to illegitimate opportunities and avoid nations that block such access. Assuming that a cultural drive to financial or political success is part of certain societies, blocked legitimate opportunities may motivate even presumably successful people to draw upon illegitimate opportunity structures. This frequently occurs because people often compare themselves with proximate others, such as those who work in similar occupations, when they judge their relative success. For example, the vice president of a corporation may resort to bribing public officials if his earlier attempts to obtain government contracts were unsuccessful. A lobbyist may provide illegal gratuities to politicians to influence votes, especially if previous efforts at using legitimate means were thwarted. Academic researchers may manipulate data if their earlier research efforts failed. Students who perform poorly on standardized exams may see cheating as a viable alternative if they are eager to be admitted to a particular academic institution. These are examples of using illegitimate opportunity structures when legitimate opportunities are perceived as unavailable.

Although blocked legitimate opportunities and access to illegitimate opportunities may explain some forms of deviant behavior, it remains unclear whether the latter is a necessary or sufficient condition. For instance, access to illegitimate opportunities is often gauged by noting deviant or criminal behavior; this is clearly tautological. However, recent research suggests that providing greater access to legitimate opportunities, such as through vocational training or providing high-quality jobs, results in less criminal behavior. Moreover, moving from an impoverished neighborhood with high rates of joblessness to a better-quality neighborhood has been shown to reduce the probability of delinquency among some youth.

IIILITERACY, ADULT IN DEVELOPED NATIONS

The last decade of the 20th century witnessed an unprecedented concern for adult literacy in many developed nations. This concern was stimulated by the completion of the first International Adult Literacy Survey (IALS), undertaken in the mid-1990s by the Organisation for Economic Co-operation and Development (OECD) and a number of its member nations, and led to varying government responses. This entry presents the broad outlines of the IALS, its methodology, and general findings, with a focus on responses in three nations—Canada, the United Kingdom, and the United States.
The International Adult Literacy Survey

The IALS methodology was the same as that of the National Adult Literacy Survey of 1993 in the United States. Like that survey, the IALS changed the traditional practice of dividing adults into the dichotomy of “illiterate” and “literate” and instead discussed adult literacy as a continuum from very low literacy to very high literacy. Using the traditional division of adults into illiterate and literate, UNESCO reported illiteracy rates of just 1 to 2 percent for developed nations in the mid-1990s. But using the methodology of the IALS, the percentages of adults in developed nations with very low literacy skills, which earlier would have been called “functional illiteracy,” were 10 times as high as the estimates of illiteracy given by UNESCO.

IALS developers defined literacy as using printed and written information to function in society, to achieve one’s goals, and to develop one’s knowledge and potential. Then, using door-to-door sampling methods, the IALS assessed the literacy skills of adults ages 16 through 65. The IALS developed performance scales composed of tasks for Prose Literacy (e.g., reading text materials such as newspapers, poetry); Document Literacy (e.g., scanning and completing forms or using a train schedule); and Quantitative Literacy (e.g., determining the amount of a tip for a restaurant meal or reviewing a bank statement). Scores on these three scales assign adults to one of five literacy levels (level 1 = very low; level 5 = very high literacy).

For 21 nations assessed in the IALS the percentages of native-born adults in the lowest level of literacy ranged from around 5 percent in Sweden to a high of over 50 percent in Chile, with an average for the 21 nations of about 20 percent on the Prose, Document, and Quantitative Literacy scales. Thus, on average, about one fifth of native-born adults ages 16 to 65 in these developed countries were considered to be “at risk” for social problems because of their low literacy. For foreign-born adults, the percentages were uniformly higher, averaging over 50 percent with Prose, Document, and Quantitative Literacy scores falling in the lowest level of literacy.

Using the Document performance tasks for illustrative purposes, with native- and non-native-born adults combined, 23.7 percent of United States adults ages 16 to 65 fell into the lowest level of literacy, while in Canada this percentage was 18.2, and 23.3 percent in the United Kingdom. Similar percentages, with a little variation, held for the assignment of adults to literacy level 1 on the Prose and Quantitative Literacy scales.

Self-Perceived Literacy and Numeracy Skills

Based on results of the literacy performance tests, about one fifth of adults ages 16 to 65 in the focal nations of Canada, the United Kingdom, and the United States were considered to be at risk for social problems such as unemployment, underemployment, low income, poverty, and poor health due to low literacy. This would come to about 3.3 million adults in Canada, 7.4 million in the United Kingdom, and 32 million in the United States.

However, the IALS did not use only literacy tests to measure adult literacy. Additionally, the IALS developed a scale for the adults’ self-assessment of their literacy ability. In this case adults were asked to rate how well they thought their literacy skills matched their needs for these skills at work or in daily life. In making these judgments, adults used the rating categories of poor, moderate, good, excellent, and no response.

Using the adults’ self-assessments of their reading abilities for work and daily life, less than 5 percent of adults ages 16 to 65 in either Canada, the United Kingdom, or the United States rated their reading as poor. Using a 5 percent estimate for these three nations, some 8 million adults in the United States, less than 1 million in Canada, and less than 2 million in the United Kingdom considered themselves at risk for poor reading skills. Similar results held for self-assessments of writing and numeracy skills.

In the IALS, then, adults’ estimates of their reading ability revealed a considerable discrepancy between the literacy skills as measured by the performance tests and the self-assessments in determining the numbers of adults at risk for poor literacy in these three nations. This discrepancy also occurred in other nations.

Efforts to Increase Access to Adult Literacy Education Programs

For the three developed nations discussed in the previous sections, there were considerable differences in the percentages of adults considered to be at risk and hence in need of literacy or basic skills instruction based on IALS test data and the actual numbers of
adults who seek out and enroll in literacy programs. In Canada, for instance, studies reported that only 5 to 10 percent of adults eligible for literacy education had ever enrolled in literacy courses. Some 43 percent of Canadians who sought information about literacy programs did not enroll because of program- or policy-related problems, such as not being called back after calling a literacy telephone hotline, long waiting lists, inconvenient course times, wrong content or teaching structure, and unhelpful program content.

In the United Kingdom, the IALS assigned around 23 percent of adults to literacy level 1 (some 8,000,000 adults) while participants in adult literacy programs around that time included less than 5 percent of that number. To increase access to provision, the United Kingdom set as a target the reduction by 750,000 of the number of adults who had difficulty with literacy and numeracy by 2004. To meet these targets the government set aside up to £1.5 billion over a 3-year period and created a number of special programs for adults.

To determine what might motivate adults with poor basic skills to seek to improve them, the Basic Skills Agency of the United Kingdom conducted a study called Getting Better Basic Skills. The research focused on adults’ perceptions of their skills, why they wanted to improve their skills, their access to learning programs, the content of the programs, and what would encourage them to try and improve their skills. Significant findings showed a third of adults thought that their basic skills needed improving, 29 percent said they would definitely take up a basic skills course, and 42 percent said they would probably do so. Factors motivating adults to improve their basic skills included being able to learn on a computer, being able to improve computer skills and basic skills at the same time, getting an education qualification, and being able to attend a course near home.

In the United States, less than 3 million adults enroll annually in the adult education and literacy programs that are funded jointly by the federal government in partnership with the 50 states. Following the National Adult Literacy Survey and the IALS, no special efforts with major funding were undertaken to reach adults with literacy needs in the United States.

In 2003, the OECD conducted a new international survey of adult literacy skills, the Adult Literacy and Life Skills survey. The report of the survey was released in 2005 and indicated that for the most part, there had been little or no improvement in adult literacy skills since the initial IALS in the mid-1990s.

Illiteracy, Adult in Developing Nations

For more than 60 years the United Nations Educational, Scientific and Cultural Organization (UNESCO) has tracked the progress of nations around the globe in achieving higher rates of adult literacy. Though nations may define literacy somewhat differently, most consider literacy as the ability to read and write simple statements in either a national or an indigenous language. Across the latter half of the 20th century, literacy rates of adults ages 15 years and older increased from 56 percent in 1950 to 70 percent in 1980, 75 percent in 1990, and 82 percent in 2004. UNESCO’s compilation of data obtained from member nations during the years 2000 to 2004 indicate that from 1990, illiteracy among adults fell
by some 100 million, from around 870 million to 770 million, or about one fifth of the world’s adult population. UNESCO data on the worldwide distribution of adult illiterates are presented next, followed by a brief discussion of some of the lessons learned in the years that UNESCO has worked to stimulate adult literacy education, primarily among developing nations.

Adult Illiteracy Worldwide

The overwhelming majority of the world’s illiterate adults live in the less-developed regions of the world, including South and West Asia (41 percent of adults are illiterate), sub-Saharan Africa (40 percent), the Arab States (37 percent), Latin America and the Caribbean (10 percent), and East Asia and the Pacific (9 percent). In 1990, which was celebrated around the world as International Literacy Year, UNESCO and its member nations made a major effort to promote the education of women. At that time women comprised about two thirds of the world’s illiterate adults. Unfortunately, over a decade later, women still make up about two thirds of the world’s illiterate adults. Women are particularly vulnerable to illiteracy in East Asia and the Pacific, where they constitute almost 72 percent of adult illiterates; the Arab States (64 percent); Southern Asia (62 percent); and sub-Saharan Africa, where women constitute about 60 percent of adult illiterates.

Globally, in terms of the extent to which literacy rates for women are at parity with those for men, 88 women are literate for each 100 men, indicating an 88 percent parity rate of women’s literacy to men’s literacy for the world. These parity rates are lower (.66 to .76) for the regions cited in the previous paragraph.

Some Lessons Learned

Among the important lessons distilled from the international communities’ work to raise the world’s literacy rate for adults, two are especially important: (1) Adult literacy programs generally produce multiplier effects, meaning that important outcomes beyond the learning of literacy are frequently forthcoming, and (2) adult literacy programs often have intergenerational consequences, meaning that improving adult literacy, especially that of women, increases the likelihood of children’s education.

Multiplier Effects in Adult Literacy Education

In 1984 UNESCO awarded a literacy prize to the National Institute for Adult Education of Mexico. In 3 years the institute enrolled nearly 3 million adults, of which some 1 million became literate in that time. In teaching literacy, the institute’s instructional materials integrated the teaching of literacy with the teaching of knowledge important in the day-to-day lives of the adults. This way, in addition to acquiring literacy, the participants also acquired knowledge about health, nutrition, education, and other vital concerns.

The National Institute for Adult Education of Mexico program is just one of many recognized by UNESCO for the approach to literacy education that illustrates that governments can expect multiple returns on investments in adult literacy education in at least five areas:

1. Improved productivity at work, at home, and in the community, leading to higher tax bases for communities, decreased violence at home and in the community, and greater participation in citizenship activities by a larger segment of the adult population

2. Improved self-confidence and other psychological and physiological aspects of health of adults, including activities that will help the brain grow throughout adulthood and contribute to reduced medical costs for adults as they age

3. Improved health of children as a result of adults learning in adult education programs, leading to better prenatal and postnatal care, reductions in low birth weight infants, and better home medical care, thereby contributing to lowered medical costs for children and fewer learning problems in school

4. Improved social justice from providing literacy education for marginalized populations to permit them to acquire skills and knowledge needed to take political action that allows them to achieve their civil rights and to overcome social exclusion and join in the mainstream of society

5. Improved productivity in the schools by providing adults with the knowledge they need to better prepare their children to enter school, help them achieve in school, encourage them to stay in school, and increase their opportunities to enroll in higher education
Intergenerational Effects of Adult Literacy Education

The fifth item in the previous list is especially important because it reveals the effects that educating adults can have on the educational opportunities and achievements of children. In 1983 a UNESCO literacy prize was presented to the Department of Adult Education of the Government of Kenya whose program reached more than a million adults, nearly four fifths of whom were women. The prize citation noted the excellent results achieved both directly through the program and indirectly through its impact upon the school enrollment and retention of the children of participants.

Research published by UNESCO illustrates the effects of girls' and women's education on children and their educational development at various stages from before birth to the school years:

Before Pregnancy. Better-educated girls/women show higher economic productivity, better personal health care, and lower fertility rates; hence they produce smaller families. The latter, in turn, is related to the preschool cognitive development of children and their subsequent achievement in school.

During Pregnancy and at Birth. Better-educated women provide better prenatal care, produce more full-term babies, and provide better postnatal care; this results in fewer babies with learning disabilities.

Before Going to School. Better-educated women produce better children's health care; better cognitive, language, and preliteracy development; and better preparation for schoolwork.

During the School Years. Better-educated women produce higher participation rates in schooling, better management of homework, and better advocacy for children's education and negotiation of school–child conflicts. In addition they produce children who achieve higher levels of education and literacy.

Because of these effects of women's education, UNESCO has for decades recommended that nations should pay special attention to the need for resources to provide literacy educational opportunities to the millions of less-literate women who will bring the next generation of children into the world. In 2003, the UN Decade of Literacy was launched with the first year of the decade devoted to issues of gender, with a focus on the literacy needs of girls and women to bring them to parity with the literacy rates of men.

Improving the Monitoring of Adult Literacy

As indicated earlier, adult literacy/illiteracy rates in developing nations are presently determined by a variety of methods. These methods are mostly based on self-reports in census surveys. But studies comparing these self-reports with direct assessments using literacy tests suggest that the traditional methods for determining literacy rates may overstate the extent of literacy. In the 2006 report on UNESCO's Education for All initiative, a report on the monitoring of adult literacy around the world, it is noted,

In Morocco, 45 percent of respondents in a sample reported being literate, but only 33 percent demonstrated basic competence in literacy. Similar patterns are found in Bangladesh, Ethiopia, Nicaragua and the United Republic of Tanzania. Among Ethiopian women with one year of schooling, although 59 percent were considered literate by household assessments, only 27 percent passed a simple reading test.

Because of the diversity of methods used to indicate literacy rates and the mixed results of studies such as the foregoing, UNESCO is developing new methods of measuring adult literacy to use in monitoring the achievement of adult literacy in developing nations in the coming decades.

Immigration

Immigration is the arrival of citizens from one nation-state who plan on taking or do take up long-term or permanent residence in another country. Thus it is secondary to the preceding migration. Subsequent generations of these immigrants either assimilate and become invisible or maintain features distinguishing them from other members of society as identifiable ethnic, racial, cultural, or religious (minority) groups. Given the historical continuum of global migration, immigration too has a historical continuum, probably observable at any point in history. The concept of immigration, however, is relatively new and corresponds to the emergence of modern nation-states. Nations are founded on various principles, such as blood, culture, fate and destiny, history, or other characteristics supposedly shared by members of a nation. Belonging has either a political or a natural definition, thus making it a matter of choice or of birthright. Therefore, the arrivals of other social or political groups not perceived as holding these commonly shared characteristics make them, in the minds of the natives, either aliens, foreigners, immigrants, or simply “the others.”

Immigration, first studied by the Chicago School during the 1920s, raises various issues. These are usually identified with or related to reception, insertion, incorporation (or at times non-incorporation), integration, adaptation, assimilation, and related processes of belonging and identity. Each concept couples with specific beliefs, theories, or policies. While conventional and assimilationist research only examines how immigrants adapt or fail to do so, progressive research also studies the adaptation of host societies. The sociological questions arising are what happens to newcomers and what happens to receiving societies; what is the relationship between indigenous populations, previous immigrants, and newcomers; and what are the social, economic, political, and cultural consequences to all? And the political questions are what is the legal status of new arrivals; which political, civil, and social rights do they have; and how can these rights be acquired?

Integration is an interactive process involving individuals and collectives from both mobile and sedentary populations. The character of the relations, their power relations, their structural positions in society, and their communication processes are crucial. The integration of immigrants into the host society is either a one-way process (the immigrants adapt to the host society) or a two-way process (both parties change). In civic and liberal nations, belonging is a matter of choice: Integration can be negotiated and subsequent belonging acquired, as in the United States or the United Kingdom. In ethnic nations where belonging is related to descent—as, for instance, in Germany, Turkey, Greece, and Japan—this is hardly possible.

Migration and immigration are major forces of global human transformation, alongside globalization and aging. Global migration, defined as the increasing global mobility of people and immigration, significantly increases heterogeneity of ethnic composition and of cultural values and practices. The consequences are manifold: (a) It might or might not increase the size of the population of a host society, depending on net migration, that balance between emigration and immigration; (b) it changes the composition of a host society’s population in terms of culture, language, religion, or ethnicity and potentially changes the fabric of a host society; and (c) immigrants increase the labor force, contribute to the economy and tax and social funds, and are consumers and service users. Issues of concern are labor market competition, overcrowding (e.g., in the housing market), drain on public services, and conflicts between indigenous and immigrant cultures. Observers pay specific attention to immigrants who simultaneously hold loyalty to their country of origin and their host country and who are engaged economically, politically, and culturally in both. These are transnational migrants and represent an increasingly relevant group. Another specific challenge relates to those who only temporarily integrate because they intend to return or move on to other destinations, which affects efforts made by both parties.
Three major models and policies of inclusion can be identified: (1) multiculturalism (e.g., in Canada and Australia) and its successors interculturalism and transculturalism, based on diversity, social equality, and participation and emphasizing social integration; (2) integration (e.g., in Germany and the Netherlands), emphasizing its structural aspects and based on social equality, participation, and adaptation to a host society; and (3) assimilation into a host society (e.g., France), based on (republican) ideas of homogeneity. The difference lies in the level of mutuality in the adaptation process, ranging from one-way assimilation to limited mutuality in integration and high levels of mutuality in multiculturalism.

Antonyms of integration are social marginalization and social or spatial segregation. All currently practiced models of integration are considered imperfect, at least with respect to implementation: All can lead to alienation, segregation, and (self-)exclusion, which undermine solidarity and social cohesion. While some, such as multiculturalism, pay due respect to mutuality in integration processes, implementation is insufficient because there still is a dominant community. Recent trends show that states prefer skilled immigrants with high levels of human capital and language proficiency, understood as preconditions to successful integration.

Both indigenous populations and immigrants contribute barriers to integration. In most receiving countries, immigrants experience discrimination, often on grounds of racism; hence they are legally, structurally, or socially treated unequally. Consequently, they suffer from such social inequalities as unemployment, poor education, substandard housing, political underrepresentation, overpolicing, and racial violence. Immigrants too might exclude themselves from a host society, and even confront a liberal society with illiberal beliefs, for example, with respect to gender relations. Instead, they might create or integrate into already existing immigrant and ethnic minority communities. These, however, could also be a response to prior rejection by the host society.

Although immigration represents a major challenge to society and community, no coherent theories and policies on integration exist. From the perspective of social scientists, present practices of political organization of humanity are not well equipped to accommodate mobile populations.

Immigration, United States

Often described as a nation of immigrants, the United States had a foreign-born population of 12.4 percent in 2005. Before the 19th century, however, people rarely used the term immigrant. Instead, the foreign-born came as settlers, pioneers, slaves, or indentured servants.

The Naturalization Act of 1790 first established a centralized process for becoming a citizen, originally open to any free white individual who could demonstrate residence in the country for 2 years. In the mid-19th century, the short-lived Know-Nothing movement emerged as a reaction to a surge in immigration, particularly of Irish Catholics after the potato famine of 1845–1851. No national legislation, however, was enacted in response. Immigration was, for the most part, welcomed as a route to national development until the late 19th century. This changed with the passing of the Chinese Exclusion Act of 1882, which barred Chinese from entering the country and excluded those already in the country from naturalization. From this point forward, who could and could not “become an American” was regulated at the national level. The immigrant became a distinct legal, as well as social, category.

Historically, two major peaks occurred in the foreign-born population as a percentage of the total population. According to U.S. Census Bureau statistics, 9.7 percent of the population was foreign-born in 1850, rising to 14.8 percent in 1890 and 14.7 percent in 1910. Midcentury, the proportion of foreign-born plummeted, representing just 5.4 percent of the total
population in 1960 and 4.7 percent in 1970. Since the 1970s, however, the number of foreign-born has risen rapidly. Estimated at more than 35.6 million in 2005, there are now more than twice as many immigrants than at any time before 1980. In addition to the increasing numbers of foreign-born people, there are significant trends in their ethnic and racial composition. In 1910, 87.4 percent of immigrants came from Europe. In 2005, 31 percent of foreign-born arrived from Latin America, 36 percent from Asia, and just 16 percent from Europe.

The gender and age cohorts of immigrants to the United States also varied over the past 100 years. Earlier immigrants were primarily male; in 1910 there were 131.2 males per 100 female immigrants. By 1960, this trend reversed, and in 1970 there were just 84.4 males per 100 female immigrants. The proportion of male immigrants rose again by 1990, with 95.8 males per 100 females, a pattern that continued through 2005. Similarly, the age distribution of the immigrant population shifted over time. In 1910, 5.7 percent of immigrants were under age 15 and 8.9 percent were over age 65. In 1940, less than 1 percent of immigrants were under age 15 and 18 percent were over age 65. By 1990, 7.5 percent of immigrants were under age 15 and 13.6 percent were over age 65.

Scholars analyze the determinants of migration to understand these changing demographic patterns, such as the shift from fewer female migrants in the early 1900s to many more females than males in the 1970s. Researchers also examine the experiences of immigrant groups and their offspring in relation to nonimmigrant populations. They may consider how race and ethnicity shape immigrants’ experiences of adaptation and mobility, how an influx of young immigrants impacts the educational system, or how the changing profile of older immigrants affects social security and health care institutions.

Causal Factors in U.S. Immigration

Theoretical approaches to understanding the determinants of immigration include neoclassical economics, world-systems theory, the household strategies models, and social network analysis.

Neoclassical Economics

Neoclassical economic approaches to migration consider the wage differentials between foreign countries and the United States as the root cause of an individual’s decision to migrate. Immigrants are often labor migrants; they may be rational actors who weigh the costs and benefits of a move abroad. Immigrants may base their decisions on push and pull factors, the former referring to the causes of economic hardship which make survival in the home country difficult and the latter referring to potential economic opportunity in the United States. As such, fluctuations in immigration can relate to labor markets. For example, expansion of the railroads in the West, starting in the 1860s, provided jobs for Asian and Mexican immigrants before Chinese immigrants and other Asians were barred from entry. More recently, the increasing entrance of women into formal labor markets since the 1970s created job opportunities in child care for many female immigrants.

Immigration patterns also necessarily relate to labor markets in immigrants’ countries of origin. In many African countries, for example, civil war and ethnic conflict since the 1980s left professionals with few opportunities for advancement. They often sought work in the United States where they received a greater return for their human capital. In other countries, such as the Philippines and in parts of India, the number of highly educated female nurses exceeded the demands of their national health care systems; many have found work in this expanding U.S. industry since the 1970s.

World-Systems Theories

In the real world, a pure relationship between economic hardship and opportunity is rare. Instead, economic decisions are embedded in social and political structures that may mitigate or intensify hardships and may create or dampen opportunities. A world-systems perspective analyzes the political structures underlying immigration and examines the relations between nations that contribute to creating these structures.

Immigration law and regulation is one key factor that influences migration patterns. For example, the National Origins Act of 1921, which restricted immigration from different countries according to a quota system, and its abolition in 1965 explain the drop in immigration to the United States in the mid-20th century. The abolition of the act also helps explain the greater diversity in the ethnic and racial composition of immigrants since 1965.
Inclusion or exclusion of potential immigrants is also intimately tied to international politics, particularly in the post–World War II era when the United States created refugee and political asylum provisions. For example, Cubans, whose Communist leader Fidel Castro has challenged U.S. intervention in the region since 1959, receive a warm welcome and resettlement support. However, during the 1980s, immigrants from Guatemala and El Salvador, where the United States backed the national governments amid civil war, were routinely denied political asylum. Religious leaders in the United States then illegally provided sanctuary for many Central Americans; their successful challenges to immigration law led to a 1990 provision for political asylum for El Salvadorans and Guatemalans.

U.S. military presence in a country may also spur immigration, particularly by women. The War Brides Act of 1945 allowed GIs to sponsor their foreign-born wives and children, sparking an increase in Korean and Japanese immigration midcentury. Many women from El Salvador first came to the United States in the 1980s as domestic workers for foreign diplomats stationed in their country during the conflict. Today the second largest Salvadoran community is in Washington, D.C.

**Household Strategies**

In contrast to external imbalances of power, the household migration strategy perspective considers the dynamics within families that shape immigration. Originally, household strategy models were relatively one-dimensional, assuming that families deployed specific members as part of a unified family migration strategy. For example, at the turn of the 20th century, Italian men often left wives and children behind when they immigrated to maintain, and at times increase, the family’s holdings via remittances, reducing the risks involved in uprooting the entire family. In contrast, Irish families often sent young unmarried women between 1880 and 1920 to work in domestic service to supplement family income, because inheritance practices limited marriage pools within Ireland.

Today, scholars suggest more complicated household strategy models by tracing the ways power imbalances within families affect decisions to migrate. These scholars argue that a unified family migration strategy may not exist and that migration may not benefit all members of a household equally. For example, some suggest that because Mexican men generally have more decision-making power than do women in their families, the male breadwinner primarily makes the decision to migrate. Other scholars describe the ways that women from Latin America and the Caribbean actively convince their families to support their moves abroad in order to escape abusive situations at home.

**Social Networks**

Social networks also shape patterns of immigration. Because the social network is considered as an independent causal factor, social network analysis is a powerful reminder of the ways that informal structures within and between communities and families influence the face of immigration. For example, in recent years, Mexicans living in the United States constituted about 30 percent of the entire foreign-born population, by far the largest immigrant group. Mexican immigration is largely shaped by social networks now institutionalized in migrants’ communities of origin.

**Consequences of U.S. Immigration**

Research on the social consequences of immigration usually pertains to one of three areas: immigrants’ experiences of adaptation and assimilation, mobility of immigrant populations, and relationships between immigrant communities and nonimmigrant groups.

**Adaptation and Assimilation**

At the beginning of the 20th century, the principal stance on immigration was that the United States was a melting pot and that immigrants needed to assimilate to U.S. culture to be successful. Social campaigns during this period often strove to teach immigrant women how to make their families more “American.” When immigrants lived in neighborhoods dominated by co-ethnics, enclaves were considered a source of social disorganization that undermined modern development.

By the end of the 20th century, the melting pot paradigm gave way to one of multiculturalism. Rather than a site of social disorganization, ethnic enclaves are now viewed as a source of social support for immigrants. They provide the necessary networks to locate employment and housing. Membership in religious organizations with co-ethnics is one of the
primary sites of civic participation among immigrants upon arrival. Ethnic enclaves are also important sources for entrepreneurship, the major means for mobility for some new immigrants. Self-employment rates are particularly high for well-educated Korean and Middle Eastern immigrants, although they may not depend on co-ethnics for business, instead acting as economic intermediaries in other ethnic minority neighborhoods. Yet for other members of immigrant groups, the ethnic enclave can become the principal site of exploitation by co-ethnics. This is particularly true for undocumented workers in Chinatowns across the country, who often must depend on informal, unregulated, and low-wage economic opportunities from co-ethnics.

Recent scholarship examines the increasingly important ways that transnational ties shape immigrant experiences in the United States. From this perspective, immigrants maintain social, political, and economic ties with communities of origin. Transnational studies may involve political ties (hometown associations), economic ties (remittances), technology, cultural identity, or family relationships. The transnational perspective shows that in a globalized world, immigrants' adaptation to life in the United States is intricately linked to the lives of those in their countries of origin.

**Mobility**

Perhaps the best way to gauge the success of immigrants’ adaptations to life in the United States is to study the lives of the second generation, that is, the fate of the children of immigrants. Given the great demographic shifts between the primarily European stock of the earlier waves of immigrants and the influx of immigrants of color since the 1960s, mobility among the children of today’s immigrants is particularly indicative of the ways race and ethnicity shape the social structure of the United States.

Among the many factors considered in gauging mobility in the second generation are language acquisition, educational attainment, and socioeconomic status. Despite public concern to the contrary, findings suggest that by the second and third generations, proficiency in English is uniform among children of recent immigrants, much as was the case among the earlier waves of European immigrants. Findings based on other indicators of mobility, however, are mixed. On the one hand, when second-generation immigrants are isolated in ethnic enclaves in inner cities, upward mobility is far less likely. In other cases, immigrant youth may maintain their identity as foreigners to distinguish themselves from minority nonimmigrants.

One of the most important research findings on mobility among second-generation immigrants is that experiences typically differ between and within various groups, a process known as “segmented assimilation.” For example, comparative studies of second-generation youth in New York and Los Angeles show that children of different genders and racial/ethnic backgrounds may have vastly different experiences.

**Relationships Between Immigrants and Nonimmigrants**

A third aspect of the consequences of U.S. immigration is interethnic relationships. Scholars from the Chicago School of sociology at the turn of the century mapped the social ecology of the city as a means of depicting the relationships between immigrant and nonimmigrant groups. Until recently, immigrant settlement patterns have not varied greatly. In urban areas like Chicago, most arrived to ethnic enclaves in the city and only those immigrants who were upwardly mobile, or their children or grandchildren, moved to the suburbs following scenarios of white flight. Moreover, Latino/a and Asian populations were once concentrated in California and in the Southwest. Cubans and other Caribbean immigrants settled in Florida and in the Northeast. In some areas, immigrants worked as migrant farmworkers. For the most part, though, the study of immigrant incorporation was a study of urban communities.

In recent decades, however, immigrants have dispersed rapidly throughout the continental United States, living in rural, urban, and suburban communities. Immigrants, many of them undocumented, have become a major cause of conflict at many of these new destinations. Their presence is associated with various social problems including concentrations of day laborers, bilingual education, health care for the uninsured, and more. Minutemen militia groups have formed at the southern U.S. border with Mexico to try to keep out immigrants. Some municipal governments have passed local ordinances to prevent immigrants from settling in their towns. The
“English only” movement has gained strength. Many fear that these tensions put immigrants’ human rights at risk; stories of women and children illegally trafficked into the United States illustrate the ways immigrants may be victimized in the underground economy associated with immigration.

Recently, concerns over terrorism, heightened after the attack on the World Trade Center in 2001, fueled rising tensions over the roles and rights of immigrants in the United States and increased pressures to regulate and monitor immigrants’ activities.

Further Readings

Imperialism corresponds closely to the concept of empire and signifies all sorts of expansion policies: economic, political, military, cultural, and so on. In The Civil War in France, Karl Marx introduced the concept of imperialism into modern social and political thought. With his classical work Imperialism: A Study, John A. Hobson initiated modern theory on imperialism. Because of the close connection between the concept of imperialism and the concept of empire, many scholars assumed a description of human history in terms of imperialism. Hobson’s theory of imperialism, on the contrary, is a historical theory of imperialism, describing it as a stage in the development of capitalism. His theory refers to a monopolist stage in the accumulation of capital that he places no later than the 1880s. He differentiates categorically between colonialism and imperialism.

In the colonialist age the driving economic force was the export and import of commodities. In the age of new imperialism, the driving force is exportation of capital, with the pursuit of an imperialist policy in the interest of a small population segment. That is, in the age of imperialism, an increase in the cosmopolitanism of capital occurs, and this should be not mixed up with internationalism. From a national viewpoint, imperialist policy is necessarily irrational. In colonial occupation of foreign countries, the mother country at least attempted to establish a colonial government and extend political and civil liberties to the occupied territories and to raise the state of civilization. Except for a few experiments in India, for example, the tendency of new imperialism goes the other way, seeking more drastic control of annexed territories and destruction of the achieved state of civilization. Politically, new imperialism is an expansion of autocracy. In terms of international relations, imperialism means a permanent rivalry between imperialist countries for the redistribution of natural resources, often a cause of new wars.

V. I. Lenin’s contribution to Hobson’s theory of imperialism is his illustration of its consistency in the tradition of Marx’s critique of political economy. Lenin acknowledged, for example, Hobson’s accuracy and deep economic/political analysis of imperialism. What Lenin criticized was what he called Hobson’s bourgeois reformism and passivism.
Contemporarily, two closely related debates on imperialism attract interest: one on cultural imperialism and another concerning empire and new imperialism theories. In the first debate the rhetoric is between a critical liberal view of the logic of cultural imperialism and its stigmatization of other cultures, or a Marxist critique of any theory of cultural imperialism. The second debate concerns the nature of imperialism in the stage of globalization, where advocates propose to replace the classical concept of imperialism for a less definable concept of empire. Marxist scholars, in contrast, want to keep the classical concept simply by acknowledging new developments.

Incarceration, Societal Implications

The United States incarcerates a larger share of its population than any other country. Increasingly, the criminal justice system affects not only the lives of convicted offenders individually but also the relative standing of demographic groups and outcomes in the country as a whole. This entry deals with the societal implications of the criminal justice system in the United States, specifically political participation, labor market performance, and black–white wage inequality.

The societal impact of the criminal justice system rests primarily on its size. In 2005, over 7 million individuals were under the supervision of the criminal justice system: 1.4 million in prisons, 0.7 million in local jails, 4.2 million on probation, and 0.8 million on parole. Millions more are identifiable as ex-convicts to authorities and employers. The risk of involvement with the criminal justice system is unequally distributed. Over 90 percent of the incarcerated population is male, most are younger than 45, and nearly half are black. The impact of the criminal justice system on these over-represented groups is naturally greater.

Felon Disenfranchisement

Most states in the United States disenfranchise incarcerated felons as well as nonincarcerated felons on probation or parole. A large minority of states additionally disenfranchise ex-felons after the conclusion of their sentence, and three states disenfranchise all felons for life. Only two states, Vermont and Maine, place no restrictions on the voting rights of convicted offenders, whereas some other states disenfranchise both felons and misdemeanants. Felon disenfranchisement is more common in the United States than in other democratic countries, where it is typically restricted to imprisoned felons for the duration of incarceration. Only Belgium, Chile, Finland, and Germany also disenfranchise (some) felons after release from prison. Although the number of states that disenfranchise ex-felons has sharply decreased since the 1950s, the number of affected individuals has increased because of an increase in the number of offenses classified as felonies and the increased probability of conviction in the sentencing stage of criminal trials. As a result of their over-representation in the criminal justice system, about 12 percent of black men nationwide had lost their right to vote as of 2004.

The impact of felon disenfranchisement on political outcomes hinges on three factors: the size of the disenfranchised population, voter turnout, and political preferences. About 5.3 million current and former felons (2.5 percent of the voting age population) were ineligible to participate in the 2004 presidential election. Approximately 40 percent of these individuals were ex-felons no longer under the supervision of the criminal justice system. Research suggests that voter turnout rates would be an estimated one-third lower among disenfranchised felons than in the general population. The number of votes prevented by felon disenfranchisement, therefore, is large. (Some researchers
argue that the apparent decline in voter turnout since the 1970s may be due primarily to felon disenfranchisement: If disenfranchised citizens—mostly felons—are subtracted from the voting age population, which forms the denominator of conventional voter turnout rates, participation rates in the voting-eligible population are essentially constant over time.) One analysis concludes that as a result of the strong preference for the Democratic Party among disenfranchised felons, the 2000 presidential election would have been decided for Democrats in the absence of felon disenfranchisement. No other presidential election, however, is estimated to have hinged on felon disenfranchisement, although a small number of Senate races in the past 30 years may have.

**Labor Market Participation and Black–White Wage Inequality**

Official labor market statistics in the United States are calculated on the basis of the civilian non-institutionalized population and exclude the incarcerated population. Because economically disadvantaged individuals face much greater risks of incarceration, official statistics may present an incomplete picture of labor market performance. For example, the employment–population ratio (EPR), which measures labor force utilization, would be lower if inmates were included in the denominator of the rate and counted as nonemployed individuals. The incarceration-adjusted EPR for young black male high school dropouts would have been almost 20 percentage points lower than the official rate in the late 1990s, whereas the incarcerated-adjusted EPR for young white male high school dropouts would have been 6 percentage points lower. The impact is smaller but still sizable for working-age men (4.9 and 0.9 percentage points difference for black and white men, respectively), but not meaningfully different for the national EPR. (Note that this EPR adjustment reverses the logic of the voter turnout adjustment mentioned previously: Whereas the official EPR excludes inmates and the adjustment includes them, conventional voter turnout rates include inmates and the adjusted rates exclude them.)

Mass incarceration also affects conventional measures of black–white wage inequality. Incarceration is selective of individuals with low earnings potential, and it removes relatively more black men than white men from the labor market and hence from official statistics. To account for the economic selectivity of incarceration, researchers have estimated inactivity-adjusted wage distributions, which impute hypothetical wages to nonworking individuals, including inmates of prisons and jails. These statistics are intended to estimate the wage distribution that would prevail if everybody earned wages in the market and nobody was inactive (neglecting general equilibrium effects). One such analysis found that selective labor market inactivity (including incarceration) depressed conventional measures of black–white inequality in log mean earnings by 20 percent among working-age men in 1999 and by almost 60 percent among men ages 22 to 30. The apparent reduction of black–white wage inequality among young men since the mid-1980s, conventionally attributed to economic gains among blacks, may be entirely due to the removal of young black men with low earnings potential from the labor market through incarceration.

**INCEST**

Incest refers to sexual relations between closely related persons. The degrees of kinship defined as incestuous vary, but virtually every known society has prohibited father and daughter, mother and son, or brother and sister from having sexual contact or marrying. Only in recent decades, though, has society recognized incest as a social problem. Earlier, the cultural prohibition, known as the “incest taboo,” was of primary interest and a topic of considerable theoretical concern. Many leading social theorists, including Sigmund Freud, Émile Durkheim, and Claude
Lévi-Strauss, considered the incest taboo foundational to human social organization.

Consistent with understandings of the taboo, most people long viewed the incidence of incest as extremely rare, and until the 1980s, no prevalence studies of incest occurred. The closest thing to survey data came from general studies of sexual behavior, such as those by Alfred Kinsey, but these studies did not focus on incest and did not separately define or report it. Although incest was prohibited by law in most jurisdictions, the conviction rate of incest offenders was extremely low. As late as the mid-1960s, for example, the annual conviction rate of offenders did not exceed two cases per million persons in any U.S. state. Social scientists recognized that the actual incidence of incest must far exceed the rate of detection by law enforcement. Yet, the available evidence and the cross-cultural studies suggested that the incest taboo was uniquely powerful. Other forms of sexual offenses and sexual pathologies were of professional and occasionally public concern, but not incest.

A series of developments, beginning in the 1960s, led to a changed awareness of sexual offenses within the nuclear and extended family. The emergence of family therapy as a clinical specialty in the 1960s was important in establishing a concern with the child victim of incest. Family therapists initiated a rejection of key elements of Freudian psychoanalysis, particularly with respect to the role of incest fantasies in mental life, and their work led to the first of many treatment programs in which child victims received counseling. The child protection movement, originally organized to draw attention to the physical abuse of children, and the anti-rape movement of the early 1970s drew public and mass media attention to child sexual abuse as a social problem. They also spurred new legislation, such as the Child Abuse Prevention and Treatment Act of 1974, which made it a criminal offense for professionals working with children and public officials not to report suspected instances of child maltreatment. These movements classified incest within the more general category of sexual abuse—sometimes using terms like intrafamilial child sexual abuse—and argued that family members and known others, not strangers, committed most abuse. In the ensuing years, research studies, surveys, and increased reporting have confirmed that incest is far more prevalent than previously assumed.

The extent of incest behavior, however, has eluded careful measurement. Studies of such highly stigmatized behavior are notoriously difficult to conduct, and under-reporting is a serious methodological problem. So too is the lack of consensus among researchers about what behaviors and what degrees of kinship define the experience of incest. Some employ narrow definitions of sexual contact—touching or penetration—whereas others use broad definitions that span a wide range of sexual and sexualized activities from penetration to such non-touch behavior as exhibitionism and sexual propositions. There is also wide latitude in what relatives are included, with some researchers adding “father figures” and other unrelated persons. Discrepancies like these have led to great inconsistency in the estimates of the prevalence of incest.

Further, in large-scale studies of sexual offenses and sexual behavior, incest between adults is not separately reported and incest involving a child is counted as a form of sexual abuse. The latter development is also reflected in some state penal codes, where sexual offenses against children by relatives are prosecuted under sexual abuse laws rather than incest statutes. The most comprehensive sources of information on sexual abuse in the United States, for example, come from the Department of Health and Human Services. Mandated studies, including the annual Child Maltreatment reports, based on compilations of data from child protective service agencies in individual states, and the periodic National Incidence Studies of Child Abuse and Neglect, based on large nationally representative samples of community professionals, provide the best estimates available on the incidence of sexual abuse. Although these studies offer some breakdown of victimization incidents by the type of perpetrator (e.g., parents, other family members), they do not discuss incest.

With heightened public and professional concern in recent decades, an immense body of research has emerged on the psychological effects of incest, on the dynamics of families in which incest takes place, and on the psychology of offenders. Studies have found that incest can have a wide variety of negative consequences for the victim, in both the immediate and longer term, depending on the frequency, duration, and type of sexual contact; age of the child; relationship to the offender; and other factors. For children, these consequences can include delinquency, anxiety, poor self-esteem, sexual acting out, and other problems. For adult survivors, issues include depression, self-destructive behaviors, and post-traumatic...
symptoms. Research on families in which incest occurs has centered on complex interaction dynamics and disturbances—intrapyschic, relational, and circumstantial. Men appear responsible for the majority of incest offenses, and much of the research on offenders focuses on various personality types and their conscious and unconscious motivations.

Public controversy and legal battles have erupted periodically since the 1980s over social problem claims of false reports of incest. Parent groups have organized to defend themselves against alleged false reports with respect to children, especially in divorce-custody cases, and by adult daughters or sons claiming trauma-induced amnesia for incestuous victimization as a child. In the latter case, parents criticize psychotherapists for using hypnosis and other “memory enhancement” techniques to induce a condition they call “false memory syndrome.” Psychologists in the trauma field remain divided over these claims.

Income Disparity

Income disparity refers to differences in income between two or more individuals or aggregates. Aggregates can be defined by relationship (family, household) or by some other attribute (community, nation, gender, ethnicity, age, class). Income disparities are important for several reasons: (a) Income is the primary source of economic well-being in modern societies, so income disparities indicate differences between individuals and groups in the ability to attain a desired standard of living; (b) income disparities are associated with a variety of social problems, including poverty, crime, and social conflict; and (c) large income disparities, especially between groups defined by ascribed status (e.g., gender, race), are contrary to norms of equity.

Theories of Income Disparity

Explanations of income disparities derive from more general theories of social organization, typically categorized as consensus and conflict theories. Consensus theories posit that social order arises from shared objectives, values, and the evaluation of individual and group behavior. Conflict theories posit that social order is imposed by the exercise of power. Consensus theories include functionalism in sociology and microeconomic price theory in economics. Conflict theories include Marxist and Weberian theories.

Functionalism asserts that, given a complex division of labor, societies must have some mechanisms to allocate individuals to jobs. Jobs can be ranked according to importance and requisite skills, and individuals can be ranked according to their diligence and ability. Inequality is the social mechanism that allocates the most qualified individuals to the most important jobs. Similarly, microeconomic price theory asserts that, in market societies, the price mechanism assures that markets will “clear”; that is, prices will rise or fall until completion of all desired exchanges of goods and services. At this price, supply equals demand, and the wage rate equals the value produced, thus maximizing the total value of production. Income differences represent productivity differences. Each individual, in maximizing his or her income, will obtain the skills which make the best use of his or her abilities.

Conflict theory asserts that disparities in income or, more generally, in life chances, result from conflict among individuals and groups over the distribution of resources. Marx and his theoretical descendants assert that, in all societies, those who own productive assets (land and other forms of capital) exploit those who do not. Those who do not own productive assets cannot acquire necessities, such as food, clothing, or shelter, unless they can access the assets of others. To do this, they must relinquish a share of what they produce to the asset owner (e.g., as rent). Although not explicit in most Marxist accounts, skill (productivity) differences can be incorporated into the theory as “human capital” assets. From this perspective, income disparities reflect disparities in the ownership of productive assets.
Weber and his theoretical descendants do not disagree that property ownership is important, but they assert additional important aspects of power in society: one’s relative position in markets for capital and for labor (“class”), the social regard of others (“status”), and collective organization for the rational pursuit of interests (“party”). Any or all of these aspects of power may be used to deny opportunities to others and monopolize opportunities for oneself and those like oneself. Income disparities therefore reflect disparities in the distribution of economic, social, and political power.

**Measurement of Income Disparity**

The extent of income disparities is measured in a variety of ways, depending on the motivating interest. If interest is in income differences between two persons or social positions, one could simply subtract, but this has the disadvantage of being affected by the value of money (e.g., inflation). A measure of such disparities not affected by the value of money is the ratio of incomes. If, instead, interest is in the distribution of income across a population, numerous statistical indices are available. Quintile income shares are the percentages of income received by each fifth of the population; the standard deviation of income measures average income differences in a population. The Gini coefficient measures departures from perfect equality, where each cumulative percentage of the population receives that cumulative percentage of income. The Gini coefficient is thus a generalization of quintile shares across the entire income distribution.

**Extent of Income Disparities**

Current and historical data on income inequality in the United States are available on the U.S. Census Bureau Web page. These data show that in 2006, the bottom quintile of households received 3.5 percent of total household income, the third quintile received 14.5 percent, and the top quintile received 50.5 percent of total household income. In 1990, the corresponding income shares were 3.8 percent for the bottom, 15.9 percent for the third, and 46.6 percent for the top quintile; and in 1980 they were 4.2 percent, 16.8 percent, and 44.1 percent, respectively. Between 1980 and 2006, the income share of the bottom quintile of households declined, as did the income share of the third quintile, whereas income share for the top quintile increased. In relative terms, the poor and the middle lost ground, and the top gained ground. Over this period, the Gini coefficient increased from .403 in 1980 to .428 in 1990 and .470 in 2006. Other inequality indices show the same pattern. Since 1980, income disparities among households in the United States have increased.

**Consequences of Income Disparities**

Consensus theories of income disparities predict that income disparities will not be a cause of social disorder, even if disparities are extreme and widespread. Shared values will produce acceptance of functionally necessary (thus, equitable) disparities in life chances. Conflict theories, on the other hand, interpret disparate life chances as both the outcome of conflict among individuals and groups and the source of future conflict.

Income disparities are associated with disparities in life chances, including physical and psychological health. This is to be expected in market economies, because the goods and services that contribute to life chances must be purchased. However, the consequences of inequality extend beyond the life chances of individuals to affect entire societies. These societal consequences include poverty, social disorder, and crime. Despite debates regarding the measurement of poverty (whether poverty is relative or absolute and what the poverty threshold should be), it is clear that the presence of income disparities is necessary for the existence of poverty.

Research consistently shows an association of between-group inequality (e.g., race, class) and social disruption (riots, strikes). Examples include the labor movement of the 1930s and the civil rights movement of the 1960s. Research also consistently finds a strong association between income inequality and both property and violent crime rates. These research literatures are thus more supportive of conflict theories. Research on the relationship between income inequality and aggregate rates of economic growth has produced mixed results. One strand of this literature finds that inequality reduces economic growth rates; a more recent strand finds the opposite: that inequality increases rates of economic growth. The first is consistent with conflict theories, the second with consensus theories. These literatures differ in their measures, models, and methods, so it is not yet possible to be confident in the findings of either.

INDEX OF DISSIMILARITY

The term index of dissimilarity refers to a standard measure of residential segregation, which gauges the extent to which two groups are evenly spread throughout neighborhoods in a given geographic area, usually a city or metropolitan area. It is interpreted as the percentage of either of the two groups that would have to move in order to achieve an even distribution across neighborhoods within the larger geographic unit of interest. An even distribution indicates that all of the neighborhoods would have the same distribution of the two groups as the larger, geographic unit of interest. Values of the index of dissimilarity range from 0 to 100, with values ranging from 0 to 30 indicating low levels of segregation or high levels of evenness, from 30 to 60 indicating moderate levels of segregation, and 60 or more indicating high levels of segregation or very low levels of evenness.

Results from Census 2000 reveal high levels of segregation for blacks and more moderate levels for Hispanics and Asians and Pacific Islanders, relative to non-Hispanic whites. More specifically, 64 percent of blacks, 51 percent of Hispanics, and 43 percent of Asians and Pacific Islanders would have to move to achieve an even distribution with whites, on average, in the metropolitan United States. Trends over time in index of dissimilarity scores reveal that blacks consistently are the most segregated group. In 1980, the dissimilarity scores for blacks, Hispanics, and Asians and Pacific Islanders were 73 percent, 50 percent, and 41 percent, respectively, relative to non-Hispanic whites. Although scores for blacks have declined over time, the level of segregation still remains within the high range, even nearly 40 years after the passage of the Fair Housing Act. Scores for Hispanics and Asians have remained relatively stable, in large part as a result of the trends in immigration of these groups.

Although the index of dissimilarity is a standard measure used to gauge levels of residential segregation, it is not free of limitations. One major limitation is that it can only examine the residential segregation of two groups at a time. Other measures, such as the multigroup information theory index, can measure the evenness of more than two groups. Another is that it is sensitive to the level of geography used as its building blocks. In general, census tract–level data are used as a proxy for the neighborhoods within which evenness is examined. However, an average census tract contains 4,000 residents. Census block groups are smaller areas of geography that are composed, on average, of 1,500 people. Studies have shown that when smaller areas of geography are used to calculate the index of dissimilarity, levels of segregation are actually higher. Other limitations with the index are that it cannot gauge how concentrated or centralized the populations of interest are. Nevertheless, because of its ease of interpretation and its detection of evenness, the index of dissimilarity remains a core measure used in the residential segregation literature.

INEQUALITY

The study of inequality lies at the heart of the sociology of social problems. No matter what the social problem might be, different forms of inequality
influence the generation of the problem, the consequences of the problem for diverse groups, the societal reaction to the problem, and the solutions and social policies intended to address the problem. In each of these dimensions, social problems correlate with inequality. Analyzing the relationship between various forms of inequality and social problems is central to sociological theory and empirical research.

Among some of the strongest forms of inequality influencing social problems are social class, race, and gender. And, while these are some of the most significant influences on social problems, they are also problems in and of themselves. No understanding of social problems makes sense without attention to race, class, and gender. But race, class, and gender are not the only correlates of social inequality. Also influencing social problems are social factors such as age, national origin, sexual orientation, ethnicity, and family status, among others. Exactly how these different social factors of inequality relate to social problems and how they interrelate are the basis for much social problems theory and empirical research.

### Inequality and the Generation of Social Problems

One way to think about how inequality relates to social problems is to ask how social problems are generated. Social stratification based on race, class, and gender forms the structural context from which social problems are created. Social inequality, structured into society, blocks opportunities for some groups, generating the conditions from which social problems emerge. The sociological literature offers countless examples of the consequences of blocked opportunity.

Research shows, for example, a strong correlation between unemployment and multiple social problems, including crime, violence, divorce, and substance abuse, to name a few. As one example, an extraordinarily large difference exists in the homicide rate of black Americans, Latinos, and whites—explained as the result of social structural conditions of both the class and race status of poor, minority men. Were non-Latino whites subjected to the same social structural conditions of inequality as are racial/ethnic minorities, white homicide rates would likely be equal to those of racial/ethnic minorities. Various measures of risk, including death by homicide, firearms, and automobile accidents, are also strongly influenced by gender. This is the result, most argue, of greater risk-taking behavior among men. The interactive mix of gender, race, and class can be a lethal combination.

Race, gender, and class also affect the likelihood of experiencing social problems other than crime and violence. For example, low-income and minority communities will more likely be sites for hazardous waste facilities and toxic dumping, not only degrading the neighborhood environment but also placing residents at greater risk for poor health. Although many such communities have organized an environmental justice movement to protest dumping in their neighborhoods, the relative lack of political power in low-income and minority communities makes environmental racism a persistent social problem.

Social problems stemming from structural inequality are also prevalent in education and work. Rates of educational attainment are higher among white Americans than among either African Americans or Latinos/as. School dropout rates, too, significantly relate to both race and income status. Hispanic students have, by far, the highest dropout rate, followed by African American students, but income matters too: Students from low-income families have twice the dropout rate of those from middle-income families and four times the dropout rate of those from high-income families. Family disadvantage also strongly relates to racial variations in math and reading comprehension for schoolchildren, and the higher the family income is, the higher are student test scores and rates of educational attainment.

At the root of educational attainment problems lie inequalities among schools themselves. Inner-city schools with large concentrations of minority and poor students suffer from inadequate facilities, poor funding, and understaffing. Furthering the problem of inequality in schooling is the resegregation of schools that is currently under way. Since 1980, segregation in U.S. schools has dramatically increased, resulting in increasing educational isolation of black and Latino/a students. School segregation partially follows from residential segregation but also results from the diminution of state-sponsored plans to challenge racial segregation in education.

Segregation is not just a matter of race, however. As inequality grows in the United States, schools are also becoming more stratified by social class. Residential and school segregation separate people not only by race but also by class. This creates disparities in school quality across neighborhoods and within schools. From ability groupings within schools...
In sum, extensive evidence shows the influence of social inequality on the generation of social problems, but are there actually more social problems among disadvantaged groups? This is the subject of debate. One answer is that social inequality produces an underclass of people who turn to crime for lack of other options. Blocked opportunity, in this argument, produces social problems—more likely among the poor and minority groups. Another answer is that, because social problems occur within disadvantaged strata of society, they are more subject to surveillance and, thus, more visible than are social problems that occur within the middle and upper classes. This area of research points to the hidden nature of social problems within more privileged communities, as well as to the increased rates of policing and other forms of surveillance, such as via social service agencies, that make social problems more likely to be detected among the poor and disadvantaged. Recognizing that identifying is part of how they are generated underscores the importance of understanding not just where problems occur but also how they are created through perceptions and judgments made in society.

Inequality and Societal Reactions

Inequality also strongly influences societal responses to social problems. Research consistently shows that victims of social problems are treated differently within various social institutions. This is especially apparent in studies of the criminal justice system, although this is not the only institutional site for seeing the influence of inequality on social problems. Yet, a multitude of studies show that the race of the accused produces differential rates of arrest, prosecution, and sentencing. Studies of rape, for example, show that not only are black perpetrators more likely to be arrested, prosecuted, and sentenced, but the rape itself is more likely to be reported when the perpetrator in black, regardless of the victim’s race. There is also an interactive effect between the race of the victim and the race of the alleged perpetrator in how justice—or perhaps better stated, injustice—is administered. Studies of the death penalty, as just one example, find strong evidence of racial discrimination in death penalty verdicts. And race of the victim, as well as race of the defendant, is an influence, with the death penalty more likely to result when the victim is a white woman. Throughout the criminal justice system, racial minorities experience disproportionate punitive treatment. They are more likely than whites to be arrested and convicted, and they are given longer sentences than whites, even when the crime is the same.

Empirical evidence of societal reactions to social problems is also evident in the influence of social class. Corporate crime, for example, if measured in terms of dollar value, is far more severe than street crime, but corporate criminals are not punished as harshly as street criminals. Furthermore, corporate crime is also less likely to be detected, and when corporate criminals are punished, they receive more lenient punishments. Gender matters, too: Together with race, gender is predictive of whether a defendant secures pretrial release.

The societal response to social problems can also be seen in the context of how clients are treated in other social institutions. The simple fact is that authorities, generally speaking, tend to treat people differently, depending on factors like class, race, and gender. Social stereotypes, even when unintentionally expressed, guide people’s judgments about one another in various realms of life. Thus, employers tend to typify black women as single mothers—regardless of the employees’ actual parental or marital status; drug offenders who most closely resemble stereotypes of dangerous drug users receive substantially more punitive sentences than those who do not conform to the stereotype; teachers’ perceptions of students’ race and ethnic status influence their
judgments about the students’ likely academic success; and racial prejudice underlies public attitudes about punishment for crime with those likely to support the most punitive policies holding the racial prejudice. In each case, social judgments not only influence how people are perceived but also produce consequences for how people are treated.

This is the essential insight of labeling theory, especially when considered in the context of structural inequality. Labeling theory is the idea that, once given a “marker” (or “label”), the so-labeled identity tends to stick and others perceive that person accordingly, regardless of the person’s actual social behavior. The person so labeled may even adopt the so-designated identity, thus becoming what others perceive him or her to be. Labeling theory has been extensively applied in the study of deviant behavior, explaining how, once people are labeled as deviant, whether or not they engage in deviant behavior, they are treated as such.

Although used primarily in studies of social deviance and crime, labeling theory is also useful in thinking about other social problems. In schools, for example, who is perceived as “at risk,” and what are the consequences of this perception? Race, gender, and class strongly influence such judgments, with young black men especially vulnerable to such attributions.

Where do these social judgments originate? Although surely the mass media are not the only source of such learned assumptions, clearly media depictions of various groups and various social problems strongly influence social stereotypes. How the news portrays social problems, for example, can influence public understanding of social problems. On the one hand, the media, for example, tend to depict violence as if it were random, with anyone having an equal chance of being victimized—an assumption that directly contradicts sociological evidence of the patterned character of violence. At the same time, however, the media also portray social problems via strong class, race, and gender stereotypes. News reports on the state of the economy disproportionately discuss economic events as they affect economic elites and investors, much less often reporting on problems that affect the general workforce. The media’s depiction of welfare also shows an increased tendency to identify African American women with images of dependency. And, although media depictions of women have improved in some regard in recent years, women are still highly sexualized and degraded in popular culture. Exposure to sexualized imagery of women has an effect on men’s and women’s sexual relationships, making relationships more adversarial and making young people more accepting of interpersonal violence.

In summary, although inequality has a strong influence on the generation of the likelihood of social problems, social problems may be more evenly distributed across the population than is commonly perceived, but societal judgments influence the perception and detection of social problems. Because disadvantaged groups are more likely to be overseen by official agencies and are more likely stereotyped in the dominant culture, the appearance is created that they are more prone to social problems.

### Inequality and Its Consequences

Another way to think about the influence of inequality on social problems is to examine the consequences of social problems for different groups. This can be seen at different levels—for individuals, for families and communities, and for society as a whole.

At the individual level, experiencing one social problem can lead to others. For example, studies find that having contact with the criminal justice system has a significant effect on one’s lifetime earnings, thus exacerbating the initial effect of the problem of criminal labeling. Likewise, experiencing mental illness can decrease an individual’s annual income by several thousand dollars. Sexual abuse not only is a problem in and of itself but is also a factor in high rates of school dropout, substance abuse, later sexual violence, prostitution, and even violent offending. However, the consequences of social problems are not always so devastating; social networks can facilitate coping with social problems. At the same time, disruption of one’s support networks— influenced in turn by the strength of the network—can lead to further social and psychological distress.

The ripple effect of social problems occurs not just among individuals but also in families and communities. Among college students, for example, studies find that African American students from racially segregated neighborhoods experience higher levels of family stress than do other students—largely because of the social problems found in their home communities.

Finally, social problems have consequences for society as a whole, as is illustrated by considering the
costs of maintaining people in prison versus the cost of investing in education. The government, including federal, state, and local direct costs, is currently spending over $185 billion per year on correctional facilities—a 423 percent increase since 1982. This amounts to $209 per person per year in the United States. And, while educational funding in total is still higher than spending levels for correctional facilities, many argue that the increase in incarceration witnessed in recent years comes at the expense of support for education, especially at the state level. Every social problem a society faces has costly consequences—measured in both economic and social terms. The total cost of teen pregnancy to society is estimated at $9.6 billion per year, measured by summing the costs of public assistance, child health and welfare, incarceration, and lost tax revenues.

There are costs other than economic ones that cannot be measured in quantitative terms. Rising rates of fear in society, high rates of imprisonment, more gated communities (prisons for the lower class, gated housing for elites), and, potentially, greater violence all amount to societal level consequences. Furthermore, economic inequality threatens the very stability of societies and leads to more coercive social control. Cross-national research findings, for instance, show a tendency for expansion of state-based social control when there is internal economic inequality in a given society.

Inequality and Solutions

The strong correlation between inequality and social problems begs the question of what needs to be done to solve some of the nation’s most difficult problems. Many analysts are now documenting the increasing inequality characterizing the nation in the early 21st century. Should inequality grow, it is predictable that social problems will increase.

Some policies for change may only exacerbate the problems of social inequality. In education, for example, new programs, such as vouchers, charter schools, and school choice, that are intended to improve educational quality, may only increase racial and class segregation in schooling. Welfare reform, legislated to encourage work and reduce the alleged dependency of women on welfare, has unintended consequences that reproduce inequality. Welfare rolls have been reduced, but poverty has increased; more women formerly on welfare have become employed but in low-wage jobs that have not improved their economic status. And without state support, many have also lost the related benefits—such as subsidized housing, food stamps, child care, and health care—that would otherwise serve them. Thus, while welfare “dependency” may be perceived as less of a problem, homelessness and the impoverishment of women and their children may be worse than ever.

Social changes addressing social problems can come from the “bottom up” through community organizing and grassroots mobilization. Change can also come from the “top down,” through state-based action, legal and policy reform, or the application of social services. Either way, thinking about the impact of change on different social groups is a fundamental part of addressing social problem reform. Comprehensive social change engages fundamental questions of national values and the collective commitment to serving all of a nation’s people. Where is the balance between values of individual freedom and collective social justice? How can a nation maintain individual freedom to pursue economic success while also supporting a social contract to support the nation’s citizenry? Although such value-laden questions are not typically those asked by sociologists researching social problems, they are nonetheless an important component of thinking about the connection between social problems and inequality. It is unlikely that this connection will be severed, but reducing its impact can become more of a national priority.

Infant Mortality in the United States

Major causes of U.S. infant mortality include congenital abnormalities, preterm/low birth weight, pregnancy-related problems, respiratory distress syndrome, and sudden infant death syndrome (SIDS). The dramatic decrease in the U.S. IMR during the 20th century primarily reflected fewer babies dying from pneumonia and influenza, prematurity, and low birth weight as a result of better, more available technology and medicine. However, among developed countries, the United States has the second worst newborn mortality rate. The poor IMR in the United States is due to substantial disparities in race/ethnicity, education, income, and health within the population. Overall, not all U.S. racial and ethnic groups have benefited equally from the long-term downward trend in infant mortality.

In the United States, prematurity/low birth weight (less than 5.5 pounds at birth) is one of the major determinants of infant mortality and has been the leading cause of death for black infants for more than a decade. In New York City, for example, infants born to black non-Hispanic mothers have an IMR more than twice the rate of those born to white non-Hispanic mothers. This difference is especially stark in communities with a high percentage of black residents. The factors that contribute to these disparities are difficult to isolate as they interact with each other, but some areas studied include the overall health of the mother, socioeconomic status, and social stressors. The stress of marginalization associated with racism has been investigated as a cause of poorer health among minorities. It is probable that these stressors can have an effect on women before conception as well as during pregnancy, which may contribute to poor birth outcomes. There are also disparities between whites and other ethnic groups. For example, compared with non-Hispanic whites, SIDS deaths among American Indian and Alaska Natives are 2.3 times greater. U.S. efforts to decrease infant mortality across ethnic groups focus not only on the individual behaviors of women but also on the communities in which they live, their economic standing, and their social status, since many factors can affect pregnant women and the health of their babies.

Infant Mortality in Developing Countries

Each year about 2 million babies worldwide die within their first 24 hours, and over 7 million babies born in
sub-Saharan Africa, Asia, Latin America, and the Middle East do not live to their first birthday. Their deaths most commonly result from pneumonia and dehydration caused by diarrhea. In developing nations, IMRs correlate inversely with a nation’s per capita income, and in countries where people make less money the IMR is significantly higher. The relationship between poverty and infant mortality is closely related because the structural conditions of poverty such as poor sanitation, lack of primary health care, malnutrition, and lack of access to clean water can be detrimental to newborns, particularly vulnerable ones.

Social factors within developing countries also have an effect on infant mortality and the ability of newborns to survive their first year. The age at which women have children can affect birth outcomes, with adolescents and women over 40 years old more at risk for giving birth to low birth weight babies. The spacing between births is another factor that can affect birth outcomes. Babies born less than 2 years apart are at greater risk of being born with a vulnerable condition, particularly when they are born to mothers who are malnourished or in a weakened physical state. Influencing interval length between births is access to, and use of, modern contraception methods to control the timing between pregnancies. High IMRs also correlate with high fertility rates, as many families attempt to balance infant deaths by having more babies to ensure the survival of some children to eventually help support the family. Unfortunately, poor parents are often unable to devote enough resources, for such things as education, to each child within a large family, making it difficult to rise out of poverty. Both reducing the IMR within developing countries through improved health conditions and shifting social norms regarding women and childbirth can have a dramatic effect on improving the quality of life of the society.

INFLATION

Simply defined, inflation is a persistent increase in the average price level of goods, commodities, and services. Typically measured as an annual percentage rate of change on an index number, in the United States, the inflation rate finds common expression using the consumer price index (CPI), a time-series measure of a weighted average of prices of a specified set of goods and services. Other key indices track producer prices, wholesale prices, and commodity prices. Currently, the base period for the CPI is the average prices in the 1982–84 period. Since 1950, the average annual inflation rate in the United States, as measured by the CPI, has typically fluctuated between 1 percent and 4 percent. However, the country experienced a much higher average annual inflation rate of 7.09 percent for the 1970–79 period, with a peak in 1974 of 11.1 percent, as a result of the Vietnam War and the price increases caused by the 1973 oil embargo by members of the Organization of Petroleum Exporting Countries (OPEC).

While it is generally acknowledged that economies are likely to function more efficiently if the rate of inflation is low, little consensus exists about the causes of inflation. The two basic categories of inflation in the economic literature are demand-pull inflation and cost-push inflation. Demand-pull inflation comes from increases in aggregate demand, whereas cost-push inflation results from decreases in aggregate supply. In modern economies, however, inflation is not a simple phenomenon of rising prices but is greatly affected by the supply of money. With the advent of fiat money, governments can have a significant impact on the rate of inflation through the manipulation of the money supply and the subsequent impact on the value of money.

An inevitable by-product of inflation is income redistribution, as the burden of increasing prices is not
shared equally across all socioeconomic classes. In general, inflation tends to have a regressive impact due to the disproportionate loss of purchasing power, particularly among lower income groups and those on fixed incomes. Another aspect of income redistribution involves the “inflation tax,” caused by the government financing current expenditures through the printing of money. The resulting increase in the money supply has the effect of causing a decrease in the value of cash-based assets.

The sociological literature on inflation is relatively sparse, although there have been a handful of prominent contributions. For instance, an early contribution adopted a social conflict perspective in arguing that the inflationary period of the 1970s was largely a result of an intensification of distributional conflicts between labor and employers. In contrast, a more recent contribution emphasized the growth of the use of monetary policies by governments as a way of understanding the dynamics of inflation. The recent resurgence in economic sociology holds promise for future sociological analyses of inflation and its effects.

Inner City

Social problems related to industrialization, immigration, criminality, and poverty were initially perceived as problems of the city in its entirety and were later associated more with the inner city. With the rapid post–World War II expansion of a distinctive suburban realm, the concept of “inner city” achieved wide currency. The identification of the inner city with social problems is a primarily North American phenomenon, even if exported to other settings such as Great Britain. The inner city was perceived as the converse of the suburbs. Thus suburbs were clean, safe, modern, and mainstream middle class, but the inner city supposedly was dirty, dangerous, outdated, poor, and inhabited by minorities. Indeed, the inner city most often served as a backdrop for film noir.

Clearly, depicting the inner city as a homogeneous entity overtaken by social problems was a gross oversimplification. In most metropolitan regions, the inner city was a complex entity, containing both poor areas and elite enclaves. Still, on the whole, the 1950s, 1960s, and 1970s were not kind to the inner city. As suburban growth proceeded apace, many inner-city districts lost their middle-class populations and thus underwent a steep filtering-down process. Accelerating socioeconomic decline was a reduction in employment as manufacturing relocated to the suburbs, thus severing the symbiotic relationship previously existing between working-class neighborhoods and close-by sources of employment.

As the condition of their housing deteriorated and perception increased about their poor adaptability to a modern, car-oriented lifestyle, many inner-city neighborhoods became a refuge for residents denied access to other parts of the metropolitan region because of low income and racial segregation. This is when the inner city became synonymous in the media and popular imagination with social pathology. Not without justification, the inner city was portrayed as overridden with poverty, crime, addiction, school abandonment, and teenage pregnancies. As social status declined, so did the housing stock, sometimes to the ultimate abandonment stage. In some cases, as in Detroit and Newark, the inner city still bears the scars of the 1960s riots. Analysts associate inner-city living conditions with the transgenerational reproduction of an “underclass.”

Inner-city problems became a target for public policy, such as the urban renewal program, first launched by the 1949 Housing Act, whose purpose was to replace “slums” with public housing and commercial development. But relocation problems and difficult living conditions in public housing projects prompted a revision of policies. The Model Cities program of the 1960s attempted to correct some of the problems of urban renewal by making more room for public participation. Also victimizing the inner city was its location between downtown and the suburbs, which
caused it to be sliced by expressways. Whereas land uses in the suburbs adapted to the presence of expressways, in the inner city these highways generally involved a destruction of the built environment and attendant displacement of residents.

Two books contributed to reversed thinking about the inner city. The Herbert Gans 1962 study of Boston’s West End revealed the existence of rich social networks in a neighborhood awaiting renewal. Most influential perhaps was Jane Jacobs, who in 1961 wrote a strong defense of the traditional inner city against the then rising popularity of urban renewal. In The Death and Life of Great American Cities, she celebrated the role that the original inner-city landscape, particularly the commercial street, played in fostering intense social interaction. She contrasted the high level of activity she observed along her Greenwich Village street with the desolation and high criminality experienced in areas changed by urban renewal. The message of these two works was clear: The social environment of traditional inner-city neighborhoods was generally superior to that provided by urban renewal projects.

In subsequent decades, favorable views on the inner city spread to well-educated young professionals preferring a central area to suburban living. Fueling the resulting gentrification phenomenon was the appeal of historical architecture, the diversity and street life of core area neighborhoods, and proximity to work for dual-income families. Successions of ever richer and risk-averse households drove gentrification: first bohemians and struggling artists, then young, upwardly mobile professionals (“yuppies”), and, last, wealthy lawyers, doctors, and executives.

Although a clear cause of homelessness (e.g., the conversion of a rooming house containing 20 low-income tenants into an impeccably restored home for a single wealthy couple), the view that gentrification itself is responsible for the replacement of the working class by richer professionals is an oversimplification. First, such a transition stems in part from the shrinkage of the traditional middle class accompanied by the rise of professional and managerial categories. Second, many well-educated newcomers to core area neighborhoods were in fact marginal gentrifiers, sharing the values, tastes, education, and some professional attributes of mainstream gentrifiers, but without a stable financial and professional situation.

Gentrification typically affected former working-class neighborhoods with the most distinctive architecture and best accessibility to amenities and employment, bypassing the ones severely deteriorated and crime-ridden. In large prosperous metropolitan regions, however, the entire inner city is now subject to gentrification or condominium redevelopment, another source of social change.

The inner city evolved into a place of extremes, a mirror of the economic polarization of recent decades. It is not unusual to find expensive condos juxtaposed with parks harboring large homeless populations. Conflicts flare easily in such environments, for example, when marginal residents are displaced to prevent their interference with economic development strategies targeted at the middle class and tourists.

From an urban planning perspective, interest in the inner city has recently been stimulated by the smart growth movement, which relies in part on core area revitalization and intensification to counter sprawl and growing automobile dependence.

INNER-RING SUBURB

Inner-ring suburbs, or what some call “first” suburbs, are communities that developed just outside of central cities during the period following World War II. Initially these suburbs were bedroom communities for mostly affluent, white residents who commuted back
and forth, often by streetcar, from work in the urban core to their home life in a safe, low-density neighborhood. Levittowns are examples of such communities.

Studying the characteristics of inner-ring suburbs is not a straightforward process. U.S. Census Bureau data are limited in the definition of suburbs as the residual portion of metropolitan areas that lies outside of central cities. Given this amorphous category, it is hard to distinguish between inner- and outer-ring suburbs. Case studies of specific metropolitan areas, particularly those that are more historical in nature, more clearly distinguish between inner- and outer-ring suburbs.

However, until recently, few studies identified differences among suburbs on a national level. The best strategy, established by researchers at the Brookings Institution, goes back to the 1950 decennial census and identifies counties that were part of the metropolitan United States at that time, which were adjacent to, or included, the top 100 cities. The county or the portion of the county that did not contain the central city was designated as an inner-ring, or first, suburb. In total, 64 counties were identified using this technique, including Nassau, New York; Arlington, Virginia; and Middlesex, Massachusetts.

Using this methodology, researchers have learned much about the character of inner-ring suburbs, relative to newer, or outer-ring, suburbs and central cities. One of the most striking features of inner-ring suburbs is that they housed nearly one fifth of the U.S. population in 2000, while central cities and newer suburbs housed 12.9 and 14.3 percent of the U.S. population, respectively. Equally important is the fact that the nature of the population in inner-ring suburbs is racially and ethnically diverse. In 2000, one third of the population in these areas comprised racial/ethnic minorities, surpassing the proportional representation at the national level (30 percent). Moreover, 29 percent of the U.S. foreign-born population lived in inner-ring suburbs, compared with 28 percent living in central cities. Finally, inner-ring suburbs have maintained a higher socioeconomic status. For example, in 2000, 31 percent of the adult population in these areas had a college education, compared with 26 percent and 28 percent in central cities and outer-ring suburbs, respectively. Likewise, average housing values in 2000 were the highest in inner-ring suburbs.

Whether the future of inner-ring suburbs is as bright as their past, however, remains to be seen. Poverty rates have been growing in these areas, particularly during the 1990s. More alarming is the fact that their poor neighborhoods have grown in recent decades, while there has been a general reduction of such neighborhoods in central cities. With trends in urban sprawl continuing, the future for inner-ring suburbs appears to be a challenging one.

INNOCENCE PROJECT

The Innocence Project is a nonprofit legal clinic that originally focused only on cases where postconviction DNA testing of evidence could demonstrate an individual’s innocence. The Innocence Project was started by Barry Scheck and Peter Neufeld in 1992 at the Benjamin N. Cardozo School of Law, where students worked (and still do) on cases involving a defendant’s innocence under supervision of a team of attorneys and clinic staff. Focusing invariably on indigent defendants, the Innocence Project typically enters into a case as a last resort, after an individual has exhausted all other legal avenues for relief.

As DNA technology became more accessible, other innocence projects began in law schools across the United States. By the end of 2006, innocence projects were operating at 40 law schools in every region of the United States. Increasingly, such projects broadened the scope of their investigation from only cases involving DNA testing to a wide array of cases involving other important indicators of a defendant’s innocence, including faulty eyewitness testimony and police or prosecutorial misconduct. The projects have been remarkably successful in proving innocence. Indeed, by August 2006, at least 183 people had been exonerated by postconviction DNA testing, and literally hundreds more had been exonerated based on other types of evidence.

Although the empirical literature on wrongful convictions has grown exponentially in the wake of the innocence project movement of the past 15 years, social scientists began investigating the issue as early as 1932. Edwin Borchard’s classic, Convicting the Innocent: Sixty-Five Errors of Criminal Justice, provides fascinating documentation of wrongful convictions stemming from prosecutorial and police
misconduct, ineffective counsel, racial discrimination, mistaken identification in eyewitness testimony, and perjury of witnesses. Throughout the 1950s and 1960s, other studies of wrongful convictions, such as E. S. Gardner’s *The Court of Last Resort* of 1952, Frank and Frank’s *Not Guilty* of 1957, and Edward D. Radin’s classic *The Innocents* of 1964 documented similar findings.

The high-profile exonerations of 13 death row prisoners in Illinois in 2000 led to the creation of more innocence projects and more available funding for empirical analysis of wrongful convictions. Recent research on wrongful convictions provided new and important insight into this phenomenon. Sophisticated quantitative analyses of wrongful convictions discovered that the quality of appellate defense was an important and statistically significant predictor of whether or not a defendant was wrongfully convicted of a capital crime.

In the policy arena, innocence projects have recently made a significant impact on the development of national legislation—most notably the passage of the Innocence Protection Act of 2004 (IPA). Relying chiefly on the testimony of Barry Scheck and other leaders in the innocence project movement, the IPA provides rules and procedures for federal inmates applying for DNA testing. Specifically, IPA creates a Post-Conviction DNA Testing Grant Program, authorizes grants to states for improving their capital prosecution and capital defender programs, and provides funding to assist families of murder victims.

The Innocence Project. (http://www.innocenceproject.org/).

**Institutional Ethnography**

Institutional ethnography is an alternative sociology that examines social relations and social institutions from the standpoint of the experiences of particular, active subjects. It is distinct from other sociological modes of investigation in that it is not under the direction or conceptual control of any sociological theory; rather, inquiry begins in and remains in the social world in which we live.

The aims of institutional ethnography investigations are twofold. The first is to discover how it is that day in and day out we put together our social world, including how our local everyday activities are linked to and coordinated by social relations that are not entirely visible from any one location. Thus, institutional ethnography research expands people’s knowledge of their everyday worlds beyond that which they develop through their routine participation. The second aim is to build knowledge of institutional processes in general and to develop new ways of discovering ruling relations. This work involves an examination of studies done in varied institutional settings and drawing out those relations and social processes commonly found across institutions. Throughout institutional ethnography investigations, however, the focus is on the material world: what people are doing, with whom they are doing it, and the conditions under which their activities are carried out.

Canadian sociologist and founder of institutional ethnography Dorothy E. Smith described institutional ethnography in the 1970s as an articulation of the women’s movement in North America. She identified two different modes of consciousness active in her life of running a household and being a mother and her life as a scholar in the university. The life in the home was one of particularities and real people, whereas the life of the university was abstract and the social relations were extra-local. Yet, through her involvement in the women’s movement, Smith learned to take her own experience as a woman as the basis for how she could know the world. She also realized, as did many others involved in the women’s movement, that the academic disciplines were written almost exclusively by men and from their viewpoint. Furthermore, the disciplines—sociology in Smith’s case—claimed objectivity while excluding women, their knowledge, and their concerns from the scholarly discourse. Smith concluded that it was necessary to remake sociology from the ground up. This alternative sociology would be a “sociology for women,” one which would discover the social relations which shaped women’s everyday experiences.

In 1986, the term *institutional ethnography* first appeared in print in Smith’s article “Resources for Feminist Research.” Indeed, the conceptual design of
institutional ethnography was to aid women in understanding the social organization of their lives. Yet, it soon became evident that the social relations shaping the experiences of women shaped those of men as well, and in the 1990s institutional ethnography evolved as a “sociology for people.” A network of institutional ethnographers (many of whom were students of Smith at the Ontario Institute for Studies in Education) formed, and they initiated research from the standpoint of people with AIDS, teachers, social workers, nurses, nursing home residents, and others.

The topics of institutional ethnography research are generally some issues or problems that people experience in their everyday lives, but the starting point (or point of departure) for the investigation is people’s actual experiences. This research is a two-step process. In the first step research begins with one’s own experience or with that of another actor, but in either case special attention focuses on what people actually do and on what they say about their activities. That is, the researchers attend to “work” and work “knowledges.” In institutional ethnography the term work expands beyond the sphere of paid labor to include any intended activity taking time and effort. “Work knowledges” refers to what people know of their work and how this work is coordinated with the work of others. Through the exploration of work and work knowledges, researchers learn of the local social organization and of the actors’ knowledge of this organization. Furthermore, people’s work and talk of work provide clues to the investigators regarding how local organization connects to the coordinating work of others. In the second step the researchers take up the clues, as evidence of local participation in the institutional practices, and trace this evidence—found in the form of discourse, spoken and textual—to the extra-local social relations.

Institutional ethnography research commonly examines texts, especially those replicable and standardized, since they coordinate people’s activities in local settings. They mediate social relations, coordinating the doings of people translocally. Texts, as taken up in local settings, enter actions and organize actions at multiple sites. While one party in the text is fixed, the reader is not. While attending to a text, the reader is active in interpreting and acting upon the text; that is, a text-reader conversation forms. In the text-reader conversation, the reader “activates” the text by taking it up and incorporating it into the local setting, thus hooking the local into the institutional. By activating the text, the reader becomes an agent of the text. This is not to imply that the text completely controls the reader. The reader may resist or disagree with the textual discourse, but through its activation, the text becomes unavoidable. Furthermore, in many work processes, one textual step follows another textual step, each dependent upon the prior step and the anticipated next step, and so on. Thus, filled-out forms and generated reports transform particular events into generalized forms that are critical in coordinating the work of others. Such regulation through texts is widespread in modern, literate societies, and it is a foundational consideration in institutional ethnographic investigations.

Institutional Ethnography of “Social Problems”

In sociology, “social problems” emerge as social objects through the ongoing research and theoretical activity of sociologists, and their existence then becomes taken for granted within the discipline. However, as both the discipline and the historical contexts evolve, a reconstruction of these social problems often follows. Smith, however, noted a difficulty with this objectification of social problems and suggested that social problems be viewed as a form of social organization operating within public text-mediated discourse, a complex of social relations within relations of ruling. As this social organization enters the local and particular actualities, experiences connect with, and translate into, standardized and generalized forms. This is a political process by which a particular experience becomes known as a social problem and other troubles align with it as cases of the social problem. Thus, “social problems” serve as a mechanism by which particular interests acquire objective status. The discourse of social problems provides a statement of general interest which may be contradicted if investigations of so-called social problems begin with experience in the local setting, rather than with interpretations provided by sociological discourse. For example, what appears as a problem of “illiteracy” or of “single-parent families” in the discourse may be found to be a shortcoming of capitalist practices in the local setting.

Paul C. Luken

Intergenerational mobility refers to the movement of individuals and groups away from the station of their parents or other forebears. Intergenerational movements across socioeconomic class boundaries are the hallmark of open societies and a central concern among social scientists.

Open societies, sometimes referred to as class societies, are those in which intergenerational mobility is possible. In such circumstances it is common to find adult children faring better than their parents—upward mobility—on an assortment of socioeconomic indicators. Conversely, we can reasonably expect to find some adult children faring worse than their parents—downward mobility—though this has less often been the case in more developed and developing societies. Closed societies, often referred to as caste societies, are those in which the socioeconomic statuses of parents are entirely predictive of those of their adult children, with little possibility for any social mobility. The prevalence and character of intergenerational mobility may gauge the extent of meritocratic or democratic practice in a given society, but measuring intergenerational mobility is not straightforward.

Children may outperform or underperform their parents on several different dimensions. Some of the most widely recognized studies of intergenerational mobility compare occupational statuses of adults with those of their parents. Because occupational status changes relatively infrequently, it may be appropriate to compare parents and children at a single point in time. However, because income and wealth tend to increase as individuals advance toward retirement age, there is a crucial temporal dimension that must be considered in any attempt to assess intergenerational mobility.

The most accurate assessments of intergenerational mobility examine the achievements of two or more generations viewed at the same or a similar place in the life course. For example, it may be misleading to compare 50-year-old parents with their 25-year-old children since the former group is, on average, well established whereas their adult children are “just getting started” and may be in transient class locations. Using such a comparison, we might conclude that children are faring worse than their parents and thus must have experienced downward mobility. A comparison of the same group of adult children with their parents 25 years earlier, when the parents themselves were 25 years old, would likely lead to different, more accurate, conclusions regarding the extent and character of intergenerational mobility.

However it is measured, upward intergenerational mobility was a pronounced feature of the 20th-century American experience. Immigration, urbanization, industrialization, and education are a few of the factors that facilitated this trend by introducing children of relatively humble origins—children of immigrants, children of farmers, lower- and working-class children, and racial minority children—into an opportunity structure that, while not free of discrimination, was more open than at any time in the past. In the early years of the 21st century, declining educational funding and quality, export of entry-level jobs, declining influence of labor unions, a minimum wage not keeping up with inflation, and regressive taxation have made significant (upward) intergenerational mobility more difficult. This is particularly true for lower- and working-class parents and children who are disproportionately racial and ethnic minorities.

INTERLOCKING DIRECTORATES

Applied to a pair or small group of organizations, interlocking directorates are instances of persons serving on the board of directors of multiple organizations, constituting an overlap in membership among the boards of those organizations. Applied to a population of organizations, the term interlocking directorates refers to a condition in which there are sufficient board member overlaps among the organizations that a path can be traced between any two organizations in the set, either directly or via a series of board overlaps between intermediary organizations. This condition typifies many interorganizational environments. Often the organizations of interest are large corporations, in which instances of interlocking directorates are also known as corporate interlocks.

Organizational theories suggest interlocking directorates may serve organizations in a variety of ways. They provide a channel of communication between organizations, which can then facilitate interorganizational coordination, be a vector for the diffusion of innovations, and enable values and practices to become normative across organizations. Director interlocks may also provide a competitive advantage in surviving in an uncertain environment, by providing information about that environment and acting as agents of the organization. Resource dependence theory specifically sees interlocking directorates as a device for gaining access to needed resources, expertise, price advantages, or lower transaction costs, a view supported by the tendency of firms to have representatives of suppliers, large customers, and experts in law and finance on their boards.

Critics of capitalism see interlocking directorates variously as means by which individual capitalists centralize power and exercise control of corporations in which they have an ownership stake, as a device for capitalist class cohesion and collective control over organizational resources and thus the economy and politics, or as a mechanism of bank control whereby commercial lending institutions ensure the safety of and return on their capital loans to industry while exercising control over the economy.

Interlocking directorates have been viewed as a social problem since the anti-trust movement, circa 1900, because their existence calls into question the independence of corporate governance, they aid in suppressing competition, and they contribute to monopoly or oligopoly control of sectors of the economy, thus upsetting market pricing and possibly retarding product development. As a means by which a power elite may have control of economic and political resources, interlocking directorates are also relevant to the study of social inequalities, the distribution of resources in society, and the understanding of the impact of formal organizations on a variety of social problems.

Conversely, interlocking directorates can aid in addressing social problems by providing channels of resource mobilization, as shown by the tendency of philanthropic donations to follow interlocks between corporate and charity organizations, or providing a mechanism for coordinating service organizations. Interlocking directorates as a strategy for negotiating a competitive and uncertain environment and coordinating with other organizations could also be viewed as a solution to social problems from the perspective of an organization.

As a type of social network, interlocking directorates are often studied using the methodological tools of social network analysis.

INTERMARRIAGE

Intermarriage is the marriage between spouses of different races or different ethnicities and is therefore either inter-racial or interethnic. Marriage between a white and a black is an inter-racial marriage, while a
marriage between a Japanese and a Chinese is an interethnic marriage. The difference between race and ethnicity, however, is not always clear. Interethnic marriages have a much longer history than do inter-racial marriages in the United States. Even in early colonial times, European immigrants of different nationalities and religions intermarried. Inter-racial marriages, on the other hand, have faced higher social stigma and legal restrictions that did not end until after the mid-20th century.

In scholarly writings, intermarriage can also refer to a union between spouses of different social characteristics. For example, a marriage between an educated person and an uneducated person might be called an educational intermarriage, regardless of the couple’s race or ethnicity. References to such intermarriages, however, are rather limited.

Similar to intramarriages, intermarriages occur for reasons such as romantic attractions and status matching between partners, but intermarriages are associated with higher probabilities of divorce than intramarriages, due to the greater social barriers the intermarried couples often have to face. Studies of marital happiness also yielded evidence that intermarried couples tend to report lower levels of marital satisfaction.

U.S. intermarriages have steadily increased in the past few decades, growing from 0.7 percent of all marriages in 1970 to 5.4 percent in 2000, while the actual number of such marriages rose by tenfold in the same period. The Census Bureau reports that the most common type of intermarriage occurs between whites and Asians.

Why do people marry out of their racial or ethnic groups? Sociological theories on intermarriage basically fall into two categories: availability and choice. Availability of potential marriage partners speaks to the structural constraints that either promote or limit intermarriages. The most important structural constraints are the number of racial or ethnic groups in the marriage market and the relative sizes and internal sex ratios of these groups. More groups potentially lead to more intermarriages, whereas group sizes inversely affect intermarriage rates. Because intermarriage involves spouses from two groups, the same number of such marriages dictates different rates between large groups and small groups, with the latter inevitably carrying higher rates. Imbalanced sex ratios of the marriageable population within a group, on the other hand, will “force” the extra men or women to outmarry. Many immigrant groups in the United States initially experienced severe sex ratio imbalances as a result of gender-specific immigration. For these groups, intermarriage rates often differed by gender.

The second category of theories that explain intermarriage focuses on choices for mates, mostly status exchange between couples. The increased intermarriages in the United States in recent decades coincided with higher educational achievements of many minorities and their participation in the labor force with whites of comparable socioeconomic status. Both the educational institutions and the workplace provide opportunities for inter-racial and interethnic interactions between people of similar statuses, thus promoting intermarriages. Rising intermarriages, in turn, reduce stigma against intergroup relations and make intermarriages a more accepted choice. Besides similar socioeconomic status, cultural preference is another consideration of mate selection, with people choosing mates with similar traditions, religions, and other cultural practices. This tendency explains selective intermarriage within large ethnic circles, such as pan-Asian, pan-Hispanic, and pan-Pacific Islanders. For example, Asians of different nationalities tend to intermarry more often than they marry non-Asians.

Choice is, of course, not independent of availability, and the two interact to affect a racial group’s inter-racial or interethnic marriage rates. High concentration of a minority group may provide higher availability of within-group mates, in addition to promoting close-knit cultural settings that strengthen ingroup solidarity that might work against intergroup relations. Asian Americans, for example, are highly concentrated on the West Coast, especially in California, where Asian intermarriage rates are lower than in other states, after controlling for social status.

Choice by gender and race also seems to occur in the inter-racial marriage market. White–black intermarriages are more likely between white women and black men, while white–Asian intermarriages tend to be between white men and Asian women, although the reverse patterns have slowly increased in recent decades.

Interracial marriage serves as an indicator of a minority group, especially an immigrant group, integrating or assimilating into the mainstream society, especially through intermarriage with whites. Outmarriage rates by themselves, however, may not indicate how likely a group will be to outmarry, because group size affects these rates. Through the use of complicated statistical models, sociologists can measure tendencies of
endogamy (ingroup marriage) and exogamy (out-group marriage) by controlling for group size and other factors. Such studies often find that whites are less endogamous than most minorities. That is, minorities actually have a stronger tendency to keep their members in within-group marriages.

**Internal Colonialism**

The concepts of “internal colonies” and “internal colonization” embrace expansive interdisciplinary efforts to explain economic, class, cultural, and racial domination and subordination of groups and geographies within the boundaries of a single society. _Internal colonies_ refer to geographic sites that are often spatially controlled, dominated, and destabilized cultural lifeworlds and to underdeveloped and exploited regions, communities, and groups. Internal colonies exist even when dominant and subordinated groups intermingle and geographies are blurred. _Internal colonization_ refers to the historical and contemporary processes of maintaining domination and subordination. These explorations examine the incorporation and cross-fertilization of class, racial, and sexual domination in a country’s internal colonies; the role of the state, market, and dominant civic organizations in disciplining the colonial order; the presence of political subjugation; the function of legal and extra-legal forms of domination and violence; and the significance of ideology and culture.

Studies of internal colonies and internal colonization overlay a broad swath of groups and countries from blacks and Chicanos/as in the United States to Northern Ireland as an underdeveloped English internal colony. Studies utilize the concepts to investigate realities as disparate as the underdevelopment of poor children in public schools to environmental racism.

The concepts have a contentious history. Lenin, Marx, and Gramsci referred to internal colonies in their characterizations of peripheral underdeveloped areas in European countries. W. E. B. Du Bois, Robert Blauner, and other U.S. scholars employed a similar framework in looking at the underdevelopment of blacks.

Despite the promise of the initial conceptual developments, antipathy to Marxist analyses, particularly in the United States, limited the full integration of the concepts of internal colonies into the social sciences, public administration, and development studies. Even though some U.S. analysts at the turn of the 20th century encouraged the study of American colonization and empire, official exhortations and academic texts minimized the country’s colonizing history of Native Americans, Mexicans, blacks, Puerto Ricans, and Filipinos/as under the rubric of “American exceptionalism.” Furthermore, the cold war erected a particularly inhibiting barrier to the integration of the concepts. The United States promoted capitalist modernization as an alternative to socialism, promising newly independent countries that lessons learned from the history of Western industrialization translated into concrete, positive prescriptions for modern industrial development. Few American analysts, notably those shaping and writing the dominant theories and texts on race relations, attempted to show that the underdeveloped “ghettos”—Appalachia and similar peripheral areas in the United States—were not modernized by industrialization. U.S. diplomats also squashed efforts by blacks to present their case of internal underdevelopment to the United Nations.

The concepts reemerged in the 1960s and the 1970s, influenced by a confluence of events and studies, including the global anti-colonial struggles and the civil rights movement, especially the Black Power movement; new theories of colonial hegemony; renewed global interpretations of the core, periphery, and semiperiphery represented by dependency theories; world-systems theory and labor market segmentation; new historical interpretations of
colonialism and imperialism; and the emergence of postcolonial studies.

**INVASION-SUCCESSION**

Ernest W. Burgess and other Chicago School sociologists developed the concept of “invasion-succession” in the 1920s to describe land use in the expanding U.S. industrial cities. Borrowing ecological concepts from natural science, Burgess saw the city’s land use as a mosaic resulting from market forces plus the cultural preferences of distinct groups of residents. Enlarged by migration, cities expanded outward from the central intersection of their rail, water, and trolley routes. Profitable enterprises—banks, law firms, department stores—and individuals with an interest in a central location were able to command commercial space in the business district or housing in adjacent “gold coast” apartments. Factories relying on ports and railroads dominated nearby areas. Their need for workers attracted migrants from the rural South as well as displaced farmers and laborers from overseas. Forced by poverty to take the cheapest housing, newcomers congregated in densely packed tenements in and near the factory zones. Speculators facilitated this clustering by building insubstantial rental flats and subdividing older housing that was abandoned as the wealthy moved on. Residents able to pool family wages were sometimes able to purchase buildings in these areas, creating temporary stability and facilitating ethnic homogeneity.

In-migrants, often lacking English, created ethnic enclaves in these zones of first settlement to reproduce familiar cultures. They supported churches and synagogues, religious schools, ethnic shops and restaurants, athletic teams, newspapers, and night life. The congruence between enclaves and political wards allowed residents to elect officials who delivered jobs, contracts, and services. The concentration of enclave populations supported an ethnic small business class and preserved familiar ways of life in otherwise alien cities.

These neighborhoods, however, also experienced disequilibrium. Where central business districts expanded into these zones, office buildings replaced tenements. When residents adjusted to urban life and took advantage of expanding economies, they increased their incomes and sought better housing elsewhere. Many in the native-born generation sought greater independence from ethnic oversight by moving to less-homogeneous areas of second settlement. At the same time, a succession of new groups arrived. Initially, Irish wards became dominated by Jews or Italians. Some of these, in turn, became African American neighborhoods. The transition could be peaceful or conflictive, depending on its speed and the state of competition for the cheapest housing. The fact that the wider society invidiously sorted groups by race and ethnicity at the border, at work, and in politics heightened ethnic tensions while the need to share political and religious institutions promoted accommodating shifts in resources.

In the 1960s, manufacturing began a sharp decline in U.S. cities. Using the power of eminent domain and federal subsidies for “slum clearance,” cities sought renewal by demolishing the many ethnic neighborhoods remaining on the edge of their central business districts. Often office towers and convention centers took their place as economies shifted to a service base. While luxury apartment towers lured many white-collar professionals from the suburbs to the urban core, others sought out and renovated what remained of older substantial housing and converted obsolete industrial lofts into spacious living quarters. Artists replaced garment workers and were themselves replaced by attorneys; tenements that continued to house the oldest and least mobile Italians or Ukrainians were converted to upscale housing by speculators and expanding universities. This gentrification, initiated by professionals who saw themselves as “pioneers in the urban wilderness,” was quickly seized upon by city governments. They delineated historical districts, zoned streets for pedestrian use, moved cultural facilities downtown, and encouraged developers to create “festival marketplaces” for well-off residents and tourists. In many cases, a restaurant
veneer of an ethnic enclave was all that remained. Government worked hand in hand with the postindustrial economy in this invasion-succession dynamic, enhancing the overall economy of cities but at the price of reducing the stock of affordable housing and ignoring manufacturing employment.

IQ Testing

Intelligence quotient (IQ) testing is scientifically controversial and has a varied history. Most IQ tests consist of verbal and performance test items that result in a score with a mean of 100 and standard deviation of 15. As such, the majority of the population (84 percent) lies in a range of 85 to 115 on most IQ tests. Of the numerous discussions of the 20th-century development of intelligence measures, most conclude with one or more of the following precepts:

1. Current cognitive ability measures, traditionally called “IQ tests,” now use broader definitions of intelligence factors and less age/development focus, so instead of the descriptor “IQ,” “cognitive” or “ability” or “intelligence” or “intellectual aptitude” is more commonly used.

2. Although part of cognitive ability is inherited, debate continues as to the exact proportion and influence of genetics versus environment.

3. IQ or cognitive ability tests are strong predictors of academic achievement and social success within groups, but score variability due to education and opportunity makes individual predictions possible but not definitive.

4. IQ tests effectively screen for cognitive strengths and weaknesses deserving special education opportunities, including programs for the retarded or gifted. Discrepancies between IQ scores and specific areas of achievement are often used to diagnosis learning disabilities.

Despite demonstrated uses of cognitive ability measures (IQ tests) in schools and employment, a number of scholarly works debate social consequences, ethnic discrimination, and biological determinism. Certainly scholars differ on the use or potential misuse of IQ tests; some even hold that intelligence is social in origin.

Recent research examines recognized phenomena not yet completely explained. These include the notion of multiple intelligences, the longitudinal increase in IQ over the past century, and emotional intelligence as a corollary of cognitive intelligence. All of these lines of scholarship start with traditional IQ testing as a historical or psychometric basis for a springboard to new theories and measures.

Regardless, the widespread use of IQ tests continues and will likely be a topic of research and discussions for the foreseeable future. Started in 1946, an international organization (MENSA) open only to the top 2 percent of IQ-tested people now has more than 100,000 members, suggesting that IQ testing has a popularly desirable outcome for high scorers. No doubt the theories and measures of factors underlying the popular notion of intelligence will continue to foster research and debate.

The evolution of religion and its relationship to the rest of society was a major topic of early sociological theory. One of its earliest and most persistent propositions—reaffirmed by many contemporary theorists of the sociology of religion—is that religion, like any other institution, is a dynamic entity and that its functional differentiation is a fundamental part of social processes. In this theoretical framework, religious institutional arrangements are thought to be evolving according to the perceived needs of the sociohistorical time period. As religion impacts the larger society, it too is impacted by the dominant patterns of society. Moreover, the various institutional arrangements either support or are in competition with one another. However, the topic of Islam and modernity, as it has evolved in the modern era, is a complex one largely due to shifting and multidimensional interpretations of both Islam and the concept of modernity.

The word Islam, which means “surrender,” is related to the Arabic word salam, or “peace.” Islam as a religion means “submission to the will of God.” It stands in a long line of Abrahimic religious traditions that share an uncompromising monotheism. The foundation of Islamic values and practices is the Koran and Hadith, which are composed of the teachings and the deeds of the Prophet Muhammad. For Muslims, the Koran is the Book of God (Allah) revealed to Muhammad by means of the angel Gabriel. In a very deep sense, Islam is the Koran and the Koran is Islam. Today Islam is the religion of one fifth of the world’s population (1.2 billion), and, as the second largest religion, it exists not only in the Middle East but also in Africa, South Asia, East Asia, Europe, and the United States.

Modernity is a term used to describe the condition of being “modern.” Since the term modern is used to describe a wide range of periods, modernity must be taken in context. In the field of sociology, many of the defining characteristics of modernity—such as specialization, rationalization, secularization, and universalism—stem from the relatively small communities to the more large-scale societies. In this context, social changes which are common to many different levels of social integration are not limited to the Western European societies. In other words, modernization is a general, abstract process, also found in non-Western societies, including Islamic society.

The Evolution of Islam

For more than 1,400 years, Islam has been in a constant state of evolution, going through many phases in its development, including the formation of nation-states in the Muslim world. However, Islam has not yet evolved to a point where there is a separation of religion and state, as found in the history of Western civilization. Historically, Islam developed both as a faith and as a political order. While Islam provided the basic framework of meaning and direction for political, social, and cultural life, it has continually adapted to the cultural, political, and social realities of various regions.

Thus, throughout history, Islam manifested itself in different cultures and societies, creating in each case a unique expression of Islamic culture. This evolutionary process gave rise to an Islamic civilization that is multicultural.

Islam also inspired a rich civilization in which Muslim scholars made important advances in sciences such as mathematics, algebra (itself an Arabic word), astronomy, and medicine. Muslim scholars have long been recognized for their contributions to the preservation of classical learning during the Dark Ages. It was through Muslim thinkers’ translations of the Greek works of Plato, Aristotle, and other classical thinkers that these works reached Europe and contributed to the first flowerings of the Renaissance. Most Islamic thinkers maintain that the initial encounter between Islam and the West during Islam’s early years of expansion represented a dynamic and fruitful interaction. According to many historians, this was because Islam possessed ample power to absorb and assimilate intercultural elements. Some historians even maintain that despite the fact that the history of Christianity and Islam has been marked by mutual hostility and confrontation, medieval Islam was a religion of remarkable tolerance for its time, allowing Jews and Christians the right to practice their religions. Thus, in its prime time, during the period that Islam was a dominant and expanding civilization, it exhibited a great amount of tolerance.

However, the “Golden Age” of Islam was short-lived and lasted only a few centuries. By the 13th century, a decline in the political and intellectual development of the Islamic world had set in. Most Islamic thinkers agree that the impediment to change was not Islam itself as a religion but rather the emergence of religiopolitical structure in the Islamic
world. Other historians believe that this decline was due to the reinterpretation of Islam by powerful conservative religious leaders.

**Islam in Modern Times**

The history of Islam in modern times is essentially the history of the Western impact on Muslim societies. The modern era in Islam’s history can be said to begin around 1800 CE, which marks the time when Napoleon Bonaparte and his forces were in Egypt. Following that, the European powers colonized one Islamic country after another. Thus, the rise of modern Europe coincided with European colonial rule, a humiliating experience for Muslims conscious of their proud past. After World War I, the European invasion of the Islamic world intensified as a result of more political and economic dominance.

Cultural and political confrontations with Europe caused Muslims to become defensive and more hostile toward Western political and cultural influences. In the shadow of European colonialism, Muslim thinkers and intellectuals developed conflicting strategies to reconcile traditional Islamic values with modernity. Their responses to modernity provoked a great deal of controversy, particularly among Muslim thinkers and Ulema (religious leaders). Secularists, while overemphasizing external factors such as colonialism and imperialism as the cause of the rapid decline of the Islamic world, advocated the restriction of religion to private affairs and its exclusion from public life. Meanwhile, the conservative sectors led by religious leaders conceived of Islam not only as a religion that allowed for no change but also as a total way of life. These religious leaders also became increasingly suspicious of independent reasoning or personal reinterpretation (Ijtihad). Ijtihad is an inherent tradition in Islam and serves as a juristic tool that allows for independent reasoning to articulate Islamic law on the issues where textual sources are silent. The conservatives did not favor “opening the door of Ijtihad,” whereas the Islamic reformists argued that Ijtihad equipped Muslims to meet the challenge of social change by the reinterpretation of Islam. In other words, to the reformists, Ijtihad was a tool to reconcile Islamic values with modernity.

Like most religious traditions, Islam has had, and continues to have, multiple interpretations and applications throughout its history and even more so today. As a result, there are a variety of Islamic movements, which display the many faces and forms of Islam. However, the phenomenon of interpretation and reinterpretation in Islam is complicated by the fact that no organized hierarchy or centralized religious authority exists in Islam. Religious authority in Islam is distributed among numerous Ulema and jurists whose authority stems from the willingness of the faithful to accept their decrees (fatwa).

The concept of Islam and modernity as presently conceived can be best explained by focusing on the developments that have occurred in the past 4 decades in the Muslim world. Since the late 1960s, Islamic revivalism has increasingly come to dominate religious and political discourse in much of the Muslim world. Muslim thinkers and political activists in Iran and other Islamic societies have responded to Western-style modernity in a variety of ways. However, since the Iranian Revolution of 1979, there has been a sharpened distinction between two general approaches or orientations toward modernization: the traditionalists and the reformists. The key difference between traditionalists and reformists is their understanding and interpretations of the Koran, Islamic history, and prophet traditions. (It must be noted that this categorization is somewhat arbitrary and that individuals and groups may overlap from one orientation to another.)

Traditionalists define Islam in a narrow and restrictive sense. They maintain that Islamic traditions are fixed and fully articulated in the past. Therefore, any change is regarded as a departure from what they call the “straight path” of Islam. The traditionalists emphasize the total self-sufficiency and comprehensiveness of Islam, and when they speak of Islamization, they mean a reinstating of the Shariah, or traditional Islamic law. The traditionalists reject modernity, which they perceive to mean Western secularism and popular sovereignty. They believe Islam is the very antithesis of secular Western democracy. However, whereas modernity as a general process is rejected, selective modernization in the areas of science and technology is not. The basic tenet of traditionalists is a demand for a return to “pure” Islam, if not the “original” Islam. This orientation has its roots in the fiercely independent traditionalist interpretation of Islam by the Wahhabists in modern Saudi Arabia.

The reformists’ view is in sharp contrast to views held by the traditionalists, particularly the conservative Ulema, who have historically preoccupied themselves with the literal interpretation of the Koran. The
reformists believe that Islamic principles and values can be applied to meet modernity. Whatever the differences in orientation and agenda, reformists believe that Islam is compatible with the core values of modernity, such as individual freedom and democratic values. Leading reformists have argued that there is no inherent contradiction between Islam and democracy. They view the traditionalists' view on Islam and politics as too rigid and not workable for the realities of modern life. Moreover, the reformists maintain that Islam itself is evolving as a religion and that the will and beliefs of the majority must shape the Islamic state. However, the reformists do not think of modernity in terms of a total break from the past or historical Islamic culture. To reformists, modernity implies not only new and better technologies and improved standards of living but also a political culture in which Islamic values are cherished and individual rights are protected.

Today, a combination of mass education, mass communication, and political awareness is dramatically transforming the Muslim-majority world. While the conflict between the traditionalists and reformists persists, the reformists have expanded the ongoing debate of modernity and Islam to include democratic issues such as pluralism, women’s rights, and human rights. However, the central proposal of the reformists continues to be a demand for the reopening of the door of Ijtihad (modern Islamic interpretation), to allow for the adaptation of Islamic laws to the realities of modern life.

Despite setbacks in recent years, particularly the politicization of Islam by extremist groups (radical Islamists), there is compelling evidence that the reformist movement is growing. Recent developments in Iran, Turkey, Malaysia, Indonesia, and Egypt offer an even more striking indication of Muslim interest in modernity, democracy, and civic pluralism. The quest for modernity and democracy among Muslims today is one of the most prominent and transformative issues of our time. Today, an increasing number of Muslim thinkers in these countries have concluded that no contradiction between Islam and modernity exists if conceived as the emergence of new kinds of public space and a greater sense of autonomy for both men and women. However, the political realities of most Islamic societies cannot be overlooked, as most Islamic countries still remain largely nondemocratic and authoritarian. At the present time, we are still watching a process of experimentation and changes unfold.

Jim Crow is the name associated with a system of white supremacy that required racial subordination and exploitation. Essentially, Jim Crow laws divested blacks of their citizenship rights. After the demise of Reconstruction in 1876 and passage of a new state constitution in 1890, Mississippi became the first post–Civil War state to deny blacks the right to vote, the most basic of citizenship rights. That constitution set in motion the restoration of the white supremacist planter class rule and the economic, political, and social exclusion of blacks throughout the South. Once slavery ended after the Civil War, Jim Crow’s purpose was to maintain or perpetuate a racialized labor force through debt peonage and the threat of violence in the agricultural economy. Maintaining this system reinforced the social construction of black inferiority, which then served as the basis for reality.

The term *Jim Crow* originated in a minstrel show song, “Jump Jim Crow,” of 1828, performed by Thomas “Daddy” Rice, a “blackface” entertainer, whose caricature spawned imitators in minstrel shows everywhere. A white supremacist South embraced this ridicule and degradation. Jim Crow became more than performance art, as a rigid system of social exclusion and segregation became the centerpiece of the Jim Crow pattern of race relations in the South.

Segregation, or Jim Crow, became the system of exclusion that relegated blacks to a then-permanent subordination within a system institutionalized as legal doctrine. What began as an isolated case of permitting racially segregated schools in Boston in 1824 became a law of the land in 1896 in *Plessy v. Ferguson*. In that Supreme Court ruling, the Court ruled that the “equal protection” clause of the 14th Amendment was satisfied by the doctrine of “separate but equal.” Buttressed by this ruling, other Southern states followed Mississippi’s lead in instituting Jim Crow laws.

At the base of the Jim Crow system was an agricultural economy. Though slavery formally ended with the Civil War, agricultural demand for a servile labor force survived the “peculiar institution.” Central to Jim Crow were the previously established Black Codes. The Black Codes were a set of laws that bound blacks back to the fields following Reconstruction. The Black Codes required that blacks serve out labor contracts, often under their former masters. The purpose of these codes and Jim Crow was to maintain white supremacy, even to the extent that in all interactions blacks had with whites, it was mandatory they practice deference as a part of “proper” etiquette. The degradation of Jim Crow served not only to entertain whites by ridiculing blacks but also, more important, to economically exploit blacks.

Job satisfaction refers to an individual’s subjective well-being at work. Because of its subjective nature, job satisfaction has not received much attention by mainstream economists in the United States. However, job satisfaction has long been a primary concern of industrial and organizational psychologists and sociologists.

Interest in job satisfaction developed out of, or in response to, early theories of individual work motivation used by industrial engineers in the early 20th century. Following the work of Frederick Winslow Taylor (1856–1915) on so-called scientific management, much of the focus of industrial engineering during the 20th century was based on the theory that workers will shirk or avoid work, if possible, and therefore need to be coerced to expend maximal effort, primarily through close supervision and properly designed wage incentives. An early competing theory of motivation came from the “human relations” movement and, in particular, the work of George Elton Mayo (1880–1949). Based on his Hawthorne experiments, Mayo argued that emotional factors are more important in determining productivity than “logical” factors. Work arrangements, Mayo suggested, must be organized to address workers’ subjective needs for satisfaction as well as the requirements for efficient production. The human relations movement emphasized managerial leadership and work design and eventually developed into the modern human resources school of management.

Studying job satisfaction is important not simply for improving the well-being of workers; much of the research attempts to help management improve the efficiency and quality of workers’ output. Worker resistance to Taylorist scientific management, often experienced as limiting individual autonomy and increasing stress, has generated resentment and dissatisfaction in the workplace, leading to productivity and quality problems. This worker dissatisfaction has been an important factor in the establishment of human resources departments in many firms, quality of working life programs in the 1970s, and, more recently, efforts to increase employee involvement through arrangements such as quality circles and teamwork.

Much of contemporary theory and research on job satisfaction has been in reaction to a prominent social psychological theory presented by organizational psychologists J. Richard Hackman and Greg R. Oldham in their 1980 book Work Redesign. In a new twist on the old human relations theory, they argued that motivation and performance at work are determined more by how tasks are designed than by personal dispositions or orientations toward work. Key to performance at work is job satisfaction, which, in turn, is a function of the “motivating potential” of work. While this “job characteristics” model formally incorporates individual work orientations, it clearly shifts the focus to the work context, suggesting that satisfaction and hence performance may be increased through job enrichment. The relative weight of the work context versus individual orientations and dispositions in determining job satisfaction remains subject to debate.

One problem with the job characteristics model that has been pointed out by psychologists and sociologists is that job satisfaction and work performance may be completely unrelated. Job enrichment, it has been argued, may increase job satisfaction but may be unrelated to job performance. Rather, motivation and performance may be a function of other determinants such as extrinsic rewards (e.g., financial rewards, relationships with managers and coworkers) and superior job design. Similarly, it has been suggested that individual job satisfaction depends on behavioral types of workers. Some workers may advance their own goals as a first priority and thus be satisfied, but they may or may not advance organizational goals. Others, in contrast, may identify with the organization and thus be committed to it, but may be unsatisfied, for example, if they observe less effort on the part of other workers.

Both psychologists and sociologists directly question the link between the work context and job satisfaction. Dispositional approaches in the social psychological literature focus on individual personality traits or attitudes. Social information processing theories emphasize contextual cues and social influences rather than objective situations and argue that job characteristics are subject to interpretation. More
sociological approaches have shown how workers attempt to actively create a positive context for themselves at work. In this view, there is no direct effect of external situations—or the work context—on job satisfaction. Rather, satisfaction is a result of successful behavioral strategies in response to a given work situation.

More recent work on job satisfaction examines the effects of increased worker participation in decision making and problem solving on subjective well-being (and on performance). This literature is largely quantitative, however, and on the whole the findings have largely been contradictory, generating little support for a strong, consistent effect of participation on job satisfaction. These inconsistent findings may be explained in part by qualitative work on job satisfaction, suggesting that individual dispositions and orientations vary across individuals, and may not be static and stable even within the same individual. Rather, individual preferences may be more fluid and adaptable than commonly understood. Over time, workers may reevaluate work arrangements and adapt to given situations, particularly when they perceive little alternative choice.

On the whole, there remains significant debate and controversy over two main issues concerning job satisfaction. The first concerns the determinants of job satisfaction, particularly in terms of individual work orientations versus the work context and job design. Questions regarding the stability of individual work preferences are also important here. The second issue concerns the relationship of job satisfaction to performance at work. Here questions remain in terms of the extent to which job satisfaction is related to individual motivation and performance. One thing that seems clear is that there is no single determinant of overall job satisfaction, such as a particular type of work design, and no simple relationship between job satisfaction and work performance that holds across all individuals. So-called intrinsic and extrinsic elements of the work experience may be systematically related to job satisfaction, but these relations depend on dispositions and orientations toward work, which vary across individuals.

Judicial Discretion
Judicial discretion refers to that area of law that empowers a trial court judge to make a decision in a legal matter that has no absolute answer in the written law. It describes the power of a court to make a choice from among two or more legally valid solutions. Discretion arises when the judge decides which way to resolve a case. This judgment of the trial court occurs in accordance with what is right and equitable given the circumstances and applicable laws. Such a judgment is not made arbitrarily but rendered in an effort to reach a just result, as sometimes occurs in stalking or sexual harassment complaints.

In administrative matters, judicial discretion is very broad. These matters include personnel hiring, courtroom procedures, and the like. In procedural matters, the ruling of a trial judge is presumed to be correct unless a statute or rule exists to the contrary. In substantive matters judicial discretion is very limited, as judges must apply the law to the facts and set forth a decision as a matter of right. Only when no law exists to apply to a specific set of facts does judicial discretion become necessary.

Judicial discretion occurs in every case that comes before the court unless certain circumstances make its use invalid. For example, when the court does not have jurisdiction over a certain matter, it thus has no authority to decide on that matter. Also, where the U.S. Constitution demands performance of certain actions, the court does not have the ability to choose among options. In addition, when statutes or rules are so clear in relation to the facts at hand that only one decision can be rendered, judicial discretion is not warranted.

Matt Vidal

See also: Alienation; Contingent Work; Hostile Environment; Taylorism
The use of discretion is not optional but mandatory in any case where the exclusionary circumstances do not exist. The need for judicial discretion is evident when a decision cannot be asserted as a matter of right. When a situation exists in which no clear, absolute answer exists, a determination must be made. A final determination is needed to promote efficiency, fairness, and finality in the administration of justice.

An abuse of discretion is not the result of an unpopular decision and involves more than a mere error in judgment or law. Such abuse involves a higher court finding that the judge’s decision was arbitrarily and unreasonably based.

When judicial discretion is properly exercised, the record will clearly show that the trial court considered all the facts of the case and reasoned its way to a conclusion. On appeal of this conclusion to a higher court, the reviewing court will invoke a three-pronged test. The reviewing court will determine if the issue before the trial court was properly determined as one of discretion, then look to see if the decision was one that a reasonable judge would make, and determine if the decision is consistent with applicable law. If the higher court finds that the trial court’s decision meets these elements, then it will uphold the trial court’s discretionary conclusion even if the higher court would have rendered a different opinion.

Justice

A fundamental concept in human society, the topic of justice, could take volumes to explore. This entry briefly examines three contexts in which justice applies today: civil or distributive justice; criminal or corrective justice; and international justice. Justice functions as both an ideal and a practical standard, so each section discusses theory and application.

Broadly defined, justice is the measure of right and response to wrong—in other words, the fundamental measure and maintenance of integrity. It can be meted out as a policy or system, or it can be held as a virtue or ideal. Justice balances the integrity and rights of the individual with the collective needs of society and dictates the corresponding responsibilities or duties of society and individuals, as well as the essential rights of the individual. The nature of the balance between individual and collective is debated largely according to whether justice is considered a dictate (duty) or a state (right).

In the Nicomachean Ethics, Aristotle laid out the basis for our understanding of justice when he specified that justice is either universal or particular. Universal justice, which acknowledges the rights of others, is self-evident and a fundamental virtue. Particular justice governs systems of distribution, rectification (or correction), and reciprocity in economic exchange. Universal justice and particular justice are non-negotiable attributes of the just person demonstrable in the just society. Alternatively, justice is something inherent within an act or policy, not an individual or a society. According to this view, articulated by Kant in his Metaphysics of Morals, justice is particular, enacted or thwarted, and fundamentally contextual. Rawls extended this view by insisting that individual rights never be sacrificed for the collective good. Whatever the view and nature of justice, it is prioritized among those qualities essential to the fulfillment of human society.

Civil Justice

A central assumption of the U.S. Constitution is the promotion and protection of a just society. Justice here refers to the assumptions, norms, and laws that permit liberty and equality to thrive, even under the stress of a diverse society with competing needs. Indeed, U.S. society seeks to protect both individuals and institutions against unfair domination, be it intellectual, racial, cultural, economic, or political, and it is the task of justice to do so. To that end, civil justice is the system by which a society distributes its resources while maintaining the fundamental ideals on which the country is founded. This is easier to define than to execute, given the tension between individual liberty and collective equality, particularly
when it is acknowledged that liberty includes liberty to acquire and that equality as humans does not mean equal quality of life, at least not in a capitalist society such as in the United States.

Philosophers and political theorists have asserted the centrality of just institutions since Plato (in the European tradition). However, the notion that civil justice denotes the extent to which social institutions attack or promote individual well-being is relatively recent, most notably articulated by Rawls in his books *Theory of Justice* and *Justice as Fairness*. Rawls insists that justice is what is demanded by any reasonable person in the so-called original position—that is, without knowledge of individual attributes and advantage. According to this theory, justice supports the least intrusive demands on any individual and would never support the abdication of individual rights for the collective good. Consequently, the distribution of wealth and other entitlements must be such that no individual is abandoned by society for expediency and that no individual is obliged to conform to moral or other values save those that prohibit harm to others (the realm of criminal justice).

It is the task of civil justice to determine when acquisition unacceptably harms others, what the minimum possessions and possibilities needed by each member of society are, and how access and acquisition are determined and protected. As a nation Americans are only partially comfortable with this role of justice. They may agree that it is better to be rich than poor, but ubiquitous debate about government reach and tax levy demonstrate that Americans are skeptical about giving the U.S. government the authority to redistribute wealth. On the other hand, and after more than a century of effort, as a society Americans agree that the government—indeed the justice system—does have authority to assure that people of all races and both genders have equal access to education, jobs, loans, and other resources.

Practically, then, civil justice requires assessment of the means of distribution within society. The primary resources to be distributed are wealth, of course, but also education, credit, power, the right to vote, mobility, and status. The task of policymakers who guide collective activity is to determine what goods and rights are central to just distribution; and when distribution must be protected, when it must be promoted, and when it must be left to market or other forces. The task for individuals is similarly complex: When is it acceptable to pursue one’s own interest, when must one defer to a standard that does not prioritize self-interest, and when may one claim ignorance or passivity legitimately?

U.S. society maintains numerous institutions and systems of social justice. The income tax distributes wealth; publicly funded education provides for children under the age of 18 as a means of setting a baseline of opportunity; everyone over the age of 18 may vote as a means of distributing political will. Despite criticism of all of these systems as inadequate or worse, at least in principle they each seek to distribute fundamental resources among citizens.

**Criminal Justice**

Perhaps the most recognized form of justice in the United States at this time is in the definition of, and response to, criminal activity. Criminal justice specifies what constitutes a crime; how society polices, prosecutes, and punishes people who commit crime; and the mechanisms for implementing these activities. Criminal justice is administered through three systems designed to be coordinated: police, courts, and corrections. Clearly, crimes consist of violation of law, but which violations are crimes and how those crimes are regarded varies by social norm, statute, and geographical location. Once crime is defined, justice responds to crime. But here, too, there is divergence. Should justice look back at the crime alone to determine appropriate punishment, or should justice look forward to the impact of the crime and of the punishment on society as a whole?

Because criminal justice responds to active violation, rather than intrinsic conditions and distributions, it is retributive in its basic function. U.S. society defines these violations as crimes and weighs their relative offense according to fundamental principles, or rights, to which Americans adhere. Because liberty and autonomy are critical to U.S. society, the society regards interpersonal crimes (such as robbery or assault) as more reprehensible, with more severe punishments, than “victimless” crimes with no directly injured party (such as prostitution, drug use, and business fraud). For the same reason, punishment must meet standards of fairness and humanity, at least in principle. At the same time, criminal justice varies by state in law and by locality in practice. Further, some states vary punishment not only based on the nature of the crime itself but also on the criminal record of the person who commits the crime. Criminal justice, then, as practiced in the United States, does not hold that all persons will be treated the same way for the same behavior.
Utilitarian concepts of criminal justice hold that a violation of law is a violation of the principles of society and must be addressed as such. A crime must be punished for the relative harm it caused, and the punishment must promote the public good as much as is possible. Under this system, the individual harm caused to the victim is less the focus of the punishment than the total harm that the crime causes society as a violation of social norms and law. Because utilitarian punishment seeks to redress the wrong to society, it condones punishment that serves both symbolic and practical purposes. The U.S. prison system is intended to incapacitate offenders, thus deterring individuals from re-offending and deterring other people who might otherwise offend but fear that they too would be put in prison. Prisons, according to utilitarian principles, also symbolically remove offenders from society, demonstrating the refusal of society to condone violation of fundamental principles. Finally, utilitarian punishment uses the term corrections because prisons are also intended to rehabilitate offenders so that they do not commit crimes upon release, thus restoring the confidence of society.

In contrast to the utilitarian approach, retributive justice looks only at the crime itself to determine appropriate response. Grounded in a moral system that prioritizes autonomy and freedom, retributive justice is tied to the liberal tradition (Kant, Rawls) that maintains the primacy of rationality over sentiment and the centrality of the individual. This approach focuses on delivering punishment to the guilty that is proportionate to the nature of the offense itself as an appropriate—that is, rational, not symbolic—response to the offense and the offender. In this way retributive justice limits the reach of the justice system (i.e., the state or collectivity) and avoids the responsibility of predicting and promoting social benefit. Under this theory prison systems should provide incapacitation and retribution to the offender, but need not rehabilitate the offender or prevent future crimes. In addition, the state must not prolong punishment in the interest of setting an example for the general public, satisfying an individual or collective desire for revenge, or creating more law-abiding citizens from the criminal population.

The implementation and oversight of the justice system are routinely criticized from both ends of the political spectrum for failing to protect the rights of individuals (victims, suspected offenders, and convicted offenders) and for failing to maintain fundamental structures of justice, such as sufficient policing and fair and appropriate sentencing. Plea bargaining, the routine waiver of the constitutional right to trial, accounts for over 90 percent of case resolution, a fact that, on its own, casts a grave shadow over the integrity of the justice system. Yet protections afforded to individuals, such as the right to an attorney and the right of habeas corpus, indicate the commitment of a punishment-focused society to protect fundamental individual rights of all members of society. While these rights may be thwarted because of lack of resources or dedication, they form the basis of the U.S. criminal justice system.

International Justice

The concepts of both civil and criminal justice assume national identity within a society, such as the United States. How are these ideals applied to people outside of that society? What are the obligations of distribution and retribution of nations toward other nations, or toward individuals outside of U.S. society? As commerce and technology have drastically reduced the time and isolation between nations and peoples, the possibility of interdependent global responsibility has developed in response to these questions. International bodies such as the United Nations, as well as many economists and philosophers, claim that a nation is obligated to protect fundamental tenets of justice internationally and that such protection extends to both civil and criminal justice.

Justice requires that states take responsibility to avert harm that can reasonably be anticipated, for example, by stabilizing regions such as the former Yugoslavia or Rwanda that, left alone, would devolve into chaos. At the same time, international justice demands that laws and practices determining conditions in other nations protect fundamental structures of humane existence rather than exploit weak justice systems in those countries for the sake of profit alone. Thus, trade agreements, international labor practices, and environmental phenomena impacting multiple nations can be viewed as matters of international justice, demanding that both the active parties (the beneficiaries) and the passive parties (the recipients) be afforded fair minimum resources. Clearly, these views of international justice reject the position that justice posits the right to fair accumulation. Even that conceptualization of justice, however, may acknowledge that the nation-state provides a link between social norms within a nation and how that nation behaves internationally, in other words, the connection...
between domestic and international authority. Whether the nation is obligated to act according to domestic norms depends on whether one views justice as a function of universal morality or finite within the cultural and geographic borders of the state.

International criminal prosecution addresses those violations of human conduct so egregious that domestic prosecution is insufficient. These are cases in which large numbers of people are killed, especially people targeted because of their ethnicity, race, or other definable and unalterable characteristic. Motivation to create an international tribunal developed as nations grew into increasing interaction with each other, following advances in transportation and the corresponding impact of commerce and war. Following World War II, the Nuremberg and Tokyo Courts were established and administered by the winning allies to address war crimes committed by the losing nations. At the end of the cold war, the Rome Statute established the International Criminal Court. In meetings that began in 1998, the court’s jurisdiction and administration evolved to try crimes against humanity, genocide, and war crimes. In 2002 the statute was signed and ratified by enough nations (60) to make the treaty binding and effectively establish the court. The statute has been ratified by 104 nations and signed by an additional 35. The United States opposes the treaty, based on concern that U.S. citizens could be tried in the court. Considerable debate exists about the exclusion of other crimes, notably drug trafficking, terrorism, and use of weapons of mass destruction, none of which has unanimous international agreement as to definition.

These two issues, ratification and definition of crimes, speak to the principle challenges of defining the terms of international justice as well as creating effective structures to administer justice internationally. Crimes committed by states or by individuals protected from one state’s justice processes by another state are difficult to define without asserting international priority over national sovereignty. Nations, particularly those that are internationally dominant such as the United States, have little practical reason to defer to an international determinant of right and wrong, preferring to define and address violation of law (and not the broader universal ethics) through national systems, including military courts, and thereby avoid seeing harsh punishment meted out in the international arena to citizens who would be absolved or benignly punished for crimes domestically. Indeed, the United States successfully sought assurance from the UN Security Council that no U.S. troop would be surrendered to the court, though the United Nations agreed to the provision only for UN-related activity. This protection, however, was revoked following evidence of abuse of prisoners at the Abu Ghraib prison in Iraq by U.S. military personnel. Indeed, the War on Terror demonstrates several challenges to executing international justice, including recognition of legitimacy, access to offenders, agreement on how violations are defined, and agreement on purpose and nature of punishment.

**Juvenile Delinquency**

Prior to 1899, the concept of delinquency—the idea that juvenile crime is something different than crime committed by adults—was nonexistent. When youth violated laws at that time, most people regarded their actions as crimes worthy of the same court processing
and punishments (even prison and the death penalty) as offenses committed by adults. Experts credit a group of progressive reformers in the late 1800s, known as the “child savers,” for inventing the concept. Their efforts resulted in the creation of separate juvenile courts and correctional programs. Crimes committed by juveniles were thereafter construed as having different causes than adult crime. Youth were considered less responsible for their actions and, therefore, more deserving of treatment rather than punishment. The child savers also helped to establish status offense laws that defined activities as illegal for persons under a specified age. For example, under age smoking, alcohol use by minors, school truancy, and youth curfew violations are status offenses.

The first juvenile court was established in Cook County, Illinois, in 1899, and the academic study of juvenile delinquency by researchers affiliated with the University of Chicago commenced shortly afterward, in the early 1900s. Today, juvenile delinquency is a well-recognized social problem in U.S. society and a thriving academic research specialty.

**Measuring Delinquency**

The two main sources of information on the extent of delinquency and who is most likely to engage in delinquency are official arrest statistics and self-report questionnaires. Each has strengths and limitations, and they sometimes provide somewhat conflicting pictures of the extent of delinquency and characteristics of delinquents.

The Federal Bureau of Investigation Uniform Crime Report (UCR) provides the most comprehensive data on arrests of juveniles in the United States. The UCR is a compilation of information from law enforcement agencies throughout the country on crimes reported to police and those cleared by arrest. For all arrests, the UCR includes information on the age, race, and gender of the person arrested. By combining this information with U.S. census data on the demographic composition of the population, the UCR can report arrests in a given year as a rate per 100,000 U.S. residents in various demographic categories (e.g., white girls ages 10 to 17).

The UCR is a valuable tool for determining changes in delinquency over time, but it has limitations, particularly in undercounting the true amount of delinquency, because most delinquent acts never result in any report to police, let alone lead to an arrest. Especially under-represented in the data are status offenses, the most common type of delinquency. Also skewing the data is the fact that youths living in different communities are subject to greatly varying levels of policing, and police often exercise discretion in deciding whether to arrest a delinquent youth or handle the matter informally without making an arrest. Another UCR limitation is that it reports only a few demographic characteristics of arrestees, thereby limiting its usefulness for understanding the causes of delinquency.

Self-report surveys use either self-administered questionnaires or interviews in which respondents are asked to report on their own delinquent behavior. These surveys can also ask respondents about various characteristics and life experiences that may be correlated with their delinquency. Self-report studies, especially longitudinal studies studying the same youth on multiple occasions throughout their childhood and adolescence, are useful for learning about delinquency causes. Conducted on representative samples of U.S. youth and repeated over time, the self-report studies can suggest prevalence of various types of delinquency and assess trends in delinquent involvement. Two widely cited nationally representative survey studies are the Monitoring the Future study of eighth-grade students and high school seniors, and the National Household Survey on Drug Use and Health sample of youth ages 12 to 17. These surveys chiefly concern tobacco, alcohol, and drug use, but they also include questions about other common forms of delinquency.

The major strengths of self-report studies are that they allow estimates of delinquent behavior that do not involve police reports or arrests, and they allow researchers to understand the causes of delinquency. These advantages overcome some of the limitations of arrest data. Self-report studies, however, have their own shortcomings and limitations. Self-report studies rely on the accurate recall and honest report of behavior that respondents may rather not remember or disclose. On the other hand, some respondents may falsely report engaging in delinquent acts not actually committed. Young adolescents, it turns out, are most likely to falsely report delinquency, so researchers have developed a number of techniques for evaluating the reliability and validity of self-reported delinquency. Safeguards include asking respondents whether they ever used a fictitious drug (e.g., “bindro”). Self-reports tend to be more accurate when respondents believe their responses will be anonymous or confidential.
Despite the limitations of both arrest data and self-report studies, their complementary strengths and consistent findings across methodologies allow for reasonably reliable conclusions about the extent, trends, and causes of delinquency.

**Prevalence and Trends**

Although many people believe we are currently in the midst of a juvenile violent crime wave, arrests of juveniles for serious crimes have actually decreased in recent years. The number of juveniles arrested for murder in 2005 was 47 percent lower than in 1996. Overall, the juvenile violent index crime arrest rate in 2005 was 25 percent lower than it had been in 1996. Unlike other crimes against persons, however, the juvenile arrest rate for simple assault has not declined substantially since the mid-1990s. This may be due to recent policies that require police to make arrests in school and domestic incidents that previously would have been handled informally.

Property crime arrest rates of juveniles have decreased substantially. In 1981, there were approximately 2,500 property crime index offense arrests per 100,000 juveniles ages 10 to 17 in the United States. By 2005, the juvenile arrest rate for property crime index offenses had decreased to less than 1,500 per 100,000 youths. The burglary arrest rate of juveniles in 2005 was less than half the rate it had been 25 years earlier (i.e., in their parents’ generation). Although motor vehicle theft arrests of youth increased between 1981 and 1991, they have since fallen to less than half the 1991 level.

Arrests for drug abuse violations have not followed the declines observed for violent and property crimes. In fact, the rate of arrests of juveniles increased over 50 percent from 1981 to 2005. The large increase in juvenile arrests over this period, however, appears to reflect increased law enforcement rather than greater drug involvement by youth since self-reported drug use by youth in national epidemiological surveys decreased over this same time period.

**Characteristics of Delinquents**

Age is the strongest predictor of delinquent behavior. For nearly every type of delinquency, involvement is rather low in childhood or early adolescence, increasing steadily with age until reaching a peak in late adolescence. Although the exact rate of increased involvement and peak age of involvement varies across offense types (property crime peaks at about age 16 and violent delinquency peaks at age 18), this general pattern of increased delinquency with age occurs in both arrest rates and self-report studies. An important related concept is age-at-onset. The age at which youth first engage in delinquent behavior is a strong predictor of the seriousness and intensity of subsequent delinquent and criminal behavior. For example, a young age at first arrest (under 14) is strongly predictive of serious, repeat delinquency and continuing criminal behavior into adulthood. Similarly, early first use of the so-called gateway drugs—tobacco, alcohol, and marijuana—strongly correlates with serious drug or alcohol dependency in adolescence or adulthood.

Next to age, gender is the best predictor of delinquent behavior. Boys are more likely than girls to engage in nearly every form of delinquency and are more pronounced in official arrest statistics. For violent index crimes (homicide, aggravated assault, robbery, and forcible rape), UCR data from 2005 indicate that male juvenile arrests exceeded female juvenile arrests by a ratio of 4 to 1. For serious property crimes, the male-to-female arrest ratio in 2005 was nearly 2 to 1, and the 2005 ratio of male-to-female drug abuse violation arrests was nearly 5 to 1. Some less-serious offense types show greater gender equality. For instance, boys are only slightly more likely than girls to be arrested for larceny-theft. Self-report studies also indicate boys are more delinquent than girls, but the sex differences in most self-report studies are smaller than the arrest data would suggest. This discrepancy between self-report and official arrest statistics may occur because girls’ delinquency is less often observed by, or reported to, police or because law enforcement officials exercise discretion in arrest decisions to the favor of girls. This hypothesis has been termed the chivalry thesis.

Race/ethnicity is another characteristic for which official arrest data and self-reports provide discrepant findings. In the United States, white youth have lower arrest rates than black youth. Asian American youth have the lowest arrest rates, whereas rates for American Indian youth are higher for some offenses (e.g., homicide) but lower for other offenses (e.g., drug abuse and weapon law violations). Black youth are more than twice as likely as white youth to be arrested for both violent index crimes and property index crimes. In self-report studies of commonly occurring delinquency such as status offenses and marijuana use,
however, white youth tend to report greater involvement in delinquency than black youth. The greater arrest rates of minority youth may result, in part, from heavier police activity in predominantly minority neighborhoods, yet studies in which researchers ride along with police and record their interactions with youth generally do not find racial bias in police officers’ use of discretion in arrest decisions.

Many studies indicate that youth in juvenile detention and correctional facilities are more likely than youth in the general population to come from low-income families. Self-report studies of delinquency, however, do not consistently find greater delinquency among low-income youth. Youth from families with lower socioeconomic status (SES) are more likely to report serious violent offenses, but higher SES youth are more likely to report some common forms of delinquency such as alcohol and marijuana use. For most forms of delinquency, self-report studies find no SES differences.

**Causal Theories**

Early theories of why youth become delinquents focused on the socially disorganized neighborhoods in rapidly urbanizing and industrializing U.S. cities. The common belief was that the problem lay in the exposure of youth in these transitional communities (many of them children of European immigrants and African American migrants from the rural South) to conflicting cultural norms and parents with fewer personal and institutional resources for socializing and supervising them to ensure law-abiding behavior. Although some critics of the social disorganization perspective noted an over-reliance on official statistics that might neglect delinquency by middle- and upper-class youth, the neighborhood disorganization perspective remains influential—especially as an explanation of violent and gang delinquency.

In the 1950s and 1960s “strain theorists” also focused on delinquency by socioeconomically disadvantaged youth. Robert Merton described a “goals-means disjunction” whereby all youth are socialized to desire success, but not all have the legitimate means to attain success. Merton suggested that economically disadvantaged youth might respond to the resulting strain by resorting to illegitimate means (e.g., stealing) or by retreatist behavior such as substance abuse. Albert Cohen also described the strain that lower-class children experience in school when they fail to meet the academic and behavioral expectations of middle-class teachers. They may cope with this “status frustration” by joining delinquent peer groups. Critics argue that strain theory, like social disorganization theory, exaggerates the delinquent involvement of lower-class youth while neglecting to explain why so many middle-class youth also engage in delinquency. Remediating this limitation is Robert Agnew’s general strain theory, which suggests that a variety of social strains, not just the strain associated with poverty, can cause delinquency.

Whereas social disorganization and early strain theories emphasized social structural inequalities as the primary cause of delinquency, process theorists focus on social interactions within primary groups such as the family and peer group. Two influential process theories are the social learning theory and the social bonding theory. Social learning theory, also known as differential association theory, suggests that juvenile delinquents learn delinquent values, attitudes, and behavior through their associations in families, peer groups, schools, and neighborhoods. According to this perspective, the delinquent is essentially normal, but through exposure to deviant influences, the youth learns delinquent behavior in the same ways that any other behavior is learned.

Whereas social learning theorists view relationships as the cause of delinquency, social bonding theorists view a lack of strong social attachments as the cause of delinquency. Social bonding theorists assert that many delinquent activities are fun and pleasurable, and therefore, all youth would become delinquent if they were not kept in check by the social bond. Instead of asking themselves why some youth engage in delinquency, bonding theorists ask, Why isn’t every youth a delinquent? They conclude that youth who lack strong attachments to peers, school, or family; who are uninvolved in conventional activities such as school or sports; who haven’t been instilled with a conventional belief system; and who are not committed to educational or other future goals are most likely to act on their delinquent opportunities and impulses.

Much of the delinquency research conducted today is guided by integrated and life course theories. Integrated theories combine aspects of social structure, social learning, and social bonding theories to predict delinquency. Life course or developmental theories also integrate traditional theoretical perspectives, but in addition, they emphasize that delinquency is a developmental process whereby innate temperament, social stresses, attachments, and opportunities
early in life predispose some youths to later delinquent involvement. Delinquent involvement, in turn, adversely affects normative social relationships and opportunities to increase the likelihood of further delinquency and adult criminal behavior. This snowball effect is especially likely to occur if delinquency results in arrest, juvenile justice system intervention, and resultant stigma.

**Current Controversies**

Advances in brain science challenge both social scientists and the justice system in their understanding of, and response to, delinquency. It is now known that certain regions of the brain responsible for learning from the present, anticipating the future, and controlling one’s impulses are impaired in some serious and chronic delinquents. Head injury, lead poisoning, fetal alcohol exposure, and attention deficit hyperactivity disorder are just a few of the identified conditions associated with alterations in brain functioning that could predispose some youth to delinquency. If delinquency is, to some extent, biologically caused, can the justice system hold delinquents accountable for their behavior? This is especially problematic given the trend over the past 2 decades to try more and more juveniles as adults.

Moreover, modern brain imaging techniques reveal that the regions of the brain responsible for foresight and impulse control are not fully developed in the normal brain until age 22 or 23. The challenge is for social scientists to incorporate this biological evidence into their theories of delinquency causation and for the U.S. justice system to reconcile personal responsibility with brain limitations as a mitigating factor. This recognition of developmental limitations influenced the 2005 U.S. Supreme Court decision that persons who were under age 18 when their crime was committed cannot receive the death penalty.

**Juvenile Institutionalization, Effects of**

The first institution created solely for “wayward,” poor, and orphaned children was the House of Refuge in New York City in the late 1800s; most states soon followed New York’s lead with their own institutions. The creation of these types of institutions marked the beginning of a shift in the conceptualization of the definition of childhood; before this, children older than age 5 were viewed as small adults, capable of the same moral capacity as adults. Gradually, the idea that children are inherently different from adults and that the state had the responsibility to protect them took hold. The culmination of this evolution occurred in 1899, when the Juvenile Court Act created the first juvenile court.

In response to court cases that pointed to the need for constitutional protection of juveniles against their treatment as adults and confinement as status offenders, the Juvenile Justice and Delinquency Protection Act of 1974 moved to deinstitutionalize many juvenile offenders. Of main concern were the negative cumulative effects of labeling on juveniles and their confinement as status offenders. (A status offense is behavior that is unlawful for minors, such as truancy or drinking alcohol.) This law identified four protections that states must provide to be eligible for federal funding: the deinstitutionalization of status offenders, “sight and sound” separation of juvenile and adult offenders, removal from adult jails and lockups, and the examination of the disproportionate confinement of minority offenders.

**Types of Juvenile Institutions**

Out-of-home placement options for juvenile offenders typically include a variety of public and private residential facilities, such as group homes, wilderness programs, boot camps, and training schools, operating under differing therapeutic approaches but sharing the
common goal of rehabilitation. Generally, when authorities determine that institutionalization is necessary, juveniles are sent to training schools. These facilities, either secure or semi-secure, often appear physically similar to a public school, although some look more like an adult facility. Perimeter security is likely, although these facilities typically have a higher offender-to-staff ratio than adult facilities. Approximately 400 long-term secure facilities, mostly state run, exist for juveniles in the United States. Training schools typically house about 50 juveniles, although the larger ones can hold between 100 and 500 residents. Juveniles in these facilities typically have access to a number of treatment options, such as GED (general equivalency diploma) classes, a variety of counseling and vocational training programs, and peer group activities.

**Negative Outcomes of Institutionalization**

Many believe that juvenile institutionalization has a negative effect on juveniles and may in fact increase recidivism (future involvement in criminal behavior). While incarcerated, juvenile offenders interact with other delinquents, allowing them the opportunity to acquire and hone criminal skills, thereby fostering delinquent values and beliefs. Criminologists find that this bringing together of delinquent youth tends to increase delinquent acts, a process called “peer deviancy training.”

Incarcerated juveniles may recidivate at a higher rate than those treated in a nonsecure, community-based setting. Additionally, incarceration may increase the probability of a multitude of problems, such as physical injury while confined, mental health issues, and lower levels of educational achievement than for those treated within the community. Many juvenile offenders have learning disabilities and find it difficult to attain educational success once they are released. Furthermore, after release many find it difficult to obtain gainful employment as well, making them more susceptible to criminal activity to achieve economic goals.

According to labeling theory (also referred to as “social reaction theory”), a sort of self-fulfilling prophecy concept, juveniles who come into contact with the juvenile justice system experience increased alienation and reinforced criminal identity. Official efforts to control crime often have the opposite effect of increasing crime. Juveniles who are arrested, adjudicated, and punished are labeled as delinquents. Others then view and treat these people as criminals, and this increases the likelihood of subsequent crime for several reasons. Labeled individuals may have trouble attaining educational goals and obtaining legitimate employment, both of which increase their level of strain and reduce their stake in conformity. Labeled individuals may find that conventional people are reluctant to associate with them, and they may associate with other criminals as a result. This reduces their bond with conventional others and fosters the social learning of crime. They begin to see themselves in a negative or criminal context, which is reinforced by a society that views them as such. During this formative and developmental stage of self-identification among adolescents, the reaction of those around them helps shape their sense of self. As a result of the adolescent’s negative self-concept, he or she may find it more difficult to resist involvement in criminal activity and may be more likely to associate with like-minded negative peers, in turn increasing the likelihood of further involvement in the criminal justice system.

In addition, juveniles often “age out” of delinquent behavior, meaning that as they age, graduate, meet a significant other, and become gainfully employed, they desist from criminal behavior and become productive members of society. Institutionalization disconnects juveniles from many prosocial factors, including family, school, and community, and may disrupt the aging-out process. Although many delinquents return to school after institutionalization, they are more likely to drop out and in turn experience higher rates of unemployment, lower pay, and poorer health than those who graduate from high school.

Juvenile Justice System

The U.S. juvenile justice system is currently designed to address the special needs of minors who engage in criminal acts but might not yet be held fully responsible for their behavior, as they are not yet legal adults recognized by society. However, juvenile justice has not always been driven by this philosophy. Prior to the 19th century, the criminal justice system treated all individuals over age 5 equally. Around 1825, a reform group called the “child savers” began advocating for more appropriate treatment of children who commit crime, arguing that the justice system should protect and rehabilitate rather than punish juveniles. They claimed that society could control juvenile delinquency if it attacked its causes—namely, poor education, poor morals, and poor standards of behavior—thus alerting juveniles to their wrongdoings in society. The child savers, mostly women, were self-proclaimed altruists and humanitarians who focused on protecting the interests of all children in an increasingly industrialized society, particularly those in the lower class. Their mission was to rehabilitate deviant youth without the stigma of a lifetime criminal record. Although the child savers claimed to be a neutral group, critics contended that the movement was more an effort to control lower-class children than protect these juveniles from societal harm.

In 1899, the Illinois Juvenile Court Act established the nation’s first juvenile court in Chicago. While the act did not create a new legal system for juveniles, its rules of procedure, outlining the best court practices when considering juvenile cases, were extensively copied. These procedures followed the British legal concept of parens patriae, a doctrine whereby the State acts in the best interests of the child through the protection, supervision, and upkeep of juveniles within its jurisdiction. This gives the court sentencing discretion, such as probation under guardianship, placement in a school of detention or reformatory, and protection from incarceration with adult offenders. One key distinction of the juvenile court is the privacy of a juvenile criminal record, thus preventing the stigma of a permanent adult record. The doctrine of parens patriae was so dominant in the early stages of the juvenile justice system that in Commonwealth v. Fisher in 1905, the Pennsylvania Supreme Court ruled that acting in the child’s best interests outweighed the child’s constitutional rights, namely, due process and a right to a trial by jury. Acting in the best interests of the child, in most situations, suggests that the goal of the courts is rehabilitation so that juveniles can become productive members of the community.

Key Legal Decisions and Juvenile Justice Policy

Even with the establishment of a system focused on parens patriae, opponents questioned its effectiveness in rehabilitation, particularly if juveniles were held in institutional settings not unlike adult prisons. Critics argued that if juveniles faced an institutional setting similar to that of adults, then these juveniles should also have the same constitutional due process protections as adults during the trial and sentencing phases of the adjudication. In response, several U.S. Supreme Court cases ultimately established the constitutional basis for protection of juvenile rights, including Kent v. US in 1966, In re Gault in 1967, In re Winship in 1970, and McKeiver v. Pennsylvania in 1971. These cases brought greater procedural focus to the juvenile courts, mandating due process and ensuring other constitutional rights for juvenile defendants.

With these protective gains, early policymakers next focused on prevention within local communities. Addressing rehabilitation issues and the role of the community, the focus for prevention was left to each local community. With no centralized federal, state, or local strategy to reduce delinquency, and no financial or technical support, initial efforts to control delinquency through community organizations was a relative failure, leading Congress to pass the Juvenile Delinquency Prevention and Control Act in 1968. Later revised in 1974, and renamed the Juvenile Justice and Delinquency Prevention Act, the goal of this act was to assist states and local communities by providing preventative, community-based services to youth in danger of becoming delinquent, to help train individuals in occupations providing such services, and to provide technical assistance in the field through the U.S. Office of Juvenile Justice and Delinquency Prevention. This initiative reinforced the importance of prevention of juvenile delinquency as a key to
reducing the behavior, but it increased the role of government in providing assistance and training for the states to act in a child’s best interests.

The 1970s brought a rise in violent crime rates and a new focus on cracking down on crime. The War on Drugs in the 1980s also fueled the desire to get tough on crime and create a more punitive juvenile justice system. During the 1990s, the United States faced growing fears about highly publicized juvenile acts of violent crime and school shootings, called “juvenile superpredators” by the Office of Juvenile Justice and Delinquency Prevention. Public fears mounted about youth who adopt a culture of violence. Despite subsequent acknowledgment that such fear was overstated, the public outcry made a lasting impression on the juvenile justice system and the way in which U.S. society addresses juvenile crime. By the end of the 1990s, almost every state had enacted a law that made it easier for a juvenile to be tried in adult court and face adult sentences by lowering ages for transfer or waivers for violent crimes. The trend toward a more conservative approach to juvenile justice continues, with the marked exception of the death penalty.

In 1988, the case of *Thompson v. Oklahoma* set the precedent for juvenile sentencing when the U.S. Supreme Court held that the execution of juveniles under the age of 16 was unconstitutional. As of 2002, the United States was one of only a few countries to carry out the death penalty on those under age 18. This changed in 2005 when, in *Roper v. Simmons*, the U.S. Supreme Court held it unconstitutional to execute any juvenile, noting in its decision that the death penalty is “disproportionate punishment” for offenders under age 18.

Labeling theory is a critical theory which argues that the application of a deviant label can have the effect of solidifying a deviant identity for the labeled, thus potentially exacerbating the problem that it purports to address. Labeling theory, therefore, prioritizes the study of social and legal processes by which certain behaviors and individuals come to be labeled as deviant, as well as the impact of such labels.

One of the greatest contributions of labeling theory has been its challenge to the traditional notion of deviance as a fixed, objective category of study, suggesting instead that the application of the label of “deviant” is highly context specific. This suggests that deviance is the result of the labeling process, not a quality intrinsic to certain individuals or actions. For example, a labeling theorist would critique the assumption that an 18-year-old who drinks alcohol is inherently deviant; whereas this behavior would be against the law in the United States, it would not be considered deviant in some countries. Thus, deviance is better conceived as a product of labeling processes than as a category of behaviors or individuals.

Labeling theorists suggest that labeling individuals as deviant has the potential of becoming a self-fulfilling prophecy. Drawing from the social psychological concept of symbolic interactionism, labeling theorists argue that individuals’ self-concepts form partly through their social interactions; when an individual is labeled as deviant, the individual will incorporate the label into his or her self-definition, increasing the likelihood of future actions consistent with the label.

A deviant label can have an impact extending beyond its effect on an individual’s self-definition. The label can directly influence how others relate to the labeled. For example, an individual with a felony conviction might have difficulty finding a job because of the label of felon, even if the label is not incorporated into that person’s self-definition.

Labeling theory draws a distinction between deviant acts and deviant labels. Those who perform acts that society considers deviant can evade detection and, as such, avoid the labeling process; alternatively, the wrongly accused can be subject to the consequences of a deviant label without having performed any truly deviant actions.

Labeling theorists note that a wide range of labels have the potential to constitute a master status, in which an individual’s actions come to be interpreted in the context of his or her label without regard to other facets of the individual’s personality. While initially applied to the concept of delinquency, the framework of labeling has been applied to other forms of deviation as well, most prominently with regard to mental illness and disability.

Labor, Child

Child labor occurs along a continuum, with harmful and exploitative work that endangers the welfare and potential of the child at one end of the spectrum and light work and often beneficial training and apprenticeship at the other. National and international labor standard regulations with respect to what constitutes a legally permissible minimum age of employment accordingly depend typically on a range of criteria including (a) the type of work, as distinguished by the degree of hazard a child faces, or whether the child is subject to exploitation, or the worst forms of child labor; (b) the sector of employment, whether in agriculture, manufacturing, or family businesses or the household; and (c) the degree to which child labor work interferes with schooling, depending on the number of hours a child is put to work, say, per week.

Though child labor statistics inevitably paint an aggregate picture, the coverage of national and international statistics has improved, reflecting a diversity of activities that come under the umbrella of child labor work. International Labour Organization (ILO) statistics treat any child as economically active with performance of at least 1 hour of work during the week prior to a survey. The ILO also defines a child laborer as synonymous with (a) an economically active person between the ages of 5 and 11, and (b) an individual between the ages of 12 and 14 who performs 14 or more hours of nonhazardous work per week or 1 hour of hazardous work per week. Based on these definitions, over 200 million children between the ages of 5 and 14 are economically active worldwide, and of these, 186 million are child laborers. In addition, nearly 6 million children are in forced or bonded labor, 1.8 million in prostitution, and 0.3 million in armed conflict.

The absolute incidence of child labor is the highest in Asia (excluding Japan), which hosts around 127 million economically active children, followed by Africa and the Middle East (61 million) and Latin America (17 million). Increasingly, child labor occurs in southern Europe and in the transitional economies of central and eastern Europe. The participation rate of child labor is highest in Africa, where approximately one out of every three children (29 percent) is economically active. In Asia and in Latin America, the figures stand at 19 percent and 16 percent, respectively. Taken together, however, these contemporary statistics still fall short compared with the incidence of child labor in 19th-century, newly industrializing countries, including Britain, France, Belgium, western parts of Prussia, and the United States.

Poverty has been a central theme in child labor research. Income from child labor often constitutes a significant part of household income in poor households, yet child labor employment can also depress adult wages. Left unchecked, a vicious cycle of poverty may ensue in which low adult wages become both the cause and the effect of child labor employment. A related concern is the impact of child labor on fertility decisions. The lack of education as a child, low adult income, and a desire to ensure old age consumption can bias household decisions in favor of an increase in the quantity of children rather than the quality of children through education. A similar vicious cycle of poverty and child labor can likewise ensue, as underinvestment in education in one generation begets underinvestment in the next.

Other pertinent determinants of child labor include (a) credit market failures in the financing of education, (b) the lack of consumption smoothing mechanisms in the face of income uncertainty and seasonal employment, (c) coordination failures on the part of households to bargain for higher wages, (d) failures on the part of households and firms to coordinate education and technology adoption decisions, (e) lack of access to quality education, (f) social stigma and norms, with respect to child labor employment and female schooling, (g) birth order effects, (h) family migration and dislocation from family networks, and (i) low female educational attainment.

In addition to these household-level determinants, a burgeoning literature examines the link between economy-wide factors and child labor. These include ineffective enforcement of legislation to combat child labor, particularly in informal sectors and rural areas; inequality in the distribution of income; trade liberalization; an economy’s dependence on agriculture; and political economy considerations.

Running parallel to these correlates of child labor are international and national policy responses to combat child labor employment. With widespread acknowledgment that poverty is a primary cause of
child labor, poverty alleviation and policies promoting adult income naturally rank foremost among efforts to eradicate child labor. Beyond these arguably longer-range policy responses, which target child labor by directly addressing the root of the problem through supply side intervention, governments have also implemented a variety of national-level efforts. These efforts fall into three categories: outcome-oriented legislations, market imperfection targeting policies, and market-based, demand-oriented policies.

Outcome-oriented legislations typically come in the form of a direct ban on child labor or through minimum age employment legislation. International labor standard conventions such as the Minimum Wage Convention and the Worst Form of Child Labor Convention of the ILO also fall under this category. While virtually all countries adopt one or more of these interventions in one form or another, their effectiveness is questionable. This results, in part, from the inherent difficulty of enforcement, particularly in the areas of rural employment, the informal sector, and family unpaid work. In addition, because legislation alone does not address the source of the child labor problem, wholesale implementation of child labor laws can result instead in the displacement of child labor from one sector to the next, where the prospects of effective inspection and enforcement are even more daunting.

Market imperfection targeting policies, in contrast, operate by addressing one or more of the market imperfections that make otherwise “voluntary” child labor employment excessive. Examples of such policies include cash or food for school programs, in which credit market constraints can arguably be relieved by providing families with financial incentives to send children to school. Public employment programs such as rural public works and employment guarantee programs provide public employment as an alternative income source and consumption smoothing mechanism. A new line of research addresses policy measures in the presence of the worst forms of child labor, such as debt bondage, trafficking, and child labor in exploitative work and hazardous conditions. A central theme emerging from this growing literature is that piecemeal policy reforms, without due regard to the precise list of market imperfections that give rise to child labor of the worst forms, can have detrimental consequences for children’s welfare.

A third class of policies, and highly controversial of late, aims at combating child labor by impacting final consumer demand. These policies come in a variety of forms and include mandatory trade sanctions on products made with child labor, along with voluntary and industry-based initiatives and labeling schemes that inform consumers about the social conditions under which products are manufactured. These initiatives affect final demand either directly, through a selective import tax, or indirectly, by allowing consumers to price discriminate between products made with or without child labor through appropriate product labeling. These are alternatives to trade sanctions, which some fear could ultimately adversely affect the welfare of children. Meanwhile, voluntary market-based labeling schemes may suffer from credibility problems in the absence of third-party enforcement. In the end, the precise nature of consumers’ willingness to pay for higher social and labor standards is nuanced, and its ultimate impact on the welfare of the child depends on whether labeling standards are fine-tuned to benefit the welfare of children or to maximize sales.

**LABOR, DIVISION OF**

The division of labor refers to the partitioning of work tasks between social groups, based on demographic characteristics such as race, sex, age, and social class. Responding to economist Adam Smith’s argument that the division of labor would lead to wealth for all, Karl Marx countered that the exploitation of the working classes would lead to alienation and revolution. According to Marx the bourgeoisie extracts surplus value from the proletariat to increase profitability and maintain a position of power.

Émile Durkheim believed that this partitioning of tasks is necessary to maintain the moral social order and cohesion between all social groups. Within simple societies with little cultural diversity, Durkheim claimed that the division of labor exhibits *mechanical solidarity*. Mechanical solidarity represents a division of labor where individuals perform identical tasks as their counterparts, making the society run smoothly. In advanced societies it is necessary to divide labor according to *organic solidarity*, meaning that workers perform specialty tasks to make their community function, like the organs in the human body.

Scientific management pioneer Frederick Winslow Taylor argued that work should be broken down to its simplest parts to maximize productivity. Taylor transformed manufacturing practices by simplifying work tasks, placing control of the labor process in the hands of management, and developing a model of production that inspired Henry Ford’s moving assembly line.

For millennia, labor has been divided according to demographic characteristics. Women and nonwhites have historically been barred entry into certain professions. Most sociological literature examines the sexual division of labor and how this favors male workers. This literature explores sex segregation in the workplace and why women and men are expected to perform different—and different levels of—uncompensated work in the home. Ruth Milkman highlighted the cultural underpinning of this sexual division of labor, a process that can shift rapidly according to the economic desires of male workers and management.

A final component of the division of labor is the distinction between economic sectors, especially service and manufacturing work. While some argue that developed nations are entering an era of postindustrial production centered on service provision, others point out that we are simply witnessing the emergence of a new, more complex global division of labor.

**LABOR, MIGRANT**

One of the most marginalized communities in the United States is that of the migrant and seasonal farmworkers who pick the crops that feed the most-fed
nation on earth. The social problems that migrant laborers face are bound to their socioeconomic disadvantages. Farmworkers occupy the lowest-paid job category in the United States, with the vast majority of immigrant farmworkers barely surviving on their below-poverty wages.

**Historical Overview**

The history of migrant labor relates to the four major migrant streams that have shuffled workers to where the crops need tending. Over the past 20 years, scholars have identified migrant streams that are increasingly Mexican immigrant, and due to political pressures to fortify the U.S.–Mexico border, the short-term sojourners are increasingly settling in rural agricultural destinations.

As the agricultural industry concentrated and expanded in the early 20th century to meet rising U.S. consumer demand, large numbers of temporary laborers were recruited to meet the short-term, labor-intensive harvest schedules of highly perishable crops. Berkeley economist Paul S. Taylor detailed the crops associated with the various migrant streams of the 1930s (see Figure 1). Remarkably, the four migrant streams did not alter significantly until the late 1980s. The East Coast migrant stream originated in Florida and the Caribbean and originally brought former African American sharecroppers north to pick apples, cranberries, and strawberries. Later, African Americans were replaced by Caribbean migrants from Puerto Rico, Jamaica, Haiti, and other islands who were first recruited to pick sugar cane in Florida and then moved up the eastern seaboard to pick the New England fall harvest. The Appalachian/Ozark migrant stream was more regionally focused and more crop specific, so wheat, cotton, and fruit pickers each followed their own distinct routes. During the Great Depression, the number of Appalachian and white sharecroppers swelled, but their presence in the migrant stream predated the 1930s. The Midwest migrant stream originated in South Texas and Mexico and most often followed the railroad lines. San Antonio, Texas, became the home base for many sojourners along this Midwest migrant stream. The Pacific Coast migrant stream originated in the Imperial Valley of California and Mexico. Mexican migrants have picked Washington apples, Oregon hops, and Idaho potatoes for well over a century.

**Recent Migrant Streams**

Over the past 20 years, the increasing reliance on Mexican labor has resulted in a redrawing of the migrant stream map (see Figure 2) and the development of new Mexican migrant streams to all agricultural regions of the United States. Workers in the established migrant streams travel from Mexico, through the border states of California, Arizona, New Mexico, and Texas, to the Pacific Coast, Mountain States, Upper Midwest, and Atlantic Coast. A number of agricultural communities in California and south Texas also send migrant workers along these same routes, but it is primarily migrants directly from Mexico who now occupy all migrant streams.

A renewed grower utilization of the U.S. government’s H-2A temporary visa program accelerated and institutionalized this process. The H-2A program originated in 1952 to meet the labor demands of Florida sugar and tobacco growers along the East Coast migrant stream. It allowed immigrant workers to obtain temporary visas to enter the country for a limited period to harvest predesignated crops. The latest available data show that agricultural firms in all 50 states employ H-2A labor and that there were 45,000 visas issued in 2003, up from 42,000 in 2002. Tobacco is the largest single crop that employs H-2A workers (35 percent of total). Scholars and labor activists readily agree that Mexican workers are the main visa recipients. Today, the fields that feed the nation, and increasingly the world, are almost exclusively harvested by workers of Mexican origin, even as the number of workers employed in agriculture continues to decline.

Data from the 2000 census partially confirm the Mexican predominance in migrant farmwork, but because the category of “migrant worker” is no longer part of data collection, the general occupational group of farming, fishing, and forestry shows that less than 1 million workers occupy this job category, with 79 percent of that workforce males. More Latinos (2.7 percent of all Latinos) are employed in agriculture than are members of all other racial/ethnic groups combined.

**Problems Affecting Migrant Workers**

The wages associated with migrant farmwork are abysmally low; the California Institute for Rural Studies estimates that each farmworker earns approximately $6,500 per year. Though workers now receive
The chart indicates only direction, not volume.
The number of migratory farmworkers in the different areas varies considerably from year to year.

Figure 2: Travel Patterns of Seasonal Migratory Agricultural Workers

the minimum wage (even though they have been exempt from minimum wage, workers’ compensation, social security, and collective bargaining rights as a result of their specific exemption from New Deal legislation), the chronic underemployment associated with seasonal labor results in such low wages that migrants must constantly move to find gainful employment. Because of the dangers associated with crossing the U.S.–Mexico border, migrants are attempting to settle permanently in the United States. However, the demand for agricultural labor continues unabated, so more undocumented immigrants and H-2A temporary visa holders are moving to tend crops.

Farmworkers are susceptible to life-threatening illnesses caused by exposure to occupational hazards as well as diminished quality of health associated with poverty. The United Farm Workers established the “Wrath of Grapes” campaign to publicize the dangers associated with pesticide exposure and the number of chronic illnesses, birth defects, and deaths that result from prolonged pesticide exposure. Farmworker children are particularly at risk for chronic conditions such as asthma, cancer, diabetes, tuberculosis, hepatitis, and many completely preventable “third world” diseases (such as polio and dysentery). Children are also vulnerable in terms of educational access, as many harvests conflict with school schedules; migrant children typically attend three or four schools in any given school year. Their frequent exposure to pesticides leads to a variety of health problems, including respiratory and nervous disorders, cancer, and asthma, which severely affect the life chances of migrant farmworkers, who collectively have a life expectancy of 54 years.

The labor force participation rate is the proportion of eligible people in the population who are involved in the labor force. The U.S. Bureau of Labor Statistics (BLS) defines the labor force as people over age 16 who are either employed or unemployed but looking for a job. People unemployed and not looking for work are not included in the labor force. Also not included are people in the U.S. Armed Forces or in institutionalized groups (penal facilities, mental facilities, and group homes). The overall U.S. labor force participation rate fluctuates seasonally but usually ranges between 66 percent and 68 percent. Demographic shifts in the population, economic cycles, and cultural changes further influence the labor force participation rate.

The most substantial shift in labor force participation in the past several decades has been the increasing participation of women. Women’s increased educational attainment and reduced propensity to marry at young ages have contributed to this surge. In 1975, only 46.3 percent of women participated in the labor force compared with 59.4 percent in 2006. Though women’s labor force participation has increased, it remains lower than men’s participation rate (73.5 percent in 2006). However, the BLS projects that the gender gap in labor force participation will continue to narrow through 2014.

Labor force participation differences by race/ethnicity are not as great as gender differences. Though the current pattern of white men and women parallels the overall gendered labor force participation rates, the African American gender gap is much smaller (about 67 percent for men and 62 percent for women). Of the race/ethnic-gender groups tracked by the BLS, Hispanic men have the highest labor force participation rate (about 80 percent) and Hispanic women have the lowest (about 56 percent). Due to
immigration and fertility rates of Hispanic groups, the U.S. Hispanic population is younger than the overall population. As these cohorts age, the BLS projects 24 percent of the labor force will be of Hispanic origin by 2050.

Labor force participation rates vary through the life course, increasing from youth to the peak work ages (25 to 54) and declining as people retire. As the large baby boomer generation (people born between 1946 and 1964) ages, the median age of the labor force is increasing and the overall labor force participation rate is expected to decline. As baby boomers retire, the labor force will decline, thus increasing the economic dependency ratio (i.e., the number of people in the total population who are not in the labor force per 100 people who are). Many social scientists are concerned the economy will not be able to maintain necessary production levels of goods and services as the labor force participation rate declines with baby boomer retirements.

Labor Market

Whereas economists analyze labor markets in terms of fluctuations in supply and demand for workers in various occupations, sociologists focus on other factors that influence employers’ decisions to hire individuals and workers’ ability to position themselves advantageously. Most sociological research explores how employees' human capital (i.e., education and training) prepares them for labor force entry and assists them in securing employment. Early attempts were made to distinguish between external and internal labor markets, with the former referring to recruitment outside of any particular organization’s jurisdiction and the latter reflecting employers’ use of career ladders and incentives to identify the most qualified in-house candidates for promotion.

Another strand of sociological research on labor markets examines how workers find employment. Mark Granovetter acknowledges the importance of human capital variables in helping workers find jobs and highlights the role of social networks in disseminating information about job openings. Granovetter finds that information gathered from those people to whom workers are closest (strong ties) is not necessarily more valuable than tips workers receive from informal associates (weak ties). This is because strong ties rarely are able to share additional labor market information because of cultural homogeneity, whereas weak ties garner diverse data because of their social distance from job seekers.

Oliver Williamson proposes that employers weigh the risks and benefits of utilizing labor markets (hiring outside contractors to fulfill specific needs) or hierarchies (developing organizational structures that foster long-term, internal labor markets). Successful firms outsource and hire workers in-house, according to their needs. By simultaneously relying on external and internal labor markets, firms can adjust to economic expansions and recessions.

Sociologists study how labor markets reflect inequalities, especially according to race and sex. A labor market segmentation hypothesis argues that in the developed world, white males occupy a series of privileged core positions while nonwhites and women are barred from entry into these labor markets and forced into secondary, peripheral jobs. Barbara Reskin and Patricia Roos find that employers create schemas (job queues) that set aside attractive, high-paying jobs for white males and relegate nonwhites and women into undesirable positions. This discrimination intensifies labor market segmentation, leading to sex- and race-based segregation at work. Samuel Cohn finds evidence that outright discrimination excludes women and nonwhites from higher-status jobs. A final strand of sociological research of labor markets examines the role of third-party organizations, namely, labor market intermediaries. These organizations are effective in streamlining hiring practices, reducing job search costs, and matching workers with quality jobs.

**Labor Movement**

Unlike a labor union, which is an empirical reality as a bureaucratic organization, a labor movement is a conceptual, rather than a physical, category. While its components are real (labor unions), it is a construct of people’s minds. In common usage it refers to a nation’s labor unions and the working class. Viewed as an *ideal type* (a Weberian term referring to the ideal version), it implies unity, coordination, cohesion, and, to draw on the favorite word of supporters of the concept, labor solidarity.

Union leaders promote respect for the concept because it connotes strength and purpose. The idea of the existence of a labor movement gives vote-seeking politicians reason to pay favorable attention to labor’s political agenda. It gives union organizers an attractive image to leverage in their ceaseless efforts to persuade the unorganized to vote to join as dues-paying members. It gives members a welcomed sense of personal significance, of being members of a social force for the Good. It also gives hope to the unorganized, as it highlights a force whose agenda includes winning gains, such as raises in the minimum wage level, that accrue to the well-being of all, union and nonunion workers alike.

Critics of the concept also promote its use, though for very different reasons. They use the idea of there being a labor movement to frighten all who fear that special interest groups undermine the general well-being of everyone. They warn that labor “bosses” (aka leaders) hobble the free market with unnecessary rules and regulations (as with those that promote safety and health at work). They use the concept to magnify shortcomings of this union or that one (such as sexist or racist ways), and they generalize from these weaknesses to the entire body of unions. And they use the concept to exaggerate labor’s power, thereby making a case for passage of new laws that weaken labor.

In fact, the concept is far weaker than either its admirers or detractors prefer acknowledging. Especially in advanced industrial nations like the United States where individualism is the main cultural motif, there is much that divides union members from one another (including levels of educational attainment, race, ethnicity, religion, gender, sexual preference, political leanings, social class self-identification, industry, craft, etc.). Accordingly, it is hard for union leaders to get members to act on behalf of a cause that is not exactly theirs but is more a concern of other unionists.

Labor movement solidarity, although often displayed at Labor Day parades and picnics where no risk or price is entailed, frequently disappears where it really counts, as in daring to strike in support of the picket line of another union. Likewise, detractors of the concept are reluctant to concede there is far less to it than their calculated use of it as a fear-provoking image suggests.

Whereas in the 1800s, during the early industrial revolution, the notion of a labor movement may have had heft and consequence, there are only two aspects today with substance: political and community affairs. In the United States and most advanced industrial nations, the labor movement remains a voting force of importance. Unions can draw on many volunteers to run phone banks, canvas neighborhoods on foot to distribute campaign literature, and, in many other consequential ways, make a difference in election outcomes. Likewise, in response to a disaster (floods, hurricanes, etc.), the labor movement can rally many volunteers to rush aid to the needy, assist rescue and recovery operations (as during the 9/11 attack in New York), and in numerous other ways, lend a distinct and valuable hand.

Notwithstanding these two strengths (political and community matters), the concept of a labor movement remains a fragile and problematic one. In developing nations it is weakened by the dominance of family and tribal identity over class identity. In more advanced nations it is weakened by all the sources of identity mentioned earlier, and especially by the desire of many in the working class to rise up and out of that class. This wish can translate into disinclination or even refusal to come to the aid of others in the working class.

As if this wasn’t enough to weaken solidarity, there is also mean-spirited rivalry among some unions.
Efforts are made to win over members of other unions, and in the process the targeted union is sharply denigrated, leaving both working-class participants in the “raid” and onlookers increasingly skeptical about there being any mutual respect left in the so-called labor movement.

Naturally, far-sighted and progressive labor leaders seek to add substance and worth to the labor movement concept. They understand its importance in promoting a social force that is supple, relevant, and significant. Their unions use educational efforts aimed at raising consciousness of solidarity, creating links among different types of members (as in creating women’s caucuses), and forging ties to relevant outside groups, such as the NAACP and La Raza, to extend the “reach” of the labor movement.

Thanks now to labor’s invaluable use of computer power to promote an “electronic community” via e-mail, Web sites, and other forms of Internet empowerment, admirers of the concept are more hopeful than ever that the 21st century will see nations host better labor movements than ever before. Indeed, the prospects are good for the welding together of a worldwide labor movement, thanks to the power of the Internet. Already more and more unions around the globe have more and more knowledge of one another and are beginning to cooperate in joint boycotts, protests, and even coordinated strikes. While much remains to divide the unions, including the biases of members (left-leaning unions find it hard to respect right-leaning ones, and vice versa), admirers of the labor movement concept are encouraged as seldom before by the possibility that slowly, carefully, and unevenly, the world’s labor unions—and large components of national working classes everywhere—may finally come together in a new labor movement worth the name.

If and when labor achieves authentic global solidarity, the course of world events is likely to change, though whether for good or naught is yet to be decided. A global labor movement could prove to be one of the most significant agents of change, or it could remain as it is at present, a wistful idea in uneven search of substance.

Arthur Bennet Shostak

Labor Racketeering

Labor racketeering (not a legal or scientific term) is a popular way of referring to organized crime exploitation of unions and union pension and welfare funds. Unions, like most organizations, have their share of corrupt officers and employees. However, unions are unique on account of the extensiveness of corruption perpetrated by the Cosa Nostra (sometimes called “mafia”) organized crime families and union officials with whom they are allied. Indeed, no other country (not even Italy or Japan, with hugely powerful organized crime groups) has experienced the degree of organized-crime-sponsored labor racketeering that has plagued the U.S. labor movement.

Setting the pattern for organized crime labor racketeering early in the 20th century were Jewish, Irish, and other ethnic gangsters like Arnold Rothstein (1882–1928), Jacob Orgen (1894–1927), Louis Buchwalter (1897–1944), and Arthur Flegenheimer, aka “Dutch Schultz” (1903–35). Sometimes hired to help a union defend itself from employers’ thugs, these gangsters got a foot in the door and then decided to stay. They took over union locals by means of violence, intimidation, and election fraud. See also Cyberspace; Global Economy; Globalization; Labor Racketeering; Labor Unions; Transnational Social Movement
These labor racketeers solicited employer bribes in exchange for sweetheart contracts and other violations of the collective bargaining agreement. In addition, in industries marked by cutthroat competition, the labor racketeers could use the union to establish and police employer cartels. Through their control over the labor force, the union officials could prevent noncartel members from doing business in the city where the cartel operated. The cartels fixed prices and allocated contracts. The mobsters also collected “dues” from the cartels’ employer members and sorted out disputes among the cartels’ members.

As early as the 1920s and 1930s, dozens of organized crime–controlled unions operated in Chicago, New York, and other cities. The Italian-American organized crime Cosa Nostra (LCN) families that came to dominate organized crime by the 1940s thrived on labor racketeering. Every city with an LCN family had significant labor racketeering. The mobsters took money out of the unions via bloated salaries, fraudulent reimbursement schemes, no-show jobs, and embezzlement. They also benefited from a steady stream of employer bribes. Starting in the 1940s, with the creation of massive employer/union pension and welfare funds, labor racketeering became much more lucrative. The multibillion-dollar Teamsters Central States Fund, for example, functioned as a bank for organized crime. In addition, labor racketeering provided organized crime bosses with social status and political power. Labor racketeers contributed endorsements, money, and manpower to politicians’ election campaigns in exchange for the politicians’ promise not to interfere with LCN’s business interests.

Law enforcement offered little opposition to labor racketeering or to organized crime generally. City police departments were either too corrupt to take on powerful organized crime groups or too lacking in resources, or both. The Federal Bureau of Investigation (FBI) was a much smaller agency in the early and mid-20th century than it is today, and, arguably, its jurisdiction did not extend to investigating organized crime. In any event, the FBI assigned top priority to fighting Communists and other subversives. Not until the mob bosses’ notorious Appalachian Conference in 1957 did the FBI begin to collect intelligence information (via illegal electronic surveillance) on organized crime.

In 1955, Elia Kazan’s (now classic) film On the Waterfront dramatized the impact of organized crime’s labor racketeering on longshoremen and fueled a demand for corrective action. From 1957 to 1959, a U.S. Senate committee (the McClellan Committee) held highly publicized hearings on labor racketeering, especially focusing on Jimmy Hoffa, general president of the Teamsters Union. Robert F. Kennedy was the committee’s chief counsel. His combative questioning of Jimmy Hoffa and Hoffa’s angry responses made front page news and good entertainment. When, in 1961, Kennedy became U.S. attorney general, he helped pass federal anti–organized crime legislation and initiated a major Justice Department offensive against the LCN crime families. When Kennedy resigned in 1964, the Department of Justice’s (DOJ’s) anti–organized crime and anti–labor racketeering efforts dissipated, but they did not disappear. More powerful legislation passed in 1968 and 1970, including the famous RICO (Racketeer Influenced and Corrupt Organizations) Act.

The mob assassination of Jimmy Hoffa in 1975 touched off a major DOJ offensive against the Italian-American organized crime families. Eventually, federal prosecutors brought hundreds of criminal cases. In addition, they found RICO’s civil provision the most effective anti–labor racketeering weapon ever invented. The DOJ lawyers filed their first civil RICO union case in 1982 against New Jersey Teamsters Local 560. That suit sought to purge LCN organized crime figure Tony Provenzano and his cronies from a local union that the mobsters had controlled for 2 decades. The judge found in favor of the government and issued a wide-ranging injunction that placed a court-appointed trustee in charge.

In 1988, Rudy Giuliani, then U.S. attorney for the Southern District of New York, filed a similar civil RICO suit against the general executive board of the International Brotherhood of Teamsters (IBT). The suit alleged that the IBT’s international officers, in league with a number of mafia bosses, ran the entire IBT as a racketeering enterprise. The case was settled on terms favorable to the government and, as in the Local 560 case, with the imposition of a novel court-supervised remedial trusteeship. The remedial phase of the case continues to this day (winter 2007), with no end in sight.

All told, the DOJ has so far brought 21 civil RICO cases against mob-dominated labor unions. The government has prevailed, usually by settlements, in all these cases, with trusteeships of one kind or another.
always imposed. The trustees have then tried to purge organized crime members and their allies from these unions and reform union governance to the point where the union will be resistant to organized crime in the future. These trusteeships have met with both successes and failures, with many cases still pending. Nevertheless, the elimination of labor racketeering appears to be a realistic goal.

LABOR SECTORS

Social scientists often refer to labor sectors as divisions of the economy. There are several ways to describe labor sectors, but all of them refer to systems of grouping similar labor or broad classifications of industries.

One common system of labor sector divisions distinguishes between the primary, secondary, and tertiary sectors. The primary sector refers to the segment of the economy working directly with raw materials from the natural environment. This sector includes industries such as agriculture, mining, and forestry. The secondary sector includes industries producing manufactured goods. Service activities such as banking, retail sales, transportation, and communication services are categorized in the tertiary sector. Social scientists sometimes, though not consistently, extend these divisions to specify a quaternary sector and a quinary sector. The quaternary sector refers to intellectual activities such as education, information technology, and scientific research. The quinary sector, a branch of the quaternary sector, is limited to the labor of high-level decision makers such as top executives in government and other industries.

The U.S. Bureau of Labor Statistics (BLS) uses a more detailed labor sector system to classify industries into sectors. The BLS lists three “goods producing” sectors and nine “service producing” sectors. The goods producing sectors include natural resources, construction, and manufacturing. The service producing sectors include trade, transportation, and utilities; information; financial activities; professional and business services; education and health services; leisure and hospitality; public administration; other services; and unclassified industries.

The BLS uses sectors to evaluate changes in the national economy, but they can also be used to understand economic structure in other countries. The distribution of labor sectors in a country has implications for the country’s development potential. In traditional developing countries, as compared with industrialized countries, a larger proportion of the economy is involved in the primary sector. When investments flow to developing countries, workers leave the primary sector for higher-paying jobs in cities. However, social scientists have noticed that labor sectors in countries developing in the modern economy do not transition in the same pattern as countries that industrialized earlier. Many researchers claim foreign investments influence developing countries’ labor sectors and maintain international inequalities.

Rather than focusing on industries in labor sectors, some social scientists define labor sectors descriptively. For example, “nonprofit sector” refers to not-for-profit organizations, and “public sector” refers to organizations for the public good (such as local government). Labor sectors can also be defined by the regulatory status of labor. In this context, the formal labor sector includes all activities reported as labor to the government. The informal sector refers to voluntary labor, unpaid labor, unreported labor, and possibly illegal labor. Often the informal sector refers to volunteers, self-employed workers, or small business employees, but this sector can also include exploitive situations for undocumented workers or other workers with few employment alternatives.

LABOR UNIONS

Organizations of hourly or salaried employees intent on improving both the at-work and off-work lives of actual and prospective members, labor unions often make up the largest social movement in a country. Able often to successfully bargain for better wages, hours, and working conditions than those afforded their matched counterparts in nonunion workplaces, labor unions raise the bar and show the way. Critics, not surprisingly, rush to charge this wage differential comes at a high cost to other stakeholders in a unionized firm, such as investors, nonunion jobholders, managers and executives, and possibly even consumers. Pro-union academics, however, contend that the higher morale, and thereby possibly the higher productivity of unionized employees, compensates for the union’s “tax” on company profits; this is one of many such endless economic arguments concerning unions.

Labor unions can trace their origins back to medieval or even Roman guilds, though nowadays they no longer produce products or services or attempt to control prices and product standards. Found in almost every country, especially since the mid-20th century, labor unions’ existence fundamentally hinges on their acceptance, or at least countenance, by government. Totalitarian countries either outlaw them or subvert them and turn them into ersatz meaningless puppets of the regime (as may be true at present in Mainland China and several Middle Eastern countries). Generally, the more democratic the political scene is, the greater is the union density (the percentage of eligible members who have joined a union).

A union consists of many worksite-based operations, known in the United States as locals. A local is the smallest unit and the one in which most members actually “experience” unionism, warts and all. It generally operates out of an office (or union hall), complete with a meeting room and the equipment necessary to house an election phone bank program, large rallies, celebrations, holiday parties, and the like. In large measure, whatever union members think and feel about unionism is derivative from the strengths and weaknesses of their local rather than from any other aspect of the union apparatus or the labor movement per se.

Locals connect to one another in a union’s citywide, statewide, and regionwide organizations. Their union may also enroll them in a sector organization (as when the locals whose employers make this product or that one are grouped together in a niche organization by this or that product line). A local may be also a member of citywide, statewide, and regional organizations along with locals of other unions. These bodies that mix locals of different unions are especially strategic for making consequential endorsements, for getting out the vote, and in many other ways, for boosting labor’s political clout.

Contrary to misleading stereotypes as predominantly blue-collar domains, labor unions, especially in advanced industrial nations, attract a wide range of members: Actors, artists, clergy, dancers, engineers, musicians, nurses, pilots, prison guards, professors, secretaries, and social workers are unionized, as are auto, factory, mine, and steel workers. This diversity helps explain the preoccupation of unions with legislative matters, as almost every proposed piece of legislation can touch on some aspect of the life of this or that union member. Likewise, the diversity of dues payers prompts unions to vigorously participate in electoral contests, commonly on the side of populist candidates.

Despite the occupational diversity of unions, critics have long charged that unions employ racist and sexist practices to control membership on behalf of their white heterosexual male members. Much evidence supports this charge, though all such barriers are lower today than ever. Thanks to federal anti-discrimination laws, and in large part to the direct efforts of protesters (especially women, civil rights, and gay activists, many of whom operate openly inside the labor movement), progress continues to be made, albeit never as fast as advocates would prefer.

Union democracy, while dismissed by some hostile critics as an oxymoron, is hailed by labor supporters as a valuable prop of a nation’s overarching democracy. The very nature of a union complicates the matter: It is at one and the same time an army capable of either highly disciplined defensive or aggressive moves and yet also a town hall culture that welcomes debate, controversy, and the uncertainties of a popular democratic style, one where leaders can swiftly be voted out of office, almost regardless of circumstances. (Union leaders, not surprisingly, want above all to continue to hold office and not “return to the tools.”) A union also endlessly recruits new members, socializing them into a culture foreign to them, one that expects loyalty and a degree of conformity. Also, it can function as a
church of sorts for a small number of ideological devotees for whom the leadership can do no wrong (or, if in opposition, no right). Plainly, then, varied definitions of democracy endlessly joust with one another, a winner at one time readily replaced by another as circumstances change.

Employers vary greatly in their reaction to unions, with most initially hostile and some even rabidly so when an organizer first shows up (a move that generally reflects a call to the union for help from some aggrieved members of the workplace). Much hinges on the national climate: When the people support egalitarian values and frown on class conflict, as in postwar Scandinavia and also in the wishful high-minded doctrine of the 25-nation European Union, employers and unions try to get along. They compromise in bargaining new labor contracts, let the government sit in to help make the deal, and agree to treat each other with mutual respect. On the contrary, when people accept ever-greater income disparities and shrug at outbreaks of fierce class conflict, as in Britain, France, Germany, Italy, and the United States, labor–management relations are testy at best, and mean-spirited, unrestrained, and ugly at worst.

When the parties lack parity in bargaining or political power, relations typically worsen. The temptation to take advantage of the weaker side is often too great to resist, even though those individuals on the (temporarily) stronger side generally recognize how shortsighted such a course of action is. The dynamic here, for example, might have employers exploit a seeming power dominance, only to have employees soon grow angry and bitter at supervisory excesses. Labor is soon the beneficiary in that new members flock to it, demanding it strike back and help restore at work a semblance of equity in power, a cessation of abuse, and a modicum of mutual respect.

At present, unions worldwide are either barely holding their own or declining in membership as a percentage of the workforce, a trend for about 3 decades. For example, U.S. unions in the mid-1970s had about 35 percent of the eligible, while in 2006 the number was only 12 percent. Explanations focus on five matters: First, federal and state labor laws, while allegedly neutral between labor and management, are damned by U.S. unions as stark hindrances to organizing and winning a first contract after a successful campaign. Second, many jobs in traditional union sectors, such as manufacturing, have been lost to automation and outsourcing. Third, employer opposition, aided by union-avoidance consultants, can be formidable. Fourth, the mass media seldom take labor’s side. Fifth, unionism has been besmirched by the presence of organized crime in a few unions and locals. Sixth, union leaders operate defensively and rarely innovate: Young workers may therefore dismiss unions as behind the times, more a relic than a contemporary aid.

Union advocates look for gains from four sources: First, younger leaders, including more women and people of color, are ascending to power. Second, after 50 years of only one labor federation there are now two rival groups: Change to Win, an upstart made up of seven large unions, and the older body, the 45-member AFL-CIO. This rivalry may spur labor’s renewal. Third, computers are enabling global boycotts and e-mail campaigns, and other novel tools are beginning to pay off. Fourth, pathbreaking unions are busy experimenting with creative uses of computer power, and this tool could help weld an “electronic community” of strategic aid to labor’s reinvention of itself.

Programmatically, in the foreseeable future more mergers are likely, as small unions accept membership into a few very large ones. Closer cooperation with community groups is likely, including a turn toward support for “green” efforts. Services may expand beyond conventional offerings (such as health and welfare benefits, pensions, retirement homes, etc.), with some unions possibly even soon becoming providers of jobs outsourced to a union by employers open to having the unions employ labor. Although all of these are problematic, this much seems assured: As long as employees feel the need for a countervailing power at work, there will be unions. They will be only as meritorious, however, as required by the surrounding culture and their membership. A nation and a workforce get the unions they deserve.

Latent functions are unintended and unrecognized consequences of intended, recognized manifest functions. Robert K. Merton contributed the original sociological explication of latent functions in his Social Theory and Social Structure of 1957. Merton, who borrowed the terms manifest and latent from Freud’s theory of dreams, explained that latent functions can be functional, dysfunctional, or irrelevant for a social system. According to Freud, dreams use the images of everyday life as manifest content representing the true latent content of repressed desires. As Merton described, several social scientists—such as Marx, Durkheim, and Veblen—implicitly referred to latent consequences in their writings.

Merton’s explication of latent functions relegates these outcomes mainly to the realm of social systems. For instance, an ethnic family may organize festivals to celebrate the achievements of its children (graduations, marriages, etc.) and invite other neighborhood members to the celebrations. The festivals serve the manifest function of observing the achievements of the children and the latent function of reinforcing the solidarity of the neighborhood members.

The condition that latent functions must be unrecognized by social actors is important in order to distinguish between manifest dysfunctions and true latent functions, since the former are unintended outcomes visible to social actors. For example, a local government may develop a large tract of public housing for poor people only to see the housing projects become poverty concentrations ripe with dangerous activities that threaten tenants.

Yet, it is not clear that all latent functions must remain unrecognized forever. Some latent functions may be eventually recognizable, but when they are, they are not necessarily consciously connected to the manifest functions from which they sprang. An example of such a latent case is a university campus that has become a marketplace for locating marital partners. The students may be aware that the campus provides access to potential marital partners but may not make a strong connection between this function and the manifest function of the university providing higher-level education.

The condition that latent functions are unrecognized illustrates the difference between the perspectives of social systems and human agency. Merton seems to restrict the knowledgeable of human agents, while Anthony Giddens credits them with being skilled and knowledgeable practitioners of social action. But, according to Giddens, unrecognized conditions and unintended consequences of social action still bound the knowledgeable of human actors. That is, human agents cannot have complete knowledge of the outcomes of their actions, especially regarding unintended consequences.

Another question is that of the time span for latent functions to develop. At the level of social systems or human agency, nothing can prevent manifest functions from having delayed latent outcomes. One could argue that it is precisely the continuity of some manifest functions that produces certain kinds of latent functions. For example, long-term European colonization fragmented African regions and created artificial, multicultural states that, after decolonialization, lapsed into interethnic conflict.

Learning Disorders

The term learning disorders refers to the problems or difficulties that some students experience in acquiring the necessary knowledge or skills that lead to academic achievement. Explanations for learning disorders are contested. Early understandings of problems...
Learning Disorders

in learning were psychological in nature and based on the medical model. Recently, sociological critiques of psychomedical approaches have led to new educational perspectives.

The medical model suggests that symptoms of a disease are the visible manifestations of an underlying pathology, requiring an accurate diagnosis to define appropriate treatment of the pathology and result in a cure.

A psychological approach to learning disorders based on the medical model sees the symptom of the “disease” as low achievement. The underlying pathology is a categorical label (e.g., learning or intellectual disabilities). Through educational assessment diagnosing the condition, treatment in the form of intervention targets the underlying pathology in order to cure the condition.

The most widely recognized category of learning disorder is learning disability, a term coined by Samuel Kirk in 1962 to refer to any limitation beyond intelligence that prevents individuals from a successful learning experience: that is, those for whom conventional categories such as intellectual disabilities could not explain their failure. Kirk described learning disabilities as a retardation or disorder in areas of school achievement such as reading or mathematics. Based on the medical model, he suggested that cerebral dysfunction or emotional disturbance caused learning disabilities. Given the difficulty in detecting the nature of the underlying cerebral dysfunction, Kirk suggested that exclusionary criteria could differentiate learning disabilities from other causes of failure. He stated that the failure was not the result of intellectual disabilities, sensory deprivation, or cultural or instructional factors.

Since Kirk first introduced the term, a number of definitions of learning disabilities have emerged, but they generally adhere to his central tenets. For example, the initial public policy definition developed as part of the Education for All Handicapped Children Act in 1977 stated that learning disability means a disorder in one or more of the basic psychological processes in understanding or using language, spoken or written, which may manifest itself in an imperfect ability to listen, think, read, spell or do mathematical calculations. The term includes such conditions as perceptual handicaps, brain injury, minimal brain dysfunction, dyslexia, and developmental aphasia. The term does not include children who have learning problems which are primarily the result of visual, hearing or motor handicaps, of mental retardation, or emotional disturbance, or of environmental, cultural, or economic disadvantage.

Although learning disability is a general term subsuming a wide range of conditions, some researchers and advocacy groups refer to more specific categories of disorders or disabilities, such as the following.

Dyslexia refers specifically to disorders with the written language (reading and spelling). Its use is common in Canada, New Zealand, the United Kingdom, and the United States, where its distinction is as a neurological impairment as opposed to an intellectual disability.

Aphasia refers to a disorder in acquiring or using language. Children or adults can have difficulties in understanding language (receptive language) or in speaking (expressive language).

Dysgraphia refers to the inability to produce written text.

Dyscalculia refers to a disorder in the ability to perform mathematical tasks.

Social Critiques of Learning Disorders

Social analysts suggest that labels such as “learning disabilities,” “dyslexia,” or “learning disorders” and the identification and labeling of students as “learning disabled” are more social constructions than examples of neuropathology.

First, such categories create arbitrary distinctions between children who are “disordered” and those who are “normal.” This is problematic in that research shows that no hard boundaries exist between the characteristics of children identified as experiencing learning disorders and those of other children who fail in school or of younger normally achieving children.

Second, researchers consistently have problems in attempting to document logical links in the medical model as it applies to children in classrooms. Many children fail to demonstrate any evidence of underlying neurological impairment or pathology so that a severe discrepancy between performance and potential substitutes for evidence of pathology. Additionally, questions remain about the adequacy of assessment techniques to “diagnose” underlying pathology.

Finally, one of the most serious limitations of the medical model is the lack of educational interventions that target the presumed pathology and are efficacious.
in enhancing the development of children experiencing problems in learning. Effective interventions for children identified as learning disabled are the same as successful ones for all other children.

**Educational Perspectives**

Educational perspectives offer an alternative to both psychomedical and social analyses of learning disabilities. In the past 3 decades, experts have been remarkably productive in identifying key factors that underpin success in learning and in developing instructional programs that enhance the learning of all students—including those identified as having learning disabilities.

From an educational perspective, because children vary on multiple dimensions that affect learning along a continuum, failure to learn arises from an interaction of children’s individual characteristics and the instructional programs provided to them. The appropriate response to failure is not a psychological or educational “treatment” but implementation of programs with demonstrated efficacy in promoting achievement.

In the case of reading and learning disabilities, the continuum of necessary skill acquisition is the same for children identified with learning disabilities or dyslexia as for all other children. The key to learning to read is phonological awareness, the ability to detect and manipulate the sound structure of language. Phonological awareness develops before the ability to read and is a powerful predictor of later reading ability. Sensitivity to rhyme is one of the earliest phonological skills to develop, followed by awareness of initial sounds. Among both children with learning disabilities and those without learning disabilities, poor readers often demonstrate core deficits in phonological processing. However, explicit instruction in phonological awareness can address these deficits and promote reading for both groups of students.

A second reason that many children fail to learn to read is the nature of early reading instruction. Effective reading instruction should teach children how to use their knowledge about letter–sound correspondences to work out unfamiliar words (phonics). Students need a systematic, structured program that teaches how to decode text. Phonics-based programs can successfully teach students to read, regardless of their assigned categorical label.

Other effective instructional approaches include minimizing distracting elements in programs so that children can focus easily on the key elements of the task. Finally, teachers should ensure that students have sufficient practice in skills so that they master each step in the learning sequence.

**Life Chances**

German sociologist Max Weber first conceptualized the term *life chances* in his work on social stratification. Contrary to Karl Marx’s theory of capitalist exploitation, in which social inequality was based on access to the means of production, Weber’s theory of stratification involved three interrelated components: social class, status group, and political affiliation. In sharp distinction to Marx’s notion of working-class struggle as a process of universal emancipation, Weber argued that membership in a social class did
not necessarily constitute membership in a community with common interests and experiences. Status groups, in his estimation, operated more like communities of people who shared a similar level of prestige, patterns of consumption, and lifestyle.

Weber’s concept of lifestyle involved two major components: (1) life choices, or self-determined behavior, and (2) life chances, which involved structural probabilities, opportunities, and likelihoods. For Weber, these factors operated dialectically in the development of one’s life course, involving degrees of freedom and self-direction as well as structural constraints. The term life chances refers to the probability of establishing a certain life course, given an individual’s position in the social hierarchy. In this respect, the concept points to the relationship between status and class situation and their impact on one’s vitality. It also refers to how people in similar class and status situations experience common advantages and disadvantages in the pursuit of a favorable quality of life and satisfaction of their needs.

Social class and status position strongly affect one’s ability to access vital social resources, such as health care, food, clothing, housing, and so on, and life chances are often measured in these terms. Studies on health, mortality, crime, and lifestyle, for example, have established direct links between social class and life chances. In times of crisis, affluent and powerful members of society have a better chance of surviving than do members of the lower classes. In addition, researchers have found lifestyle and disease to be strongly correlated. Mortality rates, especially for infants, are often used as a measure of a country’s wealth. Illnesses such as lung disease, diabetes, arthritis, and heart disease disproportionately affect low-income populations, in part because of limited access to health care but also because of poor diet, inadequate medical care, lack of health education, and increased exposure to violent crime. In this respect, life chances refer to a group’s likelihood of survival.

Life Course

The life course as a field of study is a relatively new paradigm that developed after the 1950s, based on historical demography, research on the sociology of aging, life histories, and panel and longitudinal studies. Life course research is interdisciplinary in nature and combines several models to describe the social development of individuals across the life course.

Generally, researchers focus on five elements of the life course paradigm: the principle of life-span development, agency, time and place, timing, and linked lives. Life-span development refers to an individual’s capacity to learn and grow throughout his or her life. Human agency emphasizes the fact that people shape their lives through the decisions they make based on social and historical opportunities and constraints. Determining these, to a large degree, are time and place; that is, the constraints and rooting of people’s lives by the historical context in which they live. However, the way a person experiences life and its consequences also depends on the timing of events and transitions. Transitions between family, work, education, and community roles can be either on-time or off-time. Off-time transitions, such as teen pregnancy and early grandparenthood, are usually more problematic than on-time transitions. Last, people’s lives interconnect with others, and the effect of linked lives can have long-lasting consequences for individuals. For example, a child born to a teen will have different opportunities later on in life than a child born to someone in their mid-30s. The non-normative timing of teenage pregnancy also produces the off-time transition for the parent to become a grandparent at an earlier age than expected.

The terms generation, period, cohort, and age are important in life course research. Generation refers to
the norms associated with chronological age regardless of the historical context. For example, a person turning 18 becomes a young adult because 18 is the legal age of adulthood. A period is a certain slice of history, such as the 1960s, when certain cultural and historical events occur to people of all ages but affect people of various cohorts differently. A cohort is a group of people of a similar age who grow older and move through time together and, therefore, share certain historical experiences. Age stands for the changes, physical and mental, that occur to individuals as they get older. Shared understanding of these terms allows for an interdisciplinary field that generates rich data. Even though the life course paradigm is new, it has become an important framework in understanding the totality of people’s lives.

Life Expectancy

Life expectancy is a measurement defined as the number of years a person, at a given age and within a given population, can expect to live. Calculations of life expectancy come from a life table, a demographic measurement tool that describes the pattern and level of mortality for a given population, typically on a cross-sectional basis; that is, as a snapshot in time. While any age can serve as a basis to determine life expectancy, it is the expectation of life at birth (represented within a life table as \( e_0 \)) most commonly presented because it is a summary indicator of mortality conditions across all ages for a given population, is unaffected by the overall age structure of the population, and, as such, is useful in cross-population comparisons. Occasionally, life expectancy at age 1 actually exceeds that at birth, if infant mortality rates are extraordinarily high within a given population.

Life expectancy usually declines with age. According to the National Center for Health Statistics, in 2003 life expectancy at birth for both men and women of all races in the United States was 77.5 years. At age 65, life expectancy was 18.4 years; at age 75, 11.8 years; and at age 85, 6.8 years. These calculations imply a 65-year-old could expect to live until 83, a 75-year-old until age 86, and an 85-year-old until age 91. Generally, in conjunction with declining fertility rates, improvements in life expectancy have resulted in the “graying” of many national populations.

When the first reliable U.S. life-expectancy data were produced between 1900 and 1902, life expectancy at birth was 47.3 years. Much of the increase in life expectancy resulted from decreases in infant and child mortality, which reflects systematic increases in public health interventions such as the development of sewer systems that helped reduce the spread of infectious diseases. As history suggests, social conditions affect life expectancy as do demographic and socioeconomic factors such as gender, race, income, and geography. These factors create a range of life expectancies between populations as well as within a given population. Disparities in mortality rates usually result from unequal development among countries, whereas within a given population disparities reflect social inequality or stratification. Life expectancy currently differs dramatically between developed and developing countries, the latter of whose populations lack public health resources and remain subject to high levels of infectious disease. For example, according to the 2006 World Health Report, whereas life expectancy for some women in developed countries can reach as high as 83 years, life expectancy for men in sub-Saharan Africa, where HIV/AIDS and other communicable diseases have significantly lowered life expectancies over the past 10 years, is less than 45 years.

Although the United States has one of the highest overall life expectancies in the world, it actually ranks low among other industrialized countries. Despite spending more on health care than any other industrialized country, the United States ranked 29th in life expectancy in 2006 and 43rd worldwide for infant mortality in 2005. In 2006, a study conducted by the Harvard School of Public Health found that the gap
between highest and lowest life expectancy among subgroups in the United States is over 35 years. This considerable gap reflects disparities that result from a combination of socioeconomic factors, including race, gender, income distribution, and geographic location, as well as phenomena such as widely varying rates of HIV infection and homicide and behavioral and cultural barriers to health, leading to increased rates of diabetes, the prevalence of cardiovascular disease, and alcohol-related deaths within specific populations. Further, this gap speaks to structural inequalities that limit access to health insurance and quality medical care, as well as the lack of social policies aimed at reducing socioeconomic differences.

In addition to demographic and socioeconomic factors that increase the range of life expectancies, increased overall life expectancy poses new challenges to populations where increased longevity may not necessarily correlate to improvements in quality of life. As populations age throughout the world, the prevalence of chronic illness also increases, and many public health organizations now distinguish between life expectancy and healthy life expectancy, the latter defined as the number of years an individual can expect to live a life free from disability, dependency on others, or disease. In 2000, the World Health Organization introduced the Disability Adjusted Life Expectancy (DALE) indicator, which projected that a female baby born in the United States can expect to live 72.6 healthy years, in contrast to 67.5 years for males. The prevalence of chronic illness among older populations raises issues such as the increased costs of medical care, the complications of long-term care, and strain placed on both private and public resources. Without the development of public health care initiatives that can reduce risk factors for chronic illnesses or the adoption of social policies that are capable of buffering the negative health effects of structural inequality, disparities in life expectancy will remain a social and public health concern.

Literacy, Adult

Adult literacy is an adult’s ability to read, write, listen, and speak to accomplish daily events in the community, the family, and on the job. The Adult Performance Level program popularized the notion of “functional literacy,” which is defined as reading and writing at a minimal level in day-to-day living. These functional skills include everyday literacy skills, such as reading a bus schedule, writing a check, and completing a job application. This cognitive view of literacy thus includes economic competence.

A social view of adult literacy emphasizes the reading, writing, speaking, listening, and critical thinking skills needed for participation in a democratic society. This view emphasizes social power, action, and change. Researchers, educators, community activists, and adults with limited literacy ability argue for this definition of literacy. In this view, literacy is not simply an autonomous set of generalized skills and practices predetermined by others; rather, literacy is embedded in culture and is socially and politically constructed.

The most prevalent and broadest view of literacy in adult literacy programs is “true literacy,” covering individuals who can read and write beyond survival levels, take pleasure from a wide range of reading materials (including the canon or classic literature),
and engage in writing for creative reasons. Expanding the notion of true literacy is the construct of “high literacy,” or the ability to think deeply, efficiently, and effectively with concepts and ideas necessary for the new millennium, particularly those abilities needed to keep up with the changing demands of new technologies. What is considered “high literacy” today, however, may become “basic literacy” tomorrow.

**Assessments of Adult Literacy**

The National Assessment of Adult Literacy (NAAL) is a nationally representative survey that measures English language literacy skills of U.S. adults age 16 years or older living in households or prisons. The NAAL defines literacy as both task based (everyday literacy tasks) and skills based (skills ranging from recognizing words to higher-level skills, such as making inferences from a text). Administered in 1992 and again in 2003, the NAAL examined adults’ reading ability in three areas—prose literacy (e.g., newspapers, poems, and fiction); document literacy (e.g., job applications, bus schedules, and maps); and quantitative literacy (e.g., balancing a checkbook). Resulting classifications in prose literacy were either below basic (can do no more than the most simple and concrete literacy activities), basic (can perform simple and everyday literacy activities), intermediate (can perform moderately challenging literacy activities), and proficient (can perform challenging literacy activities). Results from 2003 show that about 43 percent of adults scored below basic or basic, and 57 percent of adults scored at the intermediate or proficient levels. No significant change in prose and document literacy occurred between the two assessments, but quantitative literacy increased.

**Adult Literacy Education**

Adult Basic Education (ABE) is typically either formal literacy instruction programs, such as that offered at community colleges, or volunteer tutors providing individualized instruction. Literacy tutors receive training through federally funded programs, such as the Peace Corps or AmeriCorps, or from literacy advocacy groups such as ProLiteracy Worldwide, the oldest and largest nongovernmental literacy organization in the world. ABE programs focus on teaching adults to read and write, but they might also offer basic mathematics instruction. ABE programs attract a wide range of participants in terms of ages, grade-level reading abilities, skills, and life experiences. Contrary to popular belief, most ABE participants are not illiterate but rather individuals who have completed several years of schooling yet remain unsuccessful at learning to read. Enrollment in ABE is typically free and open-ended, enabling adults to drop in and out as circumstances allow.

**Workplace literacy** refers either to the literacy strategies, functions, tasks, and materials needed in workplace settings, or to literacy programs conducted within workplace settings. These programs may focus on specific literacy demands of the workplace or may be any literacy program conducted at the workplace, such as preparing to pass the GED (General Educational Development test, the high school equivalency test). Workplace literacy often involves myriad literacy skills, including listening, speaking (including specialized vocabulary), writing notes, reading from a paper or computer screen, doing mathematical calculations, and responding to tasks both orally and in writing.

First identified in the 1800s, workplace literacy issues led to labor union literacy programs at that time. Later, in the early 20th century, Congress heard testimony about the literacy problems among miners. The U.S. military enacted special literacy programs for soldiers during World War I. During the 1980s and 1990s, researchers documented literacy demands in the civilian workplace, finding that workers in most occupations read and wrote more in the workplace than most students did in school settings.

Workplace literacy programs evolved to cope with the growing population of workers for whom English is a second language and to provide training for workers with low literacy skills. The federal government funds workplace literacy programs that address basic language and literacy needs, as well as the more complex literacy demands of the workplace, by providing opportunities for learners to practice reading and writing using workplace examples. These activities usually also include discussion of the participants’ beliefs about and plans for literacy and informational talks about their reading and writing processes.

**Resources in Adult Literacy**

Several agencies and organizations support adult literacy programs and contribute to a continuing reform agenda. For example, the U.S. Department of Education, Division of Adult Education and Literacy, administers grants and supports research and development efforts,
such as funding the National Institute for Literacy, to promote improvement of adult literacy services. The National Center for Adult Learning and Literacy conducts and disseminates research on adult literacy. Laubach Literacy and Literacy Volunteers of America support volunteer and community-based literacy programs. The National Center for Family Literacy provides funding, training, and technical assistance to family literacy programs.

Adult Literacy and Social Justice

The issue of adult literacy is ultimately an issue of access. The culturally diverse and socioeconomically disadvantaged have the fewest opportunities for literacy development and practice both in and out of school. Those with the most resources (e.g., education, books, new technology, language-rich environments, psychological and emotional support) have the greatest access to literacy. Further, the rapid development of information technology not only broadens current definitions of literacy but also widens the gap between those who have access to the widest range of literacy practices and those who have little or no access. This gap is often referred to as “the digital divide,” a social problem that is considered a new civil rights issue of the 21st century. Hence, the digital age brings new challenges to the promotion of adult literacy development and practice in today’s society.

LITERACY, ECONOMIC

Economic literacy is the ability to understand choices and make decisions regarding limited resources. Those decisions affect what an individual produces or consumes, saves or invests. In a broader sense, the economic literacy of a nation’s citizenry affects its productive capacity and standard of living. Personal finances, national policies, and issues of globalization are all subject to the same economic principles. The knowledge and application of those principles foster more efficient use of personal, national, and global resources.

What Does It Mean to Be Economically Literate?

Economically literate individuals understand that they cannot have everything they want and that they have to make choices because resources are scarce. These decisions require an analysis and comparison of the costs and benefits of various alternatives. Each decision will incur an opportunity cost; that is, something of value will be given up. Not all decisions are between two different items; some decisions are intertemporal or between two different time periods as when money is placed in a bank account or used to purchase a bond.

Why Is Economic Literacy Important?

Although few people choose to become economists, most people have to make economic decisions every day. Rapid technological and communications advances have provided ordinary people with more information with which to make decisions and more varied goods and services about which to make them. At the same
time, globalization has made sound economic decision making crucial if we are to compete effectively in the marketplace. Furthermore, articulate, well-informed citizens are critical to the functioning of a democratic market economy. In terms of social policy, economics can help assess the costs of problems such as crime, teen pregnancy, pollution, and terrorism as well as assess the costs and benefits of policies designed to deal with them.

What Are the Dangers of Economic Illiteracy?
Without an understanding of economics, individuals are more likely to fall prey to fraud and credit abuse and exercise poor judgment on such important decisions as home buying, college savings, car financing, and retirement planning. Misunderstanding of the nature of markets may lead to such ill-conceived responses to price increases as price controls that have the opposite of the intended effect, creating shortages and exacerbating price pressures. Failure to understand the nature of competition and the need to build a strong human and physical capital base may lead to measures to protect a few jobs while denying the broad-based benefits of trade.

When Does an Individual Need to Become Economically Literate?
Certainly the earlier these economic literacy skills can be learned, the better. Good habits are best formed before bad behaviors can take root. In a world where credit cards are easily obtained and credit card debt is rampant, it is never too early to learn. In addition, the economic way of thinking is a multipurpose tool with not only a wealth of practical, real-world applications but benefits as well, even for the very young child, in terms of augmenting critical thinking skills. Furthermore, the earlier an individual learns such principles as the time value of money, the sooner he or she can take advantage of compounding his or her savings and building assets for the future.

How Do Science, Technology, and Economic Literacy Interact?
Science, technology, and economics are complements. While science and innovation determine what is technically possible, economics determines what is feasible and efficient—or what the best use of the resources consumed by competing technologies will be. This efficient use of technology drives productivity, and productivity helps drive growth and improve living standards.

How Else Does Economic Literacy Improve Living Standards?
A well-functioning economy demands an educated workforce capable of making sound decisions. To absorb the inevitable shocks, an economy also requires smoothly functioning markets, both for goods and for the financial instruments that facilitate their production. Pools of saving and sound investment decisions are necessary to direct financial resources to support the most productive innovations. On an individual basis, the informed person is better able to plan, budget, and weather his or her own financial uncertainties. The individual is also more likely to save and invest and less liable to fall victim to financial fraud and abuse.

Today’s complex issues require the use of sophisticated tools. Economic literacy has a toolset that empowers users to take back control over their lives.

**LIVING WAGE**

A living wage is a wage that is high enough for full-time workers to provide a decent life for themselves and their families. As such, calls for a living wage date back to at least *Deuteronomy* 24:14.

In the United States, about one fifth of full-time workers live in poverty. In other words, the free market sets their wage at a level that is less than a living wage. Therefore, only legislation can secure a living wage by compelling employers to pay workers more than the market deems them to be worth. For example, legislation could stipulate a minimum hourly wage just sufficient to enable a full-time worker to support a family of three (or four) at the national poverty line, plus mandated benefits and paid days off.

Critics of a living wage predict that compelling employers to pay wages in excess of what the market deems appropriate will generate one of three scenarios. In the first, firms substitute capital equipment for their “overpriced” workers, thereby having the unintended consequence of causing the unemployment of precisely the people the living-wage legislation was intended to help. The second scenario suggests that the higher wage costs cause a profit squeeze at the affected firms, bankrupting some firms and thus, again, causing unemployment. In the final scenario, the higher wage costs get passed on as higher prices, causing inflation.

Fortunately, some experiments with living-wage legislation at the municipal level, in Baltimore and Milwaukee in 1995 and Los Angeles in 1997, gave specific results instead of hypothesized scenarios. Using data from these experiments, social scientists assessed the effects of a living wage, finding the opposite of what the critics predicted. In these cases, imposing a living wage on firms unleashed a wave of increased labor productivity (i.e., the amount of output per unit of labor input) at the affected firms, making it possible for them not only to pay the living wage but also to increase profits at lower prices. The causes of this burst in labor productivity included reduced absenteeism and decreased labor turnover (i.e., the rate at which workers quit their jobs and firms then have to replace them), better quality work, better cooperation between labor and management, and thus more management flexibility in the operation of the business and, generally speaking, higher morale.

Moreover, far from causing unemployment, the increased spending by the workers receiving a living wage increased the overall demand for goods and services in their communities, with the virtuous ripple effect of creating more investment and employment opportunities for others.

**LYNCHING**

The origin of “lynching” as a social phenomenon has several possibilities, but it seems to be primarily related to the practice of vigilante justice dating from colonial days up through the “Wild West.” Regardless of the term’s origins, the lynchings suffered by African Americans were crimes against humanity, yet these events were festive spectacles. Torture, mutilation, burning alive, and hanging—of African Americans, primarily—was entertainment for celebratory white crowds, often with children at their sides. These “festivals of violence” became commonplace during Reconstruction and continued until the 1950s.

The root of this violence, as a cultural practice, is white nationalism guided by its ideology of white supremacy. As such, the pre–Civil War majority ruling of the Supreme Court in *Dred Scott* that “the black man has no rights which whites are bound to respect,” continued as law well into the 20th century, except for the brief period of Reconstruction in which blacks were enfranchised. The lynching of Italians, the minority group second most often so executed, because of their dark hair, eyes, and complexion, further illustrated this racist mentality.

In slavery, blacks were chattel, property, and of value to most slaveowners. In freedom, though, blacks
often experienced the vicious white supremacist tyrannical forces of debt peonage. Violence or “outrages” perpetrated against freed men and women were commonplace. These events were so much a part of the culture that photos of the hangings and burnings were made into picture postcards to be shared with friends and family. People kept mutilated body parts as “treasure” and sold them as memorabilia. Blacks could claim no rights as protection. For a long time, lynchings were an implicit part of the social contract governing black–white interaction.

With the history of lynching having its roots in mob “justice,” the prevailing justification for the savage brutality meted out was often retribution for alleged rapes of white women. In her *Southern Horrors*, Ida B. Wells-Barnett exposed these rape charges as mostly falsehoods. To the chagrin of the white supremacist South, Wells documented case after case of these claims against the lynch victims as fabrications. Many lynchings had more to do with resentment of black success. Wells started her anti-lynching campaign in response to the lynchings of some of her friends in Memphis by whites because their store was more successful than that of a white competitor. In 1921, a mass lynching occurred in Tulsa, Oklahoma—a case of “racial cleansing.” This mass lynching or riot in Tulsa occurred when the economically successful Greenwood district, with its “Black Wall Street,” was burned to the ground and more than 300 blacks killed at the hands of whites.

Although many of the lynchings occurred in the South, this was a national phenomenon. The “social contract” that normalized these atrocities up through much of the 20th century resulted in more than 3,000 African Americans suffering that fate. Even though the public spectacle waned, the lynching of Emmett Till in 1955 preceded other notable lynchings during the civil rights movement and into the 1990s with the dragging death of James Byrd.

Magnet schools are public schools of choice that offer specialized curricula or instructional themes in a racially integrated setting. During the 1970s, magnet schools emerged as a voluntary desegregation tool in an era of enforced busing. Magnet schools are intended to provide a school choice option that minimizes the negative effects of “white flight”—the out-migration of white families to private or suburban schools in order to avoid interracial contact in school settings. Reinforcing the goal of developing a diverse student body in magnet schools was the 1975 Morgan v. Kerrigan decision in Boston and of federal funding support programs.

The federal government provides funding to promote the development of a diverse student population in order to support court-ordered or voluntary desegregation objectives. Initially, funding was obtained through the Emergency School Assistance Act, but now the majority of magnet schools receive funding through the Magnet Schools Assistance Program (MSAP) developed in 1984. Schools applying for the grant initially declare one of three desegregation objectives: to reduce minority isolation through reducing the overall proportion of minority students in a school; to eliminate minority isolation by bringing minority enrollments to below 50 percent; and to prevent minority isolation by stopping minority enrollments exceeding 50 percent. In fiscal years 2006, 2007, and 2008, MSAP funding was set at $107 million for each year.

Magnet school numbers have increased rapidly since their introduction into the educational landscape. In 1991, 4 percent of school districts offered a magnet school option, and by 1994 this had doubled to nearly 8 percent. In 2002, the National Center of Education Statistics (NCES) reported that 28 states maintained 1,736 magnet school options that educated a total of 3 percent of the national student body. As a comparison, in the same time frame, charter schools, a much-discussed school choice option, educated 1.2 percent of the population. Illinois has the highest percentage of students enrolled in magnet schools (15 percent), followed by Virginia (11 percent), California (9 percent), and North Carolina (8 percent). Half of all magnet schools are at the elementary level, while 20 percent are high schools. Eighty-five percent of magnet schools are located in large urban school districts with student populations exceeding 10,000; 55 percent are located in predominantly minority school districts and in districts with more than 50 percent of students eligible to participate in Free Lunch programs.

The research on the success of magnet schools in promoting racial integration shows mixed results. Several studies found that magnet schools do achieve some success as desegregation tools, but others found magnet schools unsuccessful in developing integrated organizations. The magnet school goal of reducing minority isolation has not been easily accomplished. The NCES reported that only 44 percent of those schools receiving MSAP grants achieved their goal of reducing minority isolation but 72 percent of schools were successful in preventing isolation (maintaining minority enrollment under 50 percent). However, far fewer schools intended to prevent isolation (82) than to reduce isolation (529).

Overall, the studies on magnet schools indicate three critical variables that affect the potential success
of desegregation goals: the overall minority enrollment in the district; the trends in minority enrollments; and the type of magnet school. Research indicates that white families avoid schools with higher percentages of African American students; consequently, schools trying to prevent the increase of minority enrollments will probably be more successful than schools trying to eliminate or reduce minority isolation. The special focus and innovative curricula of the magnet schools, however, seek to overcome the racial fears of white parents.

School districts often provide additional funding to magnet schools to recruit more staff and faculty for such academic specialties as fine arts, computer technology, or health science. The result is often increased expenditures per pupil and lower student–teacher ratios when compared to other schools in the district, and this generates an air of prestige and exclusivity that tends to attract educated, middle-class parents to the schools. Indeed, one third of magnet schools are designated “highly” or “very” selective. Illustrating the popularity of the magnet option is the high percentage of schools—approximately 50 percent—that have student waiting lists.

Research suggests that the perception of academic excellence and student selectivity is more important to parents than is the specialized program of study. Moreover, those selecting the magnet option are more likely to be motivated parents with higher social class backgrounds and strong information networks who support their children’s academic activity. Some researchers argue, therefore, that school choice leads to a stratified and inequitable school system.

More recently, the courts have renounced the desegregation goals of magnet schools, specifically entrance decisions based on racial equity goals, as for example, in Capacchione v. Charlotte-Mecklenburg in 2001 and Wessman v. Gittens in 1999. Race-conscious programs are suspect in an educational era defined by individual rights. The ever-increasing deregulation of schools and privileging of parental choice, manifest through vouchers and charter schools, coupled with an increased focus on the achievement and accountability goals legislated by No Child Left Behind, results in an education system that is unenthusiastic about the diversity goals integral in the development of magnet schools. Instead, magnet schools are constructed as prestigious schools offering academic excellence, and the opportunity to attend should be available to any child, regardless of race and economic status.

MANAGED CARE

Managed care and managed care plans typically refer to the way health care plans both provide care and pay for services provided within a network. Networks consist of providers, such as physicians and hospitals, that serve an enrolled population of individuals, also called “enrollees,” who receive such services. Introduced in the United States in the 1980s, managed care plans arose as a way to control rising health care costs and to provide coverage to a greater number of individuals. Prior to the 1980s, the most common type of health care coverage was the indemnity system, also known as a “fee-for-service” or “pay-as-you-go” plan. In an indemnity plan, individuals choose physicians and services and receive bills for costs incurred for services—much like an open market system. By the
1990s, managed care plans were the most common method of providing health care in the United States. In fact, according to estimates for the early years of the 21st century, of those Americans with health insurance, between 50 and 75 percent have some form of a managed care plan.

**Types of Managed Care Plans**

One of the first issues related to managed care is the multitude of plans, often referred to by their acronyms. The three most common types of plans are the health maintenance organization (HMO), the preferred provider organization (PPO), and the point of service (POS). Although subcategories and variations exist for each of these plans, the basic structure and elements of each are as follows. Basic HMOs (also called “staff HMOs”) are a closed system in one physical setting in which the organization provides health care to enrollees, sets the rates for services, and pays its service providers, who function as employees. As part of this plan, a doctor, usually a primary care physician (PCP), determines access to other services, such as specialty care. The term gatekeeper arose to describe an individual’s PCP because of the major role these physicians play in controlling an individual’s access to other services. When a PCP refers an individual for services within the network, the individual does not pay, but individuals are responsible for any services outside of the HMO.

Hybrid versions of the HMO plan, such as the group model HMO, network HMO, or the mixed model HMO, have also recently sprung up.

The second type of managed care plan, the PPO, differs from the basic HMO plan. Here, providers are not located at one physical setting, but they still function as a network of providers. In this type, both doctors and patients can serve as gatekeeper and make referrals to other services. Unlike the basic HMO model, PPO members make a co-payment when they see providers within the network. Also unlike an HMO plan, members of a PPO can use services outside of their network, and the PPO plan will pay a reduced portion of the cost. However, enrollees pay less for services within the network.

The last general type of plan is the POS. For this plan, the decision to go in or out of the network is condition based; upon each new medical condition, the patient can make that determination. If the patient chooses to make a referral out of the network, only some fees are covered, but if the physician refers a patient out of the network, fees are covered.

**Paradoxical Views Toward Managed Care**

Surveys indicate that when asked to provide a rating of their own managed care plans, the American public tends to give their individual managed care plans high overall ratings. Yet attitudes of individuals and physicians are quite negative to the concept of managed care in general.

People cite long wait times for appointments, few choices of physicians, and limited access to new medical procedures and technologies. They mention the heavy-handed role of the primary care physician as gatekeeper; and, since the physician’s payment does not depend upon quality of service provided, the overall quality of service is poor. Physicians, on the other hand, mention their lower rates of reimbursement, restrictions on their decision making (such as limiting access to new treatments and having lists of approved drugs), threats to their professional role, reduced time spent with patients, and conflicting interests between patient care and fiscal management.

**Efficacy of Managed Care Plans**

Recently, researchers commonly called into question the ability of managed care plans to provide quality services while managing costs. In terms of cost, two of the greatest proposed advantages of managed care are its reduction in hospital stays and a more efficient use of new medical technologies. Yet, despite these stated advantages, the majority of studies find either zero or only a modest cost difference between managed care plans and fee-for-service plans. Several federal agencies developed standard markers of quality of care to monitor the level of services managed care plans provide. As enrollment in managed care plans continues to increase, federal agencies see monitoring the quality of care as essential to prevent some potential limitations built into the system.

MANIFEST FUNCTIONS

Manifest functions refer to the intended and recognized consequences of a deliberately executed social behavior or action. Upward social mobility, for example, is a manifest function of international labor migration undertaken by populations seeking to improve their economic conditions. Robert K. Merton gave the original explication of manifest functions in Social Theory and Social Structure in 1957.

Merton contrasted manifest functions with latent functions, which are unintended and generally unrecognized consequences. For instance, the functioning of a university campus as a marketplace for finding marital partners can be considered to be a latent function of the manifest function of providing higher-level education. As Merton explained, other social theorists, such as Karl Marx, Émile Durkheim, and William I. Thomas and Florian Znaniecki, implicitly addressed manifest and latent functions in their writings.

Merton acknowledged borrowing the terms manifest and latent from Freud. This is insightful because it demonstrates how analysts working from a systems perspective could move easily between sociological and psychological perspectives. What brought these analysts together across the fields of human behavior, such as anthropology, sociology, and psychiatry, was that they conceptualized their scientific objectives in terms of the functioning of a system, whether of a culture, society, or of the mind. This theoretical convergence decreased in the late 20th century when interdisciplinary boundaries became more rigid.

The decline of social systems analysis in sociology in the late 20th century reduced the sociological interest in explicit analyses of manifest and latent functions. Social analysts used new perspectives to frame questions about sources and outcomes of social action. One perspective, human agency, gave almost total weight to conscious, willful human action, deemphasizing if not eliminating altogether the significance of impersonal social forces that underpin social change. Anthony Giddens (1995) has offered a partial compromise of sorts through his structuration theory. According to this theory, human agents are knowledgeable practitioners of social action, but their knowledgeability has bounds of unacknowledged conditions and unintended consequences. This theorizing moves manifest and latent outcomes closer to the sphere of human consciousness. In other worlds, manifest and latent functions are properties of a knowledgeable human world, but given the imperfections of knowledgeability, the outcomes of willful social action can reach beyond the bounds of human knowledge and intention.

Merton did not reduce manifest functions to an absolute condition. An “item,” he explained, can have more than one manifest function, and different manifest functions can have similar outcomes. Moreover, what constitutes a manifest function for one group can constitute a dysfunction for another group. An example of this case is the investment of U.S. companies in Chinese manufacturing. While this business strategy keeps prices down for U.S. consumers and provides some relief for unemployed and subemployed workers in China, it decreases employment opportunities for the U.S. manufacturing workforce.

Globalization is changing the landscape across which manifest functions take effect. Early studies observed the manifest and latent functions of tribal cultures, but research today must measure the impacts of manifest functions across highly populated and interconnected world regions.

Marginality

From an intercultural perspective, the term marginal generally refers to an individual identity outcome of being caught between two worlds, with a sense of not quite belonging in either one, following a move into another culture, such as a migrant or study-abroad student. By moving into a new culture, an individual discovers that the known ways of being and doing no longer serve effectively. This discovery is both psychological and social: the initial shock of discovery that no longer does a mutual sharing of assumed cultural knowledge exist leads to difficulties in striving to create connections in this new cultural context. Individual outcomes of such cultural contact vary, and marginality—in the general sense of not quite belonging or fitting into a new culture—is one particular identity outcome of this process.

Ongoing study of marginality has occurred since the social science introduction in early 20th-century Europe of the concept of the stranger who wanders into and occupies a space in a new culture. The stranger stays and, over time, changes from contact with the new culture but remains, in essence, both close to and remote from the host culture so that there is a continuous tension and ambivalence in this relationship because full assimilation is not part of the European cultural milieu. This concept changed in the 1920s, when practitioners of the Chicago School of sociology introduced it to a U.S. audience. Its new interpretation was the construct of the marginal man resulting from cultural contact in the cosmopolitan setting of a pluralistic society whose groups are defined by ethnicity. The marginal man is the resulting cultural hybrid who belongs to two cultural traditions, aspires to assimilate and belong to the wider society, but is excluded on cultural grounds. There is no satisfying resolution, for the individual cannot break free of either culture. In fact, the marginal man has a dual perspective, namely seeing the world through two lenses that present conflicting images of the self.

Mobility and culture contact appear to create a particular personality type, and the marginal man concept dwells on the internal conflict that an individual undergoes during the process of cultural transition. For the marginal man, this process remains at the unresolved stage of not belonging to the new culture, no longer fitting into the previous one, and consequently existing in a state of crisis between the two. Immigrant children are also caught between two separate cultural worlds, as are converts from missionary activity where the resulting cultural hybrid no longer fully belongs to his original group and simultaneously is not accepted by the colonizing group. During the 20th century, the concept of the marginal man continued to intrigue, and a small number of empirical studies appeared to give evidence of the concept. Accompanying these studies were calls for further investigation and fresh attempts to redefine the concept.

The contemporary, intercultural focus on marginality is on its positive or constructive characteristics. At its core, marginality still consists of the idea of dealing with identity in multiple cultural contexts while feeling no full sense of belonging to any of them. However, the ideas of constructive marginality and encapsulated marginality now go beyond discussions of individuals with inner conflicts. The marginal individual is thus someone who can cross cultural borders and employs marginality constructively. Marginality is no longer just a debilitating condition of an individual caught in a paradox but can also mean a plurality of identities, in essence intercultural identity, translating into a dynamic position as constructive marginality. A constructive marginal resolves identity issues and is in a state in which identity is multiple and fluid and its truths lie in the multiplicity of cultural contexts in which the constructive marginal operates. Such an individual uses this marginal position constructively in a personal sense or becomes a more public figure: an intercultural mediator able to effect negotiations across cultural boundaries.

In contrast, the encapsulated marginal is unable to construct a unified identity but remains perplexed by the situation of marginality and trapped within its context of fluid and shifting boundaries. The encapsulated marginal displays similarities with previous definitions of marginality as cultural and social alienation with pressures existing in both cultures: from one, the pressure of being corrupted, and from the other, pressure to behave in uncomfortable ways to gain acceptance. Friendship is problematic, as the encapsulated marginal feels so unique that there

Further Readings
appears to be no peer group with which to form bonds. However, process-oriented intercultural training for marginals can raise awareness of the existence of other marginals who can fill this existential void as well as crystallize understanding of their particular identity perspectives.

MARIJUANA

Marijuana is the most commonly used illegal drug in America and is used more frequently than all other illegal drugs combined. Generally speaking, use rates are consistently higher for males than for females, and use is far more prevalent among youth and young adults. Lifetime use rates for high school seniors peaked at around 60 percent in 1980 and have since decreased and leveled off to around 45 percent. On average, more than one third of high school seniors reported semi-regular marijuana use over the past decade. Most law enforcement agencies describe marijuana availability as high.

Construction of marijuana as a major social problem in the United States occurred during the Great Depression, coming out of its use by Mexican immigrants in the Southwest (especially Texas), where support for its illegality originated. White citizens and lawmakers framed the issue in terms of concerns about immigrant workers’ marijuana consumption and rowdiness. Such complaints, however, masked a deeper concern about immigrant laborers competing for employment with white males. In the eastern United States, officials framed the marijuana problem by focusing on its use among black jazz and blues musicians of the 1930s in cities such as Harlem and New Orleans. Sensationalized press reports and suspect medical science also linked marijuana use to violent crime. Federally outlawed in the United States in 1937, marijuana later became a prominent part of the 1960s and 1970s counterculture movement.

Use risks include short-term memory loss and psychological dependence, accompanied by mild withdrawal symptoms such as restlessness and irritability. Sustained use often leads to poor scholastic and occupational performance. Research also suggests a causal link between marijuana use and vandalism and income-producing crime, particularly among youth. Some research indicates regular marijuana use can serve as a gateway to the use of more addictive drugs such as heroin and cocaine, and this reasoning has been a cornerstone of U.S. policy for keeping marijuana illegal. However, other research challenges this connection.

Nationwide, marijuana violations account for nearly half of all drug arrests, most for simple possession. Incarceration rates have increased substantially since the mid-1980s, due in part to mandatory sentencing for first-time marijuana offenders. This has exacerbated prison overcrowding. More recently, some U.S. city and local governments have enacted
legislation decriminalizing simple possession of marijuana. Since 1988, eleven states have approved legislation allowing for the possession and consumption of marijuana to aid in treating glaucoma and the chronic pain associated with cancer or other terminal diseases.

MASS MEDIA

The pervasiveness of the media in our everyday lives cannot be overstated. Media (short for mediation and the plural of medium) can refer to any number of categorizations that are collectively and most frequently understood to involve the dissemination of select information (often from a singular or fixed source) to a large audience. The “mass media,” then, typically consist of various oligopolistic social institutions that are capable (through technological advances) of broadcasting information to large segments of society and are designed to promote information consistent with news, marketing, and advertising messages (all categorizations of media) that collectively communicate the reproduction of cultural norms and values. Numerous studies of the effects of mass media on society have yielded key insights on the level of importance and social significance these media embody.

One of the first and most notable scholars to address how technological advances of media affected social organization was Marshal McLuhan, whose critical study of popular culture exposed the emergent notion of mass media as well as the resultant cultural and social changes accompanying the introduction of the electronic medium; his classic works include Understanding Media of 1964 and The Medium Is the Massage with Quentin Fiore in 1967. For centuries, prior to the advent of electronic technologies, the media involved the circulation of printed materials, most notably books and newspapers; 20th-century additions included audio and visual communication technologies (e.g., radio, television, Internet). Few (if any) places in the world have not been somehow directly affected by the media.

The initial ability to disseminate information to the masses is directly attributed to the proliferation of print media, most notably the newspaper. Early newspapers first appeared in the 17th century, and despite advances in media technologies, the daily print newspaper continues to remain among the most popular mass communication media in the world. Businesses and individuals discovered early on that news was indeed a profitable commodity, and although newspapers first appeared in the 17th century, and despite advances in media technologies, the daily print newspaper continues to remain among the most popular mass communication media in the world. Businesses and individuals discovered early on that news was indeed a profitable commodity, and although newspapers often consist of news and general information, they are mostly filled with advertisements. Political use of newspapers soon became widespread and filled socially significant gaps among politicians, government officials, and the general citizenry. Information presented in newspapers was not subject to much scrutiny, as the masses generally tend to rely significantly on media presentations, thus fostering the capability for the creation of a social reality and accompanying forms of social control.

Advent of the radio served as the primary catalyst for the creation of mass media. Radio technology was first developed at the turn of the 20th century and, coupled with the application of technological advances (e.g., vacuum tube, tube amplifiers), created what would become known as the “radio broadcast.” Early radio broadcasts can be traced back to the military, particularly the U.S. Navy, who employed the technology strictly as a means of communication (e.g., Morse code). According to the Oxford English Dictionary, use of the phrase “the media” first appeared in the United States during this time (e.g., circa 1920), its use frequently attributed to the popularity of radio broadcasts. Throughout the 1930s in the United States, these broadcasts increased dramatically in popularity, especially broadcasts that featured musical recordings. However, the most notable increase in listeners occurred during the Second World War, when more frequent news broadcasts informed the public about wartime events.

The most important development in mass media was television, its universal and widespread appeal resting on its combined aural and visual capabilities.
Although early television broadcasts first appeared in the 1930s, the device would not become a staple of the modern American household until the 1950s. Early telecasts featured all types of entertainment, and televised newscasts soon become the dominant source of mass information in U.S. society. The primary goal of television networks was to provide popular entertainment programming in an effort to attract the largest audiences possible so as to increase revenues through advertisements. The television as the dominant source of mass information crystallized the notion of mass media. Its growth continues to be driven largely by technological advances; the most recent and influential advance has been that of the Internet.

The ability to reach a global audience within seconds—thanks to the proliferation of mass media via satellite technologies, global telecommunication networks, and the Internet—is among the most recent and important technological developments. The Internet is a worldwide database consisting of a networking infrastructure that allows for the immediate exchange of information by a multiplicity of users. In the United States, the arrival of the Internet occurred sometime in the early 1990s. The Internet was originally created as a digital storage space designed to safeguard the containment of military information. It is among the more democratic forms of mass media. Unrestrained by national boundaries or censorship, it thus transmits information independently of state-sanctioned organizations and commercial entities. Formal social control agencies often decry the unregulated exchange of information on the Internet because of the potential for fraud and other criminal activities. Attempts to control and regulate the Internet, however, have been largely unsuccessful, and Internet commerce has proven more beneficial to the economy than detrimental. It appears certain that U.S. adjustment to these technologies will likely direct the future of these media.

MASS MURDER

Mass murder is the killing of four or more individuals at one given time or in a fairly short period of time, and in one place (in a single incident). Although often confused with serial murder—the killing of three or more people over a period of time, with intervals between murders—criminologists distinguish between the two. A variety of motivating factors drive mass murderers, for example, disgruntled employees lash out against a corporation or organization, violence is driven by intolerance of racial or sexual orientation, or an individual responds to perceived injustices.

Mass murder is generally premeditated and deliberate, not impulsive or spontaneous, with firearms most often used, enabling the individual to kill more easily as many people as possible. Oftentimes the perpetrator, after carrying out the murders, commits suicide or engages in a shootout with law enforcement, ensuring death (referred to as “suicide-by-cop”).

Characteristics of Mass Murderers

Typically, social isolation occurs in conjunction with some trigger event, most often work or relationship related. Precipitating factors often include love rejection or some form of loss, like getting fired. Women who commit multiple murders typically target their families, most often their children. These women often view their domestic status as central in their lives, and with any threat to that status (or perceived threat), they react violently. They tend to view their relationship with their children as one of complete ownership. Men, on the other hand, more often target
the entire family unit or other close relationships they maintain, such as coworkers.

**Typologies**

Mass murderers fit numerous profiles and typologies. Among these, *disciples* follow the commands of a leader; initiation into a gang or cult killings would fall into this category. The killings are typically committed in close proximity to the leader’s “headquarters,” and the selection of victims may be known solely to the leader, for a particular symbolic significance.

*Family annihilators* generally view their families as extensions of themselves, and as such feel that the family shares in their misery and the killing then holds no greater significance than a suicide. Annihilators also tend to exhibit the greatest degree of mental instability, and the killings result from an eruption of violence; suicide or suicide-by-cop is often the final result.

*Disgruntled employees* are often former employees or individuals who may have recently lost their jobs. The targets are coworkers and former bosses, but these murderers often kill randomly throughout the workplace.

*Pseudocommandos* typically amass a large number and variety of weapons, including firearms, rifles, and grenades. They view society or some aspect of it with distaste and want to “get back at it.” Typically, a great deal of planning is involved, and victims tend to be selected at random.

*Political or hate killings* are motivated by some ideological cause or by a hatred of a particular group. *Anger or revenge killings* are often very personal, directed against specific targets that the killers believe wronged them.

In general, mass murder incidents vary widely in terms of motivation, situational characteristics, and offender characteristics.

AGT systems. Vancouver, Canada, has the longest automated system in the world, SkyTrain. This urban transit operation is more than 49 kilometers long with 33 stations.

The Long-Range Viability of Mass Transit

Mass transit offers many benefits but generally requires public subsidies to operate. These subsidies are sometimes large and can face political opposition. Amtrak, the U.S. national rail passenger network, faces continual battles over its federal subsidy. Mass transit is environmentally friendly, since energy use is typically less per distance traveled than the automobile. However, transit requires sufficient population densities to operate efficiently in metropolitan areas. Typical U.S. suburban configurations, and increasingly those in other countries, often develop at densities below what is required for successful transit operation. An automobile-dominant culture offers many people a convenient alternative to mass transit, but it penalizes those without access to a vehicle. Transit is important to the carless, often poor, disabled, or elderly. For example, the U.S. urban poor (those households with incomes less than $20,000 in 2001) made four times as many trips by transit than their wealthier counterparts. Carless populations in urban areas can often access transit services. Low-density suburban and rural areas cannot support transit, and households without access to a vehicle are at a serious disadvantage.

Changes in transit ridership levels over time vary widely. Typically, declines in public transit use accompany increases in automobile ownership, but this is not always true. Three different cases—Eastern Europe, China, and the United States—highlight the current situation. In Eastern Europe, cities showed declines in the percentage of trips made by public transit between 1980 and 2000, from around 80 percent to little more than half. Accompanying these declines were increases in per capita income and auto ownership and decentralization of populations from cities to suburbs.

China, however, moved away from nonmotorized travel (walking and biking) toward public transit. While nonmotorized trips in Chinese cities declined during the period from 1996 to 2004, transit trips increased nearly 70 percent. This substantial increase in transit ridership is partly a response to longer trips created by population and job decentralization: biking and walking are no longer possible. Also, private automobile ownership jumped between 1990 and 1998 from 1.6 million to 6.5 million—nearly 400 percent—and the growth continues. Matching China’s rapidly increasing auto ownership is traffic congestion, following the pattern of Western countries. Ironically, some cities now discourage use of the bicycle, long a major travel mode, on major roadways to make way for the automobile.

Transit ridership trends in the United States vary widely by mode. Overall, transit ridership rose from 8.8 billion trips in 1990 to 9.6 billion trips in 2004, a gain of 9 percent. The bulk of these transit trips are on the bus, 5.7 billion in 2004. Bus, commuter rail, and rail rapid riderships have not increased substantially since 1990. However, light rail jumped from 175 million trips in 1990 to 350 million trips in 2004, or 200 percent. In spite of this LRT success story, only a small portion of daily trips in the United States occur by public transit: 4.7 percent of all work trips in 2000, down from 5.3 percent in 1990. This low transit use continually faces the challenge of an auto-dominated culture, a fascination with the freedom and status attached to the automobile that other countries emulate.

Beyond its role in serving the disadvantaged and the negative impact of low-density development, transit faces new challenges in safety and security, particularly since the Madrid train bombing that killed 191 people in 2004. Unfortunately, public transit facilities and vehicles are open environments with many stops and stations, making a secure system difficult to implement. Also, the use of transit for emergency evacuations is another recent public safety concern. Hurricane Katrina in 2006, for example, illustrated the need for viable transit operations that can respond quickly and systemically to emergencies.

Urban transit use worldwide faces a continual struggle against increasing auto ownership and suburbanization of development, which reduces the density of riders required for efficient operation. Without concentrations of development at sufficient levels, transit cannot generate sufficient passengers and fare revenues, even with generous public subsidy. Transit supporters argue that coherent investment is essential to provide viable alternatives to use of the automobile, which, if uncontrolled, has grave energy and environmental considerations. For transit to be viable, land use planning must focus on developing residences and employment centers at sufficient densities. TOD
(transit-oriented development) is one new concept, with residences and jobs concentrated around rail stations and bus terminals. Transit is essential to urban life, serves the disadvantaged, reduces traffic congestion, and saves energy. Mass transit is an integral part of a balanced transportation system.

Means-Tested Programs

Means-tested programs provide cash and services to people whose income and other financial assets fall below a certain level. Individuals in need must meet certain requirements to receive benefits. Along with monetary restrictions, means-tested programs may also include nonfinancial categories of eligibility such as pregnant women, children, parents with dependent children, individuals with disabilities, and the aged. Although state and local entities administer some programs, the majority of and most comprehensive means-tested programs come from the federal government. The initiation and management of these programs fall under numerous federal departments: Health and Human Services (HHS), Agriculture, Housing and Urban Development (HUD), Labor, Education, and Treasury.

Among the most well-known means-tested programs are Temporary Assistance for Needy Families (TANF); food stamps; Supplemental Security Income (SSI); Medicaid; public housing or Section 8; Women, Infants & Children (WIC); school lunches; job training; home energy assistance; Earned Income Tax Credit (EITC); and special Social Service Block Grants (SSBG). Between 50 and 100 means-tested programs exist on the federal, state, and local levels. Program benefits include income maintenance, food, health care, rent and mortgage payments, shelter, child care, utility payments, tax credits, legal services, and more. An individual or family may receive assistance from multiple programs at the same time. For example, a family may receive TANF, food stamps, and Medicaid and additionally live in public housing, take advantage of a school lunch program, and receive WIC services. Likewise, a single individual may participate in a job training program, receive food stamps, and qualify for the EITC.

Although there are numerous means-tested programs, the rules of eligibility are not uniform and differ according to the regulatory mandates of the governmental agencies from which they emanate. As a result, accessing benefits from these programs often becomes complicated, technical, redundant, and bewildering. Likewise, administration of these programs can be cumbersome, unwieldy, and complex. Most variations in eligibility criteria center around the calculation of income and valuation of assets. In determining who meets the test of need, programmatic variables include what assets to count or exclude in calculations, what amount of assets is acceptable, what income is counted or disregarded, what level of income or assets causes ineligibility, whose income is counted, and whether household or individual finances are the determining factor.

Means-tested programs lie at the core of our social welfare system. Directed at helping the poor and those with low income, they seek to address the ills of poverty. As with most programs designated for the poor, they are highly debated and somewhat controversial. Effectiveness, price, value promotion, and perceived recipient characteristics are all part of the discourse. Many see some programs for the poor as social problems themselves. The issue of poverty and its remedy, as with other social problems, is subject to different understandings and theories of intervention. With means-tested programs, disagreements arise as to what level benefits should be set at, what types of benefits should be advanced, how the benefits should be offered, and who should be allowed to apply. A prime consideration with these programs, as with all other components of the social welfare system, is the cost. How expensive will the program be and what effect will it have on federal, state, and local budgets? Could the monies be spent better in other ways or on
other problems? Many citizens, though sympathetic to the plight of the poor, are apprehensive about what they perceive as bloated and inefficient government bureaucracies that contribute to higher taxes.

Another issue is the long-range effectiveness of these programs in combating poverty. Are the benefits too generous? Do they foster dependence? Do they breed a culture of deviance? At the other end of the spectrum are those who see these programs as stigmatizing and thus worry about hindering full participation by all those in need. An impersonal and bureaucratic service delivery system also concerns present and future beneficiaries by its lack of access and humane conveyance of benefits. Most of the debate about means-testing programs or the social safety net usually focuses on what most people view as welfare: TANF. Although it is a large component of the social welfare system, it is but one of many interrelated initiatives. Means-tested programs have a wide range and function among the institutional measures designed to assist the economically disadvantaged.

Media

Among the chief concerns of this volume are how social conditions get defined as social problems and the ways different social actors and organizations view and try to solve them. Media, by any measure, are central to these processes. When we speak about media, what exactly are we talking about? While there are numerous definitions of media, in this volume it is used as a catch-all term that refers to any and all forms of information or entertainment available to a large number of people. Thus, it includes television programming, newspapers, magazines, books, documentaries, popular movies, radio, community newsletters, and, more recently, things like Internet Web sites, electronic mail, and the increasingly popular Web log or “blog.” (It is important to note the incredible range of diversity embedded within each of these categories; consider the ever-expanding array of television programming, the substantial number of general and specialized magazines, the wide array of local, regional, and national newspapers, and a seemingly infinite collection of Internet-based materials.)

Some analysts have tried to counter this broad conceptualization of media by dividing it into somewhat smaller classifications, such as press (i.e., those media products that deal primarily with “hard” news) and entertainment media. But these categories are still exceedingly broad. Further, such a division may no longer remain as viable as it once might have been given the increasing presence of media products that transcend traditional categories by incorporating elements from both news and entertainment formats (this hybrid genre is often referred to as “infotainment”).

For our purposes, then, a general definition of media will suffice. Thus, media is used here to refer to the entire range of news and entertainment “products” that audience members can consume and through which they can learn about some aspect of the world around them. In fact, a broad categorization such as this may be essential to developing a thorough understanding of the role contemporary media play in the construction of social problems because it gives reason to consider how the entire range of media productions (rather than just the dominant media forms—such as network and cable television news, newspapers from large cities, and national magazines—that most people associate with the term media) shape the ways that individuals think about, construct, and respond to social problems.

Understanding the Media–Social Problems Relationship

Media are crucial to social problems; they help shape what conditions get positioned as potential social problems, what potential problems become actual social problems, how those problems are discussed (i.e., the dominant frames through which they are
presented and considered), and how constructed problems are responded to. Certainly, other forces and social actors (e.g., scientists, academics, experts, activists, and politicians) play an important role in constructing certain conditions as social problems and propelling them into the public consciousness, but without the complicity of mass media, even the most impressively packaged and persuasive claims will find it hard to be heard amid all the competing social problems claims, general news and entertainment content, and the various diversions of daily life.

Why are media so central to how we think about and act upon social problems? While a variety of factors and forces contribute to media’s centrality in the construction of social problems, two in particular cement the media–social problems relationship: (1) the pivotal role of media in everyday social life and (2) the processes through which social problems get constructed.

**Media and Social Life**

The important role of media in how people think about and respond to social problems is first and foremost a reflection of the pivotal role of media in all of social life. We rely on news and entertainment media to learn about the world in which we live. Media serve as a source of information and provide us with many of the texts and images that we use to construct culture, shape our social reality, and navigate our daily lives. The things we see on our televisions or read in our newspapers help direct us toward certain issues or events and shape how we think and talk about those things. This capacity for shaping what issues and conditions public officials, policymakers, and the general public think and talk about, as well as setting parameters on how they might talk about them, represents a key element of the media–social problems relationship.

**Constructing Social Problems**

A second factor that reinforces media’s essential role in social problems construction is the very processes by which conditions and issues come to be defined, or “constructed,” as social problems. Social problems do not just appear out of nowhere; they are a product of the active efforts of a number of individuals and organizations. Some scholars have suggested that social problems get created through a complex combination of social actions and processes, which can be thought of as social problems work. Thus, when someone tries to persuade others that a particular issue or condition is of concern and in need of remedy, he or she is doing social problems work. Social problems work takes place in classrooms (e.g., a professor stands before her sociology class and outlines a condition such as homelessness or teen drug use as a major concern and something we must attend to), in churches (e.g., a sermon on the declining adherence to religious principles and the purported threats this poses to the long-term viability of society), in community halls (e.g., a forum on the perils of a shrinking water supply and what must be done about it), in the halls of Congress (e.g., a debate about domestic terrorism), and in a variety of other social realms.

**Doing Social Problems Work: Claims Makers and Audiences**

Much of the social problems work discussed here is done by two broad groups: claims makers (i.e., those who make “claims” that a particular issue or condition represents a social problem that needs to be fixed) and audiences (i.e., the people who evaluate those claims). Claims makers are those who try to persuade others that there is a problem out there that needs attention and resources, which means that there are two basic goals embedded in their social problems work: (1) disseminate their claims to the largest possible audience (in some cases, a smaller audience will do, as long as its membership is comprised of those with tremendous power, status, or wealth, such as politicians, celebrities, or high-ranking media officials); and (2) persuade the members of that audience that there is a troublesome condition at hand that is in need of remedy. Claims makers use rhetoric, statistics, compelling images, and any other verbal, visual, or behavioral claims to try to get audiences to devote their attention to the purported social problem and to take action in its name.

The social problems work of audiences involves evaluating these claims and determining whether the problem is worthy of attention and resources. Thus, the tasks for audience members include gauging whether the condition is as problematic as the claims maker would have us believe, how immediate the purported harms are, and whether these harms are likely to transpire as the claims maker suggests. If the audience is not persuaded that the condition is sufficiently troublesome and worthy of their immediate attention and resources, then that particular claim is likely to be
replaced by other claims deemed more important, believable, newsworthy, immediate, and so on. This renders the audience as a crucial element in the successful creation of a social problem; after all, something cannot become a social problem unless an audience deems the claims important and believable.

**Specifying the Media–Social Problems Relationship**

If it is true that claims makers and audiences are the two main groups involved in social problems work, what, then, is the role of media in the claims-making process? Recall that we have said that a desired goal for claims makers is to get their claims to a large audience. The best way to do this is to get the message into the media and allow the media to disseminate it to their audiences (this is why we find so many claims makers jockeying for time during the morning network news programs or on the various cable news channels). In our increasingly mediated society, media represent the most effective way to reach a large audience in relatively short order.

Much of the social problems work undertaken by media organizations and their personnel involves packaging and reporting the claims made by others (as opposed to constructing their own claims from scratch), such as a news report that features harrowing accounts, sound bites from public officials, statistics, and gripping images (each of which represents a social problems “claim”). Positioning the media as being oriented more toward selectively repackaging the social problems work of others should not be taken as an indication that media have a passive role in the construction of social problems. Media are not merely a conduit for the claims of others; they do not simply disseminate claims as claims makers proffer them. In fact, quite the opposite is true. Even when media are not the originators of a particular claim, they play an integral part in the form that the claim takes. Claims are constantly shaped and reshaped to bring them into alignment with the needs of media and their audiences.

This transformative capacity furthers the important role of media in how we think about and respond to social problems, because it means that media (as far as their audiences are concerned) get to determine what gets said about social problems, how it gets said (e.g., whether material is delivered as straight news, as an editorial, as a mixture of reportage and eyewitness accounts, as a docudrama, and so on), who says it (media tend to favor official sources, those with experience in the issues at hand, celebrities or others who are well known), and when it gets said (i.e., where it will be slotted in media cycles, how often it will be presented, and for what duration).

The modern media marketplace is extremely competitive, and media personnel must strive to identify and create “products” that can be produced quickly and efficiently while also being able to attract and sustain the interest and attention of a range of audiences. Thus, the decisions of media personnel determine what makes it into the mediated products that the audiences consume. What people see on their televisions or computer monitors, read in newspapers and magazines, or hear on radios and “Podcasts” represent the tangible manifestations of a series of decisions made by media personnel—editors, producers, reporters, anchors, guest bookers, executives, advertisers—as to who or what will be attended to, how much various topics will be covered, and how selected material will be framed.

Of course, these decisions about which potential social problems are transformed into mediated products (and which are not) and when, how, and by whom claims will be presented do not get made in a vacuum. The decision making of media organizations and their personnel is shaped by a number of external constraints, ranging from the structure of the media industry (i.e., media conglomeration, a profit orientation, reliance upon advertisers, and so on) to the daily demands of crafting news or entertainment products (i.e., budget limitations, deadlines, finite broadcast or print space, and so on). From a social problems perspective, a key constraint is the limited amount of time and space that media have to devote to social issues. Quite simply, media have only so much attention available for allocation to the seemingly infinite array of things that might be considered worthy of broadcast time or print space. This renders space within media presentation cycles a finite and hence valued commodity in the media marketplace. Media cannot cover it all, so media personnel have to sift through the seemingly infinite array of information, issues, individuals, and events and determine what will be attended to. What this means for our understanding of social problems is that only a miniscule proportion of the events and issues unfolding at a given time get identified as potential social problems, and only a small fraction of these get featured in the mediated products that individuals watch, read, or hear in their daily lives.
The structural, cultural, and practical constraints media personnel face lead them to favor certain types of material over others, which in turn affects the coverage of various social problems. Media personnel must actively select and reconstruct the claims they will deliver so that the claims will fit within the constraints of the structure of their work and remain consistent with the expectations of their audiences. As a result, media personnel tend to place a premium on materials that possess certain elements (i.e., items that seem important, novel, timely, and interesting; they also favor materials that feature interesting characters, can be accompanied by compelling photos or video, packaged in a noncomplex manner, and planned in advance). In short, media play both direct and indirect roles in how claims get constructed and disseminated. The direct role occurs when media personnel construct a claim (i.e., primary claims making) or refashion the claims of others (i.e., secondary claims making) and disseminate them to their audiences. The indirect role of media may be reflected in the efforts of claims makers, who, having become aware of the kinds of claims that are likely to be represented in the media, begin to shape their claims in ways that they presume will appeal to the interests of a given media organization or its audiences. Successful claims makers are those who account for the “realities” and constraints faced by media officials and who are willing and able to adjust their claims-making efforts accordingly.

The media–social problems relationship is clearly a strong one. Much of the social problems work of claims makers requires the complicity of media if it is to be effective, while at the same time media draw upon the social problems work of others to craft news and entertainment products that meet their own unique needs as well as those of their audiences. Media are a vital force in how we construct and react to social problems; how media attend to the efforts of various claims makers helps shape what gets said, how it gets said, who says it, and when it gets said, all of which are crucial determinants of whether a potential social problem becomes an actual social problem, as well as how political officials, policymakers, and the public elect to respond to constructed problems.

While the media–social problems relationship remains as strong as ever, sociologists and other analysts should take note of recent changes in the overall media landscape that could affect this relationship (not necessarily in its strength, but in its nature). In recent years, several of the mainstream media forms that have traditionally served as core outlets for the claims-making efforts of social problems activists—for example, the major television networks’ evening news broadcasts and a number of once-prominent newspapers and national magazines—have seen somewhat precipitous declines in the size of their overall audiences (and in the loyalties of some of those who remain), as many of their former audience members have found more convenient sources (e.g., Internet news sites or 24-hour all-news channels on cable and satellite television) that allow them to get the latest news content whenever they want. At the same time, innovative media forms have emerged (e.g., Internet chat rooms, blogs, Podcasting) that offer new avenues through which claims makers are able to disseminate their claims to a mass audience and provide audience members with new ways to interact with those claims. Thus, it is a time for both excitement and wariness: excitement because these shifts could spur sociologists and other analysts to undertake important empirical assessments of the strength and nature of the media–social problems relationship; and wariness because these shifts and innovations present new complexities for media consumers to navigate as they continue to turn to media to make sense of the world around them.

Further Readings

Mediation is a process designed to manage and resolve conflicts between two or more parties. As a facilitated negotiation, mediation provides the parties with the opportunity to identify their interests and needs, present their ideas for possible solutions, explore those options and alternatives, and come to collaborative solutions. Mediation is facilitated by a mediator, whose role is to guide the parties through the process without determining the outcome. Mediation is thus a conflict management and resolution process designed to provide parties with an alternative to more formal, time-consuming, and potentially expensive litigation. In mediation, the parties retain control over the outcome of their case. They may resolve all issues, some issues, or none of the issues (an impasse). Mediation is voluntary and confidential. Courts may order parties to appear at mediation, but they cannot order the parties to participate and resolve their issues.

Mediation has been used around the globe in many settings. Indigenous peoples using mediation typically have mediators who are elders or well-respected community leaders. These mediators are familiar with the parties, their circumstances and context, and the community. This is in stark contrast with the models of mediation used in the West, where the mediator is a neutral third party, unknown to the parties prior to the mediation experience. Differences in the style of mediation also exist. In Western models, the party bringing the action is invited to speak first, whereas in indigenous mediation there are cultural norms that control. These norms may include inviting an older party to speak first.

Mediation has enjoyed increased popularity in the West in the past 30 years, whether in local matters such as community disputes, including conflict between neighbors, or as an alternative to the full litigation process in family, commercial, and other civil matters. Some states provide certification for mediators as well as qualifications, guidelines, policies, continuing education requirements, and remedies for inappropriate mediator behavior and action.

Mediators invite the parties to identify the issues, explore various options and alternatives, and determine which if any of these options would best suit their needs. Mediation sessions begin with the mediator’s opening statement, which provides an introduction concerning each person’s role, the process, and the ground rules for conduct. Occasionally, the mediator may ask to have a “caucus.” A caucus enables the mediator to speak privately with one party. What is discussed in a caucus is private and is not discussed with the other party without consent.

At the conclusion of the mediation, any resolved issues will be formalized in the mediation agreement, which may become part of a court order and thus enforceable under law.

Medicaid is a joint federal and state health insurance program for low-income eligible children, adults, the elderly, and people with disabilities. This federal entitlement program was established in 1965 as Title XIX of the Social Security Act. The nation’s largest publicly financed health care program of its kind, it funds nearly half of nursing home care and a significant percentage of prescription coverage in the United States. Federal regulations provide broad coverage guidelines, but the states determine specific services. The program’s broad range of medical services include inpatient and outpatient care; rehabilitation services for people with mental and physical disabilities; primary care to women, families, elders, and children; prescription benefits; and long-term care for the aged. Title XIX is administered federally by the Centers for...
Medicare and Medicaid Services (CMS) but operated by individual state systems.

Each state establishes distinct eligibility standards, defines what type and length of medical care will be available, and also sets its own reimbursements rates to providers. As such, Medicaid eligibility does not cross state lines; anyone who moves from one state to another must seek eligibility anew. The insurance application process is a lengthy one, requiring documentation of citizenship, living situation, and financial assets.

More than 55 million individuals receive care under the Medicaid program, and at least 40 percent of Medicaid expenses are for long-term care in nursing homes. The governmental cost of caring for elders in long-term care is a major social issue because of the rapidly increasing numbers of the population who are aging and concerns about who will pay for their care.

**Basis of Eligibility**

Financial need determines Medicaid coverage, and each state conducts a means-tested evaluation of the resources of an individual or family, including property and bank assets. Certain categories of individuals are eligible for medical care if they fit into broad groups following the poverty levels set by Health and Human Services (HHS) or fall into the category of Disabled, Aged and Blind (DAB). In some states, individuals who receive Supplemental Security Income (SSI) are automatically eligible. A number of low-income eligible Medicare recipients supplement their health care, including prescriptions with Medicaid benefits, through state-administered programs.

One cannot simply transfer assets to a family member to become Medicaid eligible, since all states require a “look-back period” to determine eligibility to receive Medicaid benefits. This look-back period varies from 3 to 5 years to determine whether property or financial assets were gifted simply to gain Title XIX eligibility. If so determined, these assets are deemed available and the applicant will not qualify for Medicaid benefits. Also, most states have established estate recovery laws to recoup funds from the estates of Medicaid beneficiaries.

**Additional Services**

Many states offer optional personal services to help seniors and people with disabilities remain at home. Financially eligible seniors and people with disabilities may qualify for personal care programs that offer in-home assistance with daily living activities such as bathing, dressing, and food preparation. The primary purpose is to allow people to live in their own homes or apartments at less expense than nursing home placement paid by Medicaid and to allow more freedom, independence, and choice for people with disabilities.

Since 1997, the states have offered health care programs for children in families with incomes above the poverty level. Children can receive health care services even though the adults in the household may not be eligible, as legislated in the State Children’s Health Insurance Program (SCHIP). Even with SCHIP benefits in place, access to services may require additional fees, and if low-income families cannot afford even these minimal costs, their children who are otherwise eligible for SCHIP will still not be able to obtain necessary medical care.

Medically needy individuals may also qualify for benefits even though their income is above the eligibility level set by the state. For example, individuals with acute illnesses, high medical bills, or high-cost chronic medical needs may access Medicaid services for care.

**Problems With Medicaid**

Major problems with Title XIX include access to minimally adequate care or any care at all. Since the reimbursement rate for Medicaid providers does not meet the actual costs of care, many medical practitioners limit the numbers of Medicaid recipients they accept as patients or do not participate in the program at all. For example, access to dental care and pediatric dental care is quite problematic, given the few providers of this basic medical necessity. Also, because doctors and clinics that accept Medicaid reimbursement are limited, the wait for appointments is often long.

Fraud is another concern, leading states to set up fraud units to investigate false or duplicate charges by providers that could easily be lost in a large bureaucratic system. Fraud committed by patients ineligible for benefits is another problem.

**Current Legislative Issues**

With the passage of the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (commonly known as the Welfare Reform Bill), more restrictions exist on who is eligible for Medicaid services. Also, recent trends indicate that the federal
government is shifting the costs of Medicaid care back to the states. Ten years ago, Congress acted to ensure health care access for low-income and near-poor children by passing SCHIP. But SCHIP programs are dependent upon congressional reauthorization, and the federal government renewed the program until 2009, after unsuccessful conservative attempts to tighten financial guidelines to reduce eligibility standards so as to disqualify many children from the SCHIP medical safety net.

The next steps for Medicaid legislation include a nationally standardized Medicaid program to set minimum standards of care for those deemed eligible. Since federal law permits wide flexibility in providing Medicaid services to low-income people, a minimum standard could ensure a medical safety net on a national level. Other advocates propose universal access to health care for all, which implies a major funding increase in the future.

MEDICAL-INDUSTRIAL COMPLEX

As editor-in-chief of the New England Journal of Medicine, Arnold S. Relman first defined the new medical-industrial complex of the late 20th century as the rise of the for-profit sector in health care, a dramatic market change that challenges physicians’ abilities to best represent their patients’ interests. Throughout most of the past century, analysts viewed medical care primarily as a social service, where nonprofit public or private hospitals and private solo medical practitioners provided care. During this time, pharmaceutical and medical equipment manufacturers in the private sector comprised the “old” medical-industrial complex.

However, a specific chain of events unfolded, leading to the creation of a multibillion-dollar industry, including managed care insurance plans and pharmaceutical and biotechnology companies whose profits challenge our notion of an efficient nonprofit health care system. Experts suggest that only through the continued development of a new type of physician executive with the necessary skills to manage the future complexities of the health care system will the medical-industrial complex be able to prioritize its focus on patient care.

Corporate entities first became a presence in the health care system in the late 1960s, as the reimbursement of medical care by Medicare encouraged their entry. Proprietary hospitals, nursing homes, and a variety of outpatient care facilities first comprised these entities. Continuous inflation in the cost of care throughout the late 1970s and early 1980s, though, eventually created concern among public and private third-party payers, leading to varied cost-controlling interventions. The federal government’s measures involved diagnosis-related group (DRG) Medicare payments to hospitals and fee schedules for physician reimbursements. Large employers negotiated prepaid contracts with managed care plans that took the risk of controlling costs through health maintenance organizations (HMOs), independent practice associations (IPAs), and preferred provider organizations (PPOs), and the large majority of these were privately owned for-profit corporations. The boldest move yet consisted of the Clinton administration’s proposal to completely overhaul the health care system by controlling costs through government-regulated competition among managed care plans. However, the defeat of this plan in 1994 attracted even more private for-profit managed care plans.

Consequently, the fundamental role of physicians in the delivery of health care changed. In this environment of private managed care insurers run by persons responsible to investors, companies essentially “hire physicians” to take care of a certain number of patients on a capitated or negotiated fee-for-service basis. In addition, these contracts typically include financial incentives for physicians to decrease their use of diagnostic tests and to minimize patient hospitalization. This ultimately enables managed care insurers not only to offer competitively low premium prices to employers but also to retain a large portion of the premium to maximize the financial benefit to the investor-owners.

The relationship between payers and providers imposes potential limits on physicians’ autonomy to make decisions in the best interest of their patients with respect to their quality of care. Not surprisingly, some physicians formed groups to negotiate collectively
with managed care insurers. Recognizing this trend as another profitable entrepreneurial endeavor, many physician practice management (PPM) companies formed for the sole purpose of contracting with physicians to negotiate favorable contracts between the physicians and managed care insurers. Even though the industry of PPMs no longer exists, the nature of the relationship between payers and providers in today’s managed care marketplace illustrates how, as opposed to independent professionals, physicians in this corporate type of environment are essentially employees of companies that are in effect practicing medicine.

At the same time, though, competition in the managed care market and the rest of the medical care industry may decelerate the rise in medical costs. Competition will continue to grow as unions and state and federal governments demand the most cost-effective provision of care, and the providers who recognize this competition and determine how to employ their resources most efficiently will be the most successful. Providing high-quality care at competitive prices may also entail delegating services that physicians normally perform to physician assistants and nurses. According to the literature, supervised physician assistants and nurses can provide safe and high-quality care that is comparable to that provided by general practitioners. Moreover, the personal level of care afforded by many nurses can improve patient compliance and subsequently reduce hospitalization. Because these outcomes can only occur with utilization of physician assistants and nurses to their full capacity, however, the managerial skill of physicians becomes an important priority.

The global business concerned with the manufacture and sale of drugs and medical equipment also altered the role of physicians in the delivery of health care. Today, it is not uncommon for health care providers in academic medical centers to attend pharmaceutical company-sponsored lunches and grand rounds or to receive pens and pads labeled with the names of proprietary pharmaceutical products. These interactions often also involve medical equipment and drug manufacturers’ offerings of consultancies and honoraria, consequently creating a potential ethical dilemma between physicians’ economic self-interest and their fiduciary duties to their patients.

Nevertheless, the medical product industry does fund a substantial portion of basic and clinical science research in academic medical centers. In addition, industry research and development sections, as opposed to grant-supported research in academic labs, develop many of the technologies utilized in frontline medical care. Clearly, those in the industry of caring for patients cannot afford to live without pharmaceutical and biotechnology companies, and a plan, appropriate for the 21st century, to collaborate with both parties’ interests in mind must therefore be developed. Forums with representatives from academic medical centers and pharmaceutical companies have already called for multi- and interdisciplinary educational programming. These companies have also exhibited interest in improving methods to measure the outcomes of established continuing medical education programming that the pharmaceutical industry substantially supports financially.

The growth in the number of physician-executives trained to provide care in today’s complex environment must continue in order for physicians to best represent their patients’ interests in the medical-industrial complex. With academia focusing greater attention on entrepreneurship within nonprofit and proprietary health care organizations, some suggested that a managerial fund of knowledge is necessary for physicians to interact effectively with all those having an interest in health care. Eight specific skills deemed highly valuable include those in organizational development, financial analysis, cost accounting, micro- and macroeconomic analysis, decision science, marketing, and strategic planning. Medical education has taken early steps to enable physicians to develop these skills, as formal university curricula and continuing education programs in health care management now offer such training. Leading national educational organizations and philanthropic bodies also focus efforts on addressing leadership and management of the medical-industrial complex because of the realization that physician-executives can exhibit an authority unlike nonphysician managers and physicians without management training.

Further Readings

Medicalization is the process by which nonmedical problems become defined and treated as medical problems, usually as illnesses or disorders. This process can occur on multiple levels: a conceptual level, with the development of a medical definition of a problem; an interactional level, where the physician applies a medical diagnosis to a nonmedical problem and administers treatment; and the institutional level, where organizations advocate a medical approach.

One area drawing considerable attention is the medicalization of deviance. Behaviors once considered “badness” became viewed, through the process of medicalization, more as “sickness.” Here, medicalization diminishes individual responsibility, since experts now look at the behavior as something occurring outside the control of the individual, though often in the person’s physiology. Some examples of medicalized deviance include madness, alcoholism, attention deficit hyperactivity disorder (ADHD), addictions, and infertility. Another area of medicalization is everyday life processes including childbirth, menstrual discomfort (premenstrual syndrome, or PMS), menopause, aging, and death.

Medicalization need not be complete or discrete, but can be full, partial, expansive, and emergent. With full medicalization, as is the case with childbirth, nearly all the processes and interventions are encompassed by medical definitions and under medical control. Menopause is an example of partial medicalization; some physicians and their patients view menopause as a hormone deficiency state requiring treatment, generally through the medication of hormone replacement therapy, while others feel it is a natural life process that does not need medical intervention. With expansive medicalization, the definitional boundaries for a medicalized problem can expand over time. For example, the diagnosis of attention deficit hyperactivity disorder originally applied only to children, but in the 1990s grew to include adults also, increasing the purview of medicalization. Emergent medicalization includes problems promoted by some stakeholders (e.g., physicians and/or consumer groups) as official diagnostic categories that still await acceptance as medical disorders by significant parts of the medical profession. Examples include “Internet addiction,” “sex addiction,” and “female sexual dysfunction.”

Medicalization is a two-way process, incorporating expansion and possible contraction. Demedicalization happens when a medicalized problem no longer retains its medical definition, indicating that medical diagnoses or interventions no longer are appropriate solutions. Demedicalization generally occurs only when organized interest groups challenge medical definitions and control. Perhaps the best example is the gay rights movement convincing the American Psychiatric Association in 1973 to no longer define homosexuality as a psychiatric disorder. However, only a few processes become demedicalized as compared to the large number of behaviors and conditions that become medicalized.

Most sociologists have been critical of medicalization, referring to it as the “over-medicalization of society” or the “medicalization of ills,” emphasizing its potential for adverse social and medical consequences. They argue that medicalization may decontextualize social problems so that they are viewed solely as individual concerns devoid of a social context. Some types of medicalization produce increased risks or adverse medical consequences associated with pharmaceutical drugs (e.g., with treatment of menopause, an increased incidence of breast cancer, coronary heart disease, and stroke with the use of hormone replacement therapy). Unnecessary therapeutic interventions may contribute to rising health care costs despite uncertain benefits. Additionally, some scholars note that medicalization is yet another way to extend social control onto more aspects of daily life through the use of medical forms of social control (e.g., drugs, types of surgery, or medical surveillance).
While critics voice concern about overmedicalization, some groups with specific problems or disorders advocate for medicalization. Here, groups of people with or representing contested illnesses are vying for a diagnosis, in part to validate their experience of illness, since many lack definite physical symptoms. Some examples of contested illnesses are fibromyalgia, Gulf War syndrome, and Multiple Chemical Sensitivity Disorder. Another potential benefit of medicalization is that it can reduce the stigma associated with certain problems through redefinition as physiological or biological rather than behavioral in origin.

Initially, the major facilitating forces for medicalization (e.g., for ADHD and menopause) were the medical profession, interest groups advocating for the medicalization of controversial disorders contested by the medical profession (e.g., alcoholism and post-traumatic stress disorder), and interprofessional struggles (e.g., obstetricians medicalizing childbirth to eliminate midwives). However, because of dramatic increases in medical knowledge and the reorganization of health care during the past 25 years, a few scholars have reframed the process as “biomedicalization” to reflect the impacts of technology and biology on society. Others suggest that medicalization continues and it is just the engines behind medicalization that are shifting to biotechnology, consumers, and managed health care in the 21st century.

Advances in drug development, relaxation of Food and Drug Administration requirements concerning off-label uses of drugs, and direct-to-consumer advertising have enabled the pharmaceutical industry to medicalize problems as they create or expand markets, such as advertising medications for sexual performance and “dysfunction” or for poor performance in social situations (social anxiety disorder). Rapid advances in genetic medicine harken the potential of increased medicalization; genetic enhancement of bodies and/or cognitive abilities will likely lead to new medical categories and interventions. Consumers have become an important factor in the medicalization process, fueled by advertisements in the media, promotion by the medical profession, and widespread dissemination of medical information and advertising on the Internet. Illustrating this are the increasing demands for cosmetic surgery, the rise of adult ADHD, and the use of human growth hormones for treatment of idiopathic short stature. Here, as with contested illness, laypeople play a key role in medicalization. Finally, insurance companies concerned with rising health care costs have become key decision makers, limiting payment for what they consider appropriate treatments. These countervailing forces are likely to chart the future course of medicalization.

Medical Malpractice

Medical malpractice is any deviation by a health care provider from accepted standards of practice, whether or not it causes injury to the patient. Medical errors can occur in diagnoses, surgery, and prescriptions. In medical malpractice trials, defendants have the burden of proof, and expert witnesses testify against health care providers (including medical doctors, hospital residents, pharmaceutical companies, dentists, nurses, or therapists). Given both the injuries (fatal and nonfatal) associated with medical malpractice and the ensuing rise in costs of insurance premiums, medical liability is a social problem with significant ramifications for everyone’s health care.

According to the Institute of Medicine of the National Academies, the most common medical mistake is with medication, harming about 1.5 million people annually. Another one third of all claims result
from diagnostic errors (e.g., interpretation of radiology reports). Generally, medical errors cause approximately 100,000 deaths a year. Death from prescription errors increased dramatically in the past 25 years and exceeded all other causes of death except AIDS. Fatal prescription errors are even greater for outpatients than for inpatients, particularly among the elderly. This is due in large measure to increased use of mail order and Web-based pharmacies, enabling patients to self-medicate too much or suffer adverse effects of multiple medications, since they receive no direct professional guidance.

While medical malpractice lawsuits ensure the rights of injured patients and compensate them for medical negligence, the dramatic increase in lawsuits has caused a growing public concern about the ramifications of huge settlements. As liability insurance premiums rise for health professionals, those additional costs are passed on to consumers in the form of higher medical fees for goods and services. Furthermore, fear of lawsuits forces both hospital staff and physicians to prescribe routinely tests once considered unwarranted but now legitimated as “defensive medicine,” at a cost exceeding $50 billion annually.

Medical errors and preventable adverse drug events are causes for serious concern. Studies indicate that more than 500,000 drug-related injuries occur among Medicaid or Medicare recipients in outpatient clinics—the majority of whom are elderly, bilingual, and poorly educated. For example, poor women who are heads of households typically utilize outpatient clinics rather than private doctor offices. This large segment of society typically experiences poorer health conditions and has great high-risk medical problems.

The actual size of malpractice awards is impossible to calculate, since so many lawsuits are settled before they reach trial. The Congressional Budget Office reports that 15 claims are filed for every 100 doctors each year, and that about a third of the claims result in insurance payments.

A growing number of doctor’s groups allege that medical malpractice lawsuits are responsible for the increasing medical malpractice insurance rates. Many doctors, especially in states with higher premiums, move or retire, resulting in severe shortages in some states and within such specialties as orthopedics, neurosurgery, and obstetrics-gynecology.

A 2003 congressional report stated that premium rates grew rapidly since 1998, particularly in the area of obstetrics-gynecology, although these rates varied widely by state. Multiple factors contributed to these increases, including insurers’ losses, declines in investment income, a less competitive climate, and climbing reinsurance rates. Advocates of tort reform want a fairer assessment of the relationship among claims, insurance rates, and the overzealous litigation suits by trial lawyers. Earlier, a 1999 study by the U.S. General Accounting Office reported that the single most important factor in the dramatic increase of malpractice premium rates was the falling investment income of insurance companies as a direct result of medical malpractice claims.

Obstetrics, with the delivery of babies, is especially prone to malpractice claims, so insurance rates in most states far exceed $100,000 per doctor. Unfortunately, 1 in 200 babies is born with some form of injury. Although a neurologically impaired infant or neonatal death is a rarity, it provokes strong emotions of empathy for the infant’s family. When litigated, such cases often end with unusually large settlements awarded to the families. Increasing professional liability premiums and the fear of lawsuits have caused obstetrician-gynecologists (OB-GYNs) to make dramatic changes in their practices. According to the results from a 2006 American College of Obstetrics and Gynecology Survey, 70 percent of OB-GYNs considered retiring or moving; 65 percent decreased the number of high-risk obstetric patients and stopped performing and offering certain types of high-risk medical care. Eight percent stopped practicing obstetrics altogether. Undoubtedly, such an environment deprives women of all ages of access to experienced health care providers, since the average age of retirement for obstetricians is 48—an age once considered the prime of a professional medical career.

Public opinion supports limits on malpractice damages. In a recent Gallup poll, three fourths of respondents wanted a maximum amount set for awards for patient emotional pain and suffering. Thus, when physicians, medical associations, and insurers joined forces to pressure legislators to limit the amount of medical malpractice awards, lawmakers were receptive. The subsequent tort reforms placed caps on non-economic damages—the so-called pain and suffering and punitive damages—which led to savings, lower premiums, and reduced claims in states that placed caps on non-economic damages. Presently, 34 states have such caps, according to the National Conference of State Legislatures, and they have lower insurance costs than the remaining 16 states.
Undoubtedly, both health care providers and patients have suffered through the medical liability “crises” of the past 30 years. Legal, medical, and perceptual barriers to reducing medical errors must be addressed to ensure the health of all citizens of society. While systemic problems reside in the structure of medicine today, especially with regard to the delivery of medicine, some advocates urge the creation of a federal agency to collect and analyze data on medical errors and to make recommendations on procedures for their control and reduction.

MEDICARE

The Medicare program is a national health insurance system that currently serves more than 40 million beneficiaries and provides more than $330 million in health care benefits. Participation in the Medicare program is dependent on whether individuals are age 65 or older, have selected disabilities, or have end stage renal disease (ESRD). The majority (about 85 percent) of the Medicare population is aged, while approximately 14 percent of beneficiaries are disabled. The remaining Medicare population (less than 1 percent) is eligible for Medicare benefits because of ESRD. The Medicare program is the largest health insurer in the United States; it is a crucial element in ensuring health care to some of the most vulnerable populations.

The Medicare program actually finds its roots in the Social Security program. Though the original Social Security Act was enacted in 1935, this program to provide minimal income security through social insurance included no provision for coverage of health care expenses. Therefore, despite its goals of providing a basic social safety income net, it became apparent to policymakers that health care costs, particularly for the aged and disabled populations with high health care needs, would quickly undermine the income protections intended to be provided under Social Security. Therefore, after long debate, the Medicare program became law in 1965 as a mechanism to add health insurance to the already existing national Social Security program.

Medicare is partially financed through a combination of payroll taxes, beneficiary premiums, and beneficiary cost sharing. For most of its history, the Medicare program (now commonly referred to as “original Medicare”) consisted of hospital insurance (covered under Medicare Part A) and general medical insurance including physician services (Medicare Part B). Coverage under the original Medicare program worked under a fee-for-service system in which Medicare paid medical providers predetermined rates for specific health care services.

Medicare, however, evolved over time to include new programs. During the late 1980s, the program experimented with provision of Medicare services to beneficiaries through capitated health maintenance programs. Managed care programs, such as health maintenance organizations (HMOs), offered an alternative way for Medicare beneficiaries to receive their benefits. In exchange for enrollment in a Medicare managed care plan, beneficiaries often received additional, non-statutory benefits, including preventive care. Popularity of managed care (known first as the TEFRA HMO program) grew steadily, boosted further through passage of the Balanced Budget Act (BBA) of 1997. Under the BBA, which created the Medicare+Choice program, Medicare expanded the types of managed care organizations eligible to contract with Medicare. Through the Medicare+Choice program, also known as Medicare Part C, managed care organizations could offer new benefit options, including preferred provider organizations (PPOs) and private fee-for-service (PFFS) plans, to the original HMO options. Though a source of great policy interest and change, the Medicare managed care program (currently renamed Medicare Advantage) provides coverage to a minority (about 15 percent) of Medicare beneficiaries.

Possibly the most significant change to the Medicare program came with the enactment of the Medicare Modernization Act (MMA) of 2003. The MMA added a benefit long absent from original
Medicare: prescription drugs. The Medicare Part D program, which became effective in January 2006, provides basic and catastrophic prescription drug coverage to beneficiaries through private insurance plans. Under Part D, beneficiaries receive basic coverage of prescription drugs up to (depending on their specific plan) about $2,000. Catastrophic coverage continues after beneficiaries have paid out-of-pocket costs of $3,600. The private plans that provide Part D coverage include a wide range of Medicare prescription drug plans (PDPs) and mandated prescription drug coverage obtained by enrollment in a Medicare Advantage managed care plan. Medicare beneficiaries choose annually which type of mechanism (PDPs or Medicare Advantage plans) they want to elect for their Part D coverage.

The Medicare Part D program is credited with providing critical prescription drug coverage to more than 30 million Medicare beneficiaries, some of whom had no reliable mechanism for coverage prior to the new program. However, Medicare Part D has faced criticism for its complex, hard-to-understand benefit design, the sometimes daunting number of coverage plan options, and a “donut hole” gap between basic and catastrophic coverage.

In many ways, the Medicare program is highly successful. It offers health insurance coverage to the largest single group of Americans, offering the aged and disabled populations the most secure, stable health care in the United States. Medicare is sometimes considered a model for health care reform, particularly as a mechanism for provision of health care coverage to the more than 40 million Americans currently uninsured. Medicare is also an extremely efficient health insurance program. Unlike private insurance plans, in which health administration costs can commonly range from 10 to more than 20 percent of total program costs, Medicare’s administrative costs are less than 5 percent. Finally, the Medicare program has an extensive national beneficiary education program that provides programmatic information and support to enrollees through toll-free call centers, printed materials, and Web sites.

Despite these considerable successes, the Medicare program faces some significant challenges. As it evolved over time to include a new provider, reimbursement, cost containment, and benefit program, Medicare grew into a complex program that is often difficult to understand for both beneficiaries and Medicare providers. Understanding and navigating Medicare became particularly challenging for Medicare beneficiaries in 2006 when it required that they select a Medicare prescription drug plan. But the greatest of challenges to Medicare is likely the financial sustainability of the program. As the U.S. working population declines in size and the baby boom population nears retirement and eligibility for Medicare benefits, projections are that the program will face a financial shortfall around 2018. Addressing the looming financial insolvency of the Medicare program has been a difficult policy and political program debate.

MEGACITIES

Megacities are giant cities. The term has been in common use since the 1980s to characterize metropolitan areas with very large total populations. Most commonly, specialists and UN demographers use the term in comparative urban studies, referring to metropolitan areas with more than 8 or 10 million inhabitants. The underlying argument is that the population size of these metropolitan areas gives them special characteristics. Attention typically focuses on the total population of the metropolitan area—usually a major city and its surrounding suburbs.

Metropolitan areas, also known as urban agglomerations, are notoriously difficult to define because administrative definitions vary from country to country and because the cities integrate in many different ways with their surrounding regions. In less developed countries, the rural poor may seek work in the cities as migrant laborers, and villages become integrated with metropolitan labor markets.
On the urban fringe, agriculture, factory farming, and industries like brickmaking intensify to meet metropolitan demand, while commercial strips often line the intercity highways. In more developed countries, towns and villages around the metropolis may evolve into satellite, bedroom, second-home, and recreational communities, while suburbs may sprawl outward at lower and lower densities. Commuters and suburbanites may seek to enjoy rural landscapes and simulate rural lifestyles yet gain their livelihoods in the metropolitan economy. Planners may seek to preserve rural and wilderness areas as greenbelts and parks, but urban development often simply leapfrogs the preserved areas, creating new metropolitan satellites.

As world population rises and urbanization continues, the proportion of the world’s megacities located in less developed countries increases, and the threshold size for megacity definition tends to rise. In 1950, only one metropolitan area in the world, New York, had more than 10 million inhabitants. By 2005, however, the number had risen to 19 metropolitan areas, all but four of them in less developed countries. Two alternative terms, metacities and hypercities, have now emerged to embrace metropolitan areas with more than 20 million inhabitants. Tokyo is the first metacity, but all the others most likely to cross this threshold by 2015—Dhaka, Mumbai, São Paulo, Delhi, Mexico City, and Shanghai—are in developing countries.

Characterizing all giant metropolitan areas are high levels of congestion, pollution, land values, and living costs in relation to neighboring less densely populated regions. Both in rich and poor countries, however, megacities usually have higher average incomes and productivity levels than smaller cities and rural areas, and they are tremendously important foci of business activity. Anti-urbanists emphasize their problems, pro-urbanists emphasize their dynamism and synergies, and comparative researchers tend to emphasize the development characteristics of the countries within which the megacities are located. Some megacities—most notably Tokyo, New York, and London—are dynamic “world cities” playing pivotal roles in the global system. At the other extreme, descriptions of megacities like Kolkata, Karachi, Lagos, and Kinshasa tend to emphasize mass poverty and diseconomies of urban size.

MEGALOPOLIS

Megalopolis was an ancient mainland Greek city, founded in 369 BCE, whose name quite literally means “large city.” In the 20th century, various authors, most notably Lewis Mumford, used the term with the same general meaning as metropolis, a large city and its surrounding suburbs. In the 1950s and early 1960s, however, two authors, the French geographer Jean Gottmann and the Greek planner Constantinos A. Doxiadis, gave the term megalopolis a different and greater meaning, redefining it as an interlocking group of metropolises, forming a polynuclear urban region with at least 20 million inhabitants.

After 5 years of background research, Gottmann’s landmark book Megalopolis of 1961 profiled the 53,000-square-mile urbanized region stretching from southern New Hampshire to northern Virginia and encompassing the metropolises of Boston, New York, Philadelphia, Baltimore, and Washington, D.C., together with many smaller intermediate and surrounding cities and suburbs. This region, sometimes known as BosWash, offered the world’s first example of a true megalopolis. While preparing his study, and more intensively afterward, Gottmann interacted with Doxiadis, who was developing an emerging new academic discipline—“ekistics, the science of human settlements.”

Ekistics provided a comprehensive framework for the spatial and design disciplines—attempting to unify geography, regional science, landscape architecture, architecture, and interior decoration and to encompass economic, social, and environmental aspects of human activity. Doxiadis developed a 15-level scale, stretching from the individual (level 1) to his envisioned, inevitable global city of the future, ecumenopolis.
(level 15). His model, simultaneously descriptive and predictive, assumed continuing world population growth, economic development, technological advancement, and globalization. He predicted that neighboring metropolises (level 10) would sprawl into conurbations (physically continuous built-up areas) and eventually link into a megalopolis (level 12); neighboring megalopolises would eventually consolidate as urban regions (small eperopolis); urban regions would merge into continental urban systems (eperopolis); and the continental urban systems would eventually link and integrate to form ecumenopolis.

In the 1960s and early 1970s, Gottmann’s megalopolis attracted considerable attention from U.S. academics and political leaders, who often cited it in calls for metropolitan and regional government, regionally integrated utility networks, and high-speed intercity rail services. With metropolitan regions increasingly recognized as functional entities often having overlapping commuter fields with adjacent metropolises, Doxiadis launched studies of what he saw as the emerging Great Lakes megalopolis, stretching from Milwaukee and Chicago to Pittsburgh, Buffalo, and Toronto, and in some versions all the way to Montreal. Japanese, Chinese, and Western European researchers began to identify megalopolises, most notably between Tokyo and Osaka, and including Amsterdam, Hamburg, and Milan. By the late 1970s, however, enthusiasm for these studies began to diminish. Long-term, grand-scale planning went out of fashion as the Thatcher-Reagan era of neoliberalism and privatization gained momentum. Most important, perhaps, growing pressure for decentralization and community planning, advocated by such authors as Jane Jacobs and Robert Goodman, reflected the power of local identity and the permanence of political boundaries and divisions. Doxiadis and Gottmann’s visions of a long-term upward shift in scale, from local to regional governments and emerging synergies, have yielded, despite globalization, to the reinforcement of local identity.

MEGAMERGE

A merger is a combination of two corporations in which only one corporation survives and the other firm goes out of existence. A consolidation is the combination of two or more companies to form an entirely new company, to the point that the original companies cease to exist. Megamergers simply refer to very large mergers and consolidations. Examples include the mergers of Vodaphone-AirTouch and Mannesman ($180 billion), AOL and Time Warner ($165 billion), and Citicorp and Travelers ($73 billion).

Corporate mergers and acquisitions are important events because they represent massive reallocations of resources within the economy. Over the past century, there were five merger waves, in which a series of high merger activity was followed by a relatively inactive period. The last merger wave, called the “period of megamergers,” occurred from 1992 to 2000. The megamergers during the past decade are just larger than previous ones. The concentration of megamergers in recent years has been in the banking, telecommunications, petroleum, and pharmaceutical industries. Megamergers partially reflect the level of growth in economic activity and globalization of financial markets.

Megamergers occur for numerous reasons, such as synergy, corporate control, tax considerations, diversification, market power, transaction cost efficiency, and purchase of undervalued assets. A common motive for megamergers is synergy, which refers to an increase in competitiveness and resulting cash flows beyond what the two companies are likely to accomplish independently. Thus, the synergy motive suggests that megamergers occur for the efficiency that results from merging the resources of the two firms. Synergies come in various forms, including economies of scale due to cost savings and better capacity utilization, more effective management, improved production techniques, and combining complementary resources.
An important issue is whether megamergers create value. Some contend that megamergers increase value and efficiency and move resources toward optimal uses. Others are dubious of this view. They argue that megamergers do not lead to subsequent performance gains and destroy value. Still others believe that any gains to shareholders simply represent the distribution of wealth from other stakeholders. Thus, value is preserved.

To measure wealth effects, studies use either short-run stock performance of the bidder and target or the long-term performance of the bidder for several years after the transaction. The use of short-run stock performance appears to be more reliable, as it accounts for the changes in stock prices that would incorporate any expected changes in firm value as a result of a merger. Long-term studies focus on relative performance of the acquiring firm compared to non-acquiring peers.

The evidence on wealth gains for acquiring firm shareholders is unclear, because they may earn little, no, or negative wealth gains in the short run. The target’s stock usually increases upon the announcement of a megamerger, but often at the expense of the acquiring firm’s shareholders. Studies that examine the performance of acquiring firms during the 3 to 5 years after the transactions generally find a negative net wealth effect. Whether megamergers are good for consumers, competition, or society at large remains an empirical question.

Theoretical Context
Throughout the 19th century, presidents and poets alike echoed the idea of the United States as a unique site for cultural assimilation, as new waves of immigrants sought to put down roots. However, the visual image of foreign assimilation came to the forefront of public culture through Israel Zangwill’s popular play, The Melting Pot of 1908, which venerated the assimilation of European immigrants, even “the black and yellow races,” into a universal American culture. Once established, the icon of the melting pot served to legitimize American ideologies of equal opportunity and independence from European nations, as immigrants could recast themselves as Americans by learning English and adapting to American norms.

Early theoretical grounding for the melting pot took root in the Chicago School assimilation theory of the 1910s. Here, human ecologist Robert Park outlined a “race relations cycle” in which new immigrant groups adopted an accommodating stance to the host culture, copying outward customs and norms to allow successful economic interaction. Park and others expressed belief that, over generations, these cultural compromises gradually led to conformity of language, opinion, and belief.

Even contemporary accounts of assimilation theory interpret the idea of the melting pot as a precursor to the assimilationist idea of immigrant incorporation: a complex and multidimensional yet mostly “straight line” adaptation of immigrants into U.S. society. In his classic 1964 account of assimilation theory, Milton Gordon not only observed seven different stages of assimilation—that is, cultural, structural, identity, and so on—but he also reinforced the idea of a “triple melting pot” (Catholic, Jewish, Protestant) originally put forward by Ruby Jo Kennedy in her intermarriage study of New Haven in 1944. Gordon said that immigrants with common Protestant roots followed a direct path of adaptation into the Anglo-Saxon, Protestant...
core of U.S. society, and Catholics and Jews into their own homogenizations, thus associating the melting pot with a nexus of religious values toward which all others eventually integrated. Gordon further argued that racial discrimination prevented blacks, Asians, Mexican Americans, and some Puerto Ricans from participating meaningfully in either the white Protestant or white Catholic communities. His comments made it clear that structural societal conditions prevented the existence of one homogeneous melting pot; rather there were multiple melting pots, and some groups did not belong to any of them.

Contesting the Term

Gordon’s contemporaries Nathan Glazer and Daniel P. Moynihan further demonstrated the problematic aspects of the melting pot idea in their seminal work Beyond the Melting Pot of 1963. They showed that ethnic backgrounds and identities can provide resistance to “melting” and are quite central in structuring the immigrant incorporations. In a later 1970 edition, the authors acknowledge that not only ethnicity plays a role in structuring life and conflict in the city, but economic interests and racism are of equal significance in understanding social patterns.

The essence of Glazer and Moynihan’s argument is probably best summarized by their sentence: “The point about the melting pot is that it did not happen.” Four decades after the book’s publication, most scholarly evidence seems to support this conclusion. Scholars show that descendants of immigrants in major U.S. cities neither fully melted nor replicated the culture of the previous generation. Instead, they adopted selected elements of U.S. society while celebrating their own particularities and cultural roots, becoming Americans in their own way.

The significance of race remains a salient factor working against the image of U.S. society as a melting pot. For many immigrants, adaptation continues to be obstructed by racism, through such forms of inequalities as housing segregation and unequal access to economic opportunity and education. A more popular metaphor than melting pot is calling modern America a “salad bowl,” in which separate racial and ethnic groups interact without fully assimilating.

While the imagery of the melting pot has held powerful sway over public and academic interest for nearly a century, critical examination of immigrant populations casts doubt on its value as a theoretical concept. New research has opened up avenues exploring the enduring structures of immigrant groups, including ethnic enclaves, immigrant niches, and ethnic economies. At present, the adoption of revised perspectives such as multiculturalism and “new assimilation theory” increasingly proves the melting pot concept of limited use.

MENTAL DEPRESSION

Moods or emotions change with experience and environment, sometimes reflecting happiness and other times sadness. In emotionally healthy individuals, moods are controllable, but for people with mental depression, the mood itself is in control of both body and thoughts. Mental depression is a mood disorder characterized by specific symptoms that typically occur due to chemical alterations in normal brain functioning. Mentioned throughout history, depression harks back at least since the days of the Old Testament,
when King Saul was said to have suffered from it, causing him to take his own life. The most common and readily identifiable symptom of a depressed person is sadness, melancholy, or despair; however, a person with clinical depression experiences more than transient sadness. Oftentimes it is a sense of exhaustion or a lack of any energy at all that signals the onset of mental depression.

Mental depression is one of the clinically distinct depressive disorders. As a clinically defined disorder, its criteria is identified in the Diagnostic and Statistical Manual of Psychiatric Disorders, 4th edition (DSM-IV) with specific questionnaires and diagnostic interview techniques available for therapists, doctors, and other mental health specialists to employ in an effort to identify clinical mental depression. Two important diagnostic features are severity and duration of symptoms. For a person to be diagnosed with severe depression, the symptoms must exist for more than 2 weeks and can be recurring or single episodes. Subtypes of major depressive disorders include depression with melancholy (loss of interest or pleasure in activities), depression with atypical features like weight gain or hypersomnia (sleeping to excessive amounts), or depression with psychotic features like hallucinations or delusions. Other types of depressive disorders include long-term mild depression called dysthymia; bipolar disorder, in which moods cycle from elation to depression; postpartum depression, which occurs after the birth of a child; and depression that accompanies menstrual cycles, more commonly known as premenstrual syndrome or PMS.

Causes
Depression can occur as a primary diagnosis or secondary to a medical disorder like hypothyroidism, the ingestion of drugs for medicinal or recreational use, or as the reaction to a chronic medical diagnosis. Chronic anxiety, poor sleep habits, and drug use with prescription and illicit drugs can produce mental depression. Excessive use of alcohol or other mood-altering drugs could also signal the individual’s attempt to self-medicate against the feelings of depression.

Some psychosocial contributors to depression can be life events, environments, and interpersonal relationships. Long-lasting stress or extremely stressful events can precipitate a depressive episode. Familial psychopathology, or psychological disease patterns existing in families, affects an individual’s ability to respond to stressors and recover from, or adjust to, stressful events. Personality types and genetic factors are also determinants.

Depression and anxiety are often a coexisting diagnosis. According to the National Comorbidity Survey (U.S.), 58 percent of Americans diagnosed with major depression also suffered from anxiety disorders.

Prevalence
Among Americans 18 years and older, in any given year nearly 21 million (9.5 percent) have a diagnosed mood disorder, with the daily activities of nearly 15 million of them impacted. Major depressive disorder constitutes a prime contributor to disability for individuals between the ages of 15 and 44. More than 6 million men and 12 million women suffer from depression, but men are 4 times more likely to commit suicide because of depression. Some theories hold that depression is an inheritable trait. Physical changes, such as pregnancy, aging, stroke, chronic disease, or heart attack, can also be accompanied by mental changes. Children diagnosed with depression should be treated by psychiatrists or therapists who specialize in the treatment of children.

Common symptoms include persisting sadness, anxiety, or emptiness that may be accompanied by thoughts of victimization, helplessness, hopelessness, and/or worthlessness. The person might lose interest in activities that were once important or complain of lack of energy or inability to concentrate. Physical symptoms that do not resolve despite treatment, thoughts and ideations of suicide or death, and/or extreme sleepiness or insomnia are other indicators of depression.

Treatment
Long- and short-term therapies are available for individuals diagnosed with some form of mental depression. Approaches can be behavioral (concentrating on changing specific behaviors); cognitive (concentrating on thought processes); or a combination of the two, called cognitive-behavioral therapy. Other treatment can include medications, hospitalization, and/or ECT (electro-convulsive therapy).

Most medications that treat depression must be taken regularly over time to achieve a therapeutic effect, and many should not be stopped abruptly because the body may have a negative reaction. Some
individuals may require a combination of medications in order to achieve the desired effect. Those persons diagnosed with chronic major depression or bipolar disease should understand that the need for medication may continue indefinitely. Some patients may be placed on anti-convulsant therapy, known to be effective in treating mood disorders.

Despite the fact that most people suffering from depression do not seek medical help, depression is a treatable disease. Depression is not an indication of emotional weakness or a condition that can be willed away. Without treatment, depression becomes a chronic disease that affects all aspects of the individual’s daily activities. Families can support a person with depression by assisting him or her to get the appropriate help, diagnosis, and treatment for the disease; seeking additional family support; and learning how to provide patient, consistent emotional support. Talk of suicide should never be taken lightly or ignored. Engaging the person in conversation and recreational activities will help demonstrate affection and emotional support. Research demonstrates that, with treatment, people with depression can and do get better and live productive lives.

**MENTAL HEALTH**

Mental health was once defined as the psychological state that exists in the absence of mental illness. Contemporary social scientific thought, however, has abandoned the view that mental health and mental illness are antithetical to one another. Now, lack of mental illness no longer simply implies the presence of mental health, just as lack of mental health no longer suggests the presence of mental illness. Thus, the term *mental health* refers to a social psychological state greater than the mere absence of mental illness. Moreover, some scholars suggest that mental health can be present in individuals diagnosed with mental illness, a position that lends greater support to the view that mental health and mental illness ought not to be treated as oppositional categories.

Social scientists believe that mental health exists on a continuum, with optimal mental health occupying one pole of the continuum, poor mental health occupying the other. According to this model, an individual’s location on the continuum is subject to change over time and is influenced by some combination of social, psychological, and biological factors. In advocating this model, many practitioners of social work, sociology, and psychology reject definitions of mental health that posit it as a discrete state of being. The continuous model of mental health, however, is at times inconsistent with the definitions articulated within the medical community.

In the field of diagnostic psychiatry, in particular, many experts understand mental health as existing in a dichotomous relationship with mental illness. According to this view, the relationship between mental illness and mental health is not fluid, but discrete—one finds oneself in possession of either one or the other. The dichotomization of the concepts of mental health and mental illness occurs through the application of standardized diagnostic criteria intended to positively identify the presence of mental illness. In this sense, by demarcating cut-off points, mental health becomes bounded from mental illness and, perhaps as an unintended consequence, regarded as falling outside the purview of the research programs of psychiatry.

A systematic study of mental health has yet to emerge within the social sciences. However, even if a movement were to form around the concept, mental health most likely would continue to elude precise
definition. Two interrelated factors contribute to the inherent vagueness of the term. First, the concept as such represents a subjective state of being, varying across individuals and groups. Second, the realization of mental health rests upon culturally and temporally specific definitions of what exactly constitutes normal emotions and behaviors. In other words, the meaning attached to interpretations of mental health, and indeed to the very definition of the term normal, is necessarily rooted in cultural value judgments. As a result, even well-intended efforts to develop a universal definition of mental health are unlikely to meet with success.

Despite these issues, efforts to lend definitional clarity to the term have been made. The psychologist and philosopher Williams James, for instance, understood mental health as the achievement of happiness, a state of being largely informed by the possession of a positive outlook on life. Abraham Maslow foregrounded the concept of self-actualization in his understanding of mental well-being, arguing that once individuals meet their basic needs they may ascend to a state of self-actualization—or a state in which one is capable of making the most of his or her unique abilities. Existential psychologists have suggested that mental health rests upon discovery of the meaning of life. Positive psychologists have emphasized the relationship between human happiness and the presence of an optimistic outlook on life. In conceptualizing human happiness, positive psychology underscores a number of virtues and strengths, including wisdom and knowledge, courage, humanity, justice, temperance, and transcendence. Access to these characteristics influences one’s capacity to achieve happiness, which in turn affects his or her level of mental health.

Contemporary social scientific research uses the concept of mental health to represent a broad inventory of positive attributes. The relationship between mental health and each implicated attribute is opened up in the sense that the attribute is treated as a continuous variable (i.e., measured on a scale), and the presence of each attribute within an individual is subject to change over time. In other words, the relationship between these attributes, mental health, and the individual is not fixed. Within the social scientific community, a general consensus exists that mental health involves the presence of five general attributes, all of which correspond to an individual’s ability to capably function in society. Included among the list of attributes are (a) living up to one’s intellectual and emotional potential; (b) the ability to forge and maintain healthy and satisfying relationships; (c) the ability to cope with normal levels of stress; (d) a sense of self-efficacy; and (e) the ability to adapt to unfamiliar situations and environments. Sometimes a sixth attribute—perceiving things the way they are, or “being in touch with reality”—is added to this list. Each of these components is subject to normative assessment and therefore requires sensitivity to cultural differences. For instance, although healthy and satisfying relationships in many cultures may serve as a central determinant of mental health, what exactly constitutes “healthy and satisfying relationships” is subject to extensive intercultural variation.

According to sociologists, the structural effects of social support and social integration influence the relative presence of these attributes. Research exploring the relationship between these social variables and mental well-being dates back to Émile Durkheim’s study of suicide. In contrasting the rates of suicide among single men and members of the Protestant faith to those of married couples and Catholics, Durkheim concluded that—among married individuals and members of the Catholic faith—more intense social relationships function to create a sense of meaning and purpose in life. On a broader level, by imposing moral regulations on behavior, well-integrated communities reduce the occurrence of anomie.

In exploring the relationship between mental health and stressful life events, more recent research cites social support and social integration as avenues through which stress is mediated. The presence of external sources of support—particularly in the form of an intimate relationship with a partner, or strong relations with extended family, friends, and other members of the local community—moderates the effect of stress by improving one’s sense of security, self-efficacy, sense of belonging, and self-esteem. Such attributes improve individuals’ ability to cope with personal and social stressors and thereby enable them to achieve greater levels of mental health. Moreover, symbolic interactionists suggest that support networks contribute to the development of a strong sense of self, as identity evolves in part through interaction with others. Residing in well-integrated communities and neighborhoods furthermore functions to affirm residents’ sense of identity and worth, as individuals act as both the benefactors and recipients of activities intended to maintain the general well-being of the community. In comparison, sociologists
argue that poorly integrated communities increase the likelihood that residents will suffer from low self-esteem, a weak sense of self-efficacy, and general feelings of pessimism, all of which are potential contributors to poor mental health.

With respect to the relationship between social support mechanisms and stress, experts note that strong social support networks improve individuals’ access to material resources, such as money, transportation, a place to live, and child care. Access to such material resources reduces exposure to stress while simultaneously improving one’s capacity to cope successfully with stressful life events. Social support mechanisms prove to be of particular importance to members of lower socioeconomic classes and minority groups who, on balance, experience greater levels of discrimination, neighborhood crime, unemployment, and poor physical health. In such cases, access to a strong social support network will greatly influence mental health.

The growing emphasis on issues related to mental health has led to the implementation of mental health promotion programs in local communities, through which support structures are developed in order to increase social inclusion and cohesion. Mental health programs also function at the individual level, largely through programs intended to improve self-esteem and coping skills in the workplace and in personal relationships.

Methadone

Methadone, a synthetic narcotic with a suppression effect lasting 24 to 36 hours, is the most effective medication to help heroin patients overcome their addiction. Methadone maintenance treatment (MMT) rapidly expanded following its demonstration as an effective medical intervention in the mid-1960s. In the United States, there are 500,000–1 million heroin users, with about 180,000 (about 18 to 36 percent) enrolled in MMT. Nevertheless, an array of controversial issues surrounds this treatment at the clinical, community, and governmental levels.

Principal benefits of methadone are its reduction of cravings for heroin, blockage of such narcotic effects as euphoria, and reduction of withdrawal symptoms. Unfortunately, most who withdraw from methadone return to using heroin. Proper dosage is crucial for retaining patients in treatment. While a dosage of 80 milligrams (mg) per day leads to higher retention rates, many clinics administer an average daily dose of 59 mg, the lower end of the therapeutic range.

Since 1964, in monitoring MMT for medical safety, researchers have noted minor and usually short-term side effects in the initial stages of treatment initiation, such as increased perspiration and constipation. In most cases, length of treatment correlates with improved health of patients. MMT participation also reduces risk for HIV and can be a supplementary source of pain management for cancer patients. In tests of intellectual functioning and perceptual motor skills, methadone patients’ results fall into the normal range.

At the community level, the effects of MMT vary. For example, MMT admissions correspond with reductions in drug-related property crime, arrests, hepatitis, and deaths. Yet, community opposition has contributed to blocking the expansion of MMT. A principal concern is the diversion of methadone from patients to a street market, which often seriously affects a neighborhood’s quality of life. The reasons for the street market in methadone range from patients’ economic motivations to the need of heroin-addicted people to maintain themselves outside of a program when none is available and/or heroin is scarce or unaffordable.

The federal and state governments set regulations for MMT and the criteria for admission. Studies demonstrate that the layers of regulatory bureaucracy, which also sometimes include municipal
agencies, impede the expansion, accessibility, and improvement of MMT. The traditional treatment model consists of community-based clinics to which a patient must report daily. Observed by a nurse, patients drink their prescribed dose. Patients who demonstrate compliance, including submission of a minimum of eight urine samples a year free of heroin, eventually get assigned to a reduced schedule in which they report once a week and receive six take-home doses. There have been widespread and deepening criticisms about the disproportion of resources directed toward program regulation at the expense of enhanced treatment services, such as integration of relevant social, medical, and psychological services. This has resulted in a movement toward diversification of program models. Increasingly, patients now get a range of treatment options, including MMT primary care facilities and office-based practices of a physician.

Middleman Minority

Middleman minority refers to cultural minority populations living in complex interethnic situations and to theories about their livelihood and social position. Their occupational niche generally has been the small family firm or self-employed merchant rather than agro-industrial producer or employee of a large corporation. Accordingly, one can speak of Chinese traders in Indonesia, Indian merchants in East Africa, or Korean green grocers in New York City as middleman minorities. As immigrants or sojourners, they fill a niche as service sector intermediaries between producers and consumers or as buffers between the masses and the elite. Moreover, they are received with ambivalence or hostility by the mainstream or host society.

Many scholars view the conflict between middleman minority and others as part of the tension between “pariah capitalism” and “modern capitalism.” Analysts link the presumed universalistic and rational outlook of the latter historically to the rise of Protestantism. Modern capitalists, by this logic, treat all clients by the same ethics and standards.

By contrast, pariah capitalism has been associated with Jews and other Mediterranean and Asian trading peoples. Among its defining characteristics has been an emphasis on frugality, a dual standard of commercial morality, high achievement motivation, and high ingroup morale, among others. A dual standard implies favored treatment for one’s own people but less advantageous terms for others. The host population may interpret such behavior as hucksterism and exploitation and thus construct profoundly negative images of the minority. At the same time, a middleman minority may reinforce its separateness via ritual segregation, requiring or encouraging marriage within the group.

A challenge for middleman minority theory is reconciling its ideal concepts about capitalisms and ethnicities with real-life conditions. Useful in this regard are cases in which some aspects of middleman minority dynamics occur, perhaps, but in modified form. In northern Canada, for example, as fur traders among a largely Indian and Métis clientele, Scots have displayed a high ingroup morale, strong attachment to their homeland, and future time orientation, among other features conventionally associated with pariah capitalism. The host population has viewed their behavior as frugal, exploitative, and ethnocentric. Yet, historically, Scot traders derived from a Protestant cultural background and generally worked for large firms like the Northwest Company and the Hudson’s Bay Company. They differ from the self-employed trading minorities not so much in their image and behavior, then, as in their position within the larger political economy. Even though they faced some of the hostility of the Jewish and Asian middleman minorities, the possibility of acting upon this hostility by competitors, subordinates, and clients has been limited by the power of the large firm and the Canadian state.

Robert Jarvenpa
Human geographic mobility is as much part of human life as of human history, for human beings are a migratory species and migration is a continuum in history. International migration is the crossing of international borders, the movement from one nation state to another that falls into the main categories of labor migration, forced migration, family migration, or migration for reasons of education and training. Dividing lines, however, blur, because political borders change and distinctions between voluntary (labor) migration and forced migration or between labor migration and family migration are problematic.

Analysis and Categorization
At the onset of the 21st century, nearly 200 million people, about 3 percent of the global population, were international migrants. Thirty years ago, the figure stood at 85 million (2.1 percent), and 230 million are projected for 2030. Today, around 100 million are labor migrants, 13 million are refugees registered with United Nations (UN) agencies, and the others are family members or students.

The United Nations and International Labor Organization (ILO) official figures of international (labor) migration require some reservations. First, migration is increasingly taking irregular (illegal) forms (a tenth to a fifth of all migration) that go unrecorded. Since no method can calculate levels of irregular migration, existing figures are only estimations. Second, international migration is increasingly temporary; indeed, it is the fastest growing type of migration, and often it is too short (less than 6 months) to count as migration. Third, migration is increasingly difficult to distinguish from other forms of mobility, namely business trips and tourism. For example, businesses might involve stays of more than 6 months, labor migrants often come on tourist visas because this is often the only available means of legal entry, and retirement migrants to southern countries might be counted as tourists. Fourth, the distinction between international migration across international borders and internal mobility within a country but across administrative boundaries often is implausible. For example, geographic mobility in China, India, Nigeria, or Russia is not understood as migration because no international borders are crossed, even though movements within these countries might involve long distances and the crossing of cultural, linguistic, or religious borders. Finally, the predominant form of migration has long been rural to urban. This primary cause of the growth of cities is mostly internal, so it is not recorded as (international) migration.

Consequently, recognizing other forms of geographic mobility would produce some very different figures, perhaps between 1 and 2 billion geographically mobile people. This would mean that at least one sixth to one third of the world’s population are migrants. Putting international migration into the perspective of international travel and of internal mobility is essential, first, to produce a complete picture of human geographic mobility, and second, to judge the relevance of migration within the full range of human behavior in geographic space. In this sense, we can then examine whether migration is the behavior of only a minority (thus an exception from an otherwise sedentary norm) that requires explanation, or whether migration is normal and widespread behavior not requiring any extra justification and explanation.

Of the various major migration patterns, the first notable one is that contemporary migration is mostly from north to north (between developed countries); from south or east to north (from low- and medium-developed to developed countries), and from south to south (between developing countries). Just under half of all migration is toward and between developing countries, while the other half is toward and between developed countries, resulting in about 80 percent of all refugees found in developing countries. These directions, however, are increasingly diversifying, with recently observed large-scale movements from north to south or south to east. Second, most migration is
regional, between neighboring countries. This is because distance is short and costs are low, but also because language, culture, or religion might be similar in sending and receiving countries and historical, cultural, political, and economic links possibly facilitate that migration. In contrast, forced migration is often internal, either because conflicts are of a local nature and people can escape to other parts of a country, or because people are prevented from entering other countries and becoming internationally recognized refugees.

Notably, migration is increasingly feminized, and today women account for about half of all migrants. However, in history women migrated too, a fact often unnoticed by then-contemporary sources. Perhaps it is research finally recognizing the role of women in global migration rather than some major shift in gender migratory activity occurring.

Furthermore, nearly all countries in varying degrees experience various stages of migration, changing from being mostly sending to mostly receiving countries (such as Germany and France), or vice versa (such as Spain, Italy, and Ireland). They can also be countries of transit migration for a limited period of time (such as Turkey and Mexico), and some may experience periods of zero migration (such as modern-day Portugal). Because migration seems to be hardly predictable, it is sometimes described as “turbulences.”

**Determinants and Conditions**

No comprehensive theory of migration yet exists, although experts generally agree that migration is highly dynamic, complex, and changeable, and that migration patterns are fluid and undergo constant transformations. Further, several major determinants and conditions both drive and explain international migration: migration systems, migration networks, macroeconomic forces, non-economic factors, migration politics, and demographic developments.

*Migration systems* link regions and states historically, culturally and linguistically, economically, politically, and socially. Within such systems are simultaneous flows of information, capital, goods, and people of any kind, for any purpose, and in any direction. Meanwhile, as systems have become global, global markets for information, capital, and goods, and labor now facilitate global and sustainable movements of people.

*Migration networks* link individuals of sending and receiving communities; they provide potential migrants with preconditions such as information, finances, support with finding accommodation, and employment that encourage migration. Networks can also take the form of migration industries—businesses ranging from human smugglers to recruitment agencies and visa services—that facilitate migration. Networks often explain why migration continues even under adverse conditions, such as lack of economic incentives or unemployment in destination countries.

**Macroeconomic forces** are mostly the demand for labor and higher wages on the one hand, and by unemployment and lower wages (possibly also overpopulation) on the other hand. Thereby, so-called push and pull factors determine the flow of people, and economic modeling aims to analyze, explain, and predict these migration movements.

**Microeconomic and behaviorist theories** present migrants as individuals or families assessing their (economic) situation, considering alternative opportunities, and calculating costs and benefits of migration to improve their quality of life. Thus, migration motivations can rest within concepts of individual and collective decision making. Non-economic reasoning instead reflects climatic, cultural, or political criteria, such as warm winters, political stability, and freedom, or opportunities to enjoy a specific culture or to practice a specific religion or lifestyle.

**Demographic imbalances**—aging and decreasing populations in developed countries and increasing young populations elsewhere—impact on migration, migration discourses, and migration policies. While high-average age, high dependency ratio communities worry about future supply of labor and, at least in Europe, the lack of economically active contributors to pension and other funds, low-average age communities become natural resources to address both these issues by sending migrants.

*Migration politics and policies* such as recruitment schemes, immigration restrictions, and conditions put on entry and stay shape migration. Thus, the law determines type and character of migration, accepting a migrant as refugee or laborer or refusing entry to a migrant. Individual migrant decision making responds to set conditions and opportunities; vice versa, politics can influence individual decision making. Nevertheless, migration politics also have unintended effects; for example, controls drive people underground and recruitment stops, often resulting in migrants settling down instead of returning as anticipated.
Natural and ecological factors will increasingly cause migration. Global warming, desertification, freak weather, and rising ocean level will almost certainly cause massive population movements.

**Challenges and Opportunities**

Migration occurs within a triangle of forces: individual aspirations (including human agency, autonomy, and processes of self-selection), economic forces (including macroeconomic push and pull factors and employers’ demand for labor), and institutional goals (of political society and civil society activities). This can result in a tug of war between institutional goals and individual aspirations or of individual autonomy versus public policy. Migration brings about an encounter of sedentary populations and mobile populations and, under conditions of the market economy, it can result in competition over employment and social resources. Occasionally, conflict arises, as is most evident in protectionism, even racist responses to migration. On the other hand, migrants often occupy niches in labor markets, housing markets, and society and often do not compete with indigenous populations. Finally, they integrate and become part of the fabric of host societies.

**Normative Challenges.** Migration affects nation states’ sovereignty, hence a state’s capacity to control its external borders and access to (a) its territory, (b) its markets (labor market and housing market), (c) its social systems (public and welfare services), and (d) its political system (democratic processes and institutions). Subsequent matters arising are related to legal status (residency, citizenship) of migrants.

**Paradoxes of Globalization.** Another set of problems relates to some asymmetries and paradoxes of globalization, notably the enthusiasm over unrestricted global flows of capital, information, and goods in contrast to concerns about the flow of people. While some organizations strive for more liberal and unrestrained flows of goods and capital, other institutions aim to control and limit international migration. And while globalization provides for global migration systems and global movements of labor, facilitates the flow of information about opportunities, and brings about safe and affordable transportation, political society often remains skeptical and aims to restrict movement of people.

**Liberal Dilemma.** Migration represents a major normative and practical challenge to liberalism and liberal democracies. First, the liberal principles of equality, individual freedom, and freedom of movement are met with restrictive immigration practices and exclusive membership practices of otherwise liberal democracies. Second, international obligations—for example, to take care of refugees—are met by increasingly hostile and deterring national legislations. As a consequence, a liberal dilemma arises that is yet lacking both normative and practical resolution.

**Migration, Control, and Development.** Neoclassical economists argue that migration once liberalized would result in enormous global economic growth; given equal distribution of wealth, this would in the long run have a reducing effect on migration. Equally, shifting immigration control budgets to development politics could instead reduce the need to migrate. Critical views claim that (skilled) migration from developing world countries is a brain drain, reducing the countries’ development prospects. Meanwhile, middle-ground views instead emphasize the advantages of brain gain. Hence, human capital accumulated during a stay abroad and reinvested upon a migrant’s return contribute significantly to the sending society’s development. Finally, remittances made by migrants contribute more to development than development aid or direct foreign investments.

**Political Challenges.** Migration is one of the top international policy concerns of our time, affecting politics, international relations, and security measures. However, its determinants and conditions are beyond the scope of politics. Authorities can neither reverse history (e.g., interrupt migration systems), nor can they simply manipulate flows within migration networks once developed. Neither can those economic incentives resulting from unequal development be minimized easily, nor can population trends or climate changes be reversed in the short term. In other words, the capacity of politics to control migration is limited. Recent political trends aim to (a) distinguish between costs and benefits of migration, reduce the former, increase the latter; (b) implement selective policies that aim to attract high-skilled migrants while refusing low-skilled migrants; or (c) manage migration to the simultaneous benefit of sending countries, receiving countries, and migrants.

Migration is an intrinsic, inherent, and inevitable part of grand and continuous transformation processes. The departure and arrival of large numbers of people represent a considerable challenge to both sending
and receiving communities and societies. Whether migration as such or ill-prepared social systems and inadequate models of political organization of humanity (nation states) are at the core of the problem, migration has an impact on normative, political, economic, and social dimensions of the affected societies. Consequently, two perspectives address the migration problem: either try to prevent and contain large-scale migration (the predominant and conventional response) or better prepare societies and communities for mobile populations (the constant arrival of newcomers and departure of others).

MILITARISM

Militarism refers to the influence of the military as an institution and of the preparations to use military force on the overall social organization of society. The concept has four parts.

The first is the direct participation of military officers in the most important governing structures. This feature of militarism has been largely absent in the United States, where the Constitution provides for civilian control of the armed forces. Military officers have played a major, direct role in the recent history of countries as diverse as Argentina, Greece, Pakistan, and Myanmar. Direct military involvement in key decision making may also be at a secondary but still important level, particularly during wartime.

The second component of militarism is a foreign policy predicted on a strong military, projection of force, and what C. Wright Mills (1956) called “a military definition of reality.” Here the focus is less on who makes decisions and more on the assumptions and ideological structure that informs those decisions. In the United States, the capacity of some civilians to embrace militarized policies more thoroughly than those in uniform can be traced in the Cold War, Vietnam, the 1991 Persian Gulf War, “Operation Iraqi Freedom,” and the “Global War on Terror.”

The third element of militarism concerns the level of support for military values and norms within the overall culture of a society. Different features of popular culture can provide the military with legitimacy, sustain more peaceful alternatives, or create a middle ground where the clash between civilian- and military-influenced values and norms creates a form of “contested terrain.” Examples include respect for those in uniform; the patterning of children’s play; the content of patriotism; the prominence of the military in books, television, and feature films; and the connections between traditionally understood masculinity and military participation.

Fourth, militarism focuses on the influence of war preparations on key economic, political, and cultural institutions. Military spending can have a significant macro effect on the economy (“military Keynesianism”) and play an important role in particular industries and in regional and local economies. Military service may be required or not. Civilians may be encouraged to engage the war effort directly through war taxes, donations, and volunteerism. Preparations to use military force can make a full-scale enemy out of “the Other” or encourage the search for presumed enemies within a society. Finally, the media can be forced or induced to support the military as an institution or militarized policies. Fully militarized societies will provide structures that sustain most if not all of these. Many contemporary societies contain a complex mix of features that sustain militarism while also nurturing social alternatives.

Military-Industrial Complex

In his 1961 farewell address, President Dwight D. Eisenhower warned of the dangers of the military-industrial complex. While arguing for its necessity, he also stated that we must guard against its potential dangers to our democratic processes and liberties. This was not the first use of the term military-industrial complex. Charles Trevelyan of the United Kingdom first used it in 1914, but with Eisenhower’s warning it became part of general political discourse. The military-industrial complex refers to the combination of two powerful entities in U.S. society. The first is the military establishment. The federal government spends billions of dollars annually keeping millions of men and women working to ensure national security. Since World War II, a permanent arms industry has complemented this military establishment. With this massive private industrial might symbiotically working with the government’s military in times of war or peace, the U.S. government no longer needs to rely on a private sector conversion to military production every time war breaks out.

The pattern of U.S. military spending changed significantly in the middle of the 20th century. Prior to the Second World War, peacetime military spending as a percentage of gross domestic product (GDP) was generally less than 1 percent. During war it rose considerably—for WWI it rose to 7 percent—but still remained at fairly low levels. This all changed with the onset of WWII. From 1943 to 1945, annual military spending increased to more than 37 percent of GDP—the war dominated the economy. After the war there was a significant cutback in military spending to average levels of 5 percent of GDP. With the Korean War, these levels rose again to about 14 percent. They remained above 10 percent for the rest of the 1950s after the cessation of hostilities in Korea—peacetime military spending was at higher levels than earlier wartime levels. This maintaining of high levels of military spending—even during peacetime—marked the advent of the U.S. military-industrial complex of which President Eisenhower spoke.

These massive amounts of military spending fueled the private military-industrial sector. The federal government was now spending large amounts of money on arms production even in relatively peaceful times. Private entities, such as Lockheed Martin, Raytheon, and Northrop Grumman, were able to grow into large companies that were mostly dependent on government contracts for their survival. The relationship of these companies and the U.S. government is the essence of the military-industrial complex.

Since the 1950s, the ratio of U.S. military spending to GDP has declined considerably. During the Vietnam War this ratio was about 9 percent. Then in the 1970s it further declined to about 5 percent. President Ronald Reagan built it back up to about 6 percent in the 1980s, and then it fell to 3 percent by 2000. With the war in Iraq, it has inched back up to its current level of 4 percent.

Based on this more limited role that military spending now has in the United States, some argue that the military-industrial complex no longer exists. This would be an exaggeration. It is true that the military colossus is not quite what it was in the 1950s, but it is still a powerful presence in the U.S. and world economies. First, ratios of military spending to GDP at levels of 3–4 percent are still much higher than they were pre–World War II. Second, the absolute level of military spending is very high—the U.S. government spent more than $540 billion for national defense in 2006. Third, relative to the rest of the world, the United States spends far more on the military. The United States contributes more than half of the approximately $1 trillion spent worldwide annually on the military. In fact, the U.S. government’s military budget is more than the next 14 countries combined—it is nearly 7 times that of China, the second largest spender. Simply put, the United States still devotes an enormous amount of resources to military purposes; with arms being manufactured by private firms, the military-industrial complex remains a powerful force in the economy and society.

President Eisenhower, in his farewell address, argued that the military-industrial complex was absolutely essential for our country’s welfare. With the sort of national rivalries that existed in the world, the United States needed to be instantly ready for war,
in order to deter potential aggressors: a large and powerful arms industry would provide that readiness. The military-industrial complex is crucial to establishing national security in just such a world.

In addition to this national security argument, some economists argue that high levels of military spending are necessary to sustain capitalist economic growth. The phrase, “the permanent war economy,” coined at the end of World War II by Charles Wilson (who later became Eisenhower’s Secretary of Defense) in support of the military-industrial complex, is a phrase that describes this. The argument is that if the government does not continually maintain high expenditure levels, then a capitalist economy will fail to grow and will become mired in recessions or depressions.

For Keynesians, the effects of military expenditures are like any other nonmilitary expenditures. An increase in any kind of government spending will increase economy-wide aggregate expenditures, thereby increasing GDP, resulting in a growing economy. As long as the government spends freely, the economy will thrive.

If the two forms of expenditures have equal economic effects, why has it been military spending driving the economy? Military spending has two advantages over social spending. One, it maintains the balance of forces between the capitalist and working classes—too much social spending may tip the balance in favor of the working class. And two, it seems much easier to garner political support for military spending than for social spending, at least in the United States.

The existence of the military-industrial complex raises concerns in three separate areas: the threat to liberty and democratic processes; the increased possibility of political and economic corruption; and its debilitating economic effects. President Eisenhower raised the first concern in his farewell address. When any governmental organization gets very large, the concern always exists that by acquiring undue powers unto itself it may limit individual freedoms. This becomes particularly acute if the organization is involved in national security—the Defense Department is naturally secretive and undemocratic and inherently restricts freedom of speech. This may then carry over into the private arms industry, further undermining democracy and freedom.

In any operation the size of the military establishment, waste, fraud, and mismanagement are practically inevitable. Some analysts even argue that because of the nature of the military, these concerns are greater than for the nonmilitary functions of the government. Whatever the case, there certainly is large-scale mismanagement on the part of the Pentagon. The General Accounting Office (GAO) has repeatedly stated that the Pentagon improperly accounts for billions of dollars in assets, consistently overpays for weapons systems, and makes erroneous and improper payments to its contractors in the arms industry. For example, the GAO reported that the Pentagon could not account for more than 20 percent of its $1.2 trillion worth of property and inventory in the 1990s.

The third concern regarding the military-industrial complex is economic. Opposing the Keynesian argument that high military spending is beneficial to the economy, some economists argue that military spending in fact represents severe opportunity costs. By choosing guns rather than butter, the economy is deprived of much useful social spending. For example, building a missile serves a useful purpose only if the country is at war. And even then, once it is used, it is gone and serves no lasting purpose—it is purely destructive in nature. Building infrastructure, such as bridges and roads, on the other hand, serves a lasting purpose and adds to the economy’s use-values. The spending in either case—military or nonmilitary—may give an initial boost to the economy, but nonmilitary spending develops the economy, unlike military spending, which does nothing to enhance future economic output. These economists are essentially arguing that social spending is more economically useful than military spending.

Minimum competency tests (MCTs) measure the knowledge and skills deemed critical for the test-taker, establishing that he or she possesses these skills at a baseline level. Although often used synonymously with basic skills testing, the term can take some different twists. The typical use of MCTs is at benchmark points in the K–12 system and also for licensure in an employment field.

In the school context, under the No Child Left Behind guidelines, MCT scores influence decisions at two levels: whether individual students can progress to the next benchmark (including graduation) and whether or not the school is making adequate yearly progress (AYP) toward governmental targets. In the employment context, decisions rest on the competency of a potential employee with regard to "safe" practice, thereby protecting the public from harm in such fields as nail technicians, airline pilots, and school teachers.

Among competencies typically tested are the traditional basic skills (i.e., the 3 R’s) as well as specific content deemed critical for the decision point. In school-based MCTs this might include science. In the professions it would include job-related skills. Nail technicians would need to know how to prevent fungus infections, airline pilots how to land the plane, and teachers their content areas and pedagogical techniques. PRAXIS II is an example of an MCT for teachers.

The decision about whether or not a test-taker is minimally competent rests on a cut-off score set by the administering agency that, in theory, is the point that divides the competent from the noncompetent. A particular challenge in the cut score setting (or standard setting) process is finding the score that guards against denying a diploma or license to the competent (false negatives) or permitting graduation or licensure to the incompetent (false positives). The potential error inherent in the judgmental process used to establish cut scores adds to the concerns raised about the accuracy of inferences made.

The national trend toward school accountability caused an upsurge in MCTs, and the global social consequences of K–12 MCT testing are not yet clear. Like all standardized tests, protected and special populations tend to perform worse. Most researchers seek more data on whether or not the population is becoming more literate because of the tests. Some educational agencies are also requiring MCT test data from institutions as a potential measure of effectiveness.

Social consequences of MCTs can be positive or negative, depending on one’s sociopolitical stance. One’s position on “back to basics” could affect perception of curricular and instructional reform as overly narrow or appropriate. Teachers can become more motivated and/or stressed. Similarly, students’ motivation and self-concept can be increased or lowered. The credibility of increased test scores depends on whether or not gains are real or content or cut scores are manipulated. Heightened public awareness of student achievement may rely on invalid inferences that might lead to legislative help or interference.

Recent research has mixed results on MCT effectiveness. In one study, the labeling of low-performing schools caused control strategies that rigidified organizations and only weakly led to instructional reforms but noted that some schools were able to use MCT as a useful mechanism to identify and remediate students having difficulties. One study of 18 states concluded that in all but one state, student learning was indeterminate, remained at the same level it was before the policy was implemented, or actually went down when high-stakes testing policies were instituted. However, another study found that states that attached consequences to the tests had better results.

MINORITY GROUP

The term *minority group* has an array of meanings. However, the key element in every definition is the relative lack of power. Traditionally, *minority group* referred to racial and ethnic groups. Anthropologist Charles Wagley and Marvin Harris identified five defining elements of a minority group in 1964:

1. The group is a subordinate segment within a political unit that receives unequal treatment compared to other groups.
2. It has easily identifiable and devalued physical and/or cultural traits.
3. It has a sense of peoplehood and a feeling of self-consciousness.
4. Membership is by descent; one is born into the group.
5. Marriage occurs within the group, by necessity or by choice.

The first element is the most important. A *subordinate segment* simply refers to relative powerlessness or oppression. *Identifiable and devalued traits* refer to things such as skin color, language, or dress. A *sense of peoplehood* means that members of the minority groups are aware that they are part of a separate group. *Membership by descent* means that one is usually born into such a group and the group is like a caste; one cannot easily move out of the group. *Marriage within the group by necessity or choice* reveals much about the notion of minority group. Some groups at some times want and desire only marriage within. At other times, other groups forbid members of the minority group to out-marry. For example, in the United States, African Americans were not allowed to marry whites in many states until 1967, when state laws prohibiting intermarriage were declared unconstitutional.

This classical definition lends itself to the traditional notion of minority groups. Examples of such groups today would be African Americans, Mexican Americans, and Native Americans. If we turned the clock back to 1900, many other ethnic groups would be defined as minority groups, including Jewish Americans, Italian Americans, Polish Americans, and others.

A shorter definition of *minority group* is oppressed ethnic and racial groups. Again, we can see that racial and ethnic groups who are or were lacking in power fit this definition as well.

It should be noted that some social scholars emphasize the first element of the definition alone. Doing so increases the types and numbers of minority groups, for many groups can demonstrate a lack of power, not just racial and ethnic groups. Women certainly can show a lack of power using such measures as income, wealth, education, housing, and political representation. Gays also evidence gaps in many of those areas. Using only the first element of the definition—relative lack of power—many other groups could also qualify as minority groups: college students, left-handed people, the elderly, marijuana smokers, tobacco users, and so on.

Finally, although definitions of *minority group* vary widely, it is important to note that the term *minority* does not refer to numbers. Although minority groups in many countries are in fact smaller in numbers, this is not universally the case. Apartheid South Africa and the former Rhodesia illustrate that the minority group can be most of the population.

MISCEGENATION

Miscegenation refers to the marriage or interbreeding of races, particularly of whites with nonwhites. The Spanish equivalent is *mestizaje*, from which we get
the Spanish term mestizo, whose English equivalents, derogatory or otherwise, include terms such as half-breed, half-caste, mulatto, or hybrid.

When the first recorded interracial marriage in U.S. history between John Rolfe and Pocahantas occurred in Virginia in April 1614, negative ideas about miscegenation had hardly formed. Afterward, opposition against miscegenation involved rejection of intimate relations between groups who were phenotypically different and of the legitimacy of mixed offspring.

Reaching a peak number of 30 in 1913, miscegenation laws then existed in Alabama, Arizona, Arkansas, California, Colorado, Delaware, Florida, Georgia, Idaho, Indiana, Kentucky, Louisiana, Maryland, Mississippi, Missouri, Montana, Nebraska, Nevada, North Carolina, North Dakota, Oklahoma, Oregon, South Carolina, South Dakota, Tennessee, Texas, Utah, Virginia, West Virginia, and Wyoming. Their statutes varied, and further confusion arose from the decisions interpreting them, especially in defining races other than white and the impossibility of formulating any general rule with regard to the (il)legitimacy of the progeny from such unions. Penalties for violation of these laws ranged from either imprisonment for a few months to a term of 10 years, or fines ranging from small sums up to $2,000, or both. These laws remained in the books until 1967, when the U.S. Supreme Court abolished them.

Although no known scientific method existed for ascertaining the difference between the blood of white and nonwhite people, frequent references in the statutes spoke to persons having varying degrees of “colored” blood. This concept gave U.S. miscegenation its most peculiar characteristic, whereby a white woman could give birth to a black child but a black woman could not give birth to a white child. The terms hypodescent or descending miscegenation refer to this latter phenomenon. In popular U.S. terminology, this is the “one-drop” rule, which defines persons with even “one drop” of African blood in their veins as “black.”

In other countries, opposition to miscegenation was less strong and persistent. In 1514, the initial prohibition in Latin America of marriages between Spaniards and Indians ended, replaced by encouragement of intermarriage in the hope that this would bring Spanish adventurers to settle permanently in the New World. Similarly, miscegenation was commonplace in the Portuguese colonies.

The French recognized interracial marriages in their Caribbean colonies until the early 18th century. However, the famous Code noir of 1685 punished concubinage between a white man and an African slave, imposing a fine of 2,000 pounds of sugar if any progeny resulted; if the couple married, the woman was freed and the fine rescinded. Enforcement was lax in the colonies, unlike France itself, which officially prohibited interracial marriages in 1778; the ban ended after the French Revolution of 1789.

In colonial Africa, the French, Italians, Portuguese, and Arabs showed more tolerance toward miscegenation than the British and Germans. In the British Empire, the most widespread miscegenation occurred in South Africa, primarily the result of illicit sexual intercourse, leading to a 1927 law making extramarital relations between Europeans and Africans a punishable offense. In other British colonies, the Crewe Circular of 1909 prohibited cohabitation between government officials and “native” women.

In German Southwest Africa (GSA) in 1905, in German East Africa (GEA) in 1906, and in German Samoa in 1910, the governors enacted regulations against interracial marriages. In 1912, when the Reichstag, or German legislature, became aware of the issue of interracial unions in the colonies, it passed a resolution upholding the legality of the colonial laws.

The Arabs in colonial Africa were the most amenable to interracial marriages and concubinage. Their amenability was ameliorated by Islam, which accepts the equality of races. Equally important, due to the patriarchal nature of Arab culture, children of Arab–African unions were recognized as Arabs regardless of how dark their skin complexion was. Thus in contrast with America’s “descending miscegenation,” Arab–African miscegenation is “ascending miscegenation” because the offspring assumed the status and identity of their Arab fathers.

MISDEMEANOR

The most common way of classifying crime is by seriousness, or misdemeanor versus felony. Misdemeanor crimes are less serious than felonies. The person who commits a misdemeanor is called a “misdemeanant” and the person who commits a felony is called a “felon.” In early English law, felonies were those offenses that could lead to death as punishment and forfeiture of the felon’s property. Committing a misdemeanor did not necessarily mean that the crime was a minor one. It simply meant the misdemeanant could not be punished with the death penalty or lose his or her property.

Misdemeanors did not exist in English law until the 16th century, and then they were identified generally as transgressions against the royal peace. In contemporary criminal law, the states’ penal codes specifically define each misdemeanor crime. Typically, misdemeanors are lower-grade or -degree offenses in criminal codification and of lesser gravity and seriousness. Usually, misdemeanants are treated more leniently by criminal law than are felons, which means they receive less punishment while felons receive harsher sentences. Punishments for a misdemeanor might be a fine, probation, or a jail sentence of less than a year. Some states define the seriousness of the offense according to the place of punishment, such as prison for felonies and jail for misdemeanors.

Examples of misdemeanors are disorderly conduct, petty theft, prostitution, public intoxication, trespassing, and vandalism. However, the list of misdemeanor crimes is nearly endless. For instance, Texas has 903 misdemeanor crimes listed in its penal code. The distinction between misdemeanor and felony affects a defendant’s destiny in the criminal justice system. Usually law enforcement agencies use their discretion to arrest those defendants who have committed serious crimes rather than misdemeanor crimes. Misdemeanors also have a different court level than felonies. Trial courts of limited jurisdiction preside only over cases that involve misdemeanors and lawsuits for small amount of money. According to Bureau of Justice Statistics, 15 percent of convicted defendants in courts of limited jurisdiction are sentenced to incarceration, 50 percent receive probation, and 25 percent are fined.

The Sixth Amendment of the U.S. Constitution says criminal defendants are entitled to a right to trial by jury. However, the U.S. Supreme Court in Lewis v. United States in 1996 declared that this provision only applies to people accused of serious offenses. People who face less than 6 months in jail for a charge are not entitled to a jury trial and instead go for a bench trial, where the presiding judge determines innocence or guilt and, if the latter, the punishment within the prescribed statutes.

Like all other defendants, misdemeanants also are entitled to have an attorney. In Argersinger v. Hamlin (1972), the court required adequate legal representation for anyone, including indigents, facing a jail or prison sentence if convicted.

MISSING CHILDREN

Missing children are young people whose whereabouts are unknown or who are not where they are supposed to be. There are several types of missing children. The most common categories are children who become lost (these tend to be young children, and most are recovered fairly quickly) and runaways.
(usually adolescents who return home after a short absence, although some stay away for prolonged periods). Public concern tends to focus on two less common types of missing children: those abducted by family members (typically this occurs during custody disputes between divorced parents); and those abducted by non-family members (such children may be held for ransom, be sexually abused, and suffer other forms of serious exploitation).

The label “missing children” was promoted during the early 1980s by a social movement that claimed the problem was widespread (at that time, activists estimated that perhaps 2 million children went missing each year in the United States), and that too little was done to recover missing children. In most cases, missing children were reported to local law enforcement agencies that, particularly in the case of adolescents, often presumed that the youths had run away and would return on their own, so that officials might not begin searching for 2 or 3 days; there was no system for notifying law enforcement agencies other than those that took the initial report. Activists pointed to cases of murdered children and children who had permanently disappeared as evidence that more needed to be done to locate missing children. The issue attracted considerable media coverage, and the federal government passed laws, including the Missing Children’s Act of 1982 (which authorized the FBI’s National Crime Information Center to accept reports of missing children); the Missing Children’s Assistance Act of 1984 (which led to the establishment of the federally supported National Center for Missing and Exploited Children [NCMEC] that could coordinate search efforts, and which also ordered the government to conduct periodical efforts to measure the number of missing children); and the National Child Search Assistance Act of 1990 (which required law enforcement agencies to report cases to the NCMEC). In response to the publicity about the problem, images of missing children began to appear on milk cartons, shopping bags, and so on.

By the mid-1980s, journalists began questioning some of the movement’s statistics. While some kidnapped children certainly were victimized in terrible ways, such cases were less common than activists implied. The Denver Post received a Pulitzer Prize for stories arguing that there was a “numbers gap” between the movement’s estimates (such as claims that strangers abducted 50,000 children each year) and law enforcement records (the FBI investigated about 75 child kidnappings annually). Grouping various kinds of cases under the single heading of “missing children” had rhetorical advantages: including runaways (who far outnumbered abducted children) allowed activists to argue that hundreds of thousands—perhaps even millions—of children went missing each year; including non-family abductions let them point to frightening examples of child victimization to illustrate the problem. Families who had lost children through family abductions (and who had been frustrated by the reluctance of law enforcement to get involved in those cases) provided much of the movement’s leadership.

Partly in response to the debate over the number of missing children, the federal government funded the NISMART (National Incidence Studies of Missing, Abducted, Runaway, and Thrownaway Children) research. NISMART involved large-scale social scientific research that included surveys of law enforcement and social service agencies, as well as household surveys designed to measure the proportion of households that had experienced a missing child. The first study (NISMART-1) was conducted in 1988; it was followed by NISMART-2 (done in 1999). Because missing children statistics had become controversial, NISMART developed two definitions for most categories of missing children: “broad scope” definitions encompassed all cases counted as missing children (for example, all runaways), while “policy focal” definitions included only the more serious cases (such as runaways who lacked a familiar, secure place to stay for at least one night).

In general, NISMART estimated that most categories of missing children were less common than activists originally had suggested. NISMART-1’s estimates for the most serious cases in different categories of missing children were non-family abductions: 200–300 cases per year; family abductions: 163,200; runaways: 133,500; and throwaways (children ordered by their families to leave their homes): 59,200–127,100. NISMART-2 found that the rates for most types of missing children (per 1,000) declined between 1988 and 1999.

This missing children movement did affect public policy. Increased public awareness led to various prevention programs (which tended to focus on the danger of abductions by strangers—a relatively uncommon phenomenon) and also to improved search procedures. The NCMEC became a national clearinghouse for reports of missing children, and several
states required all law enforcement agencies to report all cases to newly established statewide clearing-houses. In addition, the movement called attention to the need for improved social services for long-term runaways, as well as thrownaway children who had been rejected by their families.

While intense concern over missing children abated after the 1980s, the issue sometimes is revived following heavily publicized cases. Thus, during the summer of 2002, reports that an adolescent girl had been abducted from her bedroom one night led to renewed media coverage of the missing children problem, including suggestions that there was a “wave” of child abductions (although the evidence for this was anecdotal). This illustrates how heavily publicized cases can revive interest in a social problem, even if the number of people affected is neither large nor growing.

Mixed Economy

The term mixed economy typically describes an economic system that combines the use of market and command mechanisms to guide economic activity. A mixed economy is typically considered a middle ground—a “third way”—between laissez-faire capitalism and state socialism. Virtually all developed economies, including that of the United States, fall into this category. Most modern manifestations of the mixed economy incorporate varying degrees of private economic activity, such as privately owned enterprises, and state regulation and control of the economy, such as social welfare programs, economic and industrial planning and development, and state ownership of economic enterprises. The modern welfare state is often viewed as a type of mixed economy, one that mitigates the vagaries and inequalities that arise in a free market economy.

In 1949, Sir Richard Stafford Cripps coined the term as a way to describe the British postwar economy. As Britain’s chancellor of the exchequer from 1947 to 1950, Sir Cripps advocated and implemented a rigid austerity program to revive Britain’s economy. The term countered the perception that some of the elements of the program resembled socialism and communism, which were both seen as anathema in the postwar political environment. Earlier, John Maynard Keynes established the intellectual foundations of the approach in his advocacy of an active role for state intervention in guiding and shaping the economy.

Throughout the 1950s and 1960s, the mixed economy was widely embraced as a strategy for economic policy. Initially, the strategy was legitimized due to the economic success of the countries that adopted the strategy. However, a series of economic crises, starting in the late 1960s and continuing through the 1970s, weakened support for the mixed economy. Since the 1980s, the rise of neoliberal economic policies has led to a greater emphasis on the primacy of the market and a growing aversion to government intervention in the economy. In the United States, this was partly manifested in a drive to divest the government of federal assets, such as the sale of Conrail to private investors in 1987.

The literature on the mixed economy is vast. In economics, the contributions range from arguments defending the mixed economy, such as Japan’s active role in industrial policy, to rejections of the “sickness” of the mixed economy. In sociology, a number of recent contributions document the social changes that occurred during the transition of formerly socialist economies to more market-oriented policies. These include the changes that occurred as a result of China’s gradual adoption of market policies and the social impacts of the so-called shock treatment policies adopted after the fall of Soviet communism.

MODERNIZATION THEORY

Modernization theory focuses on the development and progress of societies. In its examination of social formations evolving from lower levels of organization and production to higher ones, its essence lies in terms of a process of economic, social, and cultural development and change. Of the two major intertwined aspects of the debate on modernization, the first concerns the theoretical articulation and conceptual framing of progress. Here the major question is whether progress exists in history and, if so, whether it occurs in terms of evolution or revolution or—in the sense that evolution occurs in human history—if it leads to revolution. The second aspect of the debate relates to the relationship of developed countries to developing countries, and whether developing countries must follow the path of developed (Western) countries to achieve wealth and civil liberties.

The theoretical debate on modernization looks back to Max Weber’s critique of Karl Marx’s theory of history and progress (historical materialism). According to this concept, consciousness does not determine material life, but rather material life determines consciousness. Morality, religion, metaphysics, other ideologies, and forms of consciousness are rooted in the process of material production and in the material relationships of human beings. With the production and alteration of their material conditions (structure), human beings produce and change their mode of thinking (superstructure). Weber attacked this concept of history, particularly in the role of superstructure in social change. He argued that it was not changes in material conditions that prepared the way to capitalism but the Protestant ethic instead. Weber later adopted a broader concept of social change, but his aim remained the same: using ideal types to replace Marx’s concept of social formation. Weberian scholars like Talcott Parsons, for example, concentrated on the role of religion in social life (secularization) and whether it is necessary for an integrative social life. Other Weberian scholars also argued against Marx’s concept of revolution and socialism.

The second debate centers on the question of developing countries. Modernization theorists (foremost economists) claimed that these countries must change their traditional organization of production, culture, and beliefs to catch up with Western modern societies. Dependency theory arose as a critique of modernization theory. It explained backwardness of and poverty in the developing countries by referring to the world system of capitalism. According to dependency theory, this system creates backwardness and poverty systematically by exploiting these countries and destroying their historical-cultural achievements. Many proponents of dependency theory share some of the basic assumptions of modernization theory, but maintain that the modernization of the developing countries can only occur in a postcapitalist society.

MOMMY TRACK

Gender discrimination in the labor market manifests in a variety of forms. For decades, researchers have documented asymmetry in the types of work performed, remuneration for labor, and workplace...
climates for men and women. The concept of the *mommy track* emerged in the late 1980s, ostensibly as a solution for the glass ceiling effect that prevented all but a small minority of professional women from achieving high-level managerial positions in the corporate sector. The mommy track would comprise one level of a dual labor market among women and function as a formally institutionalized mechanism to distinguish between “career-primary” and “career-and-family” orientations.

Business analyst Felice Schwartz proposed that aspiring professional women should openly declare to prospective employers their intentions with regard to current or future motherhood. Women who choose the mommy track receive less corporate investment in their training and fewer advancement opportunities in exchange for the freedom of prioritizing child care and the purported distractions it presents for working women. Career-primary women would forgo child-bearing and prioritize professional advancement; they could expect corporate recognition of their differential time investments through more challenging work assignments and occupational mobility. Given the empirical reality of sex segregation in the labor market that derives, in part, from the concomitant presumptions that all women will establish families and that women are always primary caretakers, the formalization of choice for women would, ideally, eliminate some level of occupational discrimination.

During the ensuing years, the concept of mommy track changed to refer more generally to both women’s self-imposed limitations to career mobility that result from interrupted labor force participation for child rearing and the continued gender bias against women that frequently restricts their opportunities in the labor market. The recent use of the term *mommy trackers* refers to the increasing number of largely white, middle-class, college-educated women who express the desire to delay or interrupt their careers to raise children.

Critics of the concept of mommy tracking (by choice or default) suggest that highlighting women’s family roles obscures the extent to which men simultaneously participate in paid labor and bear family responsibilities and, thus, unfairly penalizes working women. Few suggest a parallel concept of a “daddy track” with any seriousness. Moreover, the mommy track concept presumes that women are unable to compartmentalize paid work and family responsibilities or are less proficient at balancing work and family than men. Finally, organizations that practice mommy tracking do not recognize the centrality of family life to all employees, and the extent to which facilitating work–life balance enhances worker productivity and the quality of work experiences for women and men.

**Monopolies**

Monopolies (from the Greek *monopolion*, “one seller”) are markets with a single producer or distributor of a certain product or service. In addition, this exclusivity serves as a barrier to free market entry, product differentiation, and a stable (inelastic) demand for products due to the non-availability of close substitutes. In economics, monopolies are the antithesis of free competition markets with multiple producers or distributors (sellers) of a product or service. Neo-classical and most contemporary economists regard monopolies as secondary, imperfect, and deviant markets in relation to free competition as a primary, perfect, and normal market.

Market monopolies can produce social problems on several interconnected grounds. These grounds are concentration of economic and other power, elimination of equality, inclusion and freedom in economy and society, economic and social inefficiency, and the transformation of economic into political and other domination.

First, market monopolies generate social problems by their concentration and abuse of economic as well as political and other power and domination. Economists measure this concentration by the Lerner (1955) index of the degree of market power (given by the difference between price and marginal costs). The
index is assumed to be the maximum (1) under monopoly and the minimum (0) in free competition. Monopolies can become serious social problems due to their tendency toward abusing such concentration of economic and other power. In short, the concentration of power corrupts and generally makes problematic market monopolies.

Second, market monopolies trigger social problems through elimination or restriction of economic and other equality, inclusion, and freedom. Monopolies reproduce economic and other social stratification through inequality and exclusion based on status, class, and power. In general, market monopolies usually act as the forces of economic and other exclusion, closure, privilege, and un-freedom.

Third, market monopolies breed social problems by their economic and social inefficiency, as reflected and measured by their typically higher prices and lower production and employment in comparison with competitive markets. Adam Smith suggested in 1776 that under market monopolies price is the maximal, while production and consumption are the lowest, as compared with free competition. Like Smith, J. S. Mill concluded in 1884 that, due to their limitation of supply and maximal price, monopolies are so economically inefficient and destructive in that they amount to the taxation of the industrious for the support of indolence, if not of plunder.

Fourth, market monopolies cause social problems in their tendency toward transforming and expanding economic into political and other power. Monopolies seek to dominate not only a certain market and the economy, but also society as a whole, including politics and government. Alternatively, due to their economic power and influence on the government, market monopolies can gain even more monopolistic privileges. Monopolies tend to expand from markets into polity and all society in the form of monopolistic political and social domination (plutocracy and oligarchy). No wonder economist Leon Walras presented in 1936 the image of market monopolies as fortifications spoiling and tyrannizing society as a whole.

*MORAL ENTREPRENEURS*

Moral entrepreneurs are individuals committed to the establishment and enforcement of rules against behavior they define as deviant. As such, they are especially visible and active agents of social control. Howard S. Becker, who coined the term moral entrepreneurs and introduced it in his classic 1963 book *Outsiders: Studies in the Sociology of Deviance*, identified two kinds of moral entrepreneurs: rule creators, or those who work to bring about new prohibitions; and rule enforcers, or those who work to enforce prohibitions already in place.

Rule creators generally express the conviction that some kind of threatening social evil exists that must be combated. This is most true of “crusading reformers,” described by Becker as “the prototype” of rule creators. Having perceived a social evil, crusading reformers take vigorous action against it. They do so by drawing public attention to the behavior they condemn; inciting people to high levels of concern and outrage over it; and convincing legislators that it is necessary to establish rules against it. Examples of rule creators abound. In *Outsiders*, Becker describes those active in the early 20th-century American Prohibition movement as classic examples of moral crusaders. Additional examples can be found in the many activists at work today against drunk driving, tobacco use, other kinds of drug use, abortion, pornography, child abuse, rock and rap music lyrics, environmental damage, cruelty to animals, illegal immigration, and many other behaviors.

If moral crusaders succeed in their efforts to create new rules, further social control of the acts they condemn falls to rule enforcers such as the police. As a group, rule enforcers typically do not exhibit as much moral zeal as rule creators. For them, the enforcement of rules is a job that must be performed day in and day out, and they tend to have less invested in the actual content of the rules. If the rules change, their enforcement efforts change with them. Becker suggests that it is more important to most rule enforcers to receive
respect and cooperation from the people whose behavior they control, and to establish to the public that there is an ongoing need for their efforts. Nonetheless, rule enforcers can demonstrate considerable moral fervor in taking action against certain offenders under certain circumstances.

The sociology of social control seeks to predict and explain the behavior of both rule creators and rule enforcers. Donald Black (1993), a prominent sociologist in the field, sees the creation and application of explicit rules as characteristics of moralism, or the tendency to treat people as enemies. Among the social conditions that he identifies as sources of moralism are status superiority and social remoteness between the agents of social control and the people whose behavior they regulate. Thus, the most likely targets of both rule creators and rule enforcers are those who are socially inferior, culturally different, and personally unknown. It is their behavior that is most likely to seem objectionable and to call forth the strenuous efforts of moral entrepreneurs.

Mortality Rate

Mortality rates provide information about deaths in a population. The most basic measure, crude death rate (CDR), is the number of deaths in a population per 1,000 individuals in that population in a given year. CDR is an inadequate, and sometimes misleading, descriptor of mortality because it obscures populations’ age and sex structures. In order to understand who is dying and when, mortality rates need to be broken down into meaningful categories. Age, sex, cause of death, race/ethnicity, social relations, geographical factors, socioeconomic status, and human and environmental hazards can all influence levels of mortality. Due to age-specific patterns of mortality, age-specific and age-standardized rates are crucial to understanding populations’ mortality profiles.

A typical age pattern begins with high mortality from birth to age 1, declining mortality from ages 1 to 5, mortality further decreasing from age 6 through late adolescence, and then mortality steadily climbing again through adulthood. This pattern makes the rates important: infant mortality rate (IMR < 1), child mortality rate (CMR 1–5), and 5-year age groups through the rest of the life course. The age pattern described is altered in high AIDS-prevalence populations, with a bump in mortality rates at prime ages (25–50), and a drop before climbing again at older ages.

While age-specific rates mirror CDR’s computational structure, decomposing rates by age allows for more specific geographic and group comparisons. Age-standardized rates, on the other hand, compare mortality in one population to another by applying the age structure of Population A to the age-specific mortality rates of Population B, thus making evident where and how the age structure influences the overall level of mortality. Age-specific mortality rates make up one column of a life table, a central tool in demography, which allows mortality rates to be translated into a number of other measures, including the probability of surviving a certain age interval and life expectancy. Other important mortality rates include those that highlight specific causes of mortality; for instance, maternal mortality rate (MMR) captures the number of maternal deaths due to childbearing per 100,000 live births.

According to Population Reference Bureau statistics, in more developed countries CDR is 10/1,000, while less developed countries’ CDR is 8/1,000. The larger percentage of older people, with a higher risk of dying in a given year, in more developed countries is what increases the CDR in these countries. When it is broken down, however, very different patterns emerge: IMR in more developed countries is 6/1,000, whereas it is 57/1,000 in less developed countries, and life expectancy at birth is 77 and 65, respectively. High HIV/AIDS prevalence leads to high IMR and low life expectancy (e.g., Swaziland: IMR 74/1,000, life expectancy 34 years). Important patterns also emerge when looking at racial/ethnic and socioeconomic differences within developed country settings, with higher IMR and CMR among minorities and the poor. Such differences provide evidence for looking beyond CDR to mortality rates by age, cause, and sociocultural categories.

Multiculturalism

Multiculturalism is a belief, ideology, movement, or policy that has several interpretations, but essentially advocates the peaceful coexistence of different cultural, ethnic, and/or racial groups within a single society interacting with one another on a mutually respectful, equal basis. Generally, nativists and those favoring assimilation oppose multiculturalism in any form, fearing its threat to national unity. Whereas proponents view multiculturalism as the foundation of a truly democratic society, opponents consider it as quicksand that will swallow up the core culture of the country.

Evolution of the Concept

Although a fairly new term coming into widespread public use in the 1980s, multiculturalism is actually a reformulation of the older concept of cultural pluralism, a term coined by Horace Kallen (1882–1974), a philosophy professor and immigrant from Eastern Europe. In the early 20th century, educator John Dewey and social worker Jane Addams both expressed concern about the loss of the cultural values of immigrants through assimilation. Kallen gave formal voice to their advocacy for cultural pluralism (the differences in language, religion, and value orientations) in an essay appearing in the *Nation* in 1915. Not until the early 1970s, though, did the concept gain widespread support, epitomized in the American Jewish Committee’s creation of the Institute on Pluralism and Group Identity. This organization held numerous conferences and workshops and published dozens of working papers, articles, and books.

In the 1970s, multiculturalists first advocated adapting school curriculum materials in U.S. history to include the contributions of non-European peoples. In an inevitable progression, next came efforts to reform all curriculum areas, from the early grades through college, as an all-inclusive recognition of U.S. diversity and to inculcate in students a greater awareness and appreciation for the cultural impact of non-European civilizations. The intent of this movement was to advance an expanded American identity that incorporated previously excluded groups into an integral component, both in heritage and in present actuality.

Some multiculturalists subsequently abandoned this integrative approach in favor of the maintenance of separate group identities. In doing so, they not only rejected a common bond of identity among the distinct racial and ethnic groups, but in advocating minority nationalism or separatist pluralism they also rejected compliance with the dominant culture as well. Not surprisingly, this position angered those already suspicious of unassimilated minorities and triggered in many a condemnation of multiculturalism as a threat to societal cohesion.

Types of Multiculturalism

Today, multiculturalists themselves are still not in agreement as to what they are advocating. Generally, they fall into one of three categories.

Generating the most controversy are the separatists. They promote maintenance of a separate group identity, resistance to assimilation, and maintenance of their own customs, language, and values. Because first-generation immigrants are commonly visible to the native-born population in appearance (clothing and/or physical features), language (accent and/or limited command of the host country’s language), residential clustering, customs, and parallel social institutions (e.g., churches, schools, social clubs, media), societal members often assume that they will remain a persistent subculture. Although most immigrant groups assimilate over two to three generations (race or religion may slow or prevent this process), contemporaries see only the present reality of a non-mainstream group in their midst. If that reality is mislabeled as a separatist threat, it can generate feelings of anti-multiculturalism.

At the other end of the spectrum, closer to the assimilationist view, are the inclusionists. Their position—comparable to the 1970s effort to include curriculum material about, by, and of non-European peoples—promotes a common identity but also a pluralist perspective by recognizing not only diversity
within society, but also society’s multiethnic, multiracial heritage and ongoing derivative elements. Instead of allegiance to a specific racial and/or ethnic group, the emphasis is on a united cause through a shared identity and appreciation for the intermingling of cultures.

Falling midway between these orientations are the integrative pluralists. Using such metaphors as salad bowl, kaleidoscope, and symphony, these multiculturalists emphasize that the nation’s strength lies in its diversity, that the blends and contrasts of its different peoples generate a dynamic synergy in its culture, quality of life, and achievements. This viewpoint suggests that both society and all individuals benefit through cultural enrichment from the presence of diversity. Society can become more cohesive when its members find common superordinate goals without insisting on a loss of racial or ethnic identity.

**Opponents of Multiculturalism**

Those against multiculturalism usually express concern about one or more of its aspects: immigration, language, culture, and race.

**Immigration.** Large-scale immigration fuels the debate over multiculturalism perhaps more than any other element. The presence of newcomers dissimilar from the native population typically generates negative reactions that can range from suspicion and anxiety to outright hostility. Prompting this response might be resentment against the changing nature of society, fears about economic competition (jobs, wages), or increased social welfare costs borne by taxpayers.

**Language.** Newcomers normally speak their own language with compatriots and only slowly acquire mastery of the new language. In the United States, where most native-born Americans are monolingual, the presence of so many individuals with limited English proficiency—compounded by bilingual education and signs—raises the ire of many who insist on rapid assimilation. A good example is passage by 30 states of official English laws to reduce the language aspect of multiculturalism.

**Culture.** When people assume the homogeneity of their culture (even though most societies have heterogeneous subcultures), they have a sense of a national identity, a feeling that they share with their fellow citizens a commonality of values and practices. If too many others speak a different language, hold beliefs unlike theirs, and do not identify with or participate in mainstream social institutions, the native population fears a loss of social cohesion and national identity.

**Race.** Most difficult to overcome of all objections to multiculturalism is a growing presence of racial minorities, especially if it is a significant demographic change or occurs in a previously homogeneous region. Except for extremist group members, few talk openly about race in their opposition to multiculturalism. Yet racial bias is often a prime factor. Whether subtle or overt, peaceful or violent, racial animosities are another manifestation of opposition to multiculturalism.

**The International Scene**

Switzerland, never ethnically homogeneous, has long been the prototype of a multicultural nation. It has four official languages (German, French, Italian, and Rumantsch), is home to multiple religions, has a 20 percent foreign-born population, and its Cantons (cities) have substantial autonomy. Although all ethnic groups live a peaceful coexistence, in reality they lead parallel, separate lives, not ones within a fully integrated society. Its German majority (64 percent of the population) lives mostly in the northern and central regions; its dominant French minority (20 percent) are mostly in the western region; its Italian minority (7 percent) reside mostly in the southern region; and those speaking Rumantsch (less than 1 percent) live mostly in the southeastern region. English is the unofficial fifth language, both in the corporate world and in popular culture.

Recognizing the linguistic and cultural diversity among their indigenous, immigrant, and immigrant-descendant populations, both Canada in 1971 and Australia in 1973—two major immigrant-receiving nations—adopted multiculturalism as official national policy. Today both countries have the most fully evolved implementation of multicultural policies, but they also have numerous critics and organized opposition, leading both countries to temper their policies somewhat. For example, Quebec now uses the term intercultural instead of multicultural, and the Australian government in 2007 renamed its Department of Immigration and Multicultural Affairs to the Department of Immigration and Citizenship.
With low birth rates and a growing labor shortage, most European countries sought foreign workers to meet their economic needs. Creation of the European Union (EU)—and the free movement of its citizens to live, travel, and work anywhere within its confines—led to its rapid adoption by most member states. However, a growing concern about unassimilated immigrant communities, particularly Islamic, led to reversals in official endorsement of multiculturalism. Denmark and the Netherlands recently returned to an official policy of monoculturalism (preservation of the native culture and exclusion of foreign influences). Other countries—notably France, Germany, and the United Kingdom—have been considering similar reversals.

Elsewhere in the world, India—with its numerous ethnic groups descended from several ancient racial stocks—is one of the world’s most culturally, linguistically, racially, and religiously diverse countries. A democratic republic, its strong central government endorses a pluralist history, not a shared one, and its constitution officially recognizes 18 languages. Japan and South Korea are among the world’s most ethnically homogeneous countries, while others, such as China and Malaysia, are culturally diverse but their governments are striving to become monocultural nations.

MULTINATIONAL CORPORATIONS

One of the most important phenomena of the latter half of the 20th century in international business was the emergence of the multinational corporation (MNC). The many different definitions of MNCs usually rest on one of the following common characteristics: (a) company headquarters far removed from the country where the activity occurs, (b) foreign sales representing a high proportion of total sales, and (c) stock ownership and management that are multinational in character. Perhaps the most common definition of a MNC, however, is that it is a company that manages and controls facilities in at least two countries.

MNCs diversify their operations along vertical, horizontal, and conglomerate lines within the host and home countries. Vertically integrated MNCs produce intermediate goods in a subsidiary that are later used for the production of final goods in other countries. For example, the General Motors plant in Tonawanda, New York, produces engines to supply GM auto plants worldwide. Horizontally integrated MNCs produce basically the same or similar goods in several countries. One example is the auto manufacturer Toyota, which produces automobiles in both Japan and the United States. Conglomerated MNCs produce different or even totally unrelated goods in various countries. For example, in the 1980s the U.S. oil company ExxonMobil acquired a foreign copper-mining subsidiary in Chile in response to anticipated declines of future investment opportunities in oil and gas.

From the Past to the Present

The phenomenon of MNCs is not new, instead tracing back to the late 18th century when firms like the British, Dutch, and French East Indian companies sought raw materials overseas. The modern-day counterparts of these raw material–seeking firms are the multinational oil and mining companies, as recent advances in transportation and communications technology increased the feasibility of global production, enabling MNCs to grow rapidly over the past 60 years.

Direct foreign investment usually allows the formation of MNCs, although their existence does not necessarily reflect a net capital flow from one country to another. MNCs can raise money for the expansion of their subsidiaries in the host country rather than in the home country. Furthermore, a good deal of
two-way foreign direct investment occurs among industrial countries: U.S. firms expand their European subsidiaries and at the same time European firms expand their U.S. subsidiaries.

Among the major factors that influence firms’ decisions to go global are (a) appropriation of raw materials, (b) reduction in costs, mainly labor costs, (c) search for new markets and consequently for demand, (d) circumventing trade restrictions such as import tariff barriers, and (e) taking advantage of government policies offered by the host country, particularly relatively lower taxes.

The three largest MNCs worldwide in 2006 were ExxonMobil, with headquarters in the United States and revenue of $339.9 billion; Wal-Mart, with headquarters in the United States and revenue of $315.6 billion; and Royal Dutch Shell, with headquarters in the Netherlands and revenue of $306.7 billion.

**Impact of Multinational Corporations**

MNCs can create several problems in the home country. Among these the most important are reduction in potential production and employment; transfer of technology to other nations, which might undermine the current and future technological superiority of the home nation; and reduction of potential tax revenue of the home country.

MNCs can positively affect the host country by increasing production and employment (number of employees and skills), and promoting technical progress. However, MNCs often come under attack in the host country for several reasons, one of which is loss of national sovereignty. MNCs may dominate the economies of the host countries and consequently influence political decisions. For example, MNCs may resist government attempts to redistribute national income through taxation. One example of political influence is in the case of Chile. When Salvatore Allende, the president of Chile, was in the process of winning the presidency, U.S. businesses opposed him, fearing that his government would expropriate their Chilean operations. Specifically, International Telephone and Telegraph (ITT) tried to prevent his election and subsequently attempted to foment civil disturbances that would lead to his fall from power. Another example is the case of United Brands (now Chiquita, producing mainly bananas), which in 1974 paid a $1.5 million bribe to the president of Honduras in return for an export tax reduction. When the bribe was discovered, the president was removed from office.

A second criticism is MNC utilization of inappropriate technologies. In many developing countries, MNCs use capital intensive production techniques that are inappropriate for labor abundant nations, where they would increase unemployment. In addition, the technology transfer usually has very limited linkages with the other sectors of the host country and consequently “the spillover effects” are very limited.

A third criticism is MNC exploitation of domestic resources. MNCs use minerals, raw materials, unskilled labor, and entrepreneurial talent acquired from the host country for production. They obtain these resources at a very low price, which results in high profits for the multinational firm, profits usually not reinvested in the host country or shared with the country yielding its natural resources and human capital.

**Regulation of Multinational Corporations**

In order to mitigate the harmful effect of MNCs and increase the possible benefits in the host country, several nations have attempted to regulate their conduct. Some developing nations now allow only joint ventures (i.e., local equity participation and set rules for the transfer of technology and the training of domestic labor); impose limits on the use of imported inputs and the remission of profits; set environmental regulations; and so on. In addition, the EU (European Union), OECD (Organization for Economic Co-operation and Development), UN (United Nations), WTO (World Trade Organization), and UNCTAD (United Nations Conference on Trade and Development) elaborated codes of conduct for MNCs.

Increasing evidence indicates that some MNCs engage in illegal activities, such as using child labor, discriminating against women, and suppressing trade unions. However, the governments in developing countries are often unable or unwilling to prosecute these violations because they are desperate to promote exports and attract investors. Rendering MNCs accountable for abusive conduct constitutes a major world order challenge, particularly because the codes of conduct provided by international organizations are still on a voluntary basis. While there are no magic bullets here, naming and shaming coupled with consumer boycott can at times produce the desired effect.

*Giuliana Campanelli Andreopoulos and Alexandros Panayides*
**Multiracial Identity**

Census 2000 identified 6.8 million Americans, or 2.4 percent of the total U.S. population, as multiracial. Of these, 93.3 percent identified with two races, 6 percent identified with three races, and 0.6 percent identified with four races. Though not the first time the U.S. Census Bureau counted multiracial individuals, Census 2000 did mark the first time individuals were able to check all races that apply on their census forms. The primary intellectual debate about multiracial identity focuses on whether such an identity is needed to give individuals of mixed racial descent greater latitude to express who they are or whether the proliferation of multiracial identities supports the status quo by subdividing traditional racial communities.

Notably, both sides of this debate agree that race is a social construct. Although commonly thought of as a biological attribute, race actually has no gene to explain its existence. Rather, racial designations result from a complex interplay between individuals’ phenotypical characteristics, social labeling and definition, culture, and individual identity. Furthermore, biologists find as much variation within racial groups as between groups on skin color and other biological characteristics typically associated with race.

Historically speaking, race relations had less to do with skin color than patterns of domination and control among groups in society. Various mechanisms reinforce the social construction of racial groups over time and to such an extent that racial categories seem legitimate and natural and are taken for granted. For example, the rule of hypodescent enables white Americans to circumscribe membership in their racial group and perpetuate their privilege by dictating that one drop of black blood (i.e., having any black ancestors) made one black. The rule of hypodescent also applied to mulattos, persons of mixed white and black parentage. Mulattos historically enjoyed higher social status than blacks, but lower than whites, giving rise to a structure of unequal privilege in black communities.

The Census Bureau itself gave legitimacy to the concept of race and hypodescent by identifying and sorting Americans into mutually exclusive groups. The Census Bureau also identifies Americans based on Hispanic origin. Hispanics (or Latinos), sometimes thought of as comprising a “brown” race, actually can be of any race, and their designation is that of an ethnic group, due to their cultural heritage.

A long history of writing, scholarly and otherwise, established a “marginal man” notion of multiracial individuals who did not fit neatly into the Census Bureau’s mutually exclusive racial categories, or into the worlds of either parent. Despite traditional pressure on people to identify with one (and only one) race, these individuals often were unable to do so. Prior to the post–World War II civil rights movement, exclusive racial categories enforced white privilege vis-à-vis other groups, serving as the basis for prejudice and discrimination. In more recent times, exclusive racial designations served as the basis for civil rights monitoring and group solidarity.

Despite change in the use of racial categories, failure to fit neatly into one of these categories due to multiracial identity continued as a personal problem. However, recent scholarship supports multiracial persons, maintaining that they are not inherently different from monoracial persons and even have the advantage of multiple social perspectives. The essence of acceptance of one’s social identity is public acknowledgment of that multiracial heritage as a source of pride and character. Multiracial identity also allows an individual to include (or exclude) any ancestral group’s heritage in defining oneself, and allows for an identity that may be different from other family members. This identity may also change over time, finding different expression in different social situations. What remains important in all instances is the right to self-define race rather than having race imposed externally by society.

The issue of multiracial identity will undoubtedly become more poignant with the passage of time as the
U.S. multiracial population grows. Many trace the modern origin of the U.S. multiracial population to the civil rights movement and the U.S. Supreme Court decision in *Loving v. Virginia* in 1967 that declared unconstitutional state miscegenation laws that prohibited interracial marriage. Since then, the multiracial population has grown alongside an ever increasing number of interracial unions.

Also growing has been an intensification of concern for what multiracial identity means on a personal, social, and political level. This concern inspired the multiracial movement, which transformed the personal problems of self-esteem and identity for interracial couples and their children into a public issue over race and its meaning. In its current form, the multiracial movement is an organized effort to deconstruct race. Pressure arising from the multiracial movement resulted in the Census Bureau acknowledging the modern complexity of race by allowing individuals to check boxes on census forms that represent their entire heritage. With the prospect of an almost unlimited number of possible racial combinations, and the accompanying analytical complexity, some scholars and activists suggest that race will eventually cease to exist as a viable construct.

The multiracial movement also spurred a countermovement that believes that acknowledging multiracial identity in census data and other public forums only reinforces the hierarchical racial structure of U.S. society and undermines efforts for civil rights monitoring. This countermovement worries that nonwhite communities will be divided by a host of new mulatto-like racial identities and confuse who is and who is not a member of a minority group.

Nevertheless, sociological deconstruction of race still leaves room for examining real inequalities between groups related to culture, politics, and economics. Uncertainty remains about what the next stage of debate regarding multiracial identity will be and whether that dialogue will result in further refinement of socially constructed racial categories or an intellectual discussion of “race” as it was once conceived.

**Murder**

Generally defined, *murder* is the unlawful killing of one human being by another. Although precise legal definitions may vary somewhat across jurisdictions, murders are usually classified into two categories: first-degree murder and second-degree murder. First-degree murder is unlawful killing involving malice aforethought (i.e., intent to kill) and premeditation. Killings also may be classified as murder in the first degree if they occur during the commission of another felony (e.g., a robbery or burglary). Second-degree murder involves malice aforethought but lacks premeditation or other aggravating circumstance (such as killing in the act of another felony). Murder is a subcategory of a broader umbrella term, *homicide*, which also includes manslaughter (killings lacking malice and premeditation) and killings that are considered excusable (i.e., accidental) or justifiable (e.g., police killing of a suspect who threatens life of the officer or another citizen).

Murder is generally considered to be the most reliably reported and recorded serious crime. Thus, it often serves as a barometer for the broader crime problem in the United States. For example, a modest spike in murder during the mid-1980s to early 1990s received a great deal of public attention and led many citizens to believe that the crime problem was progressively worsening. In reality, most types of serious crime had been in fairly steady decline since the 1970s.

Although a large share of murders have fairly mundane origins—resulting from arguments between acquaintances or family members—the frequent depiction in popular culture of rare but sensational murders has created a mystique and aura around murder that many people find intriguing.

Like many social problems, murder is not randomly dispersed in the population. Rather, specific demographic, social, and geographic patterns exist that have remained fairly consistent over time. For example, murder rates tend to be higher in larger cities and in places characterized by high rates of concentrated disadvantage (e.g., poverty, unemployment, school dropout, racial segregation). Murder offending and
victimization rates also are several times greater for males than for females, for African Americans than for whites, and for young adults (e.g., ages 18–34) than for older adults (e.g., 55+). In addition, murder has shown a long-term regional pattern with higher rates occurring in the southern parts of the United States. The majority of murders occurring in the United States are committed with handguns or other firearms.

**Further Readings**

Developed to measure victimizations that were both reported and not reported to police, the National Crime Victimization Survey (NCVS) began in 1972 and has been conducted annually since that time. Sponsored by the Bureau of Justice Statistics, it relies on a national probability sample of about 50,000 non-institutional household addresses, which results in a sample of approximately 100,000 individuals ages 12 and over. Respondents remain in the sample for a total of seven interviews, once every 6 months, over a 3-year period. The response rate for the NCVS is generally around 95 percent.

The screening questions used by the NCVS are behaviorally specific and avoid technical and legal terms such as robbery and aggravated assault. For example, instead of asking respondents if they have experienced an aggravated assault in the past 6 months, the questions ask whether the respondents have been attacked or threatened with any weapon; attacked with anything like a baseball bat, frying pan, scissors, or stick; attacked by something thrown, such as a rock or bottle; or attacked by any grabbing, punching, or choking, and so forth. The NCVS categorizes victimizations into both personal and property types and includes the violent crimes of rape and sexual assault, robbery, and simple and aggravated assault and the theft-related crimes of purse snatching and pocket picking, burglary, personal theft, and motor vehicle theft. The NCVS does not measure commercial crimes (e.g., robberies in stores) or homicide.

Victims uniquely describe each incident, giving information about (a) the date, time, and location of the incident; (b) the relationship between the victim and the offender(s); (c) characteristics of the offender, including gender, age, race/ethnicity, perceptions of drug and alcohol usage, and weapon use by the offender; (d) self-protective actions taken by the victim during an incident and the consequences of those actions; (e) consequences of the victimization, including injuries and medical care utilization and property loss; (f) whether the crime was reported to police and the reasons for reporting or not reporting; and (g) other consequences such as time lost from work and medical expenses.

Estimates of victimization from the NCVS are consistently higher than the U.S. Justice Department’s other source of data, the Uniform Crime Reports (UCR) administered by the Federal Bureau of Investigation (FBI). The UCR, and its new program, called the National Incident Based Reporting System (NIBRS), both rely on victimizations reported to local law enforcement agencies, which are then reported to the FBI. The intent of these data is to provide criminal justice statistics for law enforcement administration and management. The NCVS, on the other hand, seeks to uncover the true magnitude of crime, including both victimizations that were reported and not reported to police. As such, the NCVS remains the primary source of information on the characteristics of criminal victimization from the victim’s perspective and on the number and types of crimes not reported to police.

Nation Building

Nation building is a term used in conflict resolution to explain the actions of the international community in postwar societies. In this context, the term refers to a preventive measure to avoid the breakup and social fragmentation of the state or to an element of post-conflict peace-building strategies.

Sociologists view nation building as a distinct process but one closely linked to state building. Nation building in this sense is one of the most common processes of collective identity creation. Its intention is to legitimate a constructed state authority within a given territory. The nation is defined as a community of individuals who share common values, language, and/or customs and may become aware of the need for political sovereignty.

From this perspective, the two key elements of nation building include a unifying ideology and an integration of society. Unifying ideology refers to the existence of some variation of “nationalism,” the function of which is to legitimate policies of nation building as well as to mobilize socially for its end. Integration of society entails the incorporation of different groups into a common society. Close communication among the groups is essential for a successful outcome of nation building. The key pillars of the integration process involve development of national communication, media, and education in order to establish a national political and cultural dialogue.

In contrast to nation building, the term state building refers to the creation of viable political and administrative institutions that enable a political entity, the state, to function efficiently as an independent unit. The key elements of state building include the assertion of monopoly on violence through control of the police and military forces. This is essential for the state’s ability to rule over its territory. Finally, state building also entails the creation of an effective fiscal system as a basis for the establishment of a functioning legal and administrative system.

In cases where the society is integrated and a “nationalist” ideology is present, state building becomes a political expression of that society’s will to act independently in the pursuit of its interests. Recent experiences of international nation building in Bosnia and Herzegovina, Kosovo, Afghanistan, and Iraq indicate, however, that the creation of state institutions is the least complex part of nation building, while ideological legitimacy and social integration present difficult challenges for outside actors.

Native Americans, Cultural Degradation

Scorn for the Native Americans’ ways of life became apparent soon after their first encounters with Europeans. Disparagement of, and disrespect for, tribal cultures continued thereafter and, unfortunately, still continues today. For centuries, much of what people have known about Native Americans has rested on misinformation, stereotypes, and media creations that have led to biased attitudes and negative beliefs. The very term Indian, in fact, comes from a misconception.

Prior to the arrival of Europeans, Native Americans had rich cultures and social systems. The Aztec, Arikara,
Anasazi, Clovis, Hidatsa, Hohokam, Inca, Inuit, Mandan, Mayan, Mogollon, Mounds Builders, Oneota, Pueblo, and others developed flourishing cultures long before 1492. Although the many tribes varied significantly in language, clothing and bodily adornment, housing, social organization, and ways of life, they were mostly similar in their belief systems and primary relationships that were built on a clan or friendship system. Despite the cultural diversity among the hundreds of tribes, Europeans essentially saw them as a single entity and denigrated their culture by describing them as “savages,” “pagans,” or “uncivilized,” for the Europeans believed the tribal ways of life to be inferior to their own.

The rich cultures that Europeans and European Americans failed to recognize would disintegrate through disease, conquest, loss of ancestral lands, and subjugation.

Today, as Native Americans struggle to maintain their cultural identity, restore their lost heritage, and improve their quality of life, they still endure stereotypical assaults on their dignity, such as children playing cowboys and Indians (no one plays Asian, Irish, Hispanic, or Mormon, for example), or sports team mascots (such as the Atlanta Braves, Chicago Black Hawks, Cleveland Indians, Kansas City Chiefs, Washington Redskins).

**Forced Isolation and Acculturation**

Between 1850 and 1880, the U.S. government embarked on a policy of containment, establishing most of the nation’s reservations and forcing Native Americans to live on them. Segregated and isolated, the once self-reliant tribes became wards of the government, with bureaucrats responsible for their welfare, issuing them food rations and supervising virtually every aspect of their lives. Forbidden to engage in their own spiritual practices, they instead faced zealous Protestant missionaries who were anxious to convert the Native Americans and were encouraged to do so by the government, which gave them some reservation land on which to build churches and religious schools. Not until the 1934 Indian Reorganization Act restored their freedom of religion could Native Americans publicly return to their ancestors’ ways.

White patriarchal assumptions about proper families disrupted families that were matriarchal or egalitarian. Families were not allowed to make decisions or to direct their own lives, as everything became subject to approval by the Bureau of Indian Affairs (BIA). Policies were designed to weaken or break up families. Government programs and boarding schools thus attempted to dismantle kinship patterns by taking children from their families and placing them in boarding schools or with white families. These programs also coerced Western ways at reservation schools, forcing acculturation by forbidding historical tribal languages, dress, hairstyles, religion, and culture. Children of different tribes, even warring tribes, were boarded together. When school was not in session, children were often boarded with white families to prevent them from renewing tribal ways. Children were often abused, neglected, and mistreated. While some Indian schools did teach American Indian children some vocational skills such as pencil making, programs encouraged them to move away rather than promote employment opportunities on the reservations. This coercive acculturation led to loss of culture, tradition, and way of life.

**Religion**

Native American religions do not focus on sin, denial of personal pleasure, or fear of hell to guide them. The Protestant ethic of working and accumulating wealth instead of seeking personal pleasure is missing. Rather, the Native American religions focus on spirituality and spiritual practices. Native Americans generally prefer that strangers not attend spiritual services unless invited, yet many come, take pictures, record, or videotape services without permission. A visitor does not take the Muslim prayer rug home after using it in a mosque, yet many people will take sand paintings, dream-catchers, pipes, or other sacred items from Native American services. Unfortunately, such callous disrespect for Native American culture is a merely a modern manifestation of similar actions in the past.

Christian practices have greatly influenced Native American practices. Flathead and other Plains groups, for example, have incorporated many Christian practices into their own. The sign of the cross, “In the name of the Father, the Son, and the Holy Spirit,” is translated as, “L’squest’s Le-eu u Sku-se u Sant Spah-pah-paht. Ko-mee e-tse-hyl.” Flathead funerals include wakes, and feast days are celebrated.

Like many tribes, the Flathead have combined Christian and quite often Catholic traditions with their own traditions. A few “Blackrobes” (priests) allowed
the Flathead to include some of their own traditions, including peyote and songs, and showed some respect for the Native ways and religion. Catholic hymns, prayers, and rituals were translated into Kalispel dialect, the Salish or Flathead dialect, and others. (The Flathead are also known as the Salish, Bitterroot Salish, and as the Pend d’Oreille or Kalispel.)

The Afterlife

Native Americans send their dead to the next life with rituals and practices that reflect their religious beliefs about death and spiritual afterlife; they view desecration of the dead as a serious and offensive act. They believe that disease and even death can befall those who violate the dead and their resting places.

Archaeologists have for generations been digging up human remains to study what was buried with them to learn about cultures. The tombs of ancient civilizations have yielded great knowledge of their cultures. Reportedly, Thomas Jefferson dug up a burial mound in Virginia in pursuit of similar knowledge. Physical anthropologists have long studied Native American skulls and human bones to learn more about our various indigenous peoples. Following the Civil War, the U.S. Surgeon General ordered Army personnel to obtain Indian skulls for study at the Army Medical Museum in Washington, D.C. The U.S. Army acquired heads from Arapahoe, Cheyenne, and Kiowa killed at the Sand Creek Massacre in Colorado. Many other museums soon made comparable acquisitions.

Only in 1990, with passage of the Native American Graves Protection and Repatriation Act (NAGPRA), were their burial sites protected and a process created for returning their cultural artifacts and human remains. Museums are now slowly returning their inventories of such items, putting an end to what Native Americans considered institutional sacrilege.

The Present Scene

Today, slightly less than half of all Native Americans live on isolated, rural reservations, many with inadequate housing, plumbing, and electricity. However, tribal schools and colleges enable new generations to study their tribal languages and cultures and to acquire traditional skills that would otherwise be lost. Desperate for economic relief, some tribes have forsaken their values about the land to allow nuclear waste storage facilities or strip mining on their reservations. Some tribes are doing well from oil and gambling revenues but have abandoned much of their culture. Is it too late to save the cultures? Should the cultures be saved? These are not idle questions, for they go to the heart of a debate that has continued for generations between those who advocate assimilation and modernization on the one hand, and those who believe Native American culture should be preserved and maintained as a way of life on the other.

Cultural diffusion (the spread of values and practices from one culture to another) is one way at least parts of a culture endure. Many nontribal members hang dream-catchers from their rearview mirrors, give Kachinas to children for toys, use pipes, have “sweats,” and engage in traditional rituals in nontraditional ways. By contrast, the “Blackrobes” and other clergy who work with tribal groups adorn the Virgin Mary in traditional Hopi or other tribal garments, promote the “Black Madonna,” and hang pipes, beaded items, shawls, and other traditional items in their churches. Many nontribal peoples attend, take part, respect, and become part of traditional American Indian ceremonies.

Some do respect and admire traditions and practices of Native Americans. Yet, others seem inclined to either ignore or suppress the indigenous cultures that outsiders have tried to destroy since they first arrived. Many “Blackrobes” and other clergy do go to great lengths to respect and preserve traditional ways, as do many funeral directors.

After centuries of denigration, exploitation, discrimination, poverty, and despair, some hope exists. Symbolic is the opening of the National Museum of the American Indian in the mall of Washington, D.C., in 2005, an unusual positive happening in Washington for Native Americans. The future is both positive and negative. The economic future for some tribes is greatly improving. For others, the economic picture is quite bleak. Conflicting views about their cultures, languages, and way of life continue.

Native Americans, Reservation Life

During the 18th and 19th centuries, the United States pursued a strategy of ethnic cleansing to force hundreds of linguistically, culturally, and politically distinct indigenous peoples with their own rich histories of alliances, trade, and cultural exchange onto Indian reservations—remote, poor vestiges of their vast former holdings. The prevailing political discourse cast Native Americans as savages standing in the way of progress and the Manifest Destiny of the white race to settle the continent all the way to the Pacific. On the reservations, proud independent peoples were classified as wards of the federal government, denied individual and collective rights, and subjected to a variety of measures designed to destroy their cultures and assimilate them.

A variety of often contradictory policies, administered at first by the Department of War, and later by the Department of the Interior through the Bureau of Indian Affairs, wrought havoc on the lives of Native Americans but failed to achieve the overall aim of assimilation. Resistance was widespread and sustained. Native leaders often turned the tools of the colonizer to their own account in ongoing efforts to define their own futures. Many Native Americans today express pride in being survivors of a disastrous and vast experiment in social engineering, in having retained significant aspects of their cultures, and in their increasing success at asserting control over their own lives.

Indian reservations, including pueblos in the Southwest and rancherias in California, occupy 56.2 million acres, or 2.3 percent of the United States, a startling figure compared to the 2.38 billion acres they occupied before contact with Europeans a half-millennium ago. Reservations range in size from the 16-million-acre Navajo Nation that sprawls over parts of Arizona, New Mexico, and Utah, to tiny homelands with less than 100 acres. There are nearly 300 in 36 states, with concentrations in the West and Midwest. Some were delineated through treaties with the U.S. government; others were established by Congress or through executive orders.

Maintaining a land base is critical to Native American identity, although today only 34 percent of the 3.1 million Native Americans who identify as members of a specific tribe live on Indian reservations. Nevertheless, reservations are seen as homelands, are the locus for the assertion of tribal sovereignty, and have served as enclaves sustaining kinship relations and preserving and elaborating rich cultures.

Tribal governments exercise inherent, albeit limited, sovereignty and officially enjoy government-to-government relationships with the United States. Although situations vary, tribes generally raise revenues, promulgate and enforce laws, manage natural resources, enter into contracts with private companies, negotiate with state and federal authorities, and administer federal programs including education, health, and welfare.

Nevertheless, life for Native Americans on Indian reservations is fraught with the difficulties associated with limited resources, poor economies, inadequate health care and education, and a legacy of ruinous policies promulgated by a colonial or quasi-colonial regime. Too often, the people themselves are blamed for the problems that continue to beset them. But in virtually every instance of a social problem identified on reservations today, other instances of Native people hard at work, attempting to provide creative, culturally sensitive solutions to problems, exist as well.

Health problems on reservations are especially severe when compared with the rates for the United States as a whole. Native Americans on reservations are 7 times more likely to die from cirrhosis and nearly 4 times more likely to suffer from diabetes. The suicide rate is nearly double the national average, and in some reservations in the Dakotas is 3 to 4 times the rate, with many young people taking their own lives. Deaths from accidents, often related to substance abuse, are 2.5 times the national average for youth ages 15–24.

Federal resources directed toward addressing public health concerns are simply inadequate. The Indian Health Service (IHS), charged with providing health care to an expanding service population, a charge...
understood by many Native Americans as a treaty obligation, routinely denies care if it determines that the need is not life threatening. In 2006, IHS determined that its hospitals and clinics were funded at less than 60 percent of parity with the benchmark mainstream health plan. Individual tribes and intertribal organizations like the National Congress of American Indians routinely lobby for increased support, but their efforts are seldom successful. Some tribes, alarmed at the toll taken on their youth, are taking the lead to hold intertribal conferences to develop collective responses to the carnage.

Native Americans on many reservations are tapping into their indigenous knowledge and practices, actively using them to design and deliver mental health services that are otherwise unavailable or culturally inappropriate. They effectively use new knowledge and practices, rooted in tribal traditions, to intervene on behalf of high-risk youth. Also, youth and their families are rediscovering their traditions in a process that branches beyond the field of mental health, spilling over into areas including language preservation and treaty rights.

Education, like health, is shamefully underfunded. Allocations for Bureau of Indian Affairs schools and schools contracted by tribal governments under the Indian Education and Self-Determination Act of 1975, amount to only about half the per pupil rate of nearby public schools. Dropout rates are higher than national averages, as is attainment of higher education. The response by Native Americans on reservations includes development of consortia to study and address the problem, the creation of departments of tribal education to review and enhance curriculum, and sustained, successful efforts to supplement meager federal allocations with soft money from grants.

In the 1970s, Native Americans on several reservations determined that their members needed more access to higher education to secure jobs, to strengthen tribal culture and tradition, and to better serve the people. They organized an effort to establish their own institutions of higher learning, and now there are 32 tribal colleges providing associate’s, bachelor’s, and some master’s degree programs. Native students overwhelmingly emphasize that their motives for seeking higher education are to help their people—a sentiment in keeping with the communal impulse that continues to mark tribal communities in contradistinction to more individualistic U.S. values. Graduates have been very successful at securing employment among their people on reservations. In some instances they have transformed the service delivery sector, effectively changing the composition of the workforce away from non-Native to Native. The old situation, where non-Natives provided necessary services on reservations, is giving way. Now it is not uncommon to find that the preponderance of teachers, nurses, administrators of tribal programs, and counselors in schools are Native American. Vocational and business education provided by those institutions has swollen the ranks of entrepreneurs who provide a wide range of services and employment opportunities. The phenomenon is not yet well studied, but its existence is supported by anecdotal reports, surveys of students, and observations by trained observers. A hope some tribal educators express is that a critical mass of graduates will create a tipping point leading to systemic change.

Living conditions on reservations vary greatly, but privation is widespread. The overall unemployment rate is 49 percent. Jobs that are available often pay poorly, with 32 percent yielding wages below the federal poverty line. Theories advanced to account for the vast disparities in the unemployment rate that exist among reservations—around 20 percent on White Mountain Apache in Arizona, compared with more than 70 percent on Pine Ridge Reservation in South Dakota, for example—tend to focus on variations of dependency theory and resource theory.

In recent years, however, a paradigm focusing on institution building within the context of the policy climate of self-determination ushered in during the mid-1970s, and supported by a large number of case studies, supports the notion that tribes that create strong governments to effectively assert their sovereignty are more successful at sustained economic development. The model stands the conventional wisdom that polity follows economy on its head. The more successful tribes have instituted separation of powers, strengthened their judiciaries, reorganized governance to ensure a cultural match, worked toward transparency and accountability, and made themselves, instead of the Bureau of Indian Affairs, the chief decision makers in tribal affairs. Determining what factors move some tribes to take steps to strengthen their institutions of governance, or that keep others from doing so, continues to be an open question, though analysts have advanced theories of action and models of leadership as explanations.

Reservation homelands distinguish Native Americans from other minorities. Their sovereign status and
their special relationship with the U.S. government, which entail a raft of similar problems and opportunities, bring them together in a community of interest that cross-cuts their rich cultural diversity. Tribal leaders are collectively engaged in a battle—in state, regional, and national arenas—to sustain reservations as viable homelands; leaders on the reservations are engaged in the complementary work of cultural recovery and affirmation in a bid to help their people and the future generations. Sensitive, collaborative studies of those phenomena could help infuse the mainstream of discourse.

**Nativism**

Nativism refers to the beliefs and policies favoring native-born citizens over immigrants. Nativism emerged in dramatic fashion in the mid-19th century as Europeans arrived in large numbers from countries other than Great Britain and the Netherlands. Roman Catholic settlers in general and the Irish in particular were among the first Europeans to be ill treated. Anti-Catholic feeling originated in Europe and was brought by the early Protestant immigrants.

From independence until around 1820, little evidence appeared of the anti-Catholic sentiment of colonial days, but the cry against “popery” grew as Irish immigration increased. Prominent citizens encouraged hatred of these new arrivals. Samuel F. B. Morse, inventor of the telegraph and an accomplished painter, wrote a strongly worded anti-Catholic work in 1834. Many readily believed Morse’s warning that the pope planned to move the Vatican to the Mississippi River Valley. This antagonism was not limited to harsh words. From 1834 to 1854, mob violence against Catholics across the country led to death, the burning of a Boston convent, the destruction of a Catholic church and the homes of Catholics, and the use of Marines and state militia to bring peace to U.S. cities as far west as St. Louis.

By the 1850s, nativism became an open political movement pledged to vote only for “native” Americans, to fight Catholicism, and to demand a 21-year naturalization period. Party members were instructed to divulge nothing about their program and to say that they knew nothing about it. As a result, they came to be called the Know-Nothings. They blamed immigrants for virtually any economic, political, social, and political problem. Although the Know-Nothings soon vanished, the anti-alien mentality survived and occasionally became formally organized into such societies as the Ku Klux Klan.

The even more dramatic outbreak of nativism in the 19th century was aimed at the Chinese. If there was still the lingering belief that the United States could quietly and harmoniously accommodate all, debate on the Chinese Exclusion Act would negatively settle the question once and for all. Nativism sentiment continued into the 1900s, targeting Italian and Polish immigrants, Japanese immigrants after Pearl Harbor, Eastern European Jews after World War II, Vietnamese and other South Asian refugees of the 1970s, and the Cuban “Marielito” refugees of the 1980s.

Anti-immigration views and organized movements have continued into the 21st century. Political scientist Samuel P. Huntington (1996) referred to the continuing immigration as a clash of civilizations that could only be remedied by significantly reducing legal immigration and closing the border to illegal arrivals. Beginning in the 1990s and continuing through the present, recent immigrants and their descendants are stereotyped as responsible for a variety of social problems, such as overcrowded housing, unemployment, crime, overstretched health services, and burdened public schools.

Nativistic sentiments are not unique to the United States. Virtually all nations that have attracted immigrants have, at different historical periods, developed anti-alien sentiments, especially when the immigrants are culturally different from the host society. Concerns about terrorism have added a new nativistic element in countries like England, Spain, and the
United States, which have witnessed high-profile attacks in recent years.

**Nature–Nurture Debate**

The social and behavioral sciences have in recent years played host to what has come to be called the “nature versus nurture debate.” This is the question of to what degree our genes (“nature”) explain human differences in certain phenotypic variables such as intelligence, personality predispositions, criminal tendencies, and so on, versus the degree to which the social environment (“nurture,” which includes many social structural variables such as schooling, one’s social class status, one’s parent’s or parents’ social class status, one’s family socialization practices, nutrition, peer group influences, and so on) also explain intelligence, personality, and criminal tendencies.

Comprising part of this debate is the question of whether and to what extent there is interaction between genes and environment upon intelligence or personality predispositions. This is the issue of whether and to what extent the effect of genes depends upon what social environment(s) the individual is raised in, and also whether the effect of social environment itself depends upon a person’s genes. Thus gene–environment interaction would be present if both genes and environment combine in particular ways to account for a person’s intelligence and/or personality.

The whole issue is a debate, because while some researchers argue that the effect of genes is the greatest (in the neighborhood of 70 percent, if expressed as a percentage, thus leaving only 30 percent to social environment and gene–environment interaction), other researchers argue that the effect of the social environment is the greatest, comprising 50 percent or more of the effect on intelligence and personality. Then there are researchers who argue that gene–environment interaction is the largest component, though they are reluctant to place a percentage estimate on its effects.

The evidence and the methodology of the genetic effect as well as the effect of social environment lead to the conclusions (a) that the effect of genes on intelligence (and personality), though estimated by some researchers in the past to be “high” at around 70 percent, is instead more in the neighborhood of 50 percent, and very possibly less, in the neighborhood of 30 to 40 percent, if appropriate new methodological considerations are introduced; (b) that the effect of the social environment (ignoring for the moment that gene–environment interaction is zero) is at least 50 percent, and very probably more; and, further, that (c) while gene–environment interaction is no doubt a reality, it is not empirically estimable at the present time. So leaving aside the question of gene–environment interaction, the nature–nurture debate boils down to the question of whether the effects of genes on intelligence and personality predisposition are greater than or approximately equal to the effects of the social environment, or whether the effects of the social environment are greater.

**Measurement of Intelligence**

To estimate the effects of genes versus social environment upon something like intelligence, intelligence must first be measured accurately—that is, measured with little or no measurement error. Considerable debate exists about this issue—even apart from the question of the relative effect of genes versus social environment. Some researchers argue that intelligence and academic potential are quite accurately measured today, with little measurement error. At the same time, other researchers argue with equal verve that standardized ability tests today are not very accurate or fair measures of intelligence or academic potential of minorities as opposed to whites, of women as opposed to men, and of working-class persons as opposed to upper-middle- and upper-class persons. Both sides note, however, that achievement (specific subject) tests, as opposed to “ability” tests, are somewhat more valid across these groups.
Intelligence is an abstract concept; individuals are presumed to differ or vary from each other. “Intelligence” is itself not directly observable or measurable, but it is inferred to exist, to greater or lesser degrees, from actual results obtained on a test or indicator, such as an IQ test or the SAT (Scholastic Assessment Test). Thus “intelligence” (concept) is distinct from “intelligence test” (presumed indicator). The extent to which the indicator accurately measures how individuals differ on the concept is called the validity of the indicator or test. If the test lacks validity, then by definition some measurement error exists in the test. For example, what is called the “predictive validity” of a test, such as an IQ test (like the Stanford Binet or the Wechsler test) or the SAT, is the extent to which it predicts some later measured criterion, such as freshman-year college grades earned after taking the test. In other words, does the test do (predict) what it is supposed to? Hence, if for a sample of individuals, the higher one’s SAT score and the higher one’s freshman grade average (that is, if the test and grades had a high correlation), then the test would by definition have high predictive validity. If one’s SAT score bore no such relationship (no correlation) to freshman grades, then the test would have low or no predictive validity.

The differential predictive validity of a test is the degree to which it predicts the same or differently, test-to-criterion, for different racial/ethnic groups, different social classes, or the two different genders. Thus if an ability test taken in high school predicts freshman grades in college to the same degree (with the same correlation and/or slope) for whites as for blacks, then the test would be considered to be of equal predictive validity for both racial groups. By definition, the test would then be considered racially unbiased—even if whites scored on the average higher on the test than blacks—as is the case with the SAT, on which blacks (and Hispanics) score about 100 points less on average than whites (on the 200–800 points scale per section). The lower average score for blacks would then be attributed to two possible causes. First, the genetic (nature) explanation, which states that, assuming the test is not biased, the average difference in test score is due to fewer “intelligence” genes on the part of blacks and Hispanics. (More on this follows, under “Heritability.”) Second, the social environmental (nurture) explanation states that, again assuming that the test is not biased, the average black-white (and Hispanic-white) difference in test score occurs because of fewer educational opportunities and more environmental deprivation for blacks and Hispanics, rather than different genes.

But all this assumes zero measurement error; that is, the same predictive validity between racial groups. The fact of the matter is that, as shown in more than 100 studies of differential predictive validity, considerably more studies show different (lower) validities for blacks and Hispanics than for whites. A small number of studies do indeed show the same predictive validities for all three racial groups, but those showing different validities—thus measurement bias (measurement error) in the test—are far more numerous and also more recent. This means that the tests are significantly more biased—with significantly more measurement error—in the case of blacks and Hispanics than in the case of whites. (Asians tend to fall between whites on one hand and blacks and Hispanics on the other on predictive validity, even though Asians score on average higher than whites on the SAT math sections and somewhat lower on the verbal sections.)

The same issue applies to comparisons of females to males and to comparisons across social classes, as upper (or middle) class versus working class. While females and males score on average about the same on the SAT verbal (and writing) sections, men have consistently outperformed women on the mathematics (quantitative) sections. Some argue that this is because of “inherent” (genetic?) intellectual differences between men and women—a position once taken by the president of Harvard University, Lawrence Summers. But the results of quite a few studies on test bias strongly suggest otherwise: differential predictive validity, predicting college grades from SAT math scores, is higher (in correlation) for men than for women. This means that by definition, the test is biased (in the prediction sense) against women. And women tend to get higher grades in the sciences in college than their SATs would predict. In this sense women’s grades are underpredicted. This finding is buttressed by two kinds of evidence. First, the SAT, as well as intelligence tests, contains a number of sex-typed (thus biased) questions on the word-math problems (questions more relevant to traditional male socialization practices, like calculating the volume of an automobile crankcase, than to traditional female socialization practices, such as calculating the volume of a pot on the stove). Second, evidence, especially recent evidence, shows that overall socialization practices in general differ between boys and girls as children and as teens, thus leading to
different cultures for men and women. Thus cultural differences between female and male show up as test bias on tests such as the SAT, as is the case also with racial/ethnic comparisons.

Finally, there is the case of social class differences. In general, the higher one’s family (parents’) income (and education), then the higher one’s test score. This is a consistent, well-documented, clear relationship found in literally all studies. This relationship remains the same even when one compares people of different social classes who are of the same race. The richer your parents are, the more likely you are to score on average higher on the SAT (and the ACT as well). The poorer your parents, the lower your test score. In addition, the lower the social class of the test-taker, the less the predictive validity of the SAT test. So the SAT has some class bias in it, just as it has bias on the basis of race and of gender. Two arguments for all this are, first, families of higher social class (higher parental income, education, and occupational status) are more able to give their children better educations, wider experiences, and more cultural advantages, which all translate into higher test scores and also higher predictive validity of the test. Second, families of higher social class are more likely able to foot the bill for a test-taking seminar (such as the well-known Kaplan Seminars or Princeton Review series), which are expensive and currently cost $1,000 or more for one sequence of test prep sessions. Thus, the often heard argument that the lower a person’s social class, the less intellectual genetic endowment the person has (the argument advanced a few years back by the best-selling book entitled The Bell Curve [1994]) is untenable given the evidence of both less test validity for lower-class persons and fewer economic and cultural advantages for them.

Heritability

The question of whether human differences in intelligence and personality are caused more by their genetic differences or by their differences in social environment has been addressed by studies in several behavioral science disciplines using what is called the “heritability coefficient.” The heritability coefficient is the proportion of the total differences (total variance) in a phenotype (phenotypic variable) that is causally attributable to genetic factors. Typical phenotypic variables studied are intelligence, personality predispositions like aggressiveness, criminal tendency, and self-reported criminal acts. Equivalently, the proportion of variance in the phenotypic variable is accounted for by genetic similarity between pairs of biological relatives. Consequently, if heritability of a phenotypic variable (say, intelligence) is 70 percent, then, statistically speaking, 70 percent of the differences in intelligence (assuming no measurement error) in that population are due to genetic factors. That would mean that 30 percent of the differences in intelligence would be due to environment and to gene–environment interaction. A 50 percent heritability would mean that the differences in intelligence are equally caused by genetics and by environment (including gene–environment interaction). The heritability estimate applies only to the population studied (e.g., whites) and cannot be generalized to another population (e.g., blacks) or between populations (e.g., comparing blacks to whites), although many researchers throughout history have tried. (Those who have tried, via such faulty between-group comparisons, to say that heritability calculated on whites applies as well to other groups, such as blacks, have been, for example, Sir Francis Galton in the mid-1800s; Sir Cyril Burt in the 1920s through the 1960s; Arthur R. Jensen and Richard Herrnstein in the late 1960s and early 1970s; Charles Murray—focusing on between-class differences—in the 1990s; and J. Phillipe Rushton in the 1990s and since 2000.) The same applies to between-class comparisons and to between-gender comparisons.

How can one estimate heritability on a single population? There are generally two methods. One is to note that as the biological overlap between pairs of relatives is greater, then so is the similarity between them in the phenotype of interest. Thus, identical twins raised together (such twins are by definition exact genetic duplicates, or clones, of each other) are more similar in measured intelligence to each other than are fraternal twins raised together similar to each other. Estimates of heritability based on such comparisons tend to be in the neighborhood of 70 percent for intelligence.

The problem with this method is that as biological overlap between pairs is greater, then so is their intra-pair similarity in social environment. Identical twins raised together are not only high in genetic similarity, but high in environmental similarity also. Thus genetic causation is confounded with social environmental causation, and the relative effects of the two cannot be viewed separately. A way around this is the second methodology: the study of identical twin pairs
separated early in life and raised in separate environments. If this is true, then any similarity between them in intelligence is due to genes alone, and not social environment, since their environments are separate and uncorrelated. Estimates of the heritability of intelligence (and of certain personality predispositions) using the study of separated identical twins center around 70 percent.

This separated-twins method makes considerable sense and is methodologically sound. The problem with it is that for the actual studies of twins separated at birth because of the early death of a parent, family problems, and so on, some twin pairs are more separated than others. Some pairs were indeed separated at birth and raised apart, never meeting prior to being tested for intelligence; they were raised in completely separate families in different towns and attended different schools. Yet other pairs—said by the researchers to be separated—were in fact raised next door to each other, attended the same schools in the same grades, and had other similarities in their familial social class environments. Some were separated considerably after their birth or were reunited for a time after an initial separation. The heritability estimate for these not-so-separated twins is around 80 percent, but the heritability estimate for the remaining quite separated twins is around 40 percent—considerably distant from an estimate of 70 percent. In general, the more separated identical twin pairs are, the less similar they are in such phenotypic variables as intelligence and certain personality predispositions. This is evidence that, although genes as well as the social environment have strong effects, the effects of the social environment are greater.

In conclusion, while both genetics (nature) and the many variables comprising the social environment (nurture) affect phenotypic variables such as intelligence, personality predispositions, criminality, and others, it appears from the relevant data that the effects of the social environment are somewhat greater than the effect of genetic heritability. This assumes no measurement error for the measurement of intelligence—an implausible assumption, given the evidence of lack of predictive validity, plus evidence of racial, social class, and gender bias in current measures of intelligence and academic ability. The most convincing evidence concerning the genetic heritability of intelligence comes from reanalysis of data gathered on samples of identical twin pairs separated at birth and raised in different environments, showing that some pairs were more separated than others, and further, that the more separated the pairs are, then the less similar they are in intelligence, and thus the less the size of the heritability estimate characterizing them. No recent estimates of the effects of gene–environment interaction are available.

The Neighborhood Watch program is a crime prevention effort that has been in existence across the United States for more than 30 years. Founded in 1972 by the National Sheriffs Association, it originally aimed to deter an increasing residential burglary problem that was affecting many towns and cities throughout the United States. The program provides a means for local officials, law enforcement, and citizens to work together, forming community-based partnerships to enhance safety within their community by improving the reporting of suspicious activity in a neighborhood to the proper law enforcement authorities. While citizens are discouraged from actively getting involved in crime fighting activities, they are strongly encouraged to become the eyes and ears of local law enforcement, providing heightened community awareness.

Through the 1960s, U.S. society became more mobile and faster paced, and more and more households had two-income families. This left vast numbers of homes empty during a typical weekday. Further, some suburban neighborhoods of the 1950s began to deteriorate and families began to keep more to themselves, losing some of the familiarity that once existed in neighborhoods. As the suburbs expanded, suburban sprawl forced law enforcement to attempt to cover larger and more developed geographic areas. Law enforcement agencies sought ways to deter burglaries, instituting Neighborhood Watch as a way to train people to be more observant and attentive to the surroundings within which they lived.

In the typical Neighborhood Watch program, the local police department identifies a neighborhood as a geographic area comprised of residents who have something in common, such as the physical location of their homes. Representatives of the police department then reach out to the residents of the identified neighborhood and solicit volunteerism for the purpose of heightening awareness and looking out for each other. As a crime prevention effort, the police train neighborhood residents how to be more aware and observant of their surroundings so as to readily spot suspicious activity and report it to the police. The police department assists the watch group by providing accurate and current data on the criminal activity in and around the neighborhood, distributing anti-crime information to the citizens, and providing training on how to detect and deter crime in a neighborhood.

When initiating a Neighborhood Watch Group, police will typically make contact with a resident and ask that he or she host an informational meeting, inviting surrounding neighbors to listen to a police presentation on the Neighborhood Watch program. Interested residents will then be asked to join the effort. A block captain is usually chosen from among the volunteers, and a phone or computer chain is set up to help coordinate the movement of information. Through periodic meetings, neighbors get to know each other and what is normal activity in their neighborhood. The neighbors also become more familiar with the police officers who service their neighborhood, greatly enhancing overall communications and providing a means for efficient and effective communication when an increase in crime is detected and/or in times of emergency. As an added deterrent, when a Neighborhood Watch forms, it posts signs advising of the watch throughout the neighborhood. The police also become more familiar with the police officers who service their neighborhood, greatly enhancing overall communications and providing a means for efficient and effective communication when an increase in crime is detected and/or in times of emergency. As an added deterrent, when a Neighborhood Watch forms, it posts signs advising of the watch throughout the neighborhood, warning potential criminals that the neighborhood is protected by an organized group of citizens who watch out for each other and their property.

As part of the Neighborhood Watch program, residents are asked to participate in Operation Identification. This is another crime prevention effort in which citizens engrave personal identification numbers onto their valuable property to aid in identification and recovery should it be stolen. Other activities that Neighborhood Watch Groups often get involved in include home security surveys, street lighting improvements, safe houses (for children), and hosting of community safety lectures and demonstrations.

The Neighborhood Watch program is effective because the residents of a neighborhood are better equipped than most police officers to notice things that are out of the norm in their neighborhood. The most diligent and dedicated police patrol officer can still spend only a limited amount of time in a particular neighborhood, restricting his or her opportunity to become totally familiar with the comings and goings
of the people who inhabit the area. A resident of a street inevitably spends more time on and around that street of residence. Simply by spending that much time in the street’s environment, a resident will be more aware of what belongs and what seems to be out of the ordinary. Even in the busy society within which we presently exist, we still know what our neighbors look like, what type of vehicles they drive, and what type of vehicles their common visitors drive. A car parked legally in front of a neighbor’s house might not arouse the suspicion of a passing police car; however, a resident might recognize it as being unfamiliar to that neighbor’s house. Passing such information on to the local police ensures that all is safe and secure or perhaps deters the committing of a crime.

Neighborhood Watch programs have proven to instill a greater sense of security in neighborhoods, reduce the fear of crime, and enhance a sense of community in areas where they are used. An effective Neighborhood Watch program can be set up in any neighborhood, regardless of the socioeconomic level of the area, as there is little cost involved to operate a basic program. The biggest resource needed is a number of caring and dedicated citizens willing to get involved in an effort to improve the quality of life within their own neighborhood.

Historical Context

Neo-Malthusian thinking traces its roots to the ideas of Thomas Robert Malthus (1766–1834). In 1798, Malthus published the first edition of his iconoclastic *Essay on Population*, asserting that population increases in a geometric rate (i.e., 2, 4, 8, etc.) in contrast to the arithmetic rate of food production (i.e., 1, 2, 3, etc.). This observation led him to conclude that, unless some measures of population control take place, humans will suffer hunger, calamities, and deprivation, since they will exhaust the Earth’s necessary resources to sustain life. He also asserted that population growth has a positive correlation with the rate of production, adding to further demands for non-renewable resources. When Malthus wrote his treatise in the 18th century, he was responding to the intellectual optimism of the Enlightenment, particularly the potent influence of the Marquis de Condorcet’s *An Essay on the Principle of Population*, as well as the optimistic views of his own father.

Ecological sociology is indebted to Malthus for much of its analysis of the various ways humans impact their own environment. Environmentalists often cite his cautionary pessimism when they analyze the state of the Earth’s resources. Demographers are indebted to him for his first examining the social impact of fertility rates and thus justifying the need for a national census to keep track of population movement and growth. His ideas also influenced evolutionist thinking in economics and biology.

Neo-Malthusianism

During the first half of the 20th century, conservationists argued that scarcity of resources and population pressures necessitated the establishment of sanctuaries to preserve ecosystems, thereby influencing the creation of national parks and a federal agency to oversee them. In 1968, Paul Ehrlich published his best-selling book, *The Population Bomb*, and generated one of the most contentious and prolonged debates within the environmental movement. In his
book, this unabashed neo-Malthusian attributed most of the environmental degradation to the ever-increasing population and made several controversial predictions, such as the possibility that millions would face starvation. In a nutshell, Ehrlich’s argument was not much different than that of Malthus. He insisted that the Earth’s capacity to produce food was reaching its limits; attempts to increase food production would further degrade the environment and in turn cause such problems as plagues and even social upheavals. However, neo-Malthusian critics countered that there were other, more significant causes of degradation, such as technology, in particular nuclear contamination, energy pollutants, and even “the tragedy of the common”—the selfish motivation of individuals to maximize their own utilization of resources, disregarding the common social good—among others.

These and other writings helped institutionalize sustainable development ideas in the policy arena. Just 4 years after Ehrlich’s book, the neo-Malthusian argument resurfaced again, this time with publication of the global think tank Club of Rome’s Limits to Growth. Yet, the most radical position in the spectrum of the environmental debate was held by a new generation of neo-Malthusians. Far from unified and cohesive, this radical approach draws on several philosophical positions to argue that wilderness preservation must be the cornerstone of any theorizing about contemporary life. The two most prominent groups among radical environmentalists are the advocates of deep ecology and Greenpeace. The latter established its reputation by leading perilous confrontational actions—which they regard as “bearing witness”—to stop what they view as outrageous exploitation of the Earth’s natural resources and the human condition by commercial interests.

In general, radical neo-Malthusians exhibit a profound distrust for multinational corporations and their practices; they link environmental degradation to the growth of capitalist development throughout the world. As such, this viewpoint perceives degradation not just as endemic of voluntary human action, but also as a derivative of deterministic advanced capitalist laws. They advocate a reexamination of industrial production practices and a scaling down of consumption patterns. The bulk of their work is in four “campaign” areas: toxic waste, energy, nuclear issues, and ocean and terrestrial ecology.

Development economists caution that a sizable population ultimately increases the poverty rate among developing nations without sufficient productive capacity to absorb the number of newcomers into the labor force. Expenses to support safety net policies such as education and public health can also affect per capita income. However, some skeptics argue that underdevelopment results from inappropriate policies, institutional regimes, and ill-advised interventionist tendencies.

In addition to criticism for its dire predictions, neo-Malthusianism also endures criticism from both sides of the political spectrum. Conservatives highlight that many assumptions of the neo-Malthusian models are simply wrong. For instance, they point out that the production of synthetic foods will actually produce an overabundance of staples. The fact that some people remain poor and hungry is not because of the lack of resources but rather because of faulty distribution networks. Critics from the other side knock the neo-Malthusians for their failure to account for class interests. They argue that the benefits of capitalism are unevenly dispersed along class lines, and therefore population is not the problem as much as the amount of political power accrued along class lines to influence policy.

Neuroses

Neurosis is a mostly outdated term that has had a number of meanings throughout the history of psychology. Its usage continues today, although more so in everyday language than in academic or clinical language. Coined in 1769 by William Cullen, a physician and professor in Scotland, the term originally referred to any disorder related to the nervous system, including
disorders with elements of anxiety, hypochondriasis, or irritability. The word itself derives from its connection with the nervous system (Greek neuron means “nerve,” and osis indicates a disease). First listed in Cullen’s diagnostic guide, System of Nosology, the category of “neuroses” consisted of a range of disorders that would now be classified as neurological and psychological, but all with an ultimate physical cause. This was a significant advance, because prior to Cullen’s classification, such disorders were thought to be caused by such elusive phenomena as demons or “vapors.”

Philippe Pinel started as Cullen’s translator but eventually criticized his ideas, defining neuroses as moral disorders as well as physical disorders, and suggesting that moral component warranted psychological treatment. The medical model, however, remained the dominant paradigm of mental illness until the late 1800s. The role of physical causes in mental illnesses took a back seat to psychological causes, and the word neurosis no longer signified an organic etiology. A century after Pinel defined neurosis, Sigmund Freud and others used the word to describe mental illnesses with a psychological origin but with no characteristics of psychosis—that is, no disconnect from reality. Freud connected the concepts of psychosexual conflict, defense mechanisms, and the unconscious with neuroses. In 1896, a renowned textbook by Kraepelin explicitly divided disorders into neuroses and psychoses. The neuroses included a range of anxiety disorders, from phobias to obsessions and compulsions. Neurosis referred to milder cases, whereas psychosis referred to more serious cases more likely to have an organic cause and justify more extreme treatments. At this point, the word psychosis, and not neurosis, referred to diseases that were related to the nervous system and that had a physical origin—the original meaning of neurosis!

In the present day, the word neurosis, along with its associated adjective, neurotic, is frequently used to describe anxiety-related, dissociative, or somatoform disorders, but clinicians seldom use these terms. Since publication of the third edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-III) in 1980, neuroses have not been listed among diagnosable psychiatric disorders. Instead, most clinicians use a more specific diagnosis, such as obsessive-compulsive disorder or generalized anxiety disorder. Today, the term communicates little clinical information but remains widely used among the general population.

NIMBYism
NIMBYism (Not In My Backyard) refers to the protectionist attitudes of, and oppositional tactics adopted by, community groups facing an unwelcome development in their neighborhoods. NIMBYism is an acute sociopolitical problem since it typically involves opposition to projects that place most of the burden on those living closest to the site while dispersing benefits to the much wider community (e.g., city, region, or nation). Waste disposal and landfill sites, hazardous waste and nuclear facilities, airports, homeless shelters, low-income housing, prisons, schools, and even convention centers and sporting stadiums all pose NIMBY problems.

In the United States, since the 1970s NIMBY opposition has drastically hampered the siting of many facilities considered important and even necessary to the well-being of the overall polity. Some frustrated observers have developed a series of wry acronyms to classify NIMBY attitudes. These include NOOS (Not On Our Street), BANANA (Build Absolutely Nothing Anywhere Near Anything), and NIMTOO (Not In My Term Of Office), which reflects the propensity of local politicians to ride NIMBY waves.

The Essence of the NIMBY Problem
The NIMBY problem is inherent in any democracy and especially any form of government that recognizes the right of local residents to have input into decisions that affect them. The central difficulty is that polities that allow local residents to play a significant role in planning decisions regarding their neighborhoods are likely to end up with a dearth of socially needed projects. This is because the benefits of NIMBY projects are usually spread broadly among a large population, while the drawbacks and costs of these projects tend to be focused in concentrated form on the small group who inhabit the host community. The latter are therefore highly motivated to oppose the
project strenuously. However, because the benefits of the project are diffused over the broad community, the beneficiaries are often less vocal than the opposition groups.

One solution to the unequal distribution of costs and benefits that characterize NIMBY problems is to use part of the economic surplus that would result if the project was implemented as compensation for local residents (e.g., providing neighborhood parks, lower local taxes, and other desirable amenities). However, redistributive solutions are hampered by a number of obstacles, including transaction costs. These include difficulties in determining who should represent the local community in compensation negotiations; the prevalence of holdouts because some residents may be opposed to the project under any circumstances; residents’ fears of possible risk to their homes and neighborhoods; difficulties in getting accurate information about the project’s likely costs; and the uncertainty created by the fact that no democratic government can guarantee that future governments will not reverse a particular program or course of action designed to compensate for, or mitigate the impact of, a NIMBY project.

Of course, not all NIMBY projects are, in fact, desirable to the broader community. Thus NIMBYism can halt projects that should never have been proposed in the first place. It can also result in improvements being made to proposed projects that are eventually built.

**NIMBY Opposition**

NIMBYism tends to develop in three stages. In Stage 1, word of the project breaks, and opposition, often in fairly visceral form, starts from those living closest to the proposed project. Indeed, one iron law of NIMBYism is that the closer people reside to a proposed project, the more likely they are to oppose it. In Stage 2, the debate moves into a public arena, and the opposition arguments become more reasoned. Stage 3 often consists of a long, drawn-out conflict, which may involve some kind of arbitration. The winner is often the side with the greatest stamina for a long, drawn-out conflict.

Opposition arguments generally focus on two areas: the possible threat to property values, and safety. With respect to the property values, studies show that oppositionists often wrongly perceive a negative impact on the value of their property. Local property values tend to be more closely associated with broader phenomena rather than specific projects. As regards concerns about safety, these vary with the specific group associated with the project. Most likely to trigger alarm are such substance abusers as drug addicts and alcoholics and certain types of ex-convicts. Next would be those with mental disabilities. Other concerns that opponents commonly express about a project’s impact on the neighborhood include fears of more traffic and bringing in unkempt-looking people.

The opposition generally uses a range of tactics—letter writing, marches, political lobbying—but their most effective weapon is the zoning hearing. Since NIMBY projects typically involve a land-use variance, there are usually public hearings at which the opposition can gather strength.

**Strategies for Overcoming NIMBYism**

If the group intent on introducing the project wishes to pursue a conciliatory (nonregulatory-based) strategy, it has several options for attempting to win community-based support. These include education (television, radio, public meetings, mailings, and leafleting campaigns), the creation of community advisory boards, and making concessions. The concessions can include modification of the project’s design and the inclusion of programs to benefit the neighborhood. However, voluntary cooperation is unlikely to succeed alone, given the transaction costs discussed earlier.

**Regulatory Approaches**

As a result, an alternative strategy for those wishing to implement NIMBY projects is to seek regulatory protection, typically from the state, that can bypass local politics and opposition. States have developed a variety of regulations that can be sorted by how hierarchical and interventionist they are. The effectiveness of each of these approaches depends on the context, especially the local political regime, and on the nature of the NIMBY project. For example, a hazardous waste siting will usually be implemented only if there is a highly hierarchical regulatory regime in place. Yet the presence of such a regime does not guarantee success, and indeed the project may fail if it triggers civil disobedience.
Among the least hierarchical regulations are those that are information enhancing and designed to produce a full exchange of data between the parties involved. Among the most important are environmental impact statements (EISs), which show the likely effect of a project on the local physical and natural environment (e.g., population size, traffic, air quality, sewage facilities). The 1969 National Environmental Policy Act requires an EIS under many circumstances, and numerous states have passed analogous legislation. Other information-enhancing regulations are determination of need statements, which obligate a project’s developers to demonstrate why the project is needed (at the proposed site). Information-enhancing regulations may ease a project’s acceptance by reassuring residents about a project’s likely impact. On the other hand, they may hamper a project’s acceptance by providing data with which opponents can discredit it.

More hierarchical and interventionist are process-enhancing regulations, which influence the mechanisms by which the parties involved negotiate. Such regulations may call for the creation of specific local committees intended to ensure the representation of parties affected by a proposed facility. Other regulations may stipulate public participation measures, which are designed to allow broad public involvement (e.g., public representatives on siting and oversight boards), and still other regulations may include negotiation and arbitration regulations, which provide a further framework to the negotiations between developers and community representatives (e.g., by specifying the timing of negotiations, by imposing penalties for refusing to negotiate in good faith, and by setting up dispute resolution mechanisms such as binding arbitration). These process-enhancing regulations seek to reduce certain transaction costs (e.g., by specifying who will represent the community). On the other hand, by introducing extra layers into the process, they may slow down and even be detrimental to the project’s acceptance. Even with these process-enhancing regulations, the main decision-making authority remains in the hands of the developer and the local negotiating parties.

The most hierarchical category of siting regulations gives the state broad powers to preempt negotiations between developers and the local siting committee or to overturn decisions made at the local level. These measures—administrative controls—substitute state mandates for local decision making. Examples include state overrides, which give a state agency the authority to veto decisions made at the local level; state preemptive authority, whereby specific state agencies may make siting decisions themselves; and state inventories and ownership, whereby state officials may inventory, and even buy, suitable sites and then enter directly into negotiations with potential developers.

Civil Rights Approaches

Another approach taken with some success by supporters of certain NIMBY projects has been to appeal to the civil rights of the project’s direct beneficiaries. For example, in 1989 the Illinois legislature obligated every home rule municipality to address the local need for group homes. Broadly helpful here have been the Americans with Disabilities Act of 1990, which broadens the scope of the 1964 Civil Rights Act to include the disabled; and the Fair Housing Amendments Act of 1989, giving the handicapped the protection of Title VIII of the Civil Rights Act of 1968 (the Fair Housing Act), which outlaws housing discrimination based on race, color, religion, gender, and national origin. The latter has been interpreted to prohibit discrimination against the developmentally and physically disabled (e.g., recovering alcoholics, the mentally disabled, people with AIDS).

President George W. Bush signed No Child Left Behind (NCLB) into law on January 8, 2002, declaring a new era in U.S. public education. The legislation enjoyed overwhelming bipartisan support in the post–September 11, 2001, context. Since then, support has eroded and the policy has been criticized on many fronts.

While NCLB is revolutionary in some respects, it also contributes to a long history of attempts to address educational disparities evident in U.S. public schools. These disparities—also referred to as the “achievement gap”—show white and Asian students generally outperforming their African American and Latino/a counterparts and students from wealthier communities outperforming those from poorer ones. The root cause of this “gap” has been variously attributed to poverty, racism, discrimination, inequitable resource distribution, poorly managed schools, unqualified teachers, and low expectations.

NCLB reauthorized and renamed legislation that had been in place since 1965, when President Lyndon Johnson signed the Elementary and Secondary Education Act (ESEA). Under ESEA, federal resources were funneled into economically disadvantaged school districts for compensatory educational services. Education was seen as a tool for combating poverty and diminishing institutional barriers.

A fundamental shift in thinking is traceable to a report entitled “A Nation at Risk” issued in 1983 during the Reagan administration. The report alleged that U.S. public schools were tolerating mediocrity and urged states to take action. It shifted the focus from “inputs” (such as resources) and began to focus on “outputs,” which placed emphasis on testing to ensure that performance standards were being met. Funding was linked to higher expectations and greater accountability. What followed was a “standards and testing” movement.

President Bush referred to the “soft bigotry of low expectations,” and NCLB targeted expectations. The original legislation rested on four major pillars: stronger accountability, more local freedom, proven methods, and choices for parents.

Stronger accountability rests on mandatory testing in reading, math, and science to measure achievement and provide evidence of progress. In addition to these annual measures, NCLB required universal proficiency in reading and math by 2012. Tests would determine whether schools and school districts were making adequate yearly progress (AYP). States must disaggregate their test data and report the progress of subgroups by race, ethnicity, and socioeconomic status as well as by groups with special needs, including students with disabilities and those with limited English language proficiency. Schools must then demonstrate AYP for each subgroup.

Schools and school districts that do not meet AYP standards for 2 consecutive years are labeled “in need of improvement.” For schools so designated, a series of progressive sanctions and remedial remedies are introduced. These include the opportunity to attend another school or to receive supplemental tutoring or remedial educational services. If schools continue to fail, they must take corrective action likely to produce meaningful change, and, finally, if failure is ongoing they must design and implement a restructuring plan.

More local freedom rests on notions of local control and greater flexibility. Maximizing local control is part of a broader Republican agenda to delegate authority for social welfare to state and local governments. Under NCLB, states have flexibility to manage federal funds and to shift funding streams based on program preferences.

Proven methods refer to the idea that programs should be grounded in scientifically based research and reflect best practices. This is part of a much larger public movement known as “evidence-based practice.” Considerable controversy exists over what constitutes “best evidence” or proper “science.” In addition, this section of NCLB mandates that only highly qualified teachers (HQTs) be hired in core subject areas (reading, math, language arts, English, foreign languages, science, civics and government, economics, history, art, and geography), but it defines highly qualified in a prescriptive manner. Critics contest the theory that enhancing teacher credentials results in better teaching, which in turn translates into improved student achievement.

Finally, choices for parents are evident in provisions relating to failing schools or those deemed to be persistently dangerous. Parents may choose to send their child to another, higher-performing school, including a charter school. Charter schools are public schools that operate independently of local school districts and are supervised by state or state-authorized bodies pursuant to a state statutorily defined performance contract.
Some criticisms of NCLB include fears that high-stakes testing leads to teaching to the test and will result in constricting curriculum to subjects that are the focus of accountability standards; that both the content and quality of state tests are problematic; that motivating schools and districts through threats and punishments is not effective; that measuring schools is being confused with fixing them; that achieving 100 percent proficiency by 2012 is unrealistic; that provisions of NCLB are uniquely problematic for rural districts; and that school choice will actually lead to segregation and stratification of public schools. Critics also charge that NCLB is an unfunded mandate that imposes burdens without providing adequate resources. Others argue that no amount of funding can correct bad policy. There are additional controversial provisions embedded in NCLB—such as those permitting the U.S. military access to student information for recruiting purposes—that have received critical attention.

Interestingly, the Children’s Defense Fund (CDF), a long-standing child advocacy organization, used the slogan “Leave No Child Behind” to refer to a comprehensive and progressive legislative agenda for promoting child-friendly policy. The CDF advocates reform that would provide poor and minority children a Healthy Start, Head Start, Fair Start, Safe Start, and Moral Start. The CDF’s Leave No Child Behind agenda goes well beyond the limited education policy articulated in the No Child Left Behind Act.

Nonrenewable resources are all those materials and energy sources consumed by our industrial society at a rate that exceeds the rate at which natural processes can renew those resources. This contrasts with renewable resources such as food and timber, which, presumably can be replaced continuously at the same rate as they are used up. Almost exclusively, these nonrenewable resources come from the Earth and from processes that operate within the Earth. Therefore, nonrenewable resources are essentially the same as Earth resources. Included among nonrenewable resources are such things as metallic and nonmetallic minerals, fossil fuels, and clean, fresh water.

Humans have a voracious appetite for every possible resource, but relative demands for any particular resource fluctuate with desire and need. Social, economic, and political factors that are not entirely predictable need to be balanced against our incomplete understanding of Earth processes. Shifts in technology or fads can turn a renewable resource into a nonrenewable resource and vice versa overnight. For example, the use of chromium in the manufacture of automobiles changed drastically as auto makers shifted away from chrome-plated bumpers and trim to painted rubber bumpers and cleaner design.

In any discussion of resources, one fact must be kept clearly in mind: the ultimate resource is energy quality. Of all the things we humans use to maintain our standard of living, all but energy quality are available in essentially infinite amounts. At least some measurable, if minute, quantity of every possible resource exists everywhere. What matters for the ultimate, useful exploitation of natural resources is the distribution concentration and form that those resources take. Finding, concentrating, and refining natural resources requires the expenditure of energy currency—expenditure inevitably accompanied by the conversion of high-quality energy to less useful and lower-quality energy (the second law of thermodynamics—entropy). For example, the gasoline or diesel fuel burned by a tractor or truck is high-quality energy that represents the accumulation of the sun’s energy in organic matter and its slow transformation and concentration in the form of fossil fuel. But, once an engine consumes that fuel, it is dissipated as heat that is practically useless as a source of energy to do work. Given a choice, we will always select as a source for any resource those
deposits that are easiest to find, collect, and refine into useful products. It is the fundamental uncertainty about exactly where nonrenewable resources leave off and renewable resources begin that leads to the conflict between those who view resources within a Malthusian perspective of limits to growth and those who hold there is no practical limit to resources exploitation.

**Use of Nonrenewable Resources**

The production and consumption of most nonrenewable resources is so removed from our daily lives that most people have no idea of what and in what quantities materials are needed to provide our current standard of living. For example, while we might have some idea of how much energy we consume, say in the form of fossil fuels to heat our homes and power our automobiles, we are, for the most part, totally unaware of the energy costs that go into food production, transportation, and so on. The overall per capita consumption of natural gas in the United States is, for example, several times the average per capita consumption used for heating homes. Similarly, huge nonrenewable industries such as the mining of sand and crushed rock aggregate for producing concrete and cement are essentially invisible to the general public.

**Extent of Nonrenewable Resources**

As stated before, it is possible to find a measurable if minute quantity of any potential material almost anywhere. If you looked hard enough, you could find tiny diamonds blown around by the wind in dust storms or a few atoms of gold in a gallon of sewage. What makes a resource a recoverable resource is its concentration and availability as an ore.

The estimation of the quantity of any given resource is an integral function of modern industry and government, and many authors have taken novel approaches at making such estimates. Perhaps the most soundly based of these approaches was made by Brian J. Skinner in 1980 and 1986.

Skinner systematically examined two aspects of the distribution of metallic elements: their overall abundance and the frequency distribution of ores of various grades (concentration). To understand the overall abundance of metal resources, Skinner looked at data available from the mining industry itself within the context of what geochemists know about the likely overall concentration of those same elements in the Earth’s rocks. Skinner based his analyses on the fundamental difference between what he classifies as the “abundant” and “scarce” metallic elements. Abundant elements (such as iron, aluminum, calcium, sodium, etc.) are those that are integral components of the common silicate minerals that make up the majority of Earth’s surface rocks. The scarce elements (such as gold, silver, tin, chromium) exist only in minute quantities within most silicate minerals and rocks at concentrations even less than might be expected, given their overall abundance in the Earth. Thus, some fraction of the scarce elements shuffles off by geologic processes over time into local concentrations that we call “ores.” The frequency of discovery of ores of different quality for the common elements resembles a single-peaked bell-shaped curve, because the distribution of such elements is more or less a random process. In contrast, the frequency distribution for scarce elements is bimodal—one small peak represents the discovery of an ore, while another low-concentration peak represents the rare substitution of a scarce element for an abundant one in a silicate mineral.

The results of Skinner’s analysis have two important implications. First, since he found that nearly all economic dimensions of metal resources correspond to the known crustal abundance of the elements, it appears that humans are near, if not at, the point at which we either know about or have already used up all known nonrenewable resources. Second, the consumption of scarce metals (gold, silver, platinum, chromium) may well be near or at the point where further exploitation may no longer be profitable in energy consumption terms. We have plucked the easy pickings; what is left will cost us dearly.

**Continued Availability of Earth Resources**

Perhaps no other aspect of nonrenewable resources generates as much controversy as attempts at estimating how long any particular resource will last (and the parallel question of how much it will cost). M. K. Hubbert of the U.S. Geological Survey was among the first scientists, in 1975, to place calendar dates on the peak and ultimate production of specific nonrenewable resources. His approach was deceptively simple. If we know the history of the production of any particular resource, Hubbert reasoned, then that history will
inevitably follow a logistic type progression; that is, production will rise slowly and reach some peak, after which it will gradually decline. The logistic curve is similar to the well-known bell-shaped curve of statistics. Based on the analysis of U.S. and world oil production, for example, Hubbert predicted that U.S. production would peak in about 1975, while world production would peak in about 2005. His predictions were essentially right on the mark.

The accuracy of Hubbert-type predictions has not led to their universal acceptance. In a now-famous incident in the repertoire of environmental folklore, a group of scientists at Stanford University that included the neo-Malthusian Paul Ehrlich accepted a challenge from Julian Simon at the University of Maryland. The challenge was that the cost of a specific list of metal commodities totaling $10,000 in 1980 would fall by 1990. If the value of the list rose, Simon would pay Ehrlich the difference; if it fell, the reverse. The price of the list was less in 1990 than it was in 1980, and Ehrlich sent Simon a check for the difference. This exercise underscored the danger in making too simple an analysis of the future economic behavior of resources.

The availability of a nonrenewable resource is not just a function of a well-defined quantity divided by a well-known rate of consumption. The quantity of a resource is, in fact, a function of the technology that can be applied to its extraction, while the rate of consumption and demand can change with human whims and changing needs. Ultimately, we can be certain that all resources have limits and cannot be exploited endlessly, but we must always keep in mind the limitations on our ability to predict the future.

NORMS

Descriptive norms are typical patterns of behavior, generally accompanied by the expectation that people will behave according to the pattern. Injunctive norms are prescriptive (or proscriptive) rules specifying behavior that persons ought (or ought not) to engage in. Such norms are usually informal, emerging from and operating through everyday social interaction rather than enforced by the criminal justice system or other formal authority.

Most social scientists regard norms as prescriptive or proscriptive rules, but no consensus exists on the precise boundaries of the norm concept. The various definitions of the term imply different theoretical problems and different approaches to measurement. For example, many scholars include pervasive compliance as part of the definition of norms, and use observed uniformity in behavior as an empirical measure of norms. By this usage, a behavioral rule that people do not typically obey is not really a norm.

Still others regard the norm as the prescriptive or proscriptive rule itself; they see both enforcement and compliance as theoretical problems that may or may not be solved in any given case. Groups may fail to enforce norms for a variety of reasons, and thus the norms may fail to regulate behavior. To resolve this problem, metanorms may emerge as second-order rules that regulate enforcement of norms.

Prominent rational choice accounts regard norms as collective goods because norms may provide solutions
to problems of selfish or antisocial behavior in groups. In this usage, scholars define norms as promoting behavior that benefits the group and prohibiting behavior that harms the group. Others regard the content of norms as a phenomenon to be explained and identify conditions under which dysfunctional norms may emerge and persist.

There are a variety of accounts for why people comply with norms. It may be that people internalize norms, voluntarily obeying because they believe they ought to do so. It may be that people are motivated to conform to behavior that they see in their peers or that they are motivated to comply with the expectations of their peers. Last, it may be that people comply with norms because they believe that their behavior will be monitored and that sanctions will follow from their behavior, such as ostracism for violating rules of grammar in school.

Nuclear Proliferation

Given the immediate explosive and incendiary force of the atom and the long-term human and environmental consequences from release of radiation, curbing nuclear weapons use has been of special concern since Hiroshima and Nagasaki. Atomic energy can serve military purposes (weapons of mass destruction [WMDs] and powering submarines) or peaceful purposes (nuclear power to light the land).

Major multilateral treaties seek to discourage proliferation of the former while facilitating the latter: the 1956 Statute of the International Atomic Energy Agency (IAEA); the 1963 Partial Test Ban Treaty (PTBT); the 1968 Treaty on the Non-Proliferation of Nuclear Weapons (NPT); the Comprehensive Nuclear Test Ban Treaty of 1996 (CTBT), not yet in force. Other efforts against proliferation include the so-called Proliferation Security Initiative (PSI) and the related initiative of the UN Security Council to prevent the spread of nuclear weapons and other WMDs to non-state actors. Particular countries are also subject to current council attention, namely the Democratic People’s Republic of Korea (DPRK) and Iran, seen as backsliding from the basic nonproliferation instruments. Iraq was subject after 1991 to (apparently successful) efforts to strip it of nuclear weapons (and other WMDs).

The IAEA is part of the United Nations family of organizations and has 143 nation members. Its purpose is to promote the peaceful use of atomic energy to improve health and prosperity throughout the world and to ensure, so far as it is able, that its assistance does not serve to further any military purposes. It can apply safeguards, at the request of the parties, to any bilateral or multilateral arrangement or—at the request of a state—to activities in the field of atomic energy.

One strategy to inhibit proliferation, both by aspiring nuclear states (horizontal proliferation) and by old ones seeking new weaponry (vertical proliferation), is to limit testing. Thus, the 1963 Treaty Banning Nuclear Weapons Tests in the Atmosphere, in Outer Space and Under Water (“Partial Test Ban Treaty”) obligated parties to prohibit, to prevent, and not to carry out any nuclear weapon test explosion, or any other nuclear explosion, at any place under their control in the environments listed in the title of the treaty. It also prohibited explosions elsewhere if they cause radioactive debris to be present outside the territorial limits of the state under whose jurisdiction or control the explosions are conducted. China and France were the main holdouts to this treaty. After Australia and New Zealand brought actions against it in the International Court of Justice for testing in the Pacific, France moved its tests underground in the early 1970s, as did most other testing states. The PTBT stipulated that the parties seek to achieve, in the long term, a treaty resulting in the banning of all nuclear test explosions. That proved daunting.

Meanwhile, the NPT sought to confront proliferation frontally. The NPT lists several premises in its preamble: the potential devastation of nuclear war, the dangers from proliferation of nuclear weapons, the value of peaceful nuclear technology and of IAEA safeguards, and the desirability of nuclear and other
disarmament. Substantively, the NPT draws a distinction between nuclear-weapon states and non-nuclear-weapon states. The former—the United States, the USSR (now Russia), the United Kingdom, France, and China—were those openly possessing nuclear weapons technology at the time (not altogether coincidentally, the five permanent members of the UN Security Council); the latter was everybody else. These five countries agreed that they would not distribute nuclear weapons or explosive devices or give the control over such weapons or explosive devices to any other nation. Non-nuclear-weapon states agreed not to seek possession of nuclear weapons and to accept safeguards against diversion of peaceful nuclear energy in agreements to be negotiated with the IAEA. Stopping proliferation is not enough, however. It is necessary to rid humanity of existing stockpiles capable of destroying Earth many times over.

Although 188 states are parties to the NPT, three states known to have nuclear weapons never joined: Israel, India, and Pakistan; the DPRK purported to withdraw in 2003. In 2006, Congress approved an agreement between India and the United States under which the United States would supply material to India for its civilian nuclear facilities and India would open those facilities to IAEA inspection. Proponents regarded the deal as the recognition of reality; it subjected India to essentially the same regime as the nuclear-weapons states under the NPT. Opponents saw it as a breach of U.S. obligations under the NPT and a “reward” to India for proliferating. Meanwhile, Pakistan supplied this technology to others. South Africa, Libya, and Brazil—which probably had nuclear weapons capacity at one point—have all foresworn it and are parties to the NPT, although some doubt Brazil’s compliance with IAEA safeguards.

A Review Conference of NPT Parties meets every 5 years and examines the treaty’s operation to ensure realization of its purposes. The NPT had an initial life span of 25 years from 1970 to 1995; the 1995 review extended it indefinitely, but not without controversy, given what many saw as the intransigence of the nuclear states in negotiating nuclear disarmament. To secure this extension, four nuclear powers—France, Russia, the United Kingdom, and the United States—gave “negative security guarantees,” promising not to use nuclear weapons on a non-nuclear state unless that state carried out an attack in association or alliance with a nuclear-weapons state. China made a similar promise, without the exception. The conference in 2000 resulted in an “unequivocal” undertaking by the nuclear powers to pursue disarmament. This brought no concrete results. Indeed, at the 2005 meeting, where participants failed to agree on a final document, some slippage in this commitment was clear. Hopes for a Fissile Material Cutoff Treaty, expressed in 2000, also proved illusory. Some progress did occur, however, in declaring nuclear free zones, such as in the Pacific and Latin America.

Adopted in 1996, the Comprehensive Nuclear Test Ban Treaty (CNTBT) had 138 ratifications in mid-2007, but it is not yet in force. That requires ratification of the treaty by all 44 states listed in Annex 2 as having nuclear power or research reactors. Thirty-four of them have ratified, but the People’s Republic of China, Colombia, Egypt, Indonesia, India, Iran, Israel, Democratic Republic of Korea, Pakistan, and the United States are holdouts. The U.S. Senate’s rejection of the treaty in 1999, which some viewed as a death knell, came over arguments that breaches could not be properly verified and that the United States could not continue stewardship over its existing stockpile without some testing. Proponents vigorously denied these arguments. Undaunted by the absence of some Annex 2 powers, a de facto moratorium on testing since the mid-1990s has been broken only by India, Pakistan, and the DPRK.

The PSI was launched by the United States in 2003 and currently involves 15 core countries and another 60 who cooperate on an ad hoc basis. It aims to inhibit transfer of banned weapons and weapons technology—nuclear, chemical, and bacteriological. One offshoot is a set of bilateral ship-boarding agreements between the United States and Belize, Croatia, Cyprus, Liberia, Marshall Islands, and Panama, that among them represent the flags of registration of about 60 percent of ocean freight traffic tonnage. The treaties facilitate searches for WMDs (nuclear, chemical, and biological), their delivery systems, and related materials. Another offshoot of the initiative is UN Security Council Resolution 1540 (2004), aimed at non-state acquisition of WMDs. A Committee of the Council endeavors to enforce the resolution.

The Security Council has also been reacting strongly under Chapter VII of the Charter to proliferation issues involving particular countries. Thus, Security Council Resolution 1718 addresses the situation created by the DPRK’s nuclear test of October 9, 2006. The resolution condemns the test and seeks to have North Korea suspend nuclear activities and return to the NPT and IAEA regimes. Security
Council Resolutions 1737 and 1747, from 2006 and 2007, pressure Iran to comply completely with the IAEA regime.

While moves such as these act against horizontal proliferation, the failure of the Nuclear Five to negotiate seriously on nuclear disarmament means that vertical proliferation remains relatively unchecked and a double standard applies to haves and have-nots. Critics of the U.S. 2002 National Strategy to Combat Weapons of Mass Destruction, which includes the option of nuclear force in response to the use of WMDs, and of developing British policy debate on how to replace their aging Trident missile system, detect further possibilities of backsliding from the commitment to negotiate an end to vertical proliferation.

Nursing Home Care

Nursing homes are facilities that have at least three or more beds at which health care workers (nursing assistants, licensed practical nurses, and registered nurses) regularly provide nursing care services for persons unable to care for themselves due to physical or mental health problems, cognitive impairment, or disabilities. Despite extensive governmental regulation, nursing home care has become a social problem that is often synonymous with elder abuse, neglect, maltreatment, and despair. Many Americans see nursing homes as places of last resort for the unwanted elderly—a place where one goes to die. Recent studies by the Institute of Medicine confirm these categorizations: care deficiencies in nursing homes have caused harm to patients, and the numbers of nursing home staff are often not adequate to provide quality care. However, many older people also receive superior care and benefit from the security and stability that nursing homes provide.

Despite a common belief that most elderly people live in nursing homes, according to the U.S. 2000 census, only about 4.5 percent of those age 65 and older reside there—a decline since 1990, when 5.1 percent of those over 65 lived in nursing homes. The reduction is due, in part, to changes in governmental funding, increased usage of alternatives to nursing homes, such as home health care services, assisted living facilities, family caregiving, adult day care, assistive devices, and an overall decline in disabilities for the elderly. However, the aging of the baby boom generation (those born between 1946 and 1964) will likely result in increased demand for quality nursing home care in the near future. Although a small number of disabled and chronically ill children and adolescents live in nursing homes, most residents are elderly: in 2000, more than 1.5 million nursing home residents were age 65 and over.

The likelihood of living in a nursing home increases with age. According to the U.S. census in 2000, 1.1 percent of the 65–74 age group live in nursing homes, increasing to 4.7 percent of the 75–84 age group, and greater than 18 percent for those 85 years and older. The majority of older nursing home residents are women (around 75 percent) due in part to the longer lives of women and the reality that most female residents of nursing homes are widowed. Elderly women are more likely than elderly men to be isolated, left without a partner caregiver, increasing the risk of nursing home institutionalization. In terms of race and ethnicity, most nursing home residents are white (around 80 percent, according to the U.S. census) followed by African American at around 10 percent, and an additional 3 percent who are Latino/a, American Indian, or Pacific Islander. The difference in proportion to population rates may be due to different cultural beliefs for the aged, resistance to institutionalization of elderly, and greater kinship and support networks among some minority group
members, although nursing home utilization rates for African Americans are increasing and rates for whites are on the decline.

Increasingly, proprietary or for-profit nursing homes are replacing state-funded nursing homes. While the cost of long-term care at nursing homes is high (averaging around $160 per day), older people with the need to be institutionalized tend to have limited health insurance coverage for that purpose. According to the U.S. Department of Health and Human Services, Medicare provides only limited coverage for long-term nursing home care, skilled facilities, and home health care. Once Medicare benefits are exhausted, many nursing home residents use Medicaid, a needs-based program that varies greatly from state to state. A recent study found that 16 percent of nursing home users began as private payers and then had to convert to Medicaid use once funds were gone. An additional 27 percent were covered by Medicaid upon admission and remained on it throughout their nursing home stay. Medicaid is the largest payer of nursing home care, with costs that totaled about $38 billion in 2005.

Most nursing home residents, particularly the oldest-old (85+), need assistance with multiple activities of daily living (ADLs), such as help with bathing, showering, and dressing, to more intensive services such as assistance with eating meals and toileting. Nursing home residents are often frail and in failing health; some are confused, needing to be fed, many with bladder and bowel incontinence problems that require adult diapers. Only about 11 percent of nursing home residents are able to care for their own basic needs. Compared to the nursing home residents of 30 years ago, today’s nursing home patients tend to be sicker and in greater need of intensive services such as intravenous (IV) medications. Nursing home staff members often complain to administrators and researchers that they lack sufficient time to adequately care for the residents, given the high level of patient needs.

One of the main issues identified in nursing home care is the problem of neglect, which is a crisis both of quality of care in terms of meeting mandated governmental standards and quality of life issues for residents. Increased governmental regulation has been a possible solution to the crisis of nursing home care. The Omnibus Budget Reconciliation Act of 1987 raised the quality of care standards in nursing homes that receive Medicare and Medicaid funds (approximately 76 percent) and provided nursing home residents with a mechanism to ensure protection of their rights. According to the Administration on Aging, nursing homes in every state must provide advocacy for the elderly under the Older Americans Act. Long-term care ombudsmen intercede on behalf of residents’ complaints of improper care; elder abuse such as slapping, hitting, or verbal assaults; complaints concerning chemical or physical restraints; withholding of medical care; lack of privacy; and untimely discharge. These ombudsmen handle approximately 260,000 complaints per year. However, many complaints go unreported because nursing home residents and their families fear reprisal from nursing home staff and administrators.

Currently, nursing homes operate under elaborate systems of rules and regulations designed to maintain caregiving standards for the elderly. Nursing homes must collect and report data on use of physical restraints, presence of skin pressure ulcers, patient weights, and other quality assurance measures. While standards have improved quality of care in some states, there is wide variation. Such regulations have also had unintended consequences. Critics charge that the “human element of care” is lost in the paperwork, as the emphasis on federal and state bureaucratic documentation takes nursing time away from the provision of the emotional care that patients need. With positive and negative sanctions for nursing homes determined by the successful completion of paperwork, the completion of the paperwork becomes a goal in and of itself. As a result, nursing home residents suffer when it becomes more important to document care than to actually give it. However, proposals to change the structure of nursing home care, including the paperwork systems, frequently meet with resistance from the nursing home industry.

Although there is no single solution to the problem of poor-quality care in nursing homes, advocates suggest that increasing levels of staffing and raising wages of nursing home workers should be high-priority actions. Because nursing assistants (also called nurses’ aides) provide approximately 60 percent of direct nursing home care, their training, retention, experience, and supervision merit our attention. Nursing home workers work for little pay (median wage of $9.86 per hour in 2004) and tend to be disproportionately drawn from lower socioeconomic class backgrounds. According to the Bureau of Labor Statistics, nursing assistants may or may not be required to have a high school diploma or GED as a condition of employment. Nursing assistants are almost always
women and frequently are racial and ethnic minority group members.

Nursing home care appears to be a contradiction between capitalism and care giving. In some ways, we are getting what we pay for. Changing philosophies concerning the valuation of caring work can improve the problems in nursing home care, as can the willingness to look to other, less institutionalized forms of care delivery. For example, the Eden Alternative committed to decreasing the dehumanization of the elderly gives them the opportunity to care for plants or pets or to assist in childcare, depending on their level of ability.

Further Readings

The United States is now the fattest country in the world. In July 2007, the Centers for Disease Control and Prevention (CDC) reported that more than 60 percent of U.S. adults and 25 percent of children were overweight or obese, making obesity one of the major health challenges facing the nation. From a medical perspective, those individuals likely to experience health problems as a direct result of excess weight are considered overweight. Obese is the term for individuals who are overweight to the point that their lives will be cut short as a direct result of excessive fat, whereas morbidly obese is reserved for those more than 100 pounds overweight or whose body mass index (BMI), a measure of height and weight, exceeds 40.

Over the past several decades, cultural eating patterns changed such that more Americans dine outside of the home more frequently, eating foods containing significantly higher calories, saturated fats, and cholesterol. Americans are quite literally stuffing themselves to death. Somewhat opportunistically, a billion-dollar diet and exercise industry exists to help the obese shed pounds and inches. Because this weight loss is elusive at best and temporary for most, the weight loss industry thrives on repeat business, those searching for the weight loss miracle cure.

Associated with obesity are many health risks, including heart disease, hypertension, and diabetes. Adult onset (Type II) diabetes is increasing at an alarming rate, coinciding with expanding waistlines. In addition to overt health risks, obesity strains the health care system with medical interventions, both surgical and pharmaceutical, at great cost to individuals and insurance companies. Some interventions, such as the weight loss drug Fen-Phen, promised miracles but produced devastating, even deadly outcomes.

In response to the rising tide of obesity, grassroots movements have had some success in reducing Americans’ girth. Following a public outcry, many schools have removed candy and soda machines, packaged foods require nutrition labels, exercise facilities are more readily available in workplaces, and many fast food restaurants now offer more health-conscious meal alternatives.

In addition to the health risks linked to obesity, excessive body weight relates to a host of social-psychological problems, ranging from weight discrimination to social isolation and diminished self-esteem. Three areas of research address different aspects of obesity, and excessive weight more generally, as a social and social-psychological problem: the cultural emphasis on thinness, weight discrimination, and self-esteem problems.

Culture of Thinness

A large body of research shows a linkage between the recent increase in eating disorders, especially in girls and young women, and the cultural emphasis on thinness. The desire to achieve the cultural thinness norm, in conjunction with the fear of deviation, leads individuals to strive for thinness, causing an array of devastating eating disorders, including obesity. An individual’s deviation from the idealized image of physical thinness may provoke others to judge and condemn individual behavior, resulting in embarrassment,
severe isolation, or alienation. While attempting to adhere to the norm of thinness, many people get caught in a vicious cycle of short-lived weight loss followed by weight gain.

While both men and women are obese, women receive most of the social condemnation of obesity (although rates of eating disorders among men are growing). For this reason, researchers study the media and other cultural products as explanations for the pressures exerted on women. Of particular interest is the representation of women on television, in the movies, and in advertisements. Generally speaking, the size of women in the media has been shrinking as real women have grown heavier. One example of cultural variation over the past 55 years is the White Rock mineral girl, who was 5 feet 4 inches tall and weighed 140 pounds in 1950, while today she is 5 feet 10 inches tall and weighs 110 pounds. Similarly, 1950s actress and sex symbol Marilyn Monroe wore a size 12 dress, while contemporary supermodel Kate Moss is a mere size 4. The White Rock mineral girl and Kate Moss are indicative of a literally shrinking media woman.

By holding up an image of female perfection—such as slenderness, daintiness, or demureness—the media insinuates that women who fall short of that perfection are somehow lacking. Print ads, magazines, television programming, and movies exemplify this, as does merchandising toward females of all ages. The “feminine failing” not only jeopardizes a woman’s happiness but also questions her femininity.

Much research on women’s obsession with weight assumes that all women and girls are equally affected by the culture of thinness, but some evidence suggests that not all women are affected similarly. Compared to black females, white women are under significantly greater social pressure to be thin, so that the rates of eating disorders are higher among white women than among women of color.

When it comes to obesity specifically, however, the rates are higher among African Americans and other minorities than among whites. A number of factors contribute to the prevalence of obesity among the poor and disenfranchised, including the cost of food, with fast food and fattening snacks being relatively inexpensive while healthier options are more expensive. Additionally, it takes time and resources to maintain a healthy lifestyle.

### Weight Discrimination

Not only is flagrant weight discrimination pervasive in many areas of social life, but overweight people comprise one of the few remaining groups still openly ridiculed with little public condemnation for such action. In the past 15 years, numerous lawsuits have attempted to identify obesity as a civil rights issue, citing cases of discriminatory hiring and firing practices, housing violations, and a lack of access to mandatory safety devices and public transit. Some of these challenges have been successful. However, because no federal laws currently prohibit discrimination against the obese, weight-based discrimination continues to flourish.

#### Economic Discrimination

Perhaps the most widely accepted form of weight-based discrimination comes in the form of workplace prejudice, insensitivity, and inequity. The loss of livelihood may be blatant; examples range from the aerobics teacher fired because she did not meet the “image” of an aerobics instructor to flight attendant applicants not hired because of their size. Less cited is institutional discrimination, flourishing from stereotypes held about obesity as a perceived disability.

Research shows that obese women earn 12 percent less than non-obese women. Obese men do not face the same wage penalty as women but do tend to be underrepresented and paid less than non-obese men in managerial and professional occupations. Estimated time for an overweight person to find a new job is an average of 3 weeks longer than non-obese job seekers.

### Health

Discriminatory attitudes among health care professionals may affect clinical judgments and deter obese persons from seeking care. Many health professionals associate obesity with poor hygiene, hostility, and dishonesty, believing that obese patients are lazy and self-indulgent, lacking self-control. These biases negatively impact medical judgments and practices, such that physicians report discussing weight loss programs with obese patients less than half as often as discussing weight loss programs for mildly obese persons. The National Health Interview Survey reports that obesity is associated with decreased preventative
care measures such as breast examinations and gynecological examinations.

**Social**

Growing research evidence reveals that the obese are more socially isolated than others. For example, both adults and children consistently rank obese children as least likable when compared not only with non-obese children, but also with children with various physical handicaps and disfigurements. This social distancing makes it more difficult for the obese to develop relationships, thus further increasing social isolation and decreasing self-esteem.

**Self-Esteem**

Repeatedly, physical appearance links integrally to self-esteem, most notably among adolescents but also among the population at large. Sixty percent of adolescents, females in particular, report lower self-worth because of their appearance. As social animals, humans tend to define themselves by the attitudes of, and their interaction with, others. As such, the obese often suffer from lower self-esteem and a negative self-image, creating heightened levels of psychological distress with the result that those who are overweight are at risk not only of a host of physical problems and ailments but also of ridicule, social isolation, and discrimination.

The social pressure on Western females to literally buy into the culture of thinness is overwhelming. Women are constantly vigilant, their self-esteem hanging on the determination of whether adherence to social norms has been satisfied, allowing escape from condemnation. For some, this escape is elusive, causing self-esteem to plummet.

**Obscenity**

The term *obscenity* denotes offensiveness to modesty or decency, typically in terms of human communication about sex or sexuality. As a legal concept, the term long resisted clear definition, especially during a 16-year period between 1957 and 1973 when the U.S. Supreme Court encountered the issue repeatedly. No majority of the High Court, before or since, ever deviated from the view that obscenity, like libelous and seditious expression, had blanket constitutional protection for socially injurious content. Yet, the subjective nature of the concept produced multiple failed attempts by the judiciary to delineate its scope and limits.

In 1957, the Court first engaged in extended analysis of the constitutional status of such communication in companion cases styled *Samuel Roth v. United States* and *David Alberts v. State of California.* The relevant provisions of the U.S. Constitution that the defendants invoked were the freedoms of speech and press imbedded within the First Amendment. Ratified in December 1791, these expressive liberties have remained at the apex of the Bill of Rights ever since, often inspiring momentous confrontations in this country’s courtrooms and legislative chambers. Typical adversaries in obscenity cases are government officials seeking to protect the social interest in public morality challenged by an individual, organization, or commercial entity claiming the legal right to convey a message by verbal, printed, or visual means.

Samuel Roth had been convicted of violating a federal statute that criminalized mailing obscene advertisements, which had been seized by U.S. postal inspectors. David Alberts had been convicted under a state law prohibiting similar conduct. A divided...
Supreme Court affirmed both convictions. Associate Justice William Brennan observed that the government need not show empirical evidence of harm to society because speech or press that exhibits no redeeming social importance cannot find shelter in the First Amendment. Writing for the majority, Brennan relied on the Model Penal Code of the American Law Institute to point out that obscenity was synonymous with a shameful or morbid interest in nudity, sex, or excretion that goes substantially beyond customary limits of candor in description or representation. Justices William O. Douglas and Hugo Black disagreed. For them, the legality of communication should not pivot on the reaction of the reader or listener. From their perspective, Roth and Alberts were being punished for thoughts provoked in others rather than for overt antisocial conduct.

Over the course of the following decade, as the membership of the Supreme Court underwent only moderate change, arriving at a consensus about the legal standard of obscenity proved elusive. By 1964, for example, Associate Justice Potter Stewart conceded that to him formulating a legal standard that consistently distinguished constitutionally unprotected obscenity from constitutionally protected pornography was an impossible task. Justice Brennan was not so easily deterred. In 1966, a case styled A Book Named “John Cleland’s Memoirs of a Woman of Pleasure” v. Attorney General of Massachusetts elicited a quite different standard than had Roth and Alberts. Brennan’s far more permissive definition stipulated that three elements must coalesce in order for prior criminal convictions to be sustained on appeal. In broad outline, the Memoirs standard required proof beyond reasonable doubt that expression alleged to be obscene was (1) wholly devoid of social value; (2) patently offensive to prevailing social sentiment across the country in its description of sex; and (3) thematically focused on salacious depiction of sexual conduct.

By the start of the Supreme Court’s 1972 annual term, Chief Justice Warren Burger had replaced Earl Warren and Associate Justices Hugo Black and John Harlan had given way to Lewis Powell and William Rehnquist. On June 21, 1973, a pair of cases decided by the narrowest of margins in Miller v. California and Paris Adult Theatre I v. Slaton heralded a remarkable judicial about-face in the constitutional law of obscenity that has persisted ever since. Miller had been convicted of mailing unsolicited, sexually explicit advertising brochures in violation of a provision of the state criminal code that had incorporated the obscenity standard announced in Memoirs v. Massachusetts. Fulton County, Georgia, District Attorney Louis Slaton had sought an injunction against the owners of Paris Adult Theatres to restrain commercial exhibition of two films alleged to be obscene under a state law that tracked the Roth standard more closely than Memoirs.

Chief Justice Burger and Associate Justices White, Blackmun, Powell, and Rehnquist sustained enforcement of both the California criminal code provision and the Georgia civil injunction. Their endorsement of what became known as the Miller Test served as a model for subsequent national legislation enacted by Congress and as a minimum standard of the freedom of speech and press in state-by-state legislation as well. Under this so-called Miller Test, the defining characteristics of obscenity are that (a) the average person would find the expression to appeal to prurient interest in sex; (b) the expression is patently offensive in its description or depiction of sexual conduct in light of local community sentiments; and (c) the expression is devoid of serious value on a political, literary, artistic, or scientific basis.

Nine years later, in 1982, the U.S. Supreme Court announced a unanimous decision in State of New York v. Paul Ferber. Ferber owned an adult book store in Manhattan. He had been convicted of violating a 1977 New York statute prohibiting production or dissemination of films or photographs involving children or using children in live sexual performances, even if such expression was legally obscene. While this opinion written by Justice White did not alter the Miller Test for obscenity, it did establish a new category of expression—child pornography—as outside the protection of the First Amendment and a novel rationale for censoring it: the physical and psychological well-being of minors. Then, in 1990, the Supreme Court extended the reach of Ferber by rejecting a First Amendment challenge and upholding Ohio legislation that criminalized possession or viewing of child pornography in the home.

With the 1990s advent of electronic communication, the U.S. Congress passed a series of statutes designed to curtail access by minors to sexually explicit material found on the Internet. The Communications Decency Act of 1996 criminalized posting indecent content readily accessible to children on the Internet. A unanimous Supreme Court invalidated the CDA in 1997 in Janet Reno v. American Civil Liberties Union. The
vagueness of the concept of indecency, said the Court, violated the First Amendment due to overly broad government suppression of speech addressed to adults.

The next year, 1998, Congress approved the Child Online Protection Act. Known by the acronym COPA, the statute required that commercial Web sites verify proof of age before granting access to sexually explicit expression defined by law as obscene for minors. Variable obscenity—the principle that expression entitled to First Amendment protection when intended for adults might still be classified as obscene when intended for minors—had received a qualified endorsement in 1968 by a divided Supreme Court in *Ginsberg v. New York*. By June 2004, the judicial reception was less accommodating, as the Supreme Court sustained an injunction against enforcement of COPA previously imposed by a federal district court in 1999. *American Civil Liberties Union v. Attorney General John Ashcroft* ordered the lower court to consider whether ongoing advancements in filtering technology could protect children more effectively and with fewer affronts to the freedom of speech than the criminal sanctions provided by COPA.

Finally, in 2000, Congress enacted the Children’s Internet Protection Act (CIPA). Under provisions that became effective in April 2001, libraries and schools receiving federal technology funding were required to install pornography-blocking software on their computers. The American Library Association (ALA) filed suit in federal court in Pennsylvania, alleging that the statute as written abridged the freedom of speech guaranteed by the First Amendment. Following a trial court decision in favor of the ALA in May 2002, the U.S. Supreme Court reversed that result, upholding the law as it applied only to libraries in June 2003. The school provisions of CIPA remained in effect without legal challenge thus far.

### Occupational Safety and Health

Occupational safety and health deals with reducing and eliminating all work safety hazards, including illnesses, diseases, stress, injuries, and repeated trauma. The field of occupational health comprises multiple specialty areas such as statistics, social sciences, health sciences, ergonomics, safety engineering, and biohazard waste and control. Individuals pursuing this career can find employment in private industry, federal and state government, and colleges and universities.

Occupational health specialists seek to understand the injuries and illnesses that occur within the workplace, as well as causative factors associated with the injuries. Such an understanding is a critical step in prevention. Tracing injuries and illnesses back to their underlying causes helps occupational health specialists establish primary, secondary, and tertiary prevention programs to reduce the amount of worker displacement and psychosocial anguish and, therefore, increase productivity.

### History of Worksite Health Protection

The Industrial Revolution sparked the need to reform the working environment when the textile industry switched from human and animal power to machines. Machines allowed textiles to be produced at a rate
much faster than before. The machines used by the textile industry had a tremendous impact on production, and soon machines and technology became the cornerstone of the U.S. workforce. The benefits of using machines and alternate forms of technology are well known (i.e., increased production), but not many people examined the negative side effects of machinery and the use of technology on workers' health. Even today, we still struggle to understand how machines, chemicals, and working environment affect workers' bodies.

From 1850 to the 1900s, Lemuel Shattuck prompted a period of organization and reorganization of legislation to promote health. His 1850 report to the Sanitary Commission of Massachusetts called for an establishment of local health boards to deal with issues such as sanitation, safety, health of children, and drug use. The Lalonde Report, a landmark publication providing clarification on the causes of diseases and death, along with a series of national and international conferences, spurred the health promotion and occupational safety movement in the United States. During the next 100 years, health promotion remained linked to occupational health. Not until the 1970s, however, did worksite health promotion and protection begin to gain strength.

Health promotion and protection provides the conduit between the science of the medical community and the U.S. workforce. The governmental organization charged with keeping every working American healthy is the Occupational Safety and Health Administration (OSHA) formed by President Richard Nixon on December 29, 1970. From 1970 to the present day, OSHA has helped facilitate new laws and regulations to keep the workforce safe in an ever-changing world, ranging from the first safety standards adopted for workplaces in 1971 to protecting workers against terrorism in 2001.

**Fatal and Nonfatal Injuries**

According to OSHA, motor vehicles cause the most deaths among working Americans. The highest rates of fatal accidents occur within the professions of transportation, mining, agriculture, forestry, fishing, construction, fabrication, laborers, precision production, craft, and repairs. However, OSHA reports a steep reduction in fatal injuries counterbalanced with an increase in nonfatal injuries and their effects on the workforce and society. The professions with the most nonfatal injuries are construction, agriculture, forestry, fishing, private industry, and mining. Anxiety, stress, and neurotic disorders comprise nonfatal injuries resulting in the largest median time away from work, more than all other nonfatal injuries combined. The only competing nonfatal injury is musculoskeletal disorders, also known as repeated muscle trauma.

**Reduction of Injuries and Deaths**

Many methods attempt to reduce injuries and deaths among U.S. workers, primarily government legislation, alternative management techniques, and the creation of on-site injury prevention programs. The government document *Healthy People 2010* outlines specific objectives for worksite health promotion and protection. According to Goal 7, Objective 5, more worksites ought to offer comprehensive employee health promotion programs to their employees. A reduction in work-related injuries resulting in medical treatment, lost time from work, or restricted work activity accomplishes Goal 20, Objective 1. Goal 20, Objective 3 from *Healthy People 2010* relates to the area of reducing the rate of injury and illness cases involving days away from work as a result of repetitive motion or overexertion.

In the worksite, occupational health specialists analyze possible threats to employees' health while working for the company. The managers of corporations have made many efforts to help reduce on-site job injuries. Total Quality Management (TQM) is a continual improvement process that combines common sense, education, and training with the abilities to communicate and work as part of a team. This approach offers two steps in work injury reduction. First, an audit program assesses and provides specific measurements of medical programs, ensuring that the medical program provides all three levels of prevention; that is, primary, secondary, and tertiary. The second approach is for a team to develop an alternative return-to-work program, which assists with early rehabilitation of injured employees. Early rehabilitation of the injured person is essential for bringing the patient back to full health and activity as soon as possible.

TQM programs positively impact the health and productivity of workers involved and set the gold standard for health promotion programs in the workplace setting. Regarding effectiveness in improving the health of employees and lowering health care costs, each of these programs meets the objectives set
by the National Coordinating Committee on Worksite Health Promotion.

A worksite health program involves a combination of organizational, educational, and environmental activities that have the ultimate purpose of developing and supporting behavior that promotes a healthy work style of employees. Worksite health programs not only address safety issues at the worksite, but they also utilize the modern definition of health that comprises the physical, social, mental, emotional, and spiritual dimensions to help target the largest nonfatal injury: anxiety, stress, and neurotic disorders.

Specific objectives for worksite health involve increasing the number of worksites that offer comprehensive employee health promotion programs to their employees; reducing work-related injuries resulting in medical treatment, lost time from work, or restricted work activity; and decreasing the rate of injury and illness cases involving days away from work.

Oligarchy

When organizational survival and leader interests displace an organization’s goals, an organization experiences oligarchy. In a 1911 study of the German Social Democratic Party and labor movement, Robert Michels discussed how bureaucratization, or large-scale organization, allows leaders’ interests to dominate over the masses. Michels’s iron law of oligarchy asserts that organizations are specialized. To pursue goals such as social change, individuals must collectively organize. As the collective grows, members designate leaders to take care of administrative and coordination needs. The resulting hierarchy gives leaders access to power and resources but also reduces members’ influence and participation. To protect their positions, leaders become conservative, resistant to reform, and even repressive. As leaders replace unattainable goals with more diffuse goals or make goals conform to those of the larger society, organizations undergo goal transformation. Organizing activities shift from attaining goals to organizational maintenance, such as securing members, funds, and other resources. When power is concentrated to a few individuals, the organization relinquishes democratic practices and thus fails to reflect members’ interests.

Using Michels’s law, several social movement researchers have critiqued formal organization as derailing effective mobilization. To secure resources and support, particularly from elites and the state, organizations may soften their strategies and thus moderate their agenda. To maintain their power, for example, leaders may refuse to help newcomers because of concerns that new demands will alter power relations. To avoid such concentration of power and conservatism, a few researchers have recommended spontaneous grassroots disruption as a more effective means for gaining concessions from opponents than formal organizing. However, critics agree that organizations are crucial for successfully mobilizing persons and resources.

Increasingly, researchers have posited oligarchization as conditional rather than inevitable. An organization’s susceptibility to oligarchy depends upon conditions such as the type of organizational goals and membership, congruency of organizational goals with larger societal norms, and competition with other groups. Recent studies show that not all organizations abandon their goals as they grow or appoint leaders. When environmental conditions render mobilization difficult, professional management can improve a social movement’s abilities to reach goals. Under conditions such as a political crisis within the organization, previous activist experience, and support from other organizations, leaders can reinvigorate organizational efforts in a more radical rather than a conservative direction. In addition, checks such as a two-party system can temper oligarchization.

Katherine K. Chen
The term oligopoly designates a market form in which a few sellers dominate the market sector. This creates disequilibrium in the market, affecting both its efficiency and the entire society.

In an ideal free-market economy, firms operate in perfect competition, producing each product at the lowest possible cost and selling it at the lowest possible price. In an oligopoly, however, many parameters that characterize perfect competition are unfulfilled: products and services are less differentiated, buyers and/or sellers lack information about prices and traded goods, entry barriers exist for new sellers, and individual buyers and sellers lack independence.

Product differentiation is the process of distinguishing a product or service from those of competitors, with the aim of making it more attractive. Indeed, often differentiation is achieved by means of changes related not to the product itself, but only to its packaging, distribution, and marketing. However, buyers may perceive these small differences as important. Therefore, a large firm’s marketing strategy is to produce a variety of similar goods. Retailers are interested in showing a wide variety of merchandise; if the same firm produces many of the offered goods, this firm obtains a competitive advantage over its rivals.

In many sectors, a small number of firms exercise a dominating influence over the market, and this in turn contributes to an increase in their market share. In fact, an oligopoly exists when four firms in the industry have a market share above 40 percent. Competition for market share contributes to the growth of oligopolies, because large firms with great financial power have the opportunity to force minor producers out of the market.

Thus, firms seek to grow, either on the domestic or on the international market. In an internal market a firm can expand by increasing sales, mergers, and acquisitions. Abroad, a firm can expand by buying local brands and/or introducing brands to new markets. When a leader firm enters foreign markets, its rivals follow suit; this behavior, called “oligopolistic reaction,” increases the number and size of multinational corporations. This form of enterprise, characterizing firms that manage production establishments or deliver services in at least two countries, may threaten job security in a country.

As the decisions of one firm influence and are influenced by the decisions of its competitors, there is a high risk of collusion. Explicit collusion, in which competing firms cooperate, for instance, in raising prices, is illegal in many countries. However, rival companies can enact friendly competition: they can tacitly collude by monitoring each other’s prices and setting them at the same level. This behavior, aimed at avoiding a price war and/or excessive advertising costs, benefits the colluding firms and damages the purchasers.

In Western countries, oligopolies exist in many sectors of the economy. In the United States, for instance, oligopolies can be found in the soft drink, cookie, razor blade, commercial jet airline, and comic book industries.

ONE-DROP RULE

Arguably, one of the most permanent racialized ideas in the history of the United States has been the insistence on human classification. Regardless of its biological and scientific invalidity, the notion of “race” is an endemic feature in social relations and continues to artificially separate individuals who have more in common, racially speaking, than they have differences. Personifying the illogical reality of a racialized social construct is a particular term—the one-drop rule—in which anyone known to have even “one drop” of African ancestry was deemed or classified as African American. The social engineering of this term is inextricably interwoven within the context of the enslavement and segregation eras (1600s–1960s).

However, it was not until the late 19th and early 20th centuries that the “nadir” in segregationist legislation passed, mainly throughout the southern states. Notably, the enactment of these laws was specifically, sometimes indirectly, to enforce the one-drop rule. Previously, no state legislation enforced the segregation of all African Americans, regardless of the amount of mixed heritage from their African, European, and Native American ancestry. However, the “passing” of light-skinned African Americans into the majority white population had become increasingly common and played a role in prompting the legislation.

In particular, Homer Plessy (1862–1925), a man who described himself as seven-eighths white and one-eighth African American, was the person behind a key piece of segregationist policy (Plessy v. Ferguson) that cemented de jure segregation for nearly 6 decades. The Supreme Court decision on May 18, 1896, upheld a doctrine of “separate but equal,” bringing forth the age of official or constitutional segregation: Jim Crow. Two generations later, the 1954 Brown v. Board of Education Supreme Court ruling made segregation in the schools unconstitutional, thereby overturning the Plessy v. Ferguson decision.

A salient feature of the one-drop rule is the notion that a person has a static social identity, that a person of mixed heritage is “fixed” to the status of the “racial group” with the least social status. Therefore, having a one-sixteenth portion of African heritage could determine one’s status as a designated African American, regardless of a fifteen-sixteenths white ethnic makeup.

Overall, the one-drop rule was a sociopolitical construct that enabled the U.S. dominant culture to limit miscegenation and social integration with those of African American heritage. Not until 1967, with the Loving v. Virginia Supreme Court ruling, did the banning of interracial marriage become unconstitutional. However, this ruling did not deny the continued predominance of the one-drop rule, and today it still largely remains the social identifier within the African American experience.

OPPOSITIONAL CULTURE THEORY

Oppositional culture theory primarily explains the academic underperformance of young African American males. It holds that black youth have constructed an oppositional collective identity in response to a society they perceive as racist and antagonistic to their general well-being. From this oppositional perspective, black youth interpret the institution of education as a tool of oppression controlled by whites who serve as the gatekeepers of racial inequality. They therefore perceive academic success as conforming to a society that is antagonistic to their cultural moorings and a symbol of “acting white.”

Oppositional culture theorists place the adoption of stereotypically white behavior (“acting white”) as appearing at the end of the Civil War period and again after the civil rights movement, as African Americans increasingly integrated into the cultural
and social life of white Americans. For some African Americans, “acting white” became a way of wielding power in a society that deemed black people as an inferior social group. For other African Americans, particularly in the civil rights era, a collective black identity emerged criticizing the practice of “acting white” and embracing a sense of cultural and racial pride, as evidenced by the Black Power movement. According to oppositional culture theorists, today’s collective oppositional identity of black youth emulates the sentiment of this racial and cultural pride.

According to oppositional culture theorists, young black males are skeptical of schooling as a vehicle toward success, have a general distrust of the U.S. labor opportunity structure, and also believe that academic achievement is not masculine and not “authentically” black. The negative assessment—coupled with the positive assessment of illegal activities, sports, and entertainment as rewarding enterprises—results in many young black males coming into conflict at school and/or dropping out. Their peers reinforce and reproduce this oppositional framework, while academically successful African American students experience internal psychological stress and general feelings of alienation. Accordingly, the stigma of academic excellence is greater for African American males than for African American females and females in general. Therefore, many young black males consider resistance to schooling as a masculine trait and academic success as a feminine one.

Critics of oppositional culture theory argue that (a) when controlling for socioeconomic factors, the relationship between the oppositional culture of black youth and academic achievement significantly diminishes; (b) ingroup differences reveal “resilient” African American students who reject an oppositional relationship to schooling; and (c) the oppositional culture of African American males does sometimes include the importance of schooling as a vehicle to racial pride, as evidenced in the hip-hop artistry of Tupac Shakur. Hip-hop music, to some, is the embodiment and reproducer of an oppositional black identity.

Organized Crime constitutes in and of itself a social problem, but, in reality, it becomes an influential factor in producing many other types of social problems. Attempts at finding a definition of organized crime acceptable to all the disciplines that deal with its subject matter have met with frustration; hence, here its major characteristics are distinguished by the word organized, which means that it is committed by two or more or a group or groups of individuals working together. Another distinguishing feature lies in the criminal goals, motivations, or ends that these groups seek to achieve.

There are four basic types of organized crime. The first is mercenary organized crime, in which the major goal is attaining a direct financial profit from engaging in the crime. This category includes gangs that burglarize homes, auto theft rings, pocket-picking rings, and groups that perpetuate various forms of confidence games. By contrast, those who participate in ingroup organized crime do not have financial gain as their major motive; instead their purpose lies in the individual’s psychological and social gratification attained by belonging to a group that engages in “rumbles” and other risk-seeking thrills for the sheer adventure itself. Political-social organized crime also does not have direct financial profit as its goal; instead the goal is that of changing or maintaining an existing political-social structure; terrorist groups and the Ku Klux Klan are examples of this type. Finally, syndicated organized crime, the type that receives the most attention from
researchers, journalists, and politicians, has as the goal of its criminal participants that of attaining direct financial gain by providing illicit goods and/or services to the public through the use of threat, violence, and procuring police or political “protection” to safeguard its participants from legal interference. Illicit gambling, prostitution, and illicit drug trafficking have been its major enterprises.

In the United States, the subject of syndicated organized crime has enjoyed a romance with the terms Mafia and Cosa Nostra. In the 1950s and 1960s, U.S. governmental committees captured the public imagination and concluded that syndicated crime was primarily an Italian and Sicilian import. Critics of these conclusions were quick to point out that these governmental investigations had two serious flaws: (1) historically, they argued that syndicated crime began with Sicilian involvement in the 1930s and that its membership was exclusively of Italian and Sicilian origin. Historical fact reveals that syndicated crime has existed in America throughout its history, including during colonial times. And (2) studies show that syndicated crime is not and never has been the province of any one ethnic group. In reality, mafia as syndicated crime is better understood as a method rather than an organization, a method that includes the use of force, intimidation, or the threats of such, requiring a group whose purpose is that of providing illicit goods and services and does so by obtaining political or police protection. As such, mafia or syndicated crime can exist anywhere. As for being exported, it is individuals who migrate; the growth and survival of the system itself is ultimately dependent upon the social conditions and social system of the country where it operates, which either allows or stifles its development.

The reasons syndicated crime continuously captures the attention of those who study it as well as the general public itself lie in its moral, ethical, and legal implications. Its continued existence speaks to an eternal dialectic between good and evil, one in which governments seek to make certain goods and services illegal with the intent of controlling morality, only to find that there are always enough individuals who seek and are willing to pay for these goods and services and enough criminals willing to risk life and imprisonment in order to make them available. Thus, there is no country in the world without organized crime among its social problems. To estimate the profits rounded to an exact amount would be impossible other than noting that, yearly, around the world, the profits amount to billions of dollars.

Each country has its criminal groups; in China, we have the Triads; in Japan, the Yakuza. Because of their large membership and power, these groups exert influence on the financial affairs of their respective countries. Each group operating in the world varies in the enterprises it engages in, depending upon the social structure and the needs for illicit goods demanded by its customers. Typically, the organized criminals watch and wait for trends among the populations in which they exist. Thus illicit drug trafficking in the United States did not become a major enterprise until the 1950s when the “beatnik” and “hippie” movements made its use popular. Indeed, the entire history of U.S. syndicated crime consists of organized criminals taking advantage of changing U.S. trends and needs for illicit goods.

Clearly illustrative of this reality is the Prohibition Era ushered in by the passage of the Volstead Act in 1920. The act made the sale of alcoholic beverages illegal, other than for medical purposes. This spawned the creation of criminal syndicates throughout the country. One of its celebrated criminals was Alphonse “Al” Capone, who ruled the underworld in Chicago during the Prohibition era. Taking his power from establishments paying large sums for protection, he also made certain that he controlled the political arena by helping elect political candidates who, in return, would protect his enterprises.

Although mercenary and ingroup forms of organized crime such as petty swindlers, pickpockets, and warring gangs were prevalent on the streets of New York City in the second half of the 19th century, it was the Prohibition era that allowed syndicated criminals in the major U.S. cities to produce a level of profits unknown to them at any time before in U.S. history. The development of sophisticated avenues of corruption on a worldwide scale and a worldwide increase in the desire for illicit drugs has, since the 1950s, increasingly allowed not only U.S. syndicates but those in foreign countries as well to make extreme profits from this trade. An example of this phenomenon is Pablo Escobar, a Colombian cocaine drug lord, who in 1989, at the young age of 40, was considered the world’s most powerful criminal. In his rise to power, he killed Colombian Supreme Court justices, police chiefs, and presidential candidates. It took the
joint effort of the U.S. military and the Colombian government, using the most sophisticated surveillance equipment and weapons, to bring him out of hiding and kill him.

The power that can be amassed by criminal syndicates speaks to the issue of why this form of crime is of relevance to the creation of social problems. The single element of the corruption it generates serves to create a loss of faith in government among the citizens of local and federal governments. Mercenary forms of this crime bring financial loss to citizens and corporations such as those incurred in scams in which imitation designer bags or clothing is sold to unsuspecting customers. The customer receives an inferior product, while the designer company loses its profit from the potential sale of its legitimate and superior product. Citizens are robbed at gunpoint by gangs; autos are stolen by auto theft rings, each of these adding to the yearly financial loss of property by citizens. So, too, some Chinese and Russian syndicates within the past decade have developed enterprises that transport alien citizens from one country to another. In some cases the aliens request this service themselves, hoping to find better jobs in foreign lands. In other cases, particularly among female victims, these aliens are promised jobs only to find that once they arrive in their new country, they are turned instead into prostitutes or forced to work as cheap labor in “sweat shops.”

Probably the most serious future social problem presented by organized criminals emerges from the current and developing globalization phenomenon that allows criminals to more readily cross borders and view the entire world as a potential marketplace for their ventures. As stated earlier, these criminals are quick to take advantage of social and technological change, and now the entire world has become their stage. Add the rise within the past 2 decades of political-social organized crime in the form of terrorist groups, and we see the threat this presents to the future security of the world and the continued presence of organized crime itself as a social problem.

OUTSOURCING

Outsourcing is a business arrangement in which one organization contracts with another organization to perform services that it normally would have done itself. This occurs generally in areas outside of an organization’s core competencies in order to take advantage of cost savings.

Several different types of outsourcing should be distinguished. Probably the most common kind involves a private company hiring another company in its own country to provide certain services. For example, a computer manufacturer, such as IBM, may hire an outside contractor to clean its facilities. In this case, the service provided is clearly outside of IBM’s core competencies.

A second kind of outsourcing would be a government organization hiring a private company to do some of its work. A typical example here would be a school contracting out its food service, so that the workers providing the food service are private employees and not government employees. Here again, serving food is clearly not within a school’s core competencies.

The most controversial type of outsourcing occurs when a private company hires a foreign company to do work for it. This outside contracting, known as “offshore” outsourcing, has become more and more common in the past 20 years. Much computer technical support for U.S. companies has been outsourced to India through a variety of subcontractors in recent years.

Why do organizations outsource? Not surprisingly, the chief reason is to reduce costs. If the company has its own employees perform the service, then it must pay them as it would any of its employees. For a company that treats its employees well, this could be a large cost—the company may well be able to find outside workers who can do this non-core service adequately at a much lower price. The workers may be cheaper because they live in a foreign low-wage country (in the case of offshore outsourcing), or they may
be cheaper because they are nonunion or live in low-wage areas of the United States (in the case of domestic outsourcing).

Outsourcing may also provide the company with access to more expert employees and more up-to-date technologies. The vendor—the company to whom business is outsourced—often has highly skilled employees who are specialists in specific areas. By focusing on particular services, vendors are more easily able to adopt new technologies and avoid technological obsolescence. A company that tries to perform services that are outside of its areas of core competency may be stretching itself too thin and be unable to take advantage of new technologies as they come into use.

By hiring outside workers, a company is able to turn fixed costs into variable costs and avoid the costs associated with constantly hiring and training new workers. The ease of changing vendors compared to changing full-time, in-house employees gives the company significant flexibility in running its business. The fixed costs of the in-house employees are by definition unchangeable in the short run; they can make it that much more difficult for the company to respond nimbly to market conditions. Outsourcing turns these into variable costs, thereby enabling management to react better to the vicissitudes of the market.

The main disadvantage of outsourcing is that the company may lose some control over production; it must rely on some outside entity that is under different management. Instead of dictating how production should be organized, the company must accept whatever organization and management the vendor chooses. This would generally not be acceptable in core operations, but in ancillary operations it can be a risk worth taking.

Another disadvantage concerns offshore outsourcing. A company in a developed country, such as the United States, can count on political-economic stability for its domestic operations; it is unlikely that its production will be disrupted by external social or political forces. If, however, it outsources to vendors in an unstable country, it may be subject to such disruptions. This, of course, is not as great a concern as it would be if the company was producing for itself (not through a vendor) in these countries, but it still can cause problems. On the other hand, this is an advantage of outsourcing—a company can take advantage of a low-cost country without fully committing itself to producing in that country. If disruptions do occur to the vendors, the company can fairly easily leave; a company that is producing under its own auspices will have a more difficult time getting out.

Although outsourcing is generally undertaken by individual, private companies to increase their own profitability, it has socioeconomic ramifications beyond the company’s bottom line. It is offshore outsourcing, in particular, that generates the most controversy, since it affects workers and society in two different countries.

First, how does outsourcing affect the vendor country? Clearly, jobs shift to this country to take advantage of the low wages, a benefit to the workers involved. As long as the pay and working conditions are reasonable—within the socioeconomic context of the country—then the vendor’s employees are positively affected by outsourcing. If they are being exploited, again by the standards of their country, then it is perhaps not such a positive situation. Even in this case, however, from the point of view of a free market economist, the workers must be benefiting as they have voluntarily offered their services to the vendor. Supporters of globalization consistently argue that foreign workers take these jobs precisely because they are better than the alternatives.

The situation is quite different from the point of view of workers (or potential workers) in the company that is outsourcing. These workers are clearly losing jobs to the foreign country. These losses, which are increasingly affecting higher-skilled, better-paying service workers, have consequently become a rising source of contention over the past decade in the United States.

How significant are these losses to the U.S. economy? An estimate by Forrester Research puts the losses due to offshore outsourcing at 3.4 million white-collar jobs between 2000 and 2015. Given that the U.S. workforce currently consists of about 152 million individuals, this amounts to an annual loss of about 0.15% of that labor force to offshore outsourcing. Thus the macroeconomic effects are not particularly significant. In absolute terms, though, 3.4 million unemployed people represent a tremendous loss to society as a whole. These numbers are even more problematic to the individuals losing their jobs or not getting jobs in the first place (and incidentally, we would never know who these people are). No job means no income, regardless of the reason—unemployment is one of the worst things that can happen to an individual under capitalism.

Historically, manufacturing has been outsourced for many years. For example, U.S. clothing manufacturers
have been hiring outside contractors to make the garments for a long time. Currently, a large portion of clothing sold in the United States under a U.S. company’s label is produced in China by companies contracted by that U.S. company. This, in essence, is shipping U.S. jobs overseas and has been a concern of U.S. workers for some time.

What has changed recently is that it is no longer only manufacturing jobs that are outsourced. With advances in technology, services can now be offshore outsourced to places far, far away from the original company. Now it is not only blue-collar workers who are directly affected by outsourcing, but also more skilled, white-collar workers who have reason to complain. Newly outsourced technology services include such activities as software development, Web site designing, and technical service call centers. Certain non-core business processes are also now widely outsourced, such as back office operations, finance and accounting, payroll maintenance, and sales and marketing. The reach of outsourcing extends to many occupations, therefore putting it as a problem on the agenda for most U.S. workers.

White-collar workers, who in the past could conveniently ignore the manufacturing jobs being shifted overseas, now must confront the very same problems themselves. What was argued in the past—that the loss of jobs to foreign workers was simply the result of competitive, free market forces that only strengthen the economy—seems hollow now. Many white-collar workers have joined the chorus calling for restrictions on offshore outsourcing.

OZONE

Atmospheric ozone (O₃) is found mostly between about 9 and 23 miles above the Earth’s surface in a region called the stratosphere. This ozone layer acts as a barrier protecting life on Earth from harmful ultraviolet (UV) radiation from the sun. From 1970 on, scientists expressed concern that human-made chemicals, particularly chlorofluorocarbons (CFCs), were thinning the ozone layer. A 1976 report by the U.S. National Academy of Sciences (NAS) concluded that the ozone depletion hypothesis was supported by scientific observations. Calculations suggested a global ozone loss of 5 to 7 percent by 1995, with attendant increases in skin cancer, probable damage to human and animal DNA, as well as harmful effects on some crops.

As emergent social problems, the slowing of ozone depletion and the subsequently discovered ozone hole are remarkable success stories. Prior to the NAS report, environmentalists had put the ozone problem at the top of their list, and in 1978 the United States and several other countries moved to eliminate the use of CFCs in aerosol spray cans. The “styro wars” mounted by environmentalists led to successful public boycotts of McDonald’s for using Styrofoam and rapid decreases in the use of aerosols.

While these initial successes diminished concern about the issue, 1985 brought the surprise discovery of an “ozone hole” over Antarctica. Where scientists had expected a steady and relatively slow depletion of ozone, this crater in the ozone column was so shocking that it took just 2 years to forge an international agreement. Indeed, the Montreal Protocol was signed before scientists established that the ozone hole was due to human-made chemicals rather than the unique conditions found in Antarctica.

The Montreal Protocol not only was the first international treaty on a global ecological problem but is
widely regarded as a landmark regime and prototype for future negotiations. Its significant innovations include automatic provisions for review—these have led to a ratcheting up of the agreement—and funding by rich nations for adaptations by poorer nations. The United States took the lead in negotiating the protocol, and U.S. corporations began an energetic pursuit of substitute chemicals that, significantly, were not difficult to develop.

Sociologically, the stunning success of the solution to the ozone problem can be attributed to the availability of bridging metaphors to the popular culture and its practical intrusion into everyday life. The ozone hole can be encapsulated in a familiar “penetration” metaphor. The idea of lethal rays penetrating a damaged “shield” meshes nicely with resonant cultural motifs that include Star Wars and many video games. Practically, leakage through the shield is linked with melanoma, a deadly skin cancer, and the issue created a cultural whirlwind with President Ronald Reagan’s skin cancers, political gaffes, warnings about the outdoors becoming dangerous, and the vulnerability of children, as well as the growth of a “safe sun” industry.

Observations and calculations suggest that ozone depletion has stabilized globally and long-term recovery is anticipated. Ozone depletion has become a lesser social problem, attracting mainly “news briefs,” while concern with safe sun has attenuated.

PANDEMICS

A pandemic is the spread of a highly infectious disease across a large area, such as a continent or worldwide. In the World Health Organization (WHO) definition, the microbial agent that causes a pandemic must be a new one, never before found in human beings, and spread easily and comfortably among humans. SARS (severe acute respiratory syndrome) and avian flu are among the most recent examples. Concern about these diseases has resulted in intense debates within the scientific community and various nation-states, as well as within international organizations such as WHO and in the media.

WHO first identified the SARS microbe—the coronavirus—as a virus never before seen in humans in March 2003. SARS posed an immediate threat because the virus spread rapidly, either by droplets or by direct and indirect contact. The fear was that, at a time when people and things traveled from one point of the globe to another at an almost dizzying pace, and large numbers of people with no respiratory protection came into close contact with each other, the virus would in no time enter and thrive in new hosts. The medico-scientific community immediately suggested a threefold preventive strategy: detection of cases, their isolation, and identification of close contacts. Similarly, avian flu, despite its insignificant risk to travelers, prompted a global plan, whereby an international consortium of countries and agencies like WHO would monitor the possibilities of an influenza outbreak propagated by infected birds. The rationale underlying these programs is that in an age when globalization encourages widespread travel, any infectious disease can in no time become a pandemic.

Further compounding that concern are the limitations of available drugs and vaccinations. The last three influenza pandemics—the Spanish flu of 1917–18, the Asian flu of 1957–58, and the Hong Kong flu of 1968–69—confirmed that newer and more formidable strains of the flu virus can emerge for which no vaccination may be immediately available. Further, the extensive reliance on antibiotics has been waning, because a condition called antimicrobial resistance (AMR) looms large on the horizon. AMR constitutes the biggest global health crisis according to many health experts. For example, evidence exists of resistance to crucial antiretroviral drugs, the “weapon” of choice in the battle against HIV/AIDS. Production of bulk and generic antiretroviral drugs and their common use have created a possibility that antiretroviral resistance might become a global phenomenon. For example, tuberculosis (TB) has resurfaced with a vengeance in recent years, both in the developing and in the developed world, including the United States. Approximately 1.5 million people die annually from TB, and 1 to 2 percent of them are dying from the multi-drug resistant strains.

Diseases like SARS and avian flu have led many scholars to argue that in order to explain the emergence of these new ailments, there is a need to critically study the new, neoliberal world order. Economic processes like globalization can serve as powerful forces exacerbating economic, political, and social inequalities that can quickly convert an infectious disease into a destructive pandemic form. Global inequalities created through an aggressive market
order in turn contribute to major disparities in health resources. Excessive foreign debt, negative economic growth, and increasing levels of foreign aid have impoverished the social welfare structures of many developing countries. The debt repayment burden and a concern to integrate with the global economy further impoverished the social welfare programs in these poor countries.

Globalization has resulted in a number of processes that have led certain low-income countries to spiral into the worst nightmares of global pandemics like AIDS. For example, accompanying the steady economic and political deterioration of rural Haiti is one of the worst epidemics of HIV/AIDS. While not a cause and effect, behind the deepening AIDS crisis lie poverty, inequality, and political disturbances. Intense population pressures (Haiti is one of the most densely populated nations in the world), deepening economic catastrophe (through the decline of agricultural land and production), and “structural violence” against poor Haitian women have pushed the AIDS crisis in Haiti truly beyond control.

Ebola, Lassa fever, Legionsnaire’s disease, and toxic shock syndrome are more than freak occurrences of disease caused by novel bacteria and viruses. On the contrary, the mutation of new viruses and bacteria become possible because of errant human activities. The global order can go awry epidemiologically when the trio of poverty, war, and drugs contribute to the depletion of valuable resources that can protect people from epidemics.

The realization that any infectious disease, if formidable enough, can quickly become a pandemic in turn emphasized the importance of another crucial issue: restoration of public health services decimated by war, poverty, or deteriorating infrastructure. While medical technologies may advance future medical research, numerous scholars and activists argue that, beyond a certain threshold, medical technologies and drugs can hardly save the global human populations from threats like avian flu or Ebola. Therefore, public health emerges as a vital element.

required the courts to impose an indeterminate sentence. An indeterminate sentence is a sentence that includes a minimum number and a maximum number (10–14 years or 10–life) but must exclude “life without parole.” Parole varies between jurisdictions, and good conduct while incarcerated is not a guarantee that parole will be granted.

The idea for parole came from Captain Alexander Maconochie in 1787, when he was in charge of the penal colony at Norfolk Island, off the coast of Australia. This particular penal colony had a reputation as one of the most dangerous and violent establishments of its time. Maconochie believed that these prisoners could be rehabilitated not through the typical brutality then inflicted on prisoners but through rehabilitative means like education, skill building, labor, and behavior modification. Under Maconochie’s system, a prisoner received “marks” (good behavior credits) for each program successfully completed. These marks could be used for furloughs and early release from the colony. If at any time the prisoner exhibited poor behavior toward the programs, the prisoner could lose these marks and the opportunity for early release. By 1844, Maconochie had transformed this colony into one of controlled stability. Despite Maconochie’s proven success, many countries at that time, like France and England, refused to adopt this model. However, the United States incorporated it into its criminal justice system in 1865, and it became the prototype for the modern U.S. parole system.

Today, in the United States, parole is a controversial and politically charged topic. Many believe those individuals convicted of crimes should be punished by serving their entire sentences and not granted early release. Nevertheless, research findings reveal that parole does work. The U.S. Department of Justice reported that 57 percent of parolees in 2006 completed their sentences successfully, while 18 percent were returned to prison and 4 percent absconded, with the remaining 21 percent still on parole. Regardless of the statistics, parole’s existence is in jeopardy. “Tough on crime” policies and the “war on drugs” have influenced the federal government to abolish federal parole, and on the state level, many states, such as New York, no longer have parole for persons charged with violent crimes.

PATRIARCHY

Patriarchy has many different interpretations, depending on the theoretical and disciplinary orientation of the writer or speaker. Within anthropology, for example, patriarchy defines a condition in which male members of a society predominate in positions of authority. In female-dominated societies, the term matriarchy is used. For feminists, however, patriarchy has a different, and more political, connotation. Here, patriarchy refers to the systematic oppression and exploitation of women vis-à-vis their male counterparts. Patriarchy therefore refers more specifically to a relational and gendered process of dominance (by men) and subservience (of women). This dominance involves three basic forms of power: control over women’s labor, control over women’s reproductive abilities, and control over women’s affections.

Given the many different types of feminism, varying accounts attempt to explain the origins, meaning, and practice of patriarchy. In general, however, all see patriarchy as resulting from the existence of gendered relations within all societies. Gender, as an organizing concept, imparts an ordering of society based on perceived differences between men and women. Thus distinguished, gendered norms construct appropriate positions and responsibilities for women and men and allocate resources differentially based on these divisions. Societies characterized by male dominance of positions and resources are described as patriarchal.

As a concept, patriarchy was most explicitly analyzed by Marxist feminists during the 1970s and 1980s. They identified a material basis to patriarchy, arguing that in capitalist societies, men control women’s labor power through, for example, the institution of monogamous heterosexual marriage and the control over women’s reproductive rights.
Depending on their viewpoint, feminists take different approaches to understanding, analyzing, and working to overturn patriarchy. Liberal feminists, for example, insist that gender equality and justice will occur when the rules of society are made fair and when women are no longer discriminated against in social or occupational settings. This approach was clearly evident in the work of first-wave feminists whose goal was to achieve equal rights for women, most saliently in the right to vote. Marxist feminists, conversely, maintain that it is not possible to eliminate sexism without also addressing classism within society. Rather than working within the existing system, as proposed by liberal feminists, Marxist feminists maintain that women’s liberation will only result following the replacement of a capitalist system with a socialist system. Last, radical feminists emphasize the complex intersections of not only sexism and classism, but also, among other things, racism and ableism (discrimination against people with disabilities). Radical feminists also highlight the social and cultural, and not just economic and political, institutions that oppress and exploit women.

Patriarchy is an important concept in connecting gender to women’s inequality in society. As a concept, however, it is not without its share of critics. Some critique the concept of patriarchy as too simplistic and too reductive, arguing that many early conceptualizations of patriarchy assumed the practice to be universal, thus ignoring important geographic and temporal variations in the oppression and exploitation of women. This led to a false view of patriarchy as static and unchanging. Post-structuralists and postmodernists criticize the patriarchy concept as limited to a structured set of inequalities, questioning not only the use of preexisting categories such as male and female but also the theoretical understanding of power itself.

The USA PATRIOT Act or “Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act of 2001” was signed into law without legislative committee debate on October 26, 2001. Despite the fact that Senator Russ Feingold was the only senator to vote against the bill, it was the subject of much public debate from the outset, and there continues to be little agreement about its implications for law enforcement and civil liberties in the United States.

The voluminous bill is little understood, and some of its most radical aspects were ruled unconstitutional by the courts. However, the bill expands the powers of investigation first brought about through the Federal Intelligence Surveillance Act of 1978 (FISA) and Racketeer Influenced and Corrupt Organizations Act of 1970 (RICO), along with providing significant financial and institutional support to law enforcement for intelligence-gathering efforts. The better-known aspects of the bill are those that permit third-party searches of personal data such as financial or travel history and library use without notification to the subject under investigation; allowance for “sneak and peak” searches with significant delays in notification to the subject; and the dismantling of Watergate-era firewalls between law enforcement and intelligence gathering. Finally, the bill might be most dangerous to immigrants, who can be detained—based on suspicion alone of association with a terrorist organization for an indeterminate amount of time—or deported altogether.

The most troubling aspect of the bill, however, may be the lack of public information about how and why the various aspects of the law were enacted and the nonpublic manner in which the powers created under the bill may be exercised. Despite widespread public concern and several ongoing court challenges, the USA PATRIOT Act was subject to an “Enhancement” Act in 2003 and was renewed, without major revisions, in 2005.

The most well-known section of the act is Section 215, which allows the Department of Justice to access third-party records. This includes that party’s travel history, financial records, and even library use. Section 215 significantly expanded the original provision of FISA confining the search to investigating foreign intelligence; now it includes any investigation...
that involves terrorism. Furthermore, the Federal Bureau of Investigation (FBI) need only certify to a FISA judge this aspect of the investigation without demonstrating probable cause, and the FISA court cannot refuse the search. Originally, this section of the act did not allow libraries or banks to protest the search or notify the subject about the search request. The most vocal opponent of this section was the American Library Association, who filed suit and made a successful public education campaign against the original provision. A modification of this prohibition in 2005 enabled the third party to get legal representation. The renewed USA PATRIOT Act also mandated that the director of the FBI or the deputy director or assistant director for National Security must personally call for the search, thereby limiting the powers to persons more easily held accountable for their actions.

Sections 216 and 505 also relate to intelligence gathering on private citizens. Section 216 formalizes federal tracking of Internet activities and treats Internet activity similarly to that of phone records. The act does distinguish between movement on the Internet and content of communication and calls only for the tracking of contacts, though civil liberties activists are concerned that “content” is not defined and thus it is unclear what aspect of e-mail communications will be tracked. Section 505 authorizes the attorney general to send out “National Security” letters, which compel record holders to provide information, but these are not legal warrants nor are they overseen by any court. Furthermore, Section 505 is a significant shift from FISA in that it allows these warrantless searches to be used, at a future date, as criminal evidence. In January 2007, The New York Times revealed that the Pentagon and the Central Intelligence Agency (CIA) were also using National Security letters, claiming that they fell under the provisions of the USA PATRIOT Act.

Two sections of the USA PATRIOT Act, Sections 218 and 213, change the rules for search and seizure (guaranteed by the Fourth Amendment). Section 218 allows for a secret FISA court to authorize searches—based solely on assurances from the attorney general that such searches have to do with foreign intelligence—without public notification. Section 213 allows for searches with delayed (sometimes indefinitely) notification of the subject. It also expedites intelligence sharing between the FBI and CIA and the Department of Justice, dismantling many of the former protocols for the sharing or dissemination of warrantless searches. Section 213 has to do with “sneak and peek” searches that permit the search of private property without the notification of the subject if “immediate notification of the execution of the warrant may have an adverse result.” Once again, the vagaries in the act’s definitions permit wide latitude in the exercise of the powers created therein and, as a result, may result in the infringement of civil liberties.

The USA PATRIOT Act also raises significant concerns for immigrants and immigration organizations. The act allows for the detention and deportation of immigrants for “terrorist activity,” which, according to some experts, can include legal aid (such as monetary donations) toward organizations not necessarily on a CIA list of terrorist organizations. In order to avoid deportation, immigrants must prove that they have no connections to the “terrorist,” something that is often difficult while under detention.

Strong reactions to the USA PATRIOT Act have occurred at the public, court, and legislative levels. According to a University of Connecticut poll in 2005, of those Americans who could correctly identify the purpose of the act, 57 percent supported renewing it. Many organizations, such as the American Civil Liberties Union and the American Library Association, maintain ongoing public education campaigns against the bill. Both organizations also brought lawsuits against the bill. Numerous lawsuits have been filed against the act, including a Freedom of Information Act suit brought by the Electronic Privacy Information Center, in which a federal court ordered the FBI to turn over 1,500 pages of documentation on the use of USA PATRIOT Act provisions. Another lawsuit, brought by the Muslim Community Association of Ann Arbor, Michigan, against Attorney General John Ashcroft and FBI Director Robert Mueller, claimed that Section 215 of the PATRIOT Act was unconstitutional. In both 2003 and 2005, the Democratic Party in Congress attempted to amend the bill. The 2004 presidential campaign also involved some debate about whether the act should be renewed in 2005. However, the bill was expanded in 2003 and renewed by both houses of Congress, with some revisions, in 2005 and signed into law in March 2006.

Peacekeeping

Peacekeeping is the intervention by a third party (a neutral actor) in armed conflict, a practice utilized in both conflict management and conflict resolution. Primarily, military components, such as regular troops and military observers, intervene between warring parties and oversee truces or the implementation of peace agreements. However, as peacekeeping operations have become increasingly complex in the post–cold war era, police and other civilian components often complement the military.

The UN Department of Peacekeeping Operations identifies four categories of peacekeeping: preventive missions, traditional peacekeeping, multidimensional peacekeeping, and transitional authority missions. The latter two categories differ from the first two in that they not only seek to establish a “negative” peace—that is, the abatement of military violence—but also attempt to contribute to the establishment of a sustainable peace through peace building. The latter operations thus handle a wider range of social problems considered to increase the risk of a resurgence of violence.

Since the end of the cold war, the increased debate about peacekeeping deals both with peacekeeping operations as a solution to war and a range of problems in the context of conflict and with how to manage social problems to which operations themselves contribute.

Peacekeeping as a Solution?

Interpositioning of neutral forces occurred prior to the establishment of the United Nations, whose embryonic peacekeeping role, using military observers, was in the Middle East in 1948. However, “peacekeeping” as a concept, commonly ascribed to former Canadian Foreign Minister Lester B. Pearson, began as a practice with UN Secretary-General Dag Hammarskjöld. Although peacekeeping is not specifically mentioned in the UN Charter, Hammarskjöld drew upon the principles enshrined therein to handle the Suez crisis in 1956. Although the United Nations set the precedent, the number of peacekeeping operations deployed by non–UN actors exceeds the number of UN operations between 1948 and 2007. Moreover, not all operations mandated through the United Nations have been under UN command. Large international organizations, such as the North Atlantic Treaty Organization (NATO), have at times acted on UN mandates as peacekeeping forces.

With few exceptions, operations prior to 1988 were by third-party military contingents, with the majority of interventions handling interstate conflicts by deploying troops to oversee a ceasefire or truce. With the end of the cold war and the increased focus on war-affected populations, peacekeeping operations in new conflict regions entailed additional mandates to handle the social problems created by conflict. Humanitarian emergencies, human rights abuses—including those of women’s rights and children’s rights—and civilian protection increasingly became questions of international peace and security. Ironically, with the widening of the mandate, more unintended consequences of the operation followed, and the media increasingly brought attention to the problems that peacekeeping in itself can create for the local population.

In the United Nations, the debate on reforming peacekeeping began in the early 1990s, driven foremost by the changing context of peacekeeping operations. Events that spurred the evolution of peacekeeping were operations in Srebrenica (Bosnia-Herzegovina), Somalia, and Rwanda, where deployment into these internal conflicts did not include changing the structure of the missions or securing
sufficient resources to implement assignments successfully. Lessons learned involve both the nature of the mandate and rules of engagement, particularly allowing peacekeepers more latitude in the use of force beyond just self-defense. Apart from affecting the efficiency of the mission directly, weaknesses in the operation structure can have an effect on the peacekeeping staff’s behavior toward the local population. In addition, a need exists for more integrated missions.

The debate on peacekeeping practices also rages in academia, originating in its policy-oriented discipline and contesting the use of peacekeeping in conflict management and resolution. The issue is what possible benefits peacekeeping operations can have for establishing security and, in turn, if peacekeeping thereby influences the success of a conflict resolution process. Results are contradictory; some statistical studies display a positive relationship between establishment of peacekeeping operations and successful conflict resolution, while others find no such connection.

The complexity of the conflict into which a peacekeeping operation is deployed appears to be connected to the outcome in terms of success, as peacekeeping tends to be used in conflicts that are notoriously difficult to solve. Of central concern, then, are under what conditions peacekeeping operations are established and the role of the peacekeeping mission in relation to local parties in the conflict resolution process. On the one hand, critics contend that peacekeeping is completely irrelevant, since peace primarily depends upon the behavior of the warring parties; moreover, a peacekeeping operation may even have a negative effect by prolonging conflict through its conflict management and thus preventing conflict resolution. On the other hand, advocates call peacekeeping vital for ensuring resolution as well as sustainable peace, and, equally important, decreasing the suffering of the affected populations.

**Peacekeeping as a Cause of Social Problems?**

Besides the debate over peacekeeping’s effectiveness in conflict resolution, the implementation of peacekeeping is another growing issue. Critics attack the “quick fix” introduction of democracy and economic transformation by external parties through peacekeeping operations. Critique centers on the rapid building of new political and economic structures without sufficient local involvement or knowledge of the local context, sufficient resources, and adequate local building capacity. Such flawed operations risk creating additional local problems and increasing existing ones.

Critics also argue that democracy and economic reform require a higher degree of internal ownership and more time to develop successfully than those few years and limited resources usually granted peacekeeping operations. Furthermore, democratization and economic reform can be conflict-creating processes by themselves, particularly in an unstable post-conflict situation. The “light footprint” approach used in Afghanistan, where the international staff mainly supports local parties, is partly in response to this critique.

Initial research findings indicate that the implementation process of peacekeeping operations has contributed to a range of social problems. Sharp increases in inflation—“bubble” economies resulting from operations with budgets substantially larger than that of the host country—resulting in higher prices for food and housing; trafficking in women and children for prostitution from surrounding countries; sharp increases in prostitution and child prostitution in the host country and surrounding countries; and the spread of sexually transmitted diseases such as HIV/AIDS are all serious social problems observed following peacekeeping operations. These social problems all place a high cost on the host countries—the majority of which are poor developing countries—particularly when an operation withdraws. A large number of “UN babies”—children with a local mother and a (former) peacekeeper as an absent father—is another result of many missions. The last aspect relates specifically to the Convention on the Rights of the Child. Based on the mentioned effects, some researchers question the normative underpinnings of operations and the perceptions that peacekeepers hold about the local society.

The UN system has responded to the growing critique forwarded in both policy and research. For example, critique contributed to passage of UN Security Council resolution 1325 (2000), dealing with women, peace, and security, and General Assembly resolution 57/306 on investigating sexual misconduct of peacekeeping staff. Policies, codes of conducts, and training manuals have also been developed to improve interaction with the local population, although these policies remain far from sufficiently implemented.

Taken together, peacekeeping operations increasingly attempt to handle local phenomena identified by
international law as social problems, such as violence against civilians and humanitarian emergencies. However, for a number of local social problems—ranging from economic and political side effects; human rights abuses and insecurity for vulnerable groups in the host country; and social traumas for children growing up without fathers—peacekeeping is part of the cause. The jury is still out on whether peacekeeping facilitates resolution of the social problem of armed conflict and war.

**PEDOPHILIA**

*Pedophilia*, a term coined in 1896 by Richard Krafft-Ebing, refers to a pubescent individual who is sexually attracted to prepubescent individuals. U.S. concern about child molestation dates back to 1894, when a wave of legislation geared toward increasing the age of sexual consent was enacted. This interest was revitalized in 1932 with the media frenzy surrounding the Charles Lindbergh baby abduction and homicide. The panic led to the first wave of sexual psychopath legislation. In 1938, Illinois enacted the first sexual psychopath law, allowing judges to commit offenders convicted of sex offenses to mental health facilities in lieu of prison. Similar statutes followed elsewhere, but most had fallen out of favor by the late 1970s and early 1980s.

After several years elapsed, child protection issues again gained public attention with the 1987 case of Earl Shriner raping and mutilating a 6-year-old boy, the 1990 disappearance of Jacob Wetterling in Minnesota, the 1993 abduction and murder of Polly Klaas in California, and the sexual molestation and murder of 7-year-old Megan Kanka in New Jersey in 1994. Societal responses included the creation of the National Center for Missing and Exploited Children to increase public awareness concerning the safety of children, and passage of the National Child Search Assistance Act of 1990, mandating the immediate reporting of missing children. In addition, sexual psychopath state legislation regained popularity with passage of sexual predator laws and/or civil commitment statutes. Seemingly unaffected by constitutional challenges, the statutes gathered increased popularity and adoption in numerous states and the District of Columbia. Restricted movement of pedophiles through global positioning satellites (GPSs) and pedophile-free zones are even more extensive.

Even more far-reaching is the implementation of Megan’s Law statutes. The 1994 Megan Kanka case produced an enormous amount of public outrage, resulting in the enactment, only 2 months later, of a New Jersey state statute commonly known as Megan’s Law, that eventually led to federal legislation that included offender registration, community notification, civil commitment, discretionary use of the death penalty, discretionary life imprisonment, the development of a national sexual offender registry, lifetime supervision, DNA testing, fingerprinting, and the right to refuse good time credits. President William Clinton signed this legislation into federal law in 1996, and today all 50 states have some form of Megan’s Law.

Prevalence

Given the private nature of sexual crimes and the limited forum children have to speak out about sex crimes, experts believe incidents of child sexual victimization are undercounted. While determining the full extent of child molestation is difficult, official reports and offender and victim surveys provide some insight into the frequency.

Despite increased publicity, sexual molestations and abuses decreased in recent years. The Children’s Bureau reports that the rate of sexual victimization per 1,000 children in the population dropped from 1.9 in 1995 to 1.2 in 2004. The overall number of arrests for forcible and nonforcible sexual crimes also dropped from 75,229 in 1996 to 67,539 in 2005. Finally, self-report rape victimization in individuals ages 12 and older has continuously gone down since the 1970s, from a 1979 peak of 2.8 per 1,000 to 0.5 per 1,000 in 2005. Victimization estimates in meta-analyses display much less consistency, positing the prevalence of child sexual abuse anywhere from 7 to 40 percent in girls and 3 to 13 percent in boys.

Panic

Despite the numerous publications citing a decrease in sexual abuse of both children and adults, U.S. media broadcasts persistently report an “epidemic” of child abductions, molestations, and homicides. The dramatic shift in the terminology used to describe offenders offers an additional indicator of the heightened concern over child predation. Child sexual offenders have most often been described as “predators” or “fiends,” with the specific intention of metaphorically describing offenders as predatory animals aggressively seeking out innocent prey. While the term predator has no legal or psychological basis, American legislation bearing this terminology has recently been enacted, and its usage has increased dramatically.

The temporal coincidence between a decrease in child sexual abuse cases substantiated by child welfare services in the United States and an increase in pedophilia coverage in the New York Times, as well as the constant intensification of child sexual abuse repression laws, tends to indicate the existence of a moral panic centered on pedophilia in this country. The primary catalyst of this pedophilia panic has not been the increased frequency of child molestation; rather, sensationalized media reports and political crusading are responsible. This perceived threat of child molestation plays an important role in the generation of legislation. The resulting panic legislation is most often a knee-jerk reaction developed by the legislature to resolve the publicly perceived “emergency situation.” More often than not, these types of laws are crafted amid a state of panic and lack the calm deliberation that effective legislation exhibits. While in theory the various types of legislation are attempts to keep children safe, the practical obstacles to each may outweigh their efficacy. Plagued by issues of misdirection of attention and vigilantism, the enactment of legislation begs the question of whether its initial implementation was necessary.

particularly challenging for those widows and widowers who seldom worked and thus depend on resources acquired by their spouses.

To address the problem of many elderly losing their savings and jobs during the Great Depression, a variety of new social welfare programs came into existence under Franklin D. Roosevelt’s New Deal, including a new system of old age insurance, Social Security. It offered some federal aid for traditional local means-tested public assistance measures, such as assistance for the elderly and children, but it also provided a social insurance system for those 65 and over, regardless of financial need. Unlike European systems, which used general tax revenues to finance old age security, the U.S. approach stressed the combined assets of the private sector and its employees. In 1939, the addition of survivors insurance provided benefits to widows and other surviving dependents of a worker who died prematurely.

Originally, the act excluded domestic and agricultural workers, many of them African Americans, due largely to pressure from southern legislators. Eventually, however, most workers were brought into the system and, today, nearly all retired people receive Social Security benefits. Expansion of coverage reflected a shift in the philosophy and financial principles of Social Security. Whereas the government originated stored contributions and paid them back with interest to those over 65, current workers now pay the benefits of those already retired. This shift of current obligations to future workers has led to predictions of crisis in the system, including a recent forecast that, given the rapidly aging population, Social Security will run out of funds by 2042.

The idea of a social security crisis is not new. Fears about Social Security’s insolvency arose in the late 1970s and early 1980s, when various factors led to a decline in the program’s trust funds. Responses included an increase in payroll taxes, a gradual rise in the age at which individuals could first receive benefits, and taxation of benefits received by taxpayers with incomes over certain levels. Although policymakers hoped these changes would shore up the system for the next 75 years, the latest labor force and demographic data suggest that the reserve fund will be depleted in about 40 years. Today, about 1 of every 8 people in the United States is age 65 or older. The change in the dependency ratio between workers and beneficiaries is changing dramatically. In 1936, 15 workers supported each retiree. By 2025, the ratio may fall to 2.25 to 1. Even though baby boomers are earning more and have better private pension packages than their parents, a sense of crisis remains.

Various solutions to the Social Security problem have been suggested in more recent years. President Ronald Reagan promoted tax-exempt Individual Retirement Accounts (IRAs) as a way to build retirement income. Another approach, the use of employer-based retirement savings programs, or 401(k) plans, grew rapidly in the 1990s. In the latter, employers supplement workers’ contributions, although a specific benefit is not guaranteed. These plans are essentially supplements to Social Security benefits, not a replacement, so funding remains an issue.

In 1996, a Social Security Advisory Council appointed by President William Clinton recommended a radical approach to shoring up retirement income: investing funds in the stock market instead of just low-interest government Treasury bonds (where the government lends itself money). It suggested this be done either by the government or by workers themselves. Critics argued that not everyone has the skills and knowledge to invest money wisely and that this approach lacks protection against stock market failures. Furthermore, government decisions about investments could be politically charged.

President George W. Bush supported adding a private investment element to Social Security. His special commission, consisting solely of people in favor of private investment accounts, recommended legislation to partially privatize the system. Met by a firestorm of criticism from congressional Democrats, organized labor, and other groups, the legislation failed. The president renewed his push for private accounts in his State of the Union address in 2005, adding new details to the plan. He proposed that workers should be able to place as much as 4 percent of their taxable earnings in the accounts. However, congressional Republicans were unenthusiastic, and Democrats were almost unanimously opposed. This attempt to change Social Security also failed.

Public and private company pensions, another source of income for older Americans, have been eroding since the 1980s. Formerly, pensions were guaranteed income; if you worked long enough, you could depend on a predetermined and steady stream of income upon retirement. However, in recent years, many large companies have either cut back on their
pension plans or gone bankrupt, unable to honor their commitments to retired workers.

In 1983, more than two thirds of households headed by a worker age 47 to 62 included someone earning a pension. In 2001, only half did, and in 2005, only 20 percent of all U.S. workers were covered by traditional pensions. Some companies either never had pensions or simply stopped providing them. Those who retained pension programs often changed them from defined-benefit plans (which guarantee a predetermined monthly income after retirement that is generally based on salary and numbers of years worked) to defined-contribution investment plans such as 401(k)’s. In these plans, employees set aside part of their pay for retirement tax deferred, with the company contributing a partial match. Upon retirement, employees get whatever is in the investment account; thus their retirement money depends on the ups and downs of the stock market. In addition, there is no restriction blocking employers from reducing or terminating their contributions to employees’ 401(k)’s if business declines.

The federal government backs up pensions through the Pension Benefit Guaranty Corporation (PBGC), which collects premiums from corporations and uses the money to help workers when companies cannot fulfill their pension obligations. However, the recent bankruptcies of large companies—particularly in the airline, automotive, and steel industries—have taken a toll on the resources of the PBGC. United Airlines is a good example. Declines in passenger travel and increasing fuel costs led the company to declare bankruptcy in 2003. It won the right in bankruptcy court to terminate all four of its employee pension plans. United Airlines’ $3.2 billion in obligations was shifted to the PBGC. Similarly, General Motors tried to slash costs in 2006 by dismissing many workers and reducing the benefits of those who remained. When Bethlehem Steel shut down its pension plan, it was up to the PBGC to meet the company’s $3.7 billion in obligations to retirees.

The status of pension funds for public sector employees has also become precarious. These employees, including policemen and teachers, were generally guaranteed retirement benefits much higher than private pensions, but elected officials often failed to set aside the money necessary to cover benefits. A dramatic example was the New York City transit workers’ strike in 2005, which brought the city to a standstill. The walkout was precipitated largely by the Transportation Authority’s proposal that all new workers contribute 6 percent of their wages toward their pensions, compared to the 2 percent paid by current workers. The proposal was a response to the tripling of pension costs in the previous 3 years.

In 2006, Congress passed a major pension bill that made pension plans more expensive for many companies, requiring 100 percent funding rather than the previous 90 percent level. This legislation may temporarily aid a troubled pension system, but it is a far cry from preserving it for future generations and may even lead to some companies dropping their pension plans altogether. Some analysts predict that the defined-benefit pension approach is coming to an end and that most workers today will only receive retirement benefits through a self-contribution plan like the 401(k).

President William Clinton, on August 22, 1996, signed the Personal Responsibility and Work Opportunity Reconciliation Act. The intent of this law was to transform the U.S. welfare system into one that provided government assistance in exchange for work. The plan contained specific work requirements and a performance bonus for states that moved welfare recipients into jobs. The bill offered benefits to children and families, including enforced child support, increased child care funding, and guaranteed health care coverage.

Legislators deemed the “from welfare to work” reforms necessary due to a perceived misuse and abuse of public funds in the previous welfare system, as well as a limited scope of assistance in some areas. Based on experimental evidence that new approaches could bring about improved attitudes and fiscal advantages, Congress and the president encouraged and supported these reforms. Teen mothers would continue their studies and the law would require federal employees to support their children financially. There would also be a crackdown on those who owed child support and avoided their responsibility by crossing state lines. The act encouraged welfare recipients to enter the workforce, assisted in vocational training as well as job searches, provided for child care funding, and guaranteed some level of family health care coverage. This act thus promoted personal responsibilities and established penalties to ensure achievement of its goals.

Teen pregnancy prevention was encouraged, and unmarried parents who were under age 18 were required to stay in school and live with an adult who was willing to take responsibility for the teen and her child. Under the 1996 law, after 2 years of assistance, the recipients were required to work—single-parent families a minimum of 20 hours a week the first year and dual-parent families at least 35 hours per week. The bill provided $14 billion in child care funding to assist more mothers in entering the workforce, a $3.5 billion increase over previous government child care assistance. With the passage of this law, families who received assistance were ineligible for income aid after 5 cumulative years. States were able to exempt up to 20 percent of their cases from the time limit and to use their own discretion in providing other forms of family assistance through either the Social Services Block Grant or state funds. The bill required states to maintain their own welfare spending at least at 80 percent of the 1994 levels. The welfare law allowed each state to take money that was previously used for welfare and create jobs, provide hiring incentives, or give income subsidies for employers who were willing to hire previous welfare recipients.

This act appears to have been a move in the right direction. However, not all components have been ideal and may require amendment in the future. No consensus exists about the success of this plan in improving the welfare system, and critics have been vocal in their opinions about disturbing trends.

On a positive note, welfare caseloads dropped dramatically, from a 1994 high of more than 14 million recipients to about 4.5 million recipients in 2006. A large number of welfare recipients did indeed join the workforce and develop a new work ethic. Estimates place between 40 percent and 70 percent of those who received welfare prior to 1996 as currently working, thus significantly decreasing the poverty level for children.

However, these changes still leave many current and former welfare recipients in a desperate situation. Some are not working in full-time positions or for the whole year. Others who leave the welfare lines and enter the workforce are not able to maintain their jobs for any length of time because of the exorbitant cost or poor provision of child care, because of limited funding for child care workers. Furthermore, most welfare recipients in the workforce are earning between $6 and $8 an hour, a wage insufficient to elevate them from poverty.

Although statistics indicate that the rate of poverty has declined in general, it increased among the poor working families and especially among single-parent families. The families with the least financial resources have become poorer in the years since the implementation of the act, and, although caseloads have fallen, poverty rates rose among this group. Furthermore, while caseloads fell generally, they did not do so uniformly and, in fact, increased in some areas, especially in the large urban areas of the more populous states.

Through the act, each state receives a block grant, a lump sum of money to use toward welfare reform as the state determines. The block grant structure appears to benefit some states and communities more than others. As welfare recipients move to more concentrated
Another disturbing trend is that poorly educated wage earners seem to stagnate in the lower wage levels with little hope of improvement, while the graduates of secondary school and vocational training can potentially improve their incomes. This pattern may influence future public policy. Many working people, especially single mothers, have fallen deeper into poverty since the implementation of the 1996 law. The idea of working, alone, does not contribute to the elevation from poverty or afford a family adequate housing, food, health care, and child care. Nearly 90 percent of former welfare recipients are mothers. The success in helping these women transition to work and make a decent wage that raises their families from poverty will dictate the long-range success of the 1996 welfare reform act. Narrowing the gender gap of pay for workers and involving male parents in welfare families are only two proposed methods that might raise incomes for poor families.

Although Congress allocated more money to programs that provide child care for working poor families, unfortunately, many families still are not receiving adequate assistance. The tax credits remain too low to help poor working families with the high costs of child care. Head Start programs, which are free, serve fewer than one half of the eligible children. The quality of the low-cost care is marginal, which is again probably due to the limited funding available for child care providers.

Another problem is that health care is often out of reach for families who have given up welfare and returned to work. The working poor cannot afford most of the plans offered by employer-based health care plans. Even though the federal government expanded the Children’s Health Insurance Program, more than 6 million children are not enrolled in any health care government program. Another difficulty with the welfare reform legislation is that it does not recognize the major role of housing in the financial plan of poor families, especially in larger cities where the cost of housing has risen significantly since the mid-1990s. Inadequate financial support for housing (minimal affordable housing) has resulted in increasing poverty in welfare families, suggesting the need for additional assistance.

The Personal Responsibility and Work Opportunity Reconciliation Act has clearly accomplished only some of its goals of reform and improvement in the U.S. welfare system. With greater experience and further research, it may well be necessary to address the act’s shortcomings and to institute reforms that improve the country’s welfare system and better meet the needs of the poor in society.

PERSONHOOD, EVOLVING NOTIONS OF

What it means to be a “person” is a question that has intrigued philosophers for millennia. At least two major schools of thought in philosophy have considered personhood: deontology and utilitarianism.

Deontology, sometimes called “duty-based” or “rule-based ethical theory,” was advanced by German philosopher Immanuel Kant (1724–1804). Kant, building upon the work of Greek philosophers
Aristotle and Plato, thought that the intrinsic worth of man was based on his ability to reason and to exercise rational autonomous choices. The Greek philosophers considered speech to be a defining characteristic of personhood and that women, children, and slaves were capable of only limited reasoning and were, therefore, not full persons.

A serious problem with the Kantian approach is that, by these standards, many humans are not persons; the most vulnerable populations (i.e., infants, children, people with advanced forms of autism or Alzheimer’s disease or other cognitive disorders) do not have the rational, self-reflective capacities associated with the Kantian idea of personhood. The failure to acknowledge moral status or respect for these vulnerable populations led to a rejection of a purely Kantian approach.

Classic utilitarian theory regards the ability to experience pleasure and pain, not ability to reason, as the defining quality for personhood and the minimum criteria for moral concern and regard. Originally proposed by David Hume (1711–76), and developed more fully by Jeremy Bentham (1748–1832) and John Stuart Mill (1806–73), utilitarian theory laid the groundwork for careful consideration of how we treat other beings, whether they be nonhuman, infants, or the cognitively disabled. Bentham argued that a horse or a dog was far more rational than an infant child and that the law should extend protection to all, because they all have the same ability to suffer.

The primary drawback to utilitarianism, some people argue, is that it puts humans and animals on equal footing. However, neither classic nor modern utilitarian theory requires the equal treatment of human and nonhumans; rather it argues that what does matter is that suffering counts equally, be it human or nonhuman.

The tension between deontology and utilitarianism is reflected in the current state of the law. Traditionally, the law divided entities into two categories: persons or property, and one had to be human to be a person. The difficulty arises, however, when one looks back at the history of the law and realizes that women, children, and slaves were once considered as mere property under the law. At the same time, corporations, municipalities, and even ships were declared to be “persons” under the law. Although the law has evolved to ban slavery and recognize the legal rights of women and children (in the United States, at least), new challenges face the courts, legislatures, and law-making bodies. Laws are evolving to recognize categories that fall somewhere in between property and personhood, creating a continuum.

Three areas of emerging technology challenge traditional concepts of what it means to be a “person”: assisted reproductive technologies, transgenics, and human–machine mergers. Some current examples include the legal status of fetuses and embryos, companion animals, and great apes. Examples of future challenges include human–machine mergers (popularly known as “cyborgs”), artificial wombs, and intelligent transgenic creatures.

Pink-Collar Occupations

Occupations traditionally considered women’s work are termed pink collar. These occupations typically include the clerical, sales, and service fields. Nurse, waitress, elementary school teacher, secretary, administrative assistant, sales clerk, cashier, child care worker, and beautician are among the most common female-dominated occupations. They are termed pink collar in relation to the more common terms blue collar and white collar. These jobs do not fit in as blue collar since there is little or no manual labor, nor are they as prestigious as white-collar occupations. Often these occupations do not pay well and offer little expectation of advancement. While some pink-collar jobs carry prestige and a certain amount of autonomy, their pay is not usually reflective of this. These careers are not the lowest in status, but they often do not allow movement up the career ladder.

According to the U.S. Census Bureau, more than 20 million women work in the fields of health, education,
and social services. Many jobs in these fields are considered pink collar and carry with them a stereotype that women are more suited for this work because it requires a caring or nurturing nature, such as among kindergarten and preschool teachers, where women are over-represented. Even as men enter the field of teaching in greater numbers, women are more often teaching the younger grades, often seen as less prestigious work.

Historically, women who had to work performed domestic services in sewing, laundry, and housekeeping—jobs that utilized domestic skills they had learned in the home. They would complete such work in their own homes or the homes of more affluent families, or else they worked in factories or sweatshops where the pay was bad and conditions worse. Eventually, some women were able to move into less manual positions that offered more freedom, such as secretary, clerk, or service-related occupations. Even then, occupations that began as well respected and male only, such as clerks, were downgraded in status once women entered their ranks. For awhile, the pink-collar label applied to work once associated with “women’s machines”: telephones and typewriters.

Job requirements in pink-collar occupations can range anywhere from little education to a college degree, but one thing is consistent: the lack of equal work for equal pay regardless of gender. In 2006, for example, female workers made only 77 cents per dollar compared to males with the same level of education. Despite breakthroughs in gender roles and employment in recent decades, women are still heavily represented in clerical, service, and sales occupations. While they are taking positions in other fields as well, women often hold lower-level, lower-paid positions than males. This wage gap, until equalized, remains a problem for working women.

PIRACY, INTELLECTUAL PROPERTY

From a legalistic point of view, intellectual property refers to the exclusive rights to intellectual objects. In the United States, intellectual property includes the rights conferred by copyright, patent, and trademark laws. Copyright law grants an author the exclusive rights to reproduce, distribute, perform, and adapt a literary, musical, or artistic work; patent law gives an inventor the exclusive rights to make, use, and sell an invention; and trademark law grants a business the exclusive right to use a particular symbol to identify its products. More conventionally, intellectual property refers to the intellectual objects themselves—the original expressions of ideas fixed in tangible forms, such as books and records, and novel applications of ideas embodied in machines and technical processes.

In the United States, violation of the rights to intellectual objects is a civil offense. The offender is liable to civil prosecution and remedial sanctions, such as compensation of the victim. For example, a person who wrongfully makes a patented tool is liable for civil action, as is a person who wrongfully copies a book’s plot or labels a product with a mark resembling the one used by a company for its product. Forms of copyright and trademark infringement that are willful and oriented toward financial gain also are criminal offenses; the offender is eligible for criminal prosecution and punitive sanctions, ranging from fines to imprisonment. The unauthorized duplication of computer software for commercial gain is a criminal violation of copyright law, and the fraudulent labeling of apparel as genuine designer clothes for commercial gain is a criminal violation of trademark law.

Piracy and Theft

One type of intellectual property offense is piracy. Piracy is a violation of copyright law; it involves the unauthorized acquisition, reproduction, distribution, or performance of a creative work. Some people limit the definition of piracy to misuse that is willful and oriented toward financial gain—purely criminal violations of copyright. Other people, including most copyright owners, embrace a more expansive view, regarding piracy as virtually any unauthorized use of a creative work. For example, the Software and Information Industry Association defines piracy as
“the unauthorized use of software.” It includes downloading a legitimate copy of software onto multiple computers, producing and distributing copies from a legitimate source, renting software without permission, and exchanging software on the Internet without permission.

Although copyright owners commonly characterize piracy as theft, these actions differ in several ways. They differ in the nature of the victim’s loss. In theft, the offender acquires a physical object and thus deprives the victim of that object. In piracy, the offender misuses an intellectual object and thus deprives the victim of an opportunity to profit from the use of that object. Unlike a customary form of property, a creative work is both nonexclusive (it can be in many places at the same time) and inexhaustible (use does not deplete it). Misuse, then, does not deprive the victim of the object; a person can obtain a sound recording, reproduce it, and disseminate copies without touching the master. Rather, misuse threatens the victim’s capacity to exploit the object fully, a loss that is less certain and less tangible than the loss typically suffered by victims of theft.

Piracy and theft differ in the degree to which the objects covered by law are vulnerable to wrongful behavior. Unlike a customary form of property, a creative work is nonexclusive and thus relatively difficult to protect. Further, unlike a typical property owner who seeks to secure a belonging, a copyright owner seeks to make a creative work accessible to people. Creative works can be viewed as “diffuse” private property, for they are spread across the physical and social landscape. Such diffusion is a function of owners’ economic pursuits. Creative works are owned primarily by corporate actors—publishing houses, record companies, and so on—and these actors seek to exploit their works. What owners market are tangible items—books, compact disks, and the like—not the works fixed in them. Law permits consumers to do anything they want with these items. But it forbids consumers from exploiting the works fixed in them, as owners maintain dominion over these objects. To make a profit, owners want to market the tangible items widely. Yet wide distribution of the items means making the works embodied in them accessible to many people, including potential offenders, and this increases the vulnerability of these works to misuse.

Piracy and theft also differ in the degree to which they can be discerned. In theft, the offense often is apparent; for example, the victim quickly recognizes that her car has been stolen. In piracy, the offense often is elusive, if not invisible. Wide distribution of the items in which creative works are fixed not only makes the works accessible to many people but also places them in the domain of consumers. And owners are limited, practically and legally, in their capacity to monitor how consumers use their works. Thus, victims of piracy have a relatively hard time detecting offenses.

Although piracy and theft differ, piracy is increasingly being identified as a problem not unlike theft. Piracy is not new; unauthorized copying of creative works can be traced as far back as the invention of the printing press. However, piracy was long ignored, largely because it was inconsequential to owners. This view has changed. Piracy is now regarded as problematic, especially by copyright owners. This is so, in part, because technological innovation has upset the long-standing dominance of owners. Recent years have witnessed the development and proliferation of affordable, easily manageable exploitative information technologies—devices that enable people to access, reproduce, and distribute creative works and thus use works in ways that violate the rights of owners. Given greater control over creative works, consumers have misused them more frequently. Owners have pressed for the declaration of various uses as wrongful and the recognition of piracy as a serious problem.

### The Extent of Piracy

It is difficult to determine the extent of piracy, as statistics are meager. According to the Administrative Office of the United States Courts, the federal district courts in 2005 processed a total of 4,595 civil cases of copyright infringement, an increase of 124 percent over the number of civil cases handled in 2000. According to the Executive Office of the United States’ Attorneys, the district courts in 2005 also processed 81 criminal cases of copyright infringement, an increase of 153 percent over the number handled in 2000. To be sure, these figures are considerably smaller than the numbers of conventional property crimes processed by the criminal justice system. However, they reflect only a fraction of all incidents of piracy. While the figures refer to cases handled by the federal courts, some copyright owners employ state rather than federal law to manage piracy. In addition, the number of incidents that do not come to the attention of officials is substantial. Some owners do not take legal action against minor forms of infringement, such as copying for personal consumption. Most owners also are unaware of many offenses. The diffusion
of creative works, people’s access to them, and the difficulty of monitoring use make it nearly impossible for owners to know whether or how frequently their rights have been violated.

Sensitive to the likelihood that court records reflect a small percentage of piracy, copyright owners have furnished statistics on the magnitude of piracy. These statistics take several forms, including losses from piracy. The Recording Industry Association of America, for example, reports that piracy costs the record industry at least $300 million a year in the United States and $4.2 billion worldwide; the Motion Picture Association of America claims that piracy costs the film industry $1.3 billion a year in the United States and $6.1 billion worldwide; and the Software and Information Industry Association states that piracy costs the software industry $3.2 billion a year in the United States and $12 billion worldwide. Such figures, of course, are questionable. Owners rarely indicate how they calculate the figures or identify the source of data used to compute them. Accordingly, the figures can be easily inflated, and it may behoove owners to inflate them.

**Explaining Piracy**

How can we account for piracy? Copyright owners commonly explain this offense in terms of easy access to information technologies coupled with a weak system of legal control. However, this argument is little more than speculation, for the problem has not been a subject of systematic investigation. Routine activities theory offers an alternative explanation. This theory proposes that piracy flows from the convergence in time and space of three elements: motivated offenders, suitable targets, and an absence of capable guardians.

Piracy requires a motivated offender, a person who is both willing and able to violate the law. In the United States, the desire to misuse creative works seems pervasive. It may stem partly from the ideology that informs copyright law, an ideology that taps basic cultural values. While intellectual property law endorses the economic principle that authors have a right to remuneration for their labor, it also endorses the democratic principle that citizens have the right to as much information as they deem necessary. The idea is that if people are to lead rich, meaningful lives, they must be able to draw upon and use the creative works of others. This principle encourages people to regard intellectual objects as free and to use them in any way they see fit. The desire to misuse creative works also may stem from the belief that the behavior is harmless. Piracy lacks the clear, tangible loss associated with conventional forms of crime, and this seems to make the behavior justifiable, even acceptable. Partial confirmation of this view comes from a 2006 Harris Interactive survey of American opinion about Internet file downloading. The survey found that 54 percent of youth regard downloading as wrong, while 92 percent regard shoplifting as wrong. It’s important to remember that a person who is willing to engage in piracy must be able to do so. The offense is facilitated, if not made possible, by exploitative information technologies, such as optical scanners, digital cameras and recorders, and personal computers.

Piracy requires a suitable target, an object that is appealing and vulnerable. In the United States, creative works have considerable value; they are in great demand and a source of enormous wealth. Creative works also are vulnerable to misuse. Obviously, they are accessible to people. Because they are designed for consumption, owners strive to make these objects affordable. Because access to information is cherished, democratic governments attempt to make many of these objects available through public channels, such as libraries. Moreover, the reduction of words, sounds, and images to a digital form has made it easier to reproduce, alter, and distribute creative works.

Finally, piracy requires an absence of capable guardians. In the realm of copyright, capable guardians have been limited. On the one hand, government efforts to protect creative works have been modest. Historically, the government has done little to control misuse. For the most part, agencies have registered works and assigned exclusive rights to them; owners have been responsible for guarding their rights and enforcing them. On the other hand, owners’ efforts to protect their works have been constrained. The diffusion of creative works, people’s easy access to these objects as well as exploitative information technologies, and people’s rights to use these objects in private have made it difficult for owners to monitor the use of their works and ensure that their rights are respected.

**Controlling Piracy**

Given the appeal and vulnerability of creative works and the availability of exploitative information technologies, copyright owners have endeavored to control misuse. These efforts have taken several forms.
Owners have mobilized the legal system to control piracy. In the United States, owners have urged lawmakers to provide better protection for creative works. The recording and film industries, for example, asked Congress to increase the penalties for record and film piracy. At the same time, owners have urged lawmakers to regulate exploitative information technologies. The film industry sought to control piracy by getting Congress to prohibit the manufacture and distribution of devices for defeating anti-copying treatments. More recently, copyright industries have asked lawmakers to regulate Internet services that enable people to freely exchange creative works online. In addition, owners have pressed law enforcement officials to identify and prosecute offenders, and many owners have developed programs to assist in this enterprise. They have encouraged people to report wrongdoing, and they have established security offices to investigate complaints, identify offenders, and assist officials in prosecuting them. Although owners have long emphasized the legal process in protecting against misuse, they recognize that it offers limited security and should be supplemented with other modes of control.

Owners have used technology to control piracy. Recognizing the difficulty of identifying and prosecuting offenders, owners have tried to make it difficult for people to misuse their works by erecting technological barriers to misuse. For example, to protect against unauthorized reproduction of works, recording companies have added digital watermarks and inaudible copy protection ciphers to recordings, film studios have applied anti-copying treatments to prerecorded DVDs, and computer software manufacturers have used copy-resistant distribution disks and encryption processes. Although technology has become an important means for controlling piracy, owners acknowledge that technological barriers are more likely to thwart the average user than the sophisticated user.

Owners have used education to control piracy. In the hope of getting people to recognize and honor their proprietary rights, owners have tried to shape popular attitudes toward the use of creative works. Through various media, they have expressed the obligations of consumers and drawn on familiar cultural frameworks in arguing against deviation from these obligations. Owners have claimed, for instance, that piracy is “theft,” a breach of “mutual trust,” and detrimental to the national good as well as to everyone who benefits from the creative enterprise. It should be noted that persuading people to honor the rights of owners is a formidable task, as many people do not seem to regard creative works as meriting the respect they accord conventional forms of property.

For years, piracy was modest at most, for many people were limited technologically in their capacity to misuse creative works. The tide has turned. The development and proliferation of exploitative information technologies coupled with the diffusion of intellectual products, the ease with which these objects can be obtained and manipulated, and the circulation of values and beliefs encouraging misuse have facilitated piracy and exacerbated the problem of controlling the activity. Not surprisingly, the viability of intellectual property has become a matter of serious concern.

Plagiarism

To represent oneself as the author of some work that is in fact the work of someone else is to plagiarize. Plagiarism may include the “passing off” of the form of the work—for example, the exact words of a piece of writing—or the intellectual content, or both.

Plagiarism exists as a serious social problem within the halls of Western academia. Only exceptional circumstances bring plagiarism of someone outside of academia to public attention. Plagiarism is an ethical, not a legal, issue and it does not equate with the breaking of copyright or patents, though at times both may also involve plagiarism. The advent of the World Wide Web and vast electronic databases brought this issue to the fore within academic institutions, resulting in new methods of both
plagiarism and detection. The global nature of the Web and the increase in transcultural education through the movement of students and scholars increased awareness of a cultural dimension to plagiarism.

**Types of Plagiarism**

The seriousness of plagiarism and its problematical nature rests on the likelihood that each instance is a deliberate act of deception. The simple definition of "passing off" therefore expands to consideration of how the material was "passed off," by whom, and for what purpose. Plagiarism thus falls into three main types, depending on the original author’s level of awareness of intent to deceive.

**Author Is Aware of Deception**

*Work on Behalf.* The author of the work gives or sells the original work to another who takes credit for it by appending his or her own name. The most common example is the college “paper-mill” Web sites on which a student purchases an essay that someone else sold to it for the purpose of their reselling the work online. A different example is that of New Zealand Prime Minister Helen Clark, who engaged someone to paint pictures that she then signed and sold at a charity auction. In both instances the intention is to deceive deliberately, with both form and content plagiarized.

*Collusion.* Collusion occurs when the author of the intellectual content and sometimes the form of presentation of that content is part of a group who exchange ideas and information. Another member of the group presents the entire work as if all of it were that person’s own. One example would be students getting together to discuss an assignment intended to be an individual assignment. They each write up the assignment on their own but use each other’s ideas. The intent may or may not be to deceive deliberately. In such cases, content is always plagiarized, though form may not be.

**Author Is Unaware of Deception**

*Cut and Paste.* An individual, in this instance, copies the form containing the intellectual content without acknowledging the original author’s form, content, or both, and consequently gives the impression of ownership of form, content, or both. One such example is the cutting and pasting of a paragraph from a Web site into an essay or article without acknowledging the original source. Another example is historian Steven Ambrose’s failure to use quotation marks in some stories that gave the impression he was the author of the form of the story even where he had acknowledged the author of the content.

*Paraphrase.* Here, a person copies the intellectual content and changes the form without acknowledgment of the original source. Examples would be a journalist writing an article based on one press release and does not acknowledge the source, or the use of Ibrahim al-Marashi’s thesis by British Director of Communications Alistair Campbell that included both cutting and pasting and paraphrasing.

*Use of Content Only.* This refers to the use of intellectual content in a context without making use of the original form of presentation. Examples would be a grant application by someone based on the ideas of a former colleague or a screenplay based on a novel without acknowledgment.

In all these cases the intent may be to deceive. However, ignorance of referencing conventions or lack of skill may also play a part.

**Author Claims Partial Credit**

This occasionally happens in academia when the original author(s) of content and form are required to share credit, through coauthorship, with a more senior colleague or mentor by virtue of that person’s position in the organization rather than any contribution to the research or article. The noncontributing colleague is plagiarizing by allowing the readers to believe he or she was in part responsible for the intellectual content.

**A Brief History of Plagiarism**

Historians attribute the origin of the term *plagiarism* in its current sense to the first-century CE poet Martial, who stated that it was shameful for another poet to publicly read Martial’s poems as if they were his own. The word he used was *plagiarus*, which normally referred to someone who kidnapped a freed person and then enslaved him or her. Martial may or may not have been claiming ownership, but he was decrying the assigning of ownership to someone else, as in the modern sense of plagiarism.
The embedding of the belief into the modern Western psyche that an individual may own ideas and words may emanate from the Enlightenment and the rise of individualism. The separation of the created from the creator enabled the ascribing of ideas to the individual instead of the divine. The emergence of the printing press enabled the greater dissemination of these ideas, which had both economic and reputational consequences. The Statute of Anne of 1710 in Britain is considered the first copyright law attributing ownership and monopoly rights to authors. Since then, although copyright laws have changed, the right of an author of a piece of literature or artwork to be identified as the author has remained constant and is the dominant Western paradigm in which the concept of plagiarism resides. Consequently, many use the term *theft* to describe plagiarism, not in a legal sense, but as a metaphor to emphasize there is a “rightful” owner to form and a lowly social status to those who do not acknowledge that owner.

**In Academia**

Academia treats plagiarism seriously for two reasons. First, it devalues a profession based on honesty, and second, it undermines the fabric of advancement where recognition is through publication and citation.

Failure to properly acknowledge another academic is regarded as cheating someone out of that which is rightfully his or hers. Lack of acknowledgment may slow advancement and have financial implications for the individual and institution. Academics found to have plagiarized at any point of their career may find their careers cut short, as did Vice Chancellor (President) of Monash University Professor David Robinson.

Expectations are that students will operate within the academic paradigm by learning and obeying referencing conventions. Failure to do so affects not just the individual but the worth of the degree in the eyes of employers. Hence, the plagiarism of a few has social consequences for many.

**Frequency**

The Center for Academic Integrity, on the basis of self-reporting by 50,000 U.S. students, reported that half of them plagiarize in written assignments each year. Others estimate the plagiarizing of written assignments at 10 percent. Although many perceive plagiarism to be on the increase, its actuality awaits documentation from longitudinal studies.

**The Cyber Arms Race**

Countering students cutting and pasting from the World Wide Web or purchasing papers from paper mills are search engines and specially designed anti-plagiarism software. This software can detect even paraphrasing, not just wholesale copying.

Approaches to plagiarism include regulation and punishment, persuasion, and social change. Some academics are reluctant to follow up on possible plagiarism because of the personal cost to them in time and increased stress; others use the detection software as a deterrent, even having students use it before submitting papers. Most academics attempt to persuade through using their position of authority and educational skills. Some institutions try to change the values of the students through, for example, honor codes.

**Cultural Dimensions**

Plagiarism in the West rests on the assumptions that individuals can and do own their own words and content. This assumption remains strong despite philosophies such as deconstructionalism and relativism that tend to break down the assumption of absolute ownership of a work.

In many non-Western cultures, people find value in their relationships and position in society rather than in their expression of self. In such collectivist cultures, plagiarism is not recognized as a social wrong. Students from these cultures studying in Western institutions sometimes fail to grasp the significance to the Western academic of acknowledging the source of particular words or ideas. In addition, they may be reluctant to paraphrase or include their own ideas in a piece of writing, for this may be considered conceited. The globalization of education is, therefore, challenging the assumptions on which plagiarism rests.

PLEA BARGAINING

Plea bargaining refers to the practice, common in U.S. courts, wherein a criminal defendant agrees to plead guilty in exchange for leniency by the prosecutor or district attorney. According to the Bureau of Justice Statistics, 95 percent of criminal convictions in U.S. courts are obtained through guilty pleas. Although it is not clear what percentage of guilty pleas entail an explicit “bargain” (i.e., defendants may plead guilty without any formal agreement), it is likely that most guilty pleas include some concession on the part of the prosecutor, or at least the assurance that the judge will be more lenient.

Three types of plea bargains are most common. Charge bargaining refers to the defendant pleading guilty to a less serious offense or to fewer charges than would be brought if the case went to trial. For example, a charge of first degree murder may be dismissed if the defendant agrees to plead guilty to second degree murder, or a charge of delivering narcotics might be reduced to possession of narcotics. Alternately, a prosecutor might dismiss several less serious charges if the defendant pleads guilty to the most serious charge. In sentence bargaining, the defendant pleads guilty in exchange for the prosecutor recommending a less severe sentence than would be likely to follow a trial conviction. Finally, fact bargaining entails negotiating over “facts” that can increase the sentence, such as the quantity of drugs involved, the possession of a weapon during the crime, or that the conviction constitutes a “third strike.” Fact bargaining is especially important when the crime is subject to a “mandatory minimum” sentence.

Although judges are not required to comply with prosecutors’ recommendations in plea agreements, they typically do. Research also finds consistently that judges sentence defendants to jail or prison less often, and typically order shorter terms of incarceration, if defendants plead guilty. This “plea reward” (or “trial penalty”) is found even among defendants convicted of similar crimes and having similar criminal histories. Many studies find the type of plea entered is one of the strongest predictors of sentence severity, after the seriousness of the crime and the defendant’s criminal history.

Reasons for Plea Bargaining

The most common explanation for courts’ and prosecutors’ reliance on plea bargaining is that it is the most efficient means of resolving the large volume of criminal cases handled in state and federal courts. Jury trials are time consuming for prosecutors, and it would be virtually impossible for most criminal courts and local jails to accommodate jury trials for most defendants. By negotiating plea bargains in most cases, all parties benefit. The courts are able to process a larger volume of cases, prosecutors are ensured a high rate of convictions, and local jails are relieved of the need to hold a large number of defendants awaiting trial. Of course, by pleading guilty, defendants receive a less severe punishment than likely would follow a trial conviction, they spend less time in jail prior to sentencing, and they minimize their criminal record. Plea bargains are also attractive because they reduce the uncertainty inherent in a trial, for both the prosecution and the defense. Research typically finds that prosecutors also take into consideration the seriousness of the crime, the defendant’s level of culpability, and the threat that the defendant poses to the community when deciding whether to grant concessions for a guilty plea. Community norms and political considerations may also become a factor in plea bargaining decisions, particularly in high-profile cases.

Controversy Surrounding Plea Bargaining

Some critics charge that plea bargaining is unconstitutional, in that defendants essentially are coerced into relinquishing their most fundamental civil liberties—the right to a trial by jury, guaranteed in Article III and
the Sixth Amendment (i.e., the Bill of Rights) of the U.S. Constitution; and protection against compulsory self-incrimination, provided in the Fifth Amendment—by the threat of more severe punishment should they exercise these rights. Given that most trials result in convictions, exercising one’s right to trial is a risk that many defendants will be reluctant to take, so they may plea bargain for a lesser sentence rather than gamble that they might be among the few defendants acquitted by a jury. Defendants can also be pressured into pleading guilty because often they would spend more time in jail awaiting trial than if they pled guilty and were sentenced. However, the U.S. Supreme Court has upheld the practice of plea bargaining in a series of decisions, provided the plea is voluntary.

Plea bargaining may also be a source of racial/ethnic, gender, or social class disparities in punishment. Class disparities may result, for example, if wealthier defendants obtain greater plea concessions by hiring more effective legal counsel. This is perhaps most evident in cases involving white-collar or celebrity defendants with substantial resources. Research on the effects of race, ethnicity, and gender on plea bargaining is mixed. Some studies find that minority defendants and males benefit less through plea bargaining than do white or male defendants, but other studies find no differences. Also, some research finds that, among the vast majority of criminal cases, public defenders are as effective as privately retained attorneys.

Plea bargaining also enables prosecutors to circumvent sentencing laws designed to ensure greater uniformity in punishment or that require more severe punishment for certain crimes. For example, most states have adopted mandatory minimum sentencing laws requiring judges to order prison terms for offenders convicted of specific crimes, usually drug or weapon offenses, or for “habitual” offenders. In practice, though, prosecuting attorneys routinely agree to not file charges that would trigger a mandatory sentence if defendants plead guilty. For example, with the exception of California, most states that enacted “three strikes” laws in the 1990s have sentenced relatively few offenders under these laws.

**PLESSY V. FERGUSON**

One of the more notable events in U.S. history with regard to the status of African Americans was the 1896 Supreme Court ruling *Plessy v. Ferguson*. It legitimized African Americans’ subordinate status in society, and cast segregation as a fundamental law of the land and made constitutional what became known as “second-class citizenship.”

Even in colonial times, the status of Africans in “white America” was problematic. The shift from “nonracialized” indentured servitude in the early 1600s to “racialized” slavery by midcentury was a major status change for Africans, from human to chattel. *Chattel* refers to valuable property or investments that can be moved from place to place. These “investments” were equivalent to owning cows, horses, or other farm animals. Not even fighting in the Revolutionary War was sufficient for blacks to gain citizenship, as the nation’s first citizenship law, the Immigration and Naturalization law of 1790, restricted citizenship to whites. After 200 years as chattel in the South and noncitizens elsewhere, blacks benefited from the Union’s Civil War victory and the outlawing of slavery with passage of the Thirteenth Amendment. The Fourteenth Amendment provided due process and “equal protection of the laws” for African Americans, and the Fifteenth Amendment struck down prior servitude as a basis for denying black males the right to vote. Known as the “Civil War Amendments,” they
extended to blacks full citizenship rights that lasted for the brief Reconstruction period (1865–76).

The beginning of the end of Reconstruction, however, began with the Hayes-Tilden compromise. As a result of an electoral crisis in the 1876 election, Samuel Tilden, a New York Democrat, surrendered his electoral votes to the Republican Rutherford B. Hayes in exchange for removal of troops from the South. The compromise essentially ended protection for Reconstruction governments and their black constituencies.

What followed next was “redemption,” or the restoration of white supremacy that undid black gains, including their voting rights and right to be elected to political offices. Southern states began enacting segregation laws, such as Louisiana’s 1890 law mandating separate railway cars by race. In this climate, the Plessy ruling would provide a legal framework for further segregation.

The Plessy v. Ferguson case involved Homer A. Plessy, a New Orleans mulatto, who was one-eighth black and seven-eighths white, but was classified as African American under Louisiana law. He was arrested in 1892 for refusing to leave the white passenger car on the East Louisiana Railway. Denied that first-class accommodation, Plessy challenged the Louisiana racial segregation law under the Thirteenth and Fourteenth Amendments. After losing his appeal in the Louisiana Supreme Court, which upheld a lower court ruling in favor of the railroad’s segregation policy, Plessy took his case to the U.S. Supreme Court.

Earlier, the Supreme Court ruled in the Slaughter House Cases in 1873, and the subsequent United States v. Cruikshank in 1876, that dealing with the widespread murder of blacks practicing their constitutional political rights at the hands of white mob violence “rest[ed] alone with the states,” not on any protections from the federal government. Even earlier, in the 1857 Dred Scott decision, the majority opinion written by Chief Justice Roger B. Taney, himself a slaveholder, stipulated that “the black man has no rights which whites are bound to respect.” These postwar rulings varied little from that of Taney and essentially encouraged the tyranny of the Ku Klux Klan. As white supremacy was being restored, the random, though ever-present violence to which blacks were subjected reaffirmed that blacks had no citizenship rights. Their assailants were seldom brought to justice.

Rather than uphold the basic principle of the Fourteenth Amendment of blacks having “equal protection under the laws,” the 1896 Court held in Plessy that things could be “separate but equal.” In his majority opinion, Justice Henry Billings Brown wrote that it was not the intent of the Fourteenth Amendment to “abolish distinctions based on color” or to enforce “a commingling of the two races upon terms unsatisfactory to either.” He added that separation of the races, a state right, does “not necessarily imply the inferiority of either race to the other.”

Justice Brown’s reasoning was consistent with other Court rulings in this interpretation of the law. In suits to enforce the civil rights laws granting equal opportunity in public accommodations, housing, and so on, the Court reasoned that since blacks were no longer slaves, distinctions based on “race, or color, or class distinctions” had nothing to do with their denial because of prior servitude. By endorsing the railroad company’s refusal to allow blacks to ride in the “first-class” car, the status of African Americans as “second-class citizens” was established as a settled constitutional matter. Plessy froze the “Jim Crow” system in time and protected remnants of the black codes, including debt peonage and racial subordination. White supremacy as the nation’s law was upheld.

The case that overturned Plessy in 1954, Brown v. Board of Education, ruled that “separate was inherently unequal” and segregation was therefore unconstitutional. In this new context, it was the lone dissent of Justice John Marshall Harlan in Plessy in 1896 that gave guidance in the Brown ruling. As a result of the 1954 ruling, and the civil rights movement, the basic citizenship rights of blacks (e.g., public accommodations, housing, employment, and the right to vote) were reinstated for the first time since Reconstruction.

Pluralism

Pluralism refers to theories and practices that favor the inclusion and tolerance of human differences. These differences could involve politics, religion, ethno-racial identity, cultural tradition, language, or something else. The study of pluralism varies with academic discipline. Political scientists describe pluralism as a feature of an open, democratic society in which people have political freedom, can express dissenting opinion, and can pressure government. Religion scholars examine differences within denominations as well as cooperation between different denominational and theological traditions. Sociologists and anthropologists focus on cultural pluralism, or the interrelationships between distinct groups—particularly ethnic, racial, or cultural groups. Their various approaches have led to lively debates about how best to conceptualize and empirically study pluralism.

These different disciplinary approaches to pluralism tend to share a concern with how social problems can arise when an individual or group is restricted from peaceful participation in the political system, cultural traditions, religion, or some other domain of social life. These various approaches also raise some similar questions about the relationship between groups and society at large. How do members of different ethnic, racial, religious, cultural, linguistic, and political groups participate in a shared society? How should they relate to each other, the state, and other key institutions? Do societies have a core culture to be preserved, and if so, who determines its openness to change? Most analyses of pluralism agree with certain pluralist assumptions: unlike fundamentalism or totalitarianism, a common pluralist sentiment is that some diversity is inherently good and distinct cultures should be protected. Said differently, the scholarship about pluralism encompasses both empirical investigations into group relations and normative statements about how groups should relate to one another.

The Concept of Pluralism in U.S. History

Horace M. Kallen, an immigrant who taught at the University of Wisconsin in the early 20th century, first coined the term cultural pluralism. According to the prevailing nativist view at that time, new immigrants moving to the United States should become “Americanized” by strictly conforming to the social practices and even the blood lines of a singular, generic national culture. In 1924, Kallen introduced the term and made a radical argument: immigrants’ unique, persistent nationalities could coexist within American democracy in some kind of harmony. Since then, pluralism has meant different things at different points in U.S. history, depending on trends in academic disciplines, popular ideology, social movements, and geopolitical circumstances.

James Madison introduced one of the initial arguments for political pluralism in the 1780s when he proposed that factions would prevent any single group from dominating American politics. Not until the 1950s, however, did analysts popularize political “pluralism” as a theory of interest group politics. They understood the U.S. political system as interplay among corporate associations, labor unions, and other organizations that used resources to shape policy making. They believed that this system represented citizens, since power and influence were spread across many groups. Diversity could flourish and even enhance politics as long as everyone abided by certain American ideals, such as the democratic process and civility. This view of political pluralism, as well as popular ideas about cultural pluralism at the time, verbally lauded diversity while assuming a societal consensus around certain U.S. values.

In the 1960s, U.S. ideology about pluralism shifted toward two conflicting visions—corporate pluralism and liberal pluralism—amid social movements challenging discrimination at home, anti-colonialism abroad, and new laws allowing immigration from regions such as Latin America. Under corporate pluralism, ethnic and racial groups have formal legal status and rights, and individuals’ rights depend, in part, on the groups to which they belong. The Black Power movement and its separatist call for black power
exemplified this vision. Some critics of this view called for liberal pluralism, in which democratic individualism and equality of opportunity are governing principles. They believe that the state should prevent discrimination against ethnic and racial groups but not control these groups or affirm their potentially divisive differences. Similarly, policy analysts have worried that some groups, especially poor black families, failed to adequately assimilate to a shared national culture. Critics of this view argue that it focuses on cultural deficiencies and largely ignores issues of structural inequality.

Contemporary pluralism emphasizes multicultural tolerance and the value of cultural diversity. Unlike earlier versions, it also suggests that intergroup interaction produces measurable, positive outcomes. For example, in two U.S. Supreme Court cases concerning affirmative action in 2003, the University of Michigan successfully argued that race-conscious admissions policies create a diverse student body, which leads to a better academic environment; students learn more when they interact with students of different backgrounds. Some progressive critics argue that contemporary pluralism emphasizes individuals’ cultural identity while downplaying concerns about systematic discrimination and societal injustice. Others view this vision of pluralism as congruent with a neoliberal international order, globalization of capital markets, and rising U.S. conservatism because it treats diversity as a means to economic competitiveness rather than greater equity. Conservative critics question the government’s role in promoting diversity or portray rhetoric about diversity as a repackaging of corporate pluralism—granting minorities and women unfair advantage that undermines principles such as merit.

Contemporary Areas of Research Focus

Theories and empirical studies of pluralism and its social problems offer different perspectives on the relationship between groups and society. Political theorists survey the political structures of pluralist countries such as Canada, India, and the United States and propose models for the proper relationship between cultural populations and the modern state. Some social scientists investigate how groups form from a macro-level perspective, examining the broader economic, political, and social forces, like race and racial distinctions, that shape institutions. For example, some scholars argue that the rise of modernity and Western capitalism depended fundamentally on processes of racialization that justified the exploitation of nonwhite “others” from Africa and the Americas. Other scholars point to the organizational processes of ethno-racial formation, such as the five racial categories created by the U.S. Office of Management and Budget in 1977 for data collection. Still others examine group formation and its related social problems closer to the ground by looking within groups, at their boundaries, social networks, and identities. Research on ethnic groups, for instance, focuses on immigrants’ economic activity and their children’s socialization, as well as the impact of churches, geographic concentration, and transnational movement.

Another common research area looks at the resources and opportunities available to racial minorities, women, and other historically excluded groups. Many sociologists study minority group representation and stratification in different sectors of society. For instance, the current U.S. power elite—those who own large banks and corporations, fund political campaigns, and serve in government—includes more women, people of color, and openly homosexual men and women than it did in the 1950s, but white, Christian males still predominate. The new and old members alike tend to come from wealthy families and attend similar private schools. A related approach examines how organizations and law can increase minority group representation. For example, workforce policies that assign responsibility for improving diversity, such as affirmative action plans, move more women and black men into managerial ranks than do diversity trainings that try to minimize bias among managers.

**Police**

Police forces are agencies empowered by some level of government—local, county, state, or federal—to maintain social order through legal means, coercion, or use of force. Police serve as the enforcement arm of the criminal justice system, which consists of police, the judiciary, and corrections.

Unlike many other countries, the United States has decentralized police forces. With localism distinguishing U.S. police forces since their conception, municipal government and police chiefs have been fundamental to shaping police activities, resulting in police forces in different places that are often quite different from each other. This legacy of decentralized police organization and lack of coordination among district, county, and state police and the Federal Bureau of Investigation (FBI) and the Secret Service was cited as problematic in The 9/11 Commission Report and led to the development of the Department of Homeland Security to coordinate with local police departments, although it still has an undefined jurisdiction over local police.

Although many textbooks still describe the first U.S. police forces as emerging in the mid-1800s in northeastern cities, many contemporary scholars of police studies cite police forces’ initial emergence in southern cities near the turn of the 19th century. These forces, which often patrolled on horseback and in some cities lived in dorms, were paid, civilian, patrolling entities created to help contain the urban slave population. Their duties included checking slaves for passes allowing them to be out on the street, searching for runaway slaves, and monitoring the free African American population and keeping them from gathering or interacting with slaves. However, because these forces had jurisdiction to arrest any city resident and did so, and interacted with the courts, they are by definition police forces and thus push back the origin date of police forces in the United States to the first years of the 19th century and geographically to southern cities rather than northeastern ones.

Boston and New York developed police forces in 1838 and 1844, respectively, and did so under pressure from local populations for more social order in a time of civil unrest. By the end of the 19th century, nearly all metropolitan areas had police forces, and starting in 1905 in Pennsylvania (which organized its state police in response to the unrest around the Great Anthracite Strike), state police forces began serving rural areas. By the start of World War II, all states had statewide police forces.

The discontinuity of the inception of police forces speaks to the most prevailing characteristics of policing in the United States, namely, its history of local autonomy and organization, which has only recently begun to change. By the mid- to late 19th century, urban police forces were deeply tied to local political parties and machines. In many larger cities, such as San Francisco, New York, and New Orleans, police were so intimately connected to local political parties that if their party lost its majority in the city council, the police department would be purged and new officers brought in who were loyal to the prevailing party. Therefore, employment in the police was contingent on political connections, and there was rarely any kind of formal training or serious application process. Combine this with the facts that no preprinted secret ballot yet existed and that police officers marshaled elections, and one can see the origins of the prevailing violence found on Election Day in many large cities.

Among the many calls for reform during the Progressive Era (1890s–1920s) were demands for the separation of local police forces from political machines. Progressives called for police officers to be put through a system of application and training and to receive pay increases and promotion through a merit-based system of exams. Perhaps foremost among the champions for this professionalization was August Vollmer (1876–1955), Berkeley’s first police chief, who persuaded the University of California at Berkeley to establish the first criminal justice program, in which he subsequently taught. Known as “the father of modern law enforcement,” he was the first...
to create both bicycle and motorized patrols, to establish a police academy, and to require that officers earn college degrees; he also hired the first women police officers and was noted for his support of African American officers. After the Progressive Era, urban police forces, while still sometimes awash with corruption and brutality, no longer had the same level of connection to local politics. This value of “professionalism” in policing remains one of the central tenets of policing today and characterizes police reforms throughout the 20th century.

The riots that plagued U.S. cities in the mid-20th century—almost all sparked by instances of police brutality—were a serious challenge to the legitimacy of local police forces. As a result of this unrest, the President’s Commission on Law Enforcement and Administration of Justice suggested in their 1967 report the development of “team policing.” This concept, which became “community policing” in the 1980s and 1990s, called for greater coordination between police and community and for civilian oversight into police actions, particularly in investigating instances of police brutality. This emphasis on police intimacy with local communities and civilian participation remains popular today. However, the dictates of zero-tolerance policing that emerged in the 1990s (in which police forces are “arrest driven,” concentrate on a deep knowledge of local crime hotspots, and arrest people for minor crimes in the hopes of preventing more serious ones) can strain police–community relations and sometimes be at odds with community policing.

Indeed, tensions and violence between local police forces and the communities they police have long characterized U.S. policing. Police corruption, brutality, and racial profiling have been among the more prevailing complaints about police comportment. Often citizen outrage has sparked substantive police reform. Various commissions were set up throughout the 20th century to study police problems and suggest changes. Furthermore, federal lawsuits became a major purveyor of police reforms, with changes in police organization or training as part of the lawsuit settlement.

In the aftermath of September 11, 2001, the federal government developed the Department of Homeland Security. Designed as an overarching entity overseeing all manner of threat to the United States, be it natural disaster or attack, this department has profound implications for local police forces. This influence is twofold. First, the Department of Homeland Security gives grants to local police departments and state governments to fund emergency preparedness equipment and personnel. Second, it provides training to local police forces against terrorist attacks. However, the dictates of the Department of Homeland Security in connection with both provisions are controversial. First, those concerned with civil liberties worry that the call for police officers to be intelligence gatherers rather than “responders” to crime or disorder has the potential to substantially change the nature of policing by asking police to spy on citizens. Second, the federally organized Department of Homeland Security calls to question the value of local citizen participation in policing or even the ability to express concern with police actions when jurisdiction is federal. For the most part, however, the structure and sanctioned actions of the Department of Homeland Security are still evolving and the long-term changes to be brought about by the new agency remain uncertain at this time.

**Police Stress**

Continual exposure to sudden life-and-death experiences, human suffering, and the frustration of strictly codified responses to violence, injury, and insult creates a unique set of potentially debilitating psychological stimuli often referred to as “police stress.”
During everyday activities, whether on duty or off, the police officer is exposed to a higher than average number of life-threatening activities that precipitate sudden activation of the fight-or-flight mechanism within the physiology of the human body. Unlike the average citizen, the police officer often does not have the option of flight, which normally provides both escape and relief from the stress of confrontation. Chronic exposure to this accelerated physiological state and the subsequent release of body chemistry designed to stimulate mental acuity and body defense mechanisms has been clinically shown to produce mental health-related disabilities such as depression, post-traumatic stress disorder, and general anxiety disorder. As a result, increased numbers of cases of dysfunctional marital and family relationships, suicides, chemical addictions, and personality disorders are prevalent among police officers.

Additional factors that exacerbate the detrimental effects of police stress upon the officer include poor diet and eating habits stemming from frequent motor patrol assignments, disrupted sleep patterns resulting from around-the-clock shift work, the strict discipline inherent in a paramilitary work environment, and frequent displays of disrespect offered by offender and citizen alike.

An important factor that aggravates the identification of police officers whose work product and quality of life are negatively affected by police stress is an archaic belief that officers with stress-related disorders must be relieved of duty. In recent years, more departments have developed enlightened policies on the management of police stress and the treatment of officers from both a preventative and rehabilitative aspect. Many departments now mandate psychological debriefings or de-stressing sessions after an officer is involved in a high-stress incident, such as an officer-involved shooting (OIS), the loss of a partner, or response to a high-order disaster such as the World Trade Center attacks on September 11, 2001. Many police officers are particularly affected by incidents involving small children who are victims of heinous or brutal crimes.

The life partner of a police officer can be particularly helpful in identifying symptoms of police stress and in making sure that professional treatment is obtained in a timely fashion. Symptoms of mental health issues caused by police stress include nightmares and disturbed sleep patterns, restlessness, avoidance of activities previously enjoyed by the person, withdrawal from social interaction, uncharacteristic outbursts of anger, increase in blood pressure and pulse rate not due to underlying medical conditions, excessive work absences due to nonspecific illnesses, weepiness and melancholy, and an unusual preoccupation with death and dying.

A mental health professional can be very effective in treating police stress-related disabilities. Through the introduction of analysis, cognitive changes, and the use of psychotropic medications, the mental health practitioner can often reverse the ill effects of police-related stress and restore the individual’s quality of life to a normal level. The education of police practitioners and those who command police departments is a key factor in the recognition and prevention of new police stress cases.

While many modern police administrators embrace community policing as a method of lowering crime rates within their commands, the concentration on police accountability inherent in the practice has recently become a major source of police stress, with ramifications for top-level commanders and administrators as well as front-line personnel. For example, the press reported that the use of the Compstat program (an accountability process driven by computer mapping of problem areas) within the auspices of the New York City Police Department apparently led to the death of at least one precinct commander who experienced a fatal coronary event in preparation for his appearance before the Compstat board. When a precinct commander fails to meet the expectations of such a board, the trickle-down effect to executive officers, supervisors, and the rank and file is palpable. The resulting stress affects each person in various ways and degrees.

On the positive side, other results of community policing practice may have an ameliorating influence on police stress. The reinstitution of such classic police techniques as foot patrol and bicycle patrol have healthy side effects for police officers by providing increased opportunity for aerobic exercise, a medically accepted antidote to stress, and the concomitant benefit of popularity within the community, which can help lessen the tension between officer and citizen. Community policing practitioners are frequently encouraged to make their own hours and set their own patrol style within the community. By taking advantage of the particular knowledge of crime patterns learned through patrol, the officer has the opportunity to become directly involved in crime prevention strategy at the beat level. Since the officer is directly involved in results-oriented behavior, a sense of control over
events is experienced, which can alleviate a portion of the frustration inherent in cruise-and-respond styles of policing.

Few jobs provide such a high level of responsibility to the common citizen. The police officer is part soldier, part lawyer, part psychologist, and part social worker. In the authorized use of deadly physical force, the officer becomes both judge and jury. This is an awesome responsibility further encumbered by the split-second timeline within which to make a life-and-death decision. In the wake of such a decision, the officer must maintain proper decorum and provide aid and assistance to the individual who may have, just seconds before, attempted to take away a life. This dichotomy of violent threat versus courageous behavior takes its toll on the police practitioner. It is an unknown factor that determines just how many stressful incidents an individual officer can experience before exhibiting a decline in work performance. Furthermore, officers may be exposed to the detrimental effects of stress not yet affecting work performance but nevertheless impacting negatively on social interaction and normal family life.

Policing, Community

Emerging from the tradition of locally organized police forces in the United States, community policing is a philosophy of police administration that focuses on cooperation and empathy between local police forces and communities. This style of policing embraces visible policing practices like foot or bike patrol and interactions with community members outside of emergencies, car accidents, or crime. Furthermore, this approach encourages substantive dialogue between police representatives and local organizations and sometimes goes so far as offering incentives for patrol officers to live in the communities in which they work. Based on the idea that police and the public should know each other as well as possible to be effective, community policing was a favorite buzzword throughout the late 1990s. While sometimes frustrating police officers because it was thought to be more style than substance and at other moments in contradiction to popular ideas of “zero-tolerance” policing, in fact community policing is thought, under the right circumstances, to improve quality of life. Today, community policing is in jeopardy due to budget retrenchment and the dictates of homeland security.

Examples of community policing efforts are police representation at Neighborhood Watch meetings and in civic organizations; police working with youth in athletic leagues or Explorer Clubs; police attending educational meetings at schools on drug education, violence, and abuse; and foot patrols that offer both police and the public opportunities to interact informally. Furthermore, community policing efforts are often equated with sustentative reforms such as civilian review boards and accountability on the neighborhood level for quality of life issues.

In 1967, the President’s Commission on Law Enforcement and Administration of Justice produced a report that recommended, among other things, “team policing.” This idea, informed by the riots in U.S. cities against urban police departments, called on local police forces to become better informed about community problems and sensitive to their concerns. A series of studies on expanded foot patrol in the 1970s led to an influential study of police and community relations, which was conducted in Newark, New Jersey, in 1981 and concentrated on what are now viewed as the major dictates of community policing. This study claimed that while increased foot patrols and everyday interactions between officers and community members did not decrease crime, it did make people feel better about their community and the police and generally less fearful of random street crime.

After several more studies of community-based policing reforms, a 1987 report on community policing efforts outlined substantial reforms in police administration and organization and found them to be largely successful. After the published report and
accompanying conference in Racine, Wisconsin, that same year, community policing grew in popularity as a paradigm of police reform. The peak of public recognition of the movement may well be President William Clinton’s 1994 campaign promise to fund 100,000 police officers for community policing efforts. Throughout the late 1990s, community policing continued to be a very popular concept both within police organizations and in public discussions of policing.

However, as a result of the September 11 attacks, community policing has been largely usurped in the public imagination with police as “first responders” who respond to and protect communities from terrorist attack and work closely with the Department of Homeland Security. Furthermore, while sometimes thought to be positive but not necessary, community policing efforts are often the first to be cut as police departments deal with decreased revenues and increased responsibilities for the “War on Terror.”

Although sometimes used in tandem, the reforms of community policing should not be mistaken for the philosophy of “zero-tolerance” policing, where police forces arrest perpetrators of small-scale offenses such as vandalism, trespassing, and truancy in order to maintain public order. While zero-tolerance policing does concentrate on community knowledge, that information often comes from sophisticated computer geographical programs that track crime rather than community perceptions of crime problems. Further, community policing requires significant police discretion that arrest-driven, zero-tolerance policing cannot accommodate. In fact, some controversial aspects of zero-tolerance policing, such as stop-and-frisks, diminish community opinion of police activities. Furthermore, many critics connect zero-tolerance tactics with police brutality. For example, the New York police force, prior to September 11, 2001, was fully entrenched in zero-tolerance policing and was the target of five federal government investigations and one lawsuit.

While challenged by the dictates of homeland security, no study ever questioned the tremendous potential of community policing at the neighborhood level, and it remains popular throughout the United States. In fact, college campuses are some of the most successful sites of community policing activities, where campus police work closely with universities and their students in order both to respond to crime and to inform students about drug addiction, domestic abuse, and sexual violence. College campuses have, in the past 15 years, seen an increase of reporting of rape, thought to be partially due to police efforts on campuses to take the shame out of victimization and relate to the student population.

POLICING, STRATEGIC

Strategic policing refers to proactive measures that police take to prevent crime, control disorder, improve citizens’ quality of life, and resolve community problems. To achieve these goals, the police employ tactics within a general, community-oriented strategy commonly known as “community policing.”

While community policing is the dominant paradigm of policing, police strategies have evolved since the origin of modern police departments in the United States. For example, local politics heavily influenced U.S. police departments in the second half of the 19th century, and officers served largely at the discretion of ward politicians. Officers then provided a variety of community services to the public and generally had an intimate knowledge of the beats they patrolled. However, poor training, questionable standards regarding hiring and promotion, and political influence led to corrupt, incompetent, and often brutal practices.
Reformers in the early and mid-1900s, in an effort to improve policing and elevate the status of officers, sought to separate police from the corrupting influences of local politics. They attempted to accomplish this goal by shifting the police strategy from one that addressed a broad array of community issues to one that focused on “law enforcement”—especially the enforcement of serious felonies. Police agencies essentially removed officers from neighborhood beats and instead organized around centralized dispatch systems, whereby officers could respond quickly to calls for service. Their superior officers discouraged police from proactively handling minor community problems and providing other social services to the public. Instead of an intimate relationship with citizens, officers received encouragement to remain professionally remote “crime fighters.” The popular 1950s television show *Dragnet* effectively depicted this image of the impartial law enforcement officer with Sergeant Joe Friday’s famous line, “Just the facts, ma’am.”

This law enforcement strategy did much to enhance the image of police, develop better training and supervision of officers, and improve internal management and organizational concerns. Questions remain, however, as to the extent to which this strategy improved the quality of policing services overall. Crime rates, as well as citizen fear of crime, continued to rise despite the emphasis on the police “crime-fighting” image. Empirical research studies conducted during the 1960s and 1970s demonstrated that the preferred police patrol and investigative tactics of the time had little impact on crime prevention or on arrest rates. Supreme Court cases, such as *Mapp v. Ohio* of 1961 and *Miranda v. Arizona* of 1966, pointed to the inadequacies and inappropriateness of police procedures. Finally, tensions between police and minority communities—often the result of unfair or heavy-handed practices on the part of police—escalated to the point of rioting in several major U.S. cities.

In light of the deficiencies of the “law enforcement” strategy, several ideas on police practice emerged during the 1970s and 1980s that influenced the development of the community policing model. Building on the results of foot patrol experiments, for example, analysts criticized the remoteness of police officers and suggested that citizens desired more intimate contacts with police. They revealed that citizens greatly valued the broadly based, order maintenance and service functions that police can provide, which police administrators had been actively discouraging. In addition, they were critical of the reactive nature of police work, arguing that police can control crime through more proactive, problem-solving techniques.

Although community policing is difficult to define, most agree that the strategy involves a combination of enhanced partnerships between police and citizens as well as a more proactive approach to solving community problems. As community policing evolved, police departments across the United States altered their structures and operations to better fit the goals of the community-oriented approach. For example, many departments now assign officers to regular geographic beats, with foot and bicycle patrols growing in popularity. These efforts seek to increase officer familiarity with specific community problems on their beats, foster order maintenance and problem management activities by officers, and enhance relationships between police and citizens.

From the operational perspective, police strategists now attempt to shift away from the reactive approach to crime control that dominated during most of the 20th century. In an attempt to return to the more proactive notion of crime prevention, they now address specific crime problems with more focused initiatives utilizing modern analytical techniques. Through the analysis of crime data, for example, agencies are often able to identify specific, crime-prone “hot spots” and determine the specific situational circumstances that generate crime at those locations. With a better understanding of neighborhood problems, utilization of special preventative techniques can reduce future opportunities for criminal activity. Police programs designed specifically to reduce gun carrying in “hot spots” of violent crime, for instance, have been effective in reducing violence in those locations. Another popular technique calls for officers to pay more attention to minor offenses, such as prostitution and public alcohol and drug use. The idea behind this tactic suggests that a linkage between minor disorders and serious felonies exists. Therefore, by controlling minor offenses, police may prevent occurrences of more serious crime.

Although responses to community problems often involve traditional police tactics such as arrests or citations at a specific location, simply making arrests or issuing citations may not resolve a recurring problem. More innovative methods draw upon the resources of the community or other government agencies. It is not unusual, for example, for police to partner with prosecutors to enhance civil penalties for
violators or to work with environmental engineers and architects to “design out” opportunities for crime in public places.

**Political Action Committees**

Political action committees (PACs) are organizations dedicated to fundraising and supporting the election or defeat of specific political candidates. Their existence traces back to 1944, when the Congress of Industrial Organizations (CIO) supported efforts to reelect President Franklin Delano Roosevelt. To avoid violation of the Smith Connally Act of 1943, which prohibited federal candidates from receiving contributions from labor unions, the CIO encouraged its union members to voluntarily contribute directly to the PAC’s effort to support the Roosevelt campaign. These efforts proved so successful that numerous other PACs soon appeared. Today, PACs literally raise billions of dollars in support of thousands of political candidates at both state and federal levels.

Although the number of PACs grew continuously through the 1950s and 1960s, they reached their real prominence during the 1970s. It was then that Congress attempted to limit some of the “big money” influence in national elections by enacting the Federal Election Campaign Act (FECA). In 1976, the U.S. Supreme Court reviewed the constitutionality of FECA in *Buckley v. Valeo.* At issue was the conflict between limiting campaign abuses and infringing on the rights of free speech and association contained within the First Amendment. Since all political groups require money to grow and to convey their message, any restrictions on fundraising or campaign spending could impact an organization’s First Amendment rights. In a decision nearly 300 pages in length, the Supreme Court distinguished between contributions and expenditures by stating that, constitutionally, restrictions on contributions were less harmful to freedom of association and speech than were limitations on expenditures. As a result, while the Court struck down FECA provisions limiting presidential candidates’ use of their own or their immediate family’s money to $50,000 and restricting “independent spending” by others in support of a federal office candidate, it upheld FECA provisions placing maximum limits on the amount individuals or groups can contribute to federal office candidates. It also limited the public finance process for presidential candidates whereby funds are matched in primaries and caucuses, while allowing the general election to be fully funded, in exchange for spending limits by candidates.

In subsequent decades, the Supreme Court continued to examine a number of issues concerning independent expenditures. In *Federal Election Commission v. National Conservative Political Action Committee* in 1985, the Court struck down a spending restriction on independent political committees supporting presidential candidates who had accepted public funding, ruling such expenditures “produce speech at the core of the First Amendment.” Then, in 1996, the Supreme Court addressed a provision of FECA limiting the amount of “coordinated expenditures” a political party could spend in connection with the campaign of a congressional candidate. Ruling that such spending should not be presumed to be coordinated, and maintaining that First Amendment protections applied to these expenditures, the Court in *Colorado Republican Federal Campaign Committee v. FEC* (*Colorado I*) said that spending limits are unconstitutional as long as the party’s media campaign develops independently of the party’s nominee. Finally, in 2001, the Supreme Court examined the issue of expenditures that were, in fact, coordinated between a political party and the candidate’s campaign in *Federal Election Commission v. Colorado Republican Federal Campaign Committee* (*Colorado II*). Ruling that such coordinated expenditures were similar to contributions to the candidate, thus circumventing contribution
restrictions, five justices ruled the First Amendment was not a protection against “coordinated expenditure” limitations.

In an effort to prohibit all “soft money” or unregulated contributions to national party organizations, Congress enacted the Bipartisan Campaign Reform Act (BCRA) in 2002. Responding to the 2000 elections, when Republicans and Democrats raised nearly $500 million in soft money, the law raised the yearly limits for individual contributions but specifically banned unregulated donations to national party organizations, placed restrictions on contributions to state and local party organizations, and limited broadcast advertising in support of a candidate unless funded by a party’s “hard money” or regulated contributions. As expected, the Supreme Court reviewed BCRA in McConnell v. Federal Election Commission in 2003. Adopting the same 5–4 positions they took in Colorado II, a majority of the Court upheld the restrictions on “soft money” as well as the limitations on “electioneering communications” in an effort to continue the decades-long fight against expenditure corruption or the appearance of corruption.

Over the course of the past quarter-century, some of the most prominent PACs have emanated from specific corporations (such as Microsoft) or labor groups (such as the Teamsters Union). Politicians have also formed leadership PACs in an effort to support the campaigns of other candidates or test the support for a run at a higher office. PACs not connected to specific corporations, labor groups, political parties, or politicians may be referred to as “nonconnected PACS.” The National Rifle Association is an example of such a PAC. Rather than soliciting contributions from just their employees and members, these organizations can fundraise from the general public as well. With election costs escalating dramatically each year, primarily because of television advertising, the influence of PACs has correspondingly increased. For example, between January 1, 2003, and June 30, 2004, the Federal Election Commission reported that, of the $629.3 million raised by PACs, $514.9 million was spent and $205.1 million was contributed to federal candidates. During the 2004 presidential election, the top ten PACs in spending money were EMILY’s List; Service Employees International Union; American Federation of Teachers; American Medical Association; National Rifle Association; Teamsters Union; International Brotherhood of Electrical Workers; National Education Association; American Federation of State, County, and Municipal Employees; and Laborers’ International Union of North America.

By enacting the Bipartisan Campaign Reform Act, Congress attempted to restrict any further abuses in campaign finance regulation, but with various factors guaranteeing that money will continue to play a vital role in politics, it seems likely groups will continue to discover ways they can use the BCRA to their advantage. Some of the more prominent factors ensuring the role money plays in politics include (a) the fact that in 2004, those Senate candidates who spent the most money in their campaigns won 88 percent of the time, while those House of Representative candidates who spent the most won 98 percent of the time; (b) the influence political parties have on the general public has declined, opening the door for direct lobbying by single-issue PACs and interest groups; (c) computer technology has provided organizations with a fertile avenue for recruiting members and disseminating their message; and (d) the dramatic increase in diversity among the U.S. population has greatly encouraged the development of single-issue PACs and interest groups.

Since concerns continue to be expressed over the perception that the more powerful PACs possess the ability to purchase policy or take advantage of inequitable opportunities for access to government, numerous proposed reforms seek to help alleviate these issues. Generally, these suggested reforms fall into four categories: (1) supply-side reforms, such as raising or lowering contribution limits or extending limits to a greater range of groups and activities; (2) demand-side reforms, such as reducing the need for money by providing candidates with free or reduced-cost television and radio time or mail; (3) informational reforms, such as having government broadly publicize required disclosures on all contributions made to candidates before an election; and (4) the elimination of the appearance of corruption reforms, such as preventing officeholders from participating in legislative decisions affecting donors who have minimal restrictions on contributions and prohibiting such donors from obtaining state contracts under certain conditions.

Whether these reforms are enacted will depend on a number of factors. The first factor to overcome is the general lack of consensus present over the reform proposals. A wide variety of disagreements exist at present concerning both the category of reform needed and the specific type and degree of reform required.
The second factor involves the high degree of self-interest inherent among the legislators and their constituents. The third factor to overcome will be any legislation’s eventual judicial review by the Supreme Court. Although a majority of the Court upheld the provisions challenged in *Colorado II* and *McConnell*, the slim majority in those cases may well shift to the minority as the new members of the Court, Justices Samuel Alito and John Roberts, have jurisprudential views generally similar to the minority’s ultra-conservative philosophy.

Regardless of any criticism and reforms, PAC activity will continue to flourish over the course of the foreseeable future and, as such, both public and private interest groups will be relied upon to convey and advance the interests of their constituents to legislators. Although, at present, federal election laws prohibit PACs from contributing more than $5,000 to a candidate per election or $15,000 to any national party committee per year, since there are no current restrictions placed on PACs for advertising monies spent in support of candidates or in the promotion of their philosophy or priorities, they will remain a prominent player in the game of politics.

**Political Fragmentation**

Political fragmentation, the existence of multiple units of government in urban and surrounding suburban areas, is not new. It has existed in the United States since the late 1800s, when people began to move away from urban areas and establish independent suburban communities. Political fragmentation also occurs through the proliferation of special purpose governmental units, such as transportation authorities and school districts, whereby citizens are governed and taxed by many different governmental agencies at once.

Different theoretical perspectives—such as public choice, human ecology, and social reform theories—provide dissimilar ways to examine and deal with the ramifications of political fragmentation. While public choice and human ecology theorists stress the voluntary nature and positive impact of the racial/ethnic and class divisions that tend to arise in the wake of political fragmentation, social reform theorists note the negative implications of the segregation and inequality that tend to accompany political fragmentation. For example, while public choice theorists see such fragmentation as fostering healthy competition among local governments to offer residents more and better services for less tax money, social reform theorists note that only economically secure citizens actually have a choice as to where to reside. In turn, communities that can’t afford to offer the best services and opportunities for their residents tend to be populated by those with the fewest economic and social choices.

At various times over the past 100 years, movements have arisen to consolidate local governments in order to make them more efficient and fair. The first such effort was part of the Progressive movement’s late 19th-century drive to clean up corruption and decrease the power of political machines in local government. The second occurred in response to the great growth of the suburbs during the 1950s and 1960s. However, while many Americans have complained about inefficient government and high taxes, relatively few have voted to consolidate local governments into regional ones. According to the National Association of Counties, just 21 of the 131 referendums on consolidation put forth between 1921 and 1996 passed.

The few regional and metropolitan governments that have been created are not uniform. They vary as to how much power is given to larger, regional or metropolitan governments and local governments. For example, Jacksonville–Duval County, Florida, is a regional-level government with power to directly govern the region, while the Miami-Dade, Florida, county government shares power with cities under its umbrella.
Today, there is once again a strong movement to curb political fragmentation. However, the most popular proposals to address political fragmentation in this era call for cooperation rather than consolidation. Many members of local communities are wary of big government and afraid of losing their distinct political voices. While concerned about political fragmentation, they advocate for increased cooperation between local governments and consolidation of particular services across different towns and cities rather than the creation of large regional or metropolitan governments. Motivations behind the current drive to curb political fragmentation vary but include the following: making government more efficient and thus less costly; combating urban sprawl; allowing sectors of geographic regions to collaborate in order to better compete in the global marketplace; and spreading resources from richer to poorer areas of our nation. While consolidation has not been a popular answer to the social problems related to political fragmentation, cooperation may be a more politically viable and effective means of addressing this persistent social issue.

Politics and Christianity

Most researchers studying the intersecting and influence of Christianity and politics on one another frequently quote Matthew 22, in which Jesus, in response to the Pharisees’ question about the legality of paying taxes to Caesar, says, “Give therefore to Caesar the things that are Caesar’s and to God the things that are God’s.” Some Christians cite these words as a warning, even a command that the church should stay out of politics. They contend that the purpose of the state is to govern this world, to tend to our material and physical needs, and the purpose of the church and religion is to tend to our spiritual needs and to prepare us for the world to come.

On the other hand, many Christians interpret these words rather differently. They contend that this trick question from the Pharisees, a question intended to trap Jesus, results in a trick answer, with its meaning hidden in plain sight. These individuals suggest that everything in the world belongs to God, who created everything, even Caesar. So in the end, even Caesar belongs to and is accountable to God.

The first commandment in Exodus 20:3 proclaims, “You shall have no other gods before me,” a priority that the U.S. government officially recognizes; every time Americans say the Pledge of Allegiance, they declare they are “one nation under God.” Religious advocates argue that any attempt to compartmentalize life, to say this belongs to the state and this belongs to God, violates the first commandment. They maintain that since God is Lord of all life, the church should therefore be concerned about and involved in all of life, including politics.

However, real dangers exist in both of these interpretations if taken to the extreme. Believers insist that life cannot be separated neatly into the physical and the spiritual. For instance, many doctors insist that a patient’s attitude toward his or her cure is as important as the remedy prescribed for the cure, and they endorse a holistic approach to health care. Just as water is no longer water when separated into hydrogen and oxygen, Christians contend that humans lose their essence of being when separated into the physical and the spiritual. Because they believe in the resurrection of the body as well as the immortality of the soul, Christians maintain that the body and soul cannot be separated; they are one.

In contrast, Karl Marx described religion as the “opiate of the people,” partly because the only religion he was familiar with refused to get involved with the physical needs of the people. As an example, in 1917, when the citizens of Petrograd were starving and rioting in the streets, the Russian Orthodox Church was meeting in that same city debating the length and color of their liturgical vestments.

Many Christian leaders insist that the church must care about people’s physical needs as well as their
spiritual well-being, and if caring for others involves politics, then so be it. They contend that it is impossible to love one’s neighbor in the abstract. When people of faith remain silent and do nothing in the face of evil and injustice, they in effect condone that wrong. This reasoning was behind the Sanctuary movement of the 1980s, when clergy and congregations defied the government and offered aid to Ecuadorian refugees.

However, danger exists in the other point of view as well. When religious groups think they know best, when they set themselves up as the only interpreter of God’s will, when the church tries to get directly involved in legislation and governing by endorsing candidates and party platforms, disaster often follows, such as the Crusades, the Spanish Inquisition, and the burning of heretics and witches at the stake. More recently, religious intolerance violently divided countries like Ireland, the former Yugoslavia, and Iraq. On another level, the intrusion of religious beliefs into the political process on such issues as abortion and gay marriage has polarized U.S. politics.

In 1887, the British statesman Lord Acton wrote that power tended to corrupt and absolute power corrupted absolutely. History has shown that this statement is as true for the church as it is for individuals. This reality is one of the reasons that Thomas Jefferson promoted the doctrine of separation of church and state, and it remains a compelling reason that Americans still strive to protect and promote this doctrine. Freedom of religion and freedom from religion are two of the factors that motivated many immigrants, past and present, to come to the United States.

Moderate Christian activists suggest that the middle ground between these two extremes is revealed in the Bible. They contend that, without ever seeking the power to govern, the Hebrew prophets spoke what they considered to be the truth again and again to those in power. For example, Amos spoke up for the poor and oppressed and against the indifference of the political and religious powers of his day when he thundered in Amos 5:24: “Let justice roll down like waters, and righteousness like an ever-flowing stream.” This quotation, frequently used by Rev. Martin Luther King Jr. in his speeches, is inscribed on the Civil Rights Memorial in Montgomery, Alabama. It is not at all coincidental that many Christians—ministers and laity alike—were in the forefront of the civil rights movement.

In all of Jesus’ teachings, he never endorsed a particular political system, economic program, or any detailed plan of social reform. Instead, he gave broad guiding principles rather than specific instructions. British scholar and Christian author C. S. Lewis once observed that while Jesus told people to feed the hungry, he did not provide a cooking lesson. Feeding the hungry is not optional, but how to do so rests with the ingenuity of each generation and culture. That ingenuity, say Christian moderates, rests with the collective will of the people, not the imposed will of one religious group over others.

Consequently, some Christian scholars suggest that, on the issue of war and peace, the church should be asking, among other things, whether or not the violence is justified and the only viable solution, and whether or not we have exhausted all avenues of diplomacy, negotiation, and compromise. In the midst of the debate on immigration, they maintain that church leaders should refrain from endorsing a particular piece of legislation, but they clearly and forcefully state repeatedly that every person should be treated as one of God’s creatures. On the question of gay marriage, they suggest that religious people should consider not only its morality but also what constitutes fairness and justice.

The still-continuing debate about how the United States should treat prisoners of war affords another example of potential Christian involvement in seeking to influence national policy. The Bush administration consistently refused to voluntarily adhere to the Geneva Convention and to speak to its transferring prisoners of war to sympathetic countries that routinely use torture as an interrogation technique. Christian scholars lamented that, in contrast to the spontaneous, nearly unanimous outrage in 2006 at the possibility that some U.S. port facilities might be owned and operated by an Arab company, there was a surprisingly apathetic response to the revelations about torture.

The challenge for Christians, then, lies in their recognition of a society’s social problems not just as reality, but in determining how they can, on the one hand, be true to their beliefs and take steps to make a difference, yet still respect the rights of the non-Christian community, who may well have another perspective on righting societal wrongs.

Population, Graying of
The 1870 U.S. Census enumerated the elderly—people 65 years of age or older—at about 1.2 million people (3 percent of the total population of 40 million). However, during the 20th century, with industrialization and changes in fertility and mortality patterns, a new age structure emerged for the population of the United States. Twenty-eight million people were added during the 1950s, at the height of the baby boom era that began after World War II and ended in 1964. The years between 1960 and 1980 were especially dramatic in their contribution: although the total population increased by nearly 19 percent, the population of people ages 65 and older increased by 34 percent (about 25 million in 1980). When age 65 was set as the threshold for Social Security benefits in 1935, the predicted average life expectancy at birth was barely over 60 years. In comparison, the average life expectancy presently is about 78 years. This growth and change has resulted in the “graying” of the U.S. population, and the phenomenon has not diminished since.

In 1986, 12 percent of the population was made up of senior citizens, or about 29 million people over the age of 65. By 2030, the proportion of Americans age 65 or older is predicted to increase to nearly 20 percent, or about 72 million elderly people. In 2000, the median age of the overall population was 35.3 years; barely a century ago, the median age was 22.9 years. In 2030, according to current Census Bureau projections, our median age will be 39.0 years. We are the oldest that our population has ever been, but younger than it is projected ever to be again.

The expansion of the elderly population has been especially pronounced for the “oldest old,” that segment of individuals who are age 85 and older. The proportion of the oldest old in our total population has increased so dramatically that it is no longer unusual to encounter people who are age 100 or more. By 2050, the Census Bureau’s middle-range projections suggest that the proportion of Americans ages 85 and older will be nearly as large as the proportion that were age 65 or older in 1930.

As the U.S. population continues to grow, demographers project that programs for the elderly will consume a larger share of federal tax dollars. In 1980, federal spending on the elderly was nearly a third of the federal budget and may well be nearly half the federal budget in 2015. The future problems with Social Security costs, as the baby boomers approach retirement, though, will pale in comparison to the continually rising costs of health care and prescription drugs; the expectations are that Medicaid and Medicare program costs will triple by 2015.

What these data suggest is that the aging of the population will have a significant effect on society. Median age has increased, as has life expectancy; people are living much longer, and therefore there are more elderly people in competition with the young for societal resources. Two questions emerge about the conundrum of the graying of our population: With the rising costs of Medicaid and Medicare and Social Security, and the challenges of demographic change, how are we going to take care of the graying population, without short-changing current and future generations? Also, how does the situation in the United States compare with the rest of the world, in both the industrialized and developing worlds?

Generational Conflict
Before 1960, Medicare and Medicaid did not exist as social programs. One of President Lyndon Johnson’s goals in his “War on Poverty” in 1964 was to provide assistance for health care needs and extended medical insurance under the Social Security system and to reduce poverty among the elderly. Prior to the assistance of these social programs, about 35 percent of Americans over the age of 65 had incomes below the poverty line; in comparison, by the year 2000 the poverty rate for elderly people had dropped to 10 percent.

However, poverty figures don’t take into account factors that may push the elderly population into a fragile economic state, despite an income status that places them above the official poverty line. For senior citizens, a sizable chunk of income is claimed by rising health care costs. Alternate measures of poverty suggest that, all other factors being equal, if out-of-pocket...
health care costs were taken into account, nearly 20 percent of elderly Americans would be classified as poor.

Changes in the demographic landscape also contribute to a genuine concern for assessing the dependency thresholds in both younger and older age groups in our population. It is assumed in public policy that dependency thresholds exist for particular age categories; the dependency ratio is currently defined as the number of people under age 18 (children) or ages 65 and over (elderly) per 100 people ages 18 to 64 (defined as the working population). The dependency ratio in 1900 was 80; children accounted for nearly all of it (73), whereas in 1960, the ratio was 82, with child dependency at 65. With the baby boom population now in the midlife stage, the current dependency ratio at 62 (the child dependency ratio is 41) is the lowest it has been since the 1930s, but once this generation is beyond age 65, the dependency ratio will increase if current demographic trends continue. Census projections are that in 2050 the dependency ratio will be about 80, with children accounting for less than half. That increased dependency suggests that the needs and expenses of the elderly will outweigh that of youth.

However, current trends suggest that actual dependency for young people extends well beyond age 18, as many college students are moving back in with their parents after college. Furthermore, dependency for many older people now comes much later than age 65, as people put off retirement or move into new careers. Another concern is that of the “Sandwich Generation,” when adults simultaneously provide a home and/or care for both their parents and their children. This is reflected in debates over family leave policies to accommodate changing needs. Multigenerational households are becoming more commonplace and complex, as families adapt to the changes going on around them.

**Global Comparisons**

Compared with other industrialized nations, the U.S. population is relatively young, with 12 percent age 65 or older, compared to the “oldest” country, Italy, with 19 percent. Except for Japan, the world’s 20 oldest countries are all in Europe. But less developed nations also have large numbers of older citizens, and the numbers are increasing rapidly. Sixty percent of the world’s older population now lives in less developed countries; by 2030, this proportion is projected to increase to 71 percent as societies experience downturns in their natural population increases. This is similar to the decline that previously occurred in industrialized nations with decreases in fertility and mortality and resulting changes in the age structure.

Demographers project that the older population will become an ever-larger proportion of each nation’s total population across the globe. The older population within countries is also changing, and in many countries the oldest old are the fastest-growing segment of the population. In 2004, more than half of the world’s oldest old were living in six countries: China, the United States, India, Japan, Germany, and Russia. This simultaneous graying of population and overall decline in the total size of some populations poses new challenges for societal and policy adaptation to these demographic changes.

POPULATION GROWTH

The modern expansion of human numbers began in the late 18th century in Europe and North America. Since then, population growth has spread to all continents and has accelerated: the first billion was reached in 1800; the second, third, fourth, and fifth billions took 125, 35, 14, and 13 years, respectively; and the sixth billion was added in just 12 years, between 1987 and 1999. Today's world population of 6.5 billion is expected to continue to grow, reaching 9.1 billion later in this century before stabilizing. This projection implies that the world’s population will have grown by more than tenfold—from 0.8 to 9.1 billion—between 1750 and 2050.

The Demographic Transition

Accompanying the development process that transforms traditional agricultural societies into modern industrial ones is a distinct pattern of secular population growth and demographic change called the “demographic transition.” Before the transition’s onset, population growth is near zero as high death rates more or less offset the high birth rates typically found in traditional societies. Population growth is again near zero after the completion of the transition, as birth and death rates both reach low levels in modern developed societies. During the intervening transition period, population growth is positive, as the death rate drops before the birth rate. Over the course of the transition, the population size typically grows by an order of magnitude.

Until the mid-18th century, global birth and death rates were both high, at approximately 4 percent per year, and growth rates were close to zero. Over the past two and a half centuries, the death rate declined steadily, to below 1 percent per year by 2000. The birth rate changed little from its historic high levels until the early 1970s, when a precipitous drop began that demographers expect to continue in future decades. The population growth rate of the world peaked at 2.1 percent per year in the late 1960s, when the birth and death rates stood at 3.4 and 1.3 percent per year, respectively. Since the 1960s, the growth rate has declined, reaching an estimated 1.1 percent per year in 2000–2005. In contrast, the annual additions to the population of the world peaked later and will remain high for longer (above 70 million per year until about 2020), because the slowly declining growth rate applies to a rapidly expanding population base. The half-century from 1970 to 2020 represents the period of most rapid expansion of human numbers ever, with the addition of nearly 4 billion people.

The timing of the onset of the transition, the duration of its different phases, and the levels of birth, death, and growth rates differ widely among countries and regions. The developed world, also called the North, was the first to enter the demographic transition in the late 18th century with a decline in mortality, and the birth rate began its decline in the late 19th and early 20th centuries. Today the North has reached the end of the demographic transition, and growth averages near zero. The transition in Africa, Asia, and Latin America, also called the South, started much later than in the North. A sustained reduction in the death rate did not occur until the beginning of the 20th century, and the birth rate remained high until about 1970. Since 1970, fertility in Asia and Latin America declined sharply, while Africa’s birth rate remains relatively high.

Table 1 shows past trends in population from 1950 to 2005 by region. Asia is, and has been by far, the largest region, containing well over half of the world’s

population. Population growth between 1950 and 2005 averaged 157 percent for the world as a whole. Over this period, Africa experienced the most rapid growth (304 percent), and Europe the slowest (33 percent).

**Prospects for the Future**

The United Nations biannually publishes projections to 2050 for the world, major regions, and countries. Projected population trends vary widely among world regions (see Table 1). In 2005, Asia had a population of 3.9 billion, which is expected to reach 5.2 billion by 2050. Africa, with 0.91 billion inhabitants in 2005, is likely to experience the most rapid future expansion, more than doubling in size by 2050. Latin America, with 0.56 billion in 2005, is the smallest of the regions of the South; this should remain the case with a growth pattern similar to Asia’s. Projected trends for the two principal regions in the North diverge between 2005 and 2050: an increase from 0.33 to 0.43 billion in Northern America, but a decline from 0.73 to 0.65 billion in Europe. These divergent regional trends imply that nearly all future growth will take place in the South, while the North as a whole will see little change. Another consequence of the wide diversity of growth rates is that the regional distribution of population will shift significantly over time. While Asia’s (60.8 percent) and Latin America’s (8.3 percent) shares change little, Europe’s declines sharply (from 11.3 to 7.2 percent) and Africa’s rises substantially (from 14.0 to 21.3 percent). Between 2005 and 2050, the North’s share should decline from 18.7 to 13.6 percent.

Notably, population growth continues at a rapid pace in Africa despite the large numbers of deaths due to the AIDS epidemic. The impact of this epidemic can be assessed by comparing the standard population projection for Africa (which includes the epidemic’s effects) with a separate hypothetical projection in which AIDS mortality is excluded. The former project Africa’s population to increase from 0.91 billion in 2005 to 1.94 billion in 2050; the latter expects population size to reach 2.20 billion in 2050. The difference of 0.27 billion between the projections with and without the epidemic is due to deaths from AIDS as well as the absence of births of their descendants. The epidemic clearly has a large effect on population growth by raising the death rate, but expectations are that the birth rate will remain higher than the elevated death rate for the next half-century, thus ensuring continued rapid population growth.

**Policy Implications**

The policy implications of current demographic trends are very different for the South and the North. In the already crowded South, the addition of several billion more people will hamper ongoing efforts to reduce poverty and achieve sustainable development. Concern over these adverse consequences provides the principal rationale for past investments in voluntary family planning and reproductive health programs that help couples avoid unwanted childbearing. Expanding this effort could be social investments in young people—for example, in the education of girls—that help offset population growth momentum, in addition to bringing many direct benefits for the quality of individual lives.

In the North, the potential adverse consequences of very low birth rates, rapid aging, and declining populations prompt extensive discussions but little effective action. Among the numerous policy options proposed to encourage childbearing are free or subsidized child care, reduced taxes for families with children, paid parental leaves, and subsidized housing for young couples. Unfortunately, little useful experience exists to draw on in assessing the potential effectiveness of various options. The reluctance of most governments to pursue explicit pronatalist policies is due to a range of factors, including the awkwardness of domestic pronatalism while subsidizing fertility reduction programs in the developing world; a reluctance to interfere in the personal matter of reproductive choice; the large expense entailed in implementing an effective intervention; and the benefits for the global environment of fewer rich consumers of natural resources. Nevertheless, the urgent need to address these adverse demographic trends is likely to lead to more vigorous action in the near future.

**Pornography**

Pornography or sexual materials are seemingly a part of human culture. From antiquity to the present, many societies have employed forms of sexual materials in writing, images, song, or dance for entertainment and/or sexual enjoyment. Not all cultures approve of such material, nor is there societal consensus regarding them. Over the past several decades, the debate in the United States about pornography has become increasingly salient, with a rise in political attention, in part as a result of increased consumption of pornography due to technological advances in the availability of sexual materials and in part from societal reactions to this greater availability. In response, pornography is the subject of research from a variety of disciplinary perspectives and has become a hotbed of contention both within feminist discourse and outside the academy.

**Problem of Definition**

Discussions about pornography often begin with questioning how to define it. Pornography is difficult to define, as the constructions are politically loaded regarding censorship and given the various ideological positions on pornography. Extensive research exists on the relationships between pornography and society, with followers of each position able to cite findings to bolster their position. Sociodemographic factors also affect individuals’ beliefs concerning pornography. Another factor affecting the debate is that pornography is a lucrative financial industry that generates billions of dollars in revenue despite its disreputable social standing.

Various attempts at regulation have attempted to address problems of definition regarding pornography, obscenity, erotica, and art. Some differentiate between hard-core and soft-core pornography, gay and lesbian pornography, and fetish pornography. All definitions, imbued with subjectivity, have social, political, and moral ramifications. Further, the meanings and understandings of pornography have changed over time, influenced by legalistic and scholarly interpretations or changing societal values. Consensus about a definition thus remains elusive and controversial.

Legislation in the United States has played an integral role in societal conceptualizations of sexual materials. The first federal law regarding pornography was the Comstock Act of 1873. The Comstock Act prohibited transport by mail of any material related to sexuality and contraception. The 1957 *Roth v. U.S.* Supreme Court decision narrowed the interpretation by defining as obscene only material that was utterly without redeeming social value. In 1970, the President’s Commission on Obscenity and Pornography recommended repealing all laws prohibiting the distribution of sexually explicit materials to consenting adults, as it did not find a causal link between viewing pornography and violence. The commission suggested that pornography could even be beneficial in some circumstances, in allowing for a release of sexual tension. The commission also advocated sex education programs in schools to counterbalance incorrect sexual information gleaned from pornography.

Some differentiate between pornography and materials defined as obscene. In 1973, a pivotal court case, *Miller v. California*, changed the criteria to assess whether a work, be it literary or video, was obscene. One resulting criterion, the S.L.A.P.S. test, evaluates whether a work lacks serious literary, artistic, political, or scientific value. Other criteria include whether the average person, applying contemporary community standards, would find that the given work appeals to prurient (lewd) interests. Finally, if the work depicts in a patently offensive way, sexual conduct specifically defined by applicable state laws, it can be judged obscene. These criteria for evaluating work, resulting from *Miller v. California*, made banning pornography easier.

During the 1980s and early 1990s, federal prosecutions of obscenity cases and condemnation of sexual imagery increased considerably. For example, a large
group of congressmen denounced the homoerotic imagery in the photography of Robert Mapplethorpe in a publicly funded exhibition as pornographic despite Mapplethorpe’s well-respected status in the art world. Fueling the growing intolerance of sexual imagery was the 1986 Report of the Meese Pornography Commission that identified four types of sexual imagery: violent pornography, degrading (nonviolent) pornography, nonviolent and nondegrading sexual imagery, and simple nudity.

The Final Report of the commission claimed that most Americans opposed pornography, but there was a lack of enforcement of obscenity laws; some types of pornography were harmful; and organized crime controlled the pornography industry. The Meese Commission encouraged further legislation using obscenity laws as defined by Miller and recommended that legislators consider restitution for victims of pornography. Many pornography researchers criticized the commission for its anti-pornography ideology and agenda. In addition, numerous scholars condemned the commission’s research as biased and methodologically flawed. Despite the criticism, the Commission’s report is still the benchmark often used when referring to federal guidelines on pornography.

In addition to judicial and legislative decisions, contemporary intellectuals and scholars have influenced definitions of pornography. One definition commonly used is sexual materials intended to cause sexual excitement. This definition, however, assumes a consensus in human response to sexual materials and simplifies the many intentions that a work could have, be it artistic, literary, or political commentary. Some scholars describe pornography as any materials that are degrading and/or dehumanizing to women. These definitions often look at the portrayal of women in sexual materials in relation to men’s behaviors. This type of definition emphasizes gender inequality in society and oppresses women through sexuality. Defining sexual materials in this manner links pornography with various social consequences, especially to the detriment of women.

Other scholars define pornography as explicit depictions of men and women as sexual beings. This definition does not visualize pornography as inherently harmful to women and focuses on the consensual nature of the depicted sexuality. From this viewpoint, pornography is a venue for sexual exploration and even liberation for men and women.

Pornography may be juxtaposed against erotica, which is often seen as less vulgar or explicit and depicting loving and affectionate human sexual interaction. In addition, many recognize the blurred lines among pornography, erotica, and art. Some scholars suggest that finding distinctions among pornography, erotica, and art, however, may be subjective and indicative of social class bias.

**Ideological Positions on Pornography**

Scholars identify four ideological positions on pornography: religious conservatism, civil libertarianism, anti-censorship feminism, and anti-pornography feminism. Each position has various beliefs about pornography and its regulation that stem from social, moral, and political ideologies.

Religious conservatism focuses on the moral aspects of pornography, mainly that it is sinful and leads to further immoral behavior by inciting lust. Religious conservatism concerns itself with the harm to the family, children’s moral development, and the sanctity of marital, heterosexual sex. This ideology may include beliefs that pornography leads to rape and sexual abuse. Here the concept of pornography is that it is addictive, leading individuals to need more and more to satisfy their cravings. Proponents of this ideology support censorship and define a wide array of materials as pornographic.

Civil libertarianism, in contrast, strongly opposes censorship of any sort. Libertarians emphasize individual rights and strive for limiting state regulation and involvement in citizens’ freedoms. This view does not see pornography as harmful or as a domain appropriate for state involvement. While some libertarians acknowledge that they might personally find pornography offensive or distasteful, the principles of freedom supersede distinctions of individual taste.

Pornography has been a divisive topic within feminism, resulting in heated debates and alliances among various scholars. Anti-pornography feminism focuses on the harm to women resulting from pornography. The roots of this ideology lie in a radical feminist approach to sexuality that views sexuality, specifically heterosexuality, as a venue for male domination. Men have co-opted female sexuality and reproduction and embodied this practice in pornography. Anti-pornography feminism sees pornography as created...
with a male gaze for male viewers with unrealistic and degrading portrayals of female sexuality and subservience. Pornography is thus another form of patriarchal control of women through sexual exploitation, much like rape and prostitution. Pornography both causes further harm to women and reinforces the gendered status quo. This position has led to a tenuous alliance between anti-pornography feminists and religious conservatives in campaigns against pornography, despite their disparate ideologies.

Anti-censorship feminism, however, does not see pornography as inherently dehumanizing for women. Sexuality, according to anti-censorship feminism, can be a means of sexual repression of women’s desires, but sexuality can also be a means of empowerment for women. This ideology, which shares similarities with sex-positive feminism, focuses on consensual exchange in sexual interactions. Thus, while acknowledging gender inequality, this position conceptualizes pornography as a means of sexual liberation for women. Anti-censorship feminists fear that censoring pornography could suppress feminism, homosexuality, and other non-normative aspects of sexuality.

**Social Factors Affecting Beliefs**

Despite high rates of pornographic consumption in the United States, no consensus exists regarding beliefs about pornography. Social scientific research has identified a variety of social factors that affect individuals’ beliefs about pornography, including gender, religion, age, political ideology, and race or ethnicity.

Gender is an important predictor of beliefs about pornography, with women having more negative attitudes toward sexual materials. Many studies find that women are more likely than men to believe that pornography leads to rape and a breakdown in morals. Some researchers believe that these gender differences may be a result of pornography’s creation for a male audience. Others contend that this discrepancy lies in the different socialization of the sexes regarding sexuality.

Religious traits are quite influential in attitudes toward pornography. Conservative Protestants are the most common religious group that espouses the harm of pornography. The Religious Right has been vocal and influential in its condemnation of pornography. The cognitive structure underlying this opposition rests in their belief in the inerrancy of the Bible as well as belief in social contagion of immorality. Even more important than religious affiliation is strength of religiosity. Persons who report strong religiosity, often assessed through attendance at church services, are more likely to view pornography as harmful.

Politically conservative individuals tend to oppose pornography for reasons similar to religious conservatives. Those with conservative beliefs are concerned about the effects of pornography on the family and morality. This political ideology supports censorship of pornography and does not see pornography as a civil liberties issue.

Age is also a significant correlate concerning beliefs about pornography. Older individuals are more likely to believe that pornography has negative effects. Education also affects views toward pornography: the higher one’s educational achievement, the greater one’s tolerance of pornography.

The evidence on the relationship between race and beliefs about sexual materials is equivocal. Some suggest that African Americans are more accepting of erotic materials than whites, while others report that African Americans are just as likely as whites to believe pornography leads to a breakdown in morals and an increase in rapes.

As a whole, females, whites, persons who attend church frequently, politically conservative individuals, and people with no exposure to pornography are more likely to support censorship. During the past several decades, U.S. public sentiment has grown increasingly intolerant of pornography, reflected in the growing beliefs that pornography has a variety of negative effects and should be censored.

**Relationship Between Pornography and Society**

Many critics of pornography express particular concern with the violence depicted in sexual imagery. Numerous reports of abused women reveal that their partners used violent pornography and forced them to enact scenes from films. The majority of research on the effects of pornography, however, relies on experimental methodology that critics question for credibility and accuracy. Scholars point out that the inherent problems with this research include discrepancies in definitions of pornography, extrapolating laboratory research to “real-world” experiences, the use of undergraduates as subjects, linking erotic stimuli with anger
and provocation, and questionable amounts of exposure to pornography in such research. Some suggest that violence, whether sexual or not, leads to desensitization toward violence directed at women and acceptance of rape myths. As a whole, experimental research findings are inconclusive regarding the relationships between sexually explicit materials and subsequent attitudes and behaviors toward women.

Researchers also analyzed rates of pornographic consumption and effects. The 1970 President’s Commission on Obscenity and Pornography reported that as pornography became more widely available in the late 1960s, sex-related crimes decreased. Following the repeal of laws banning pornography in Denmark in the late 1960s, sex offenses decreased. Other research looked at circulation rates of soft-core pornography and the relationship to beliefs about women’s status. Beliefs about gender equality are higher in U.S. states that have higher circulation rates of soft-core pornography. Thus, some surmise that consumption of some types of pornography can coexist with egalitarian beliefs about gender. Research does show a correlation between higher circulation of pornography and rates of rape, but scholars suggest that hypermasculinity and proclivity to violence may be the key variable in the relationship.

The Pornography Industry

Pornography is a booming business, with conservative estimates at $10–$14 billion a year just in the United States. Even many mainstream companies gross millions from pornographic sales. For example, pornographic films in hotel rooms generate nearly $190 million a year for hotels. In fact, more than 10,000 adult films are released every year in the United States, compared to about 400 Hollywood films.

Technological advances have played an integral role in the proliferation of pornography. The introduction of the VCR in the 1970s forever changed the ability to consume pornography privately rather than in an adult theater. Pay-per-view adult films made viewing pornography even more accessible. Finally, the Internet has made pornography readily available. Research estimates that 1 in 4 regular Internet users visits a pornographic Web site at least once a month.

The adult film industry employs many men and women, although careers are often short lived. Women generally earn more than men in the pornography industry. The industry’s biggest growth market in consumers is women and couples. Many women are now directing and owning adult film companies that appeal to a female audience. Although testing for sexually transmitted infections and HIV is mandated as a part of workplace safety laws, cases of transmission do occur, as unprotected sex is still normative for many adult film companies. Despite the growth of the adult film industry, this type of work has not gained societal acceptance and remains highly stigmatized and subject to legal scrutiny.

Critics voice concern that women, especially, are coerced into pornography; this view is supported by accounts from people formerly involved in pornography that corroborate these assertions. In contrast, vocal advocates of the pornography industry cite individual choice, freedom, and autonomy. Numerous actresses from the industry have publicly supported their career choices and denied allegations of abuse and coercion in pornography.

Consumer demand for pornography shows no signs of waning, and the industry is a major source of revenue. Scholarly and legal attention to pornography will continue because of the myriad social, political, moral, and health factors involved in evaluating and regulating pornography.

PORNOGRAPHY, CHILD

Child pornography, which is illegal in the United States, refers to images, literature, or other materials that depict a child (any individual under the age of 18) engaging in sexual activity or that portray the child in a sexually explicit manner. Child pornography may involve either the creation of materials depicting minors engaged in sexual activities or the production and distribution of materials harmful to minors. Many individuals, groups, and agencies—inside and outside the criminal justice system—make both proactive and reactive attempts to reduce and/or eliminate this crime. As with many crimes, child pornography has existed for centuries, and until relatively recently, it was not a major societal concern. Today, most attempts to reduce child pornography focus on those children as victims of sexual abuse.

Cases involving the production and distribution of child pornography are increasing, as are specialized law enforcement units focused on combating these crimes. With the introduction of technology and the Internet, the cases of child pornography have multiplied, because it is no longer unusual or difficult to access different forms of child pornography. Officials have documented that some sex offenders use the privacy of the Internet to identify vulnerable children who are utilizing the Internet unsupervised and are therefore easier prey. Also, despite U.S. federal and state laws prohibiting the transmission of child pornography over the Internet, the locations of many of these sites are in other countries, thereby complicating the lines of authority, enforcement, and police jurisdiction. Finally, records show that many of the perpetrators of child pornography are relatives of the child victim. Child pornography is thus a phenomenon involving different dynamics and variables that are unique to criminal activity.

Specifically unique to child pornography is that, in most instances, physical contact between the children and the pornography viewer never occurs. Nevertheless, the children initially victimized during the production of the pornography become repeatedly victimized as the pornography is distributed to the thousands of viewers in the market for child pornography.

At one time, when someone described people who distributed child pornography, the characteristics were of middle-aged, uneducated, white males. Today, law enforcement is discovering ever-increasing numbers of teens and individuals in their 20s involved in producing and distributing child pornography. With men and women of all ages involved in the production and distribution of child pornography, no simple demographic description or profile of a perpetrator of child pornography is valid.

Finally, another type of child abuse often involving child pornography is the use of child sex rings. The term sex ring refers to any situation in which one or more offenders are simultaneously involved in the sexual abuse of several children. Operation of a sex ring thus brings a different set of organizational characteristics to child sexual abuse. A sex ring is a business—the business of child prostitution. Just as an adult may pay to have consensual sex with an adult partner, adults pay or trade children to satisfy their desire to have sex with a child. Often, adults interested in participating in a child sex ring identify desired child victims through pornographic pictures of them. In fact, there are often lines of communications among the offenders in regard to the desired demographic characteristics of the child and the sex ring leader’s ability to locate the sought-after child.

Several U.S. laws address the issue of pornography and computer technology. The 1977 Sexual Exploitation of Children Act prohibited the transportation of child pornography by mail or computer. In 1984, the Child Protection Act defined anyone younger than 18 as a child. In 1988, the Child Protection Enforcement Act made it unlawful to use a computer to transport child pornography, and, in 1996, the Child Pornography Act amended the definition of a child to include computer-generated children. However, in 2002, the Supreme Court ruled that computer-generated children were not children.

Today, the U.S. government and the criminal justice system attempt to reduce the production and distribution of child pornography through action programs and funding efforts. Specifically, the Internet Crimes Against Children (ICAC) organization sponsors a program to provide citizens with an avenue for reporting the use of the Internet by child molesters to solicit children, and local law enforcement agencies, such as the Bedford County Sheriff’s Office in Virginia, have established specific units (Bedford County’s is called Blue Thunder) within their agency to focus exclusively on the detection of cases and apprehension of perpetrators involved in child pornography. In addition, law enforcement not only proactively promotes hot lines that individuals can call to report suspected cases of child pornography, but
it also welcomes opportunities to talk to children and the general public on the warning signs for child abuse through pornography.

This growing social problem remains a concern locally, nationally, and internationally. However, through cooperative efforts by law enforcement, social services, the media, and the public, the United States is beginning to address the problem in the hopes of reducing the prevalence of this crime.

Pornography and the Internet

With the invention and extensive dispersion of the Internet since the 1990s, pornography distributed via the World Wide Web has become a widespread social phenomenon. Some of its popularity stems from the fact that the Internet, like VHS tapes and DVDs, allows people to view pornography in the privacy of their homes. The problem often connected to the anonymity and easier availability of online pornography is that people (for example, children) may retrieve and view virtually any material in cyberspace—even if their access might otherwise be socially or legally restricted. Also, the Internet expanded the distribution of illegal pornographic material, like child pornography or material with sexually violent content.

The Internet, a complex international network of interconnected computers with an ever-growing population of users, offers an almost infinite selection of sexually explicit material in the form of photos, text and audio files, video clips, as well as streaming media, like live Webcam access offering interactive sexual encounters. Pornographic content is mostly distributed via free and commercial Web sites as well as peer-to-peer file sharing or Usenet newsgroups. The latter, a form of discussion groups prevalent mainly in the early days of online pornography, exists in the form of free services of uploaded pictures and short videos. A large number of pornographic Web sites are in fact free and function to attract users to viewing commercial Web sites by offering a sampling of their more explicit content in the form of thumbnail images or galleries.

Along with the rise of the Internet is growing general concern over the sheer volume of pornographic material available online as well as its legal status concerning both distribution and content—particularly the number of Internet users under the age of 18. (The average age of first Internet exposure to pornography is now 11.) The anxiety over minors’ exposure to obscene material results from the easy availability of sexually explicit Web sites and the incredible growth of the Internet pornography industry in general. More than 4.2 million pornographic Web sites now exist, about 12 percent of all total Web sites online. Their popularity is undeniable: U.S. pornography revenue (more than $6 billion) exceeds the revenues of ABC, CBS, and NBC combined, and pornography revenue is also larger than all combined revenues of all professional baseball, basketball, and football franchises.

Legal regulation of the distribution and accessibility of online pornographic material is difficult. The Internet is a truly international phenomenon, and presently no international laws regulate the circulation, purchase, or possession of Internet porn. Each country has its own individual legal frameworks, but foreign Web sites are unaffected by national regulatory or law enforcement efforts that limit the distribution of online material.

Nonetheless, numerous attempts continue to prohibit the distribution of certain types of pornography (e.g., featuring violence, bestiality, or child pornography), to prevent minors from accessing pornographic
content, and to ensure that actors in pornographic media are of legal age. In the United States, several legal efforts to regulate primarily commercial sources of pornographic content often met with heated debates revolving around the issues of censorship and the First Amendment. The Communication Decency Act (CDA) of 1996, for example, covered a wide variety of activities, including the distribution of pornography on the Internet. Challenged in federal court by civil rights groups such as the American Civil Liberties Union (ACLU), the portion of the CDA relating to indecent speech was found unconstitutional due to its infringement on the speech rights of adults on the Internet. A second attempt, the Child Online Protection Act (COPA) of 1998, which demanded all commercial Web publishers offering “material harmful to minors” to restrict their sites from access by minors, was struck down by the Supreme Court in 2004 as unconstitutional. A year earlier, however, the U.S. Supreme Court upheld the constitutionality of a 2000 law, the Children’s Internet Protection Act (CIPA), challenged as unconstitutional by the ACLU and the American Library Association (ALA). CIPA mandates that schools and libraries receiving federal funds for Internet connections must block or filter access to visual depictions that show obscenity, child pornography, or other material “harmful to minors.”

Technology-based tools, such as software filters that limit access to certain Web sites, constitute another attempt to control the distribution of sexually explicit material online. Many Web sites provide a warning of their pornographic content upon entry, requiring users to affirm that they are at least 18 and wishing to view sexually explicit material. Commercial Web sites often restrict access by using an online Adult Verification System, which seeks to differentiate between adults and minors by requesting a valid credit card number to buy a “membership” to the site.

POSTINDUSTRIALISM

Technological advances in the 19th and 20th centuries gave rise to industrialism and improved the overall quality of life in the United States and most of Europe. With the general rise in income came an increasing demand for services to sustain this higher standard of living: improved education, leisure activities, entertainment, health care, and information provision. However, many of these new services, unlike a majority of manual tasks in agriculture or industry, could not be mechanized. Because these tasks were more complicated to reproduce and often required more education, service industry workers became much sought after, more of a commodity than industrial or agrarian laborers and more expensive to employ. This shift from industrial, manual labor to a service-focused industry centered on the distribution and production of information is often referred to as “postindustrialization.”

The Rise of the Postindustrialist Society

Sociologist Daniel Bell was one of the first to develop the idea of the postindustrial society. In his book, The Coming of Post-Industrial Society (1973), Bell suggested that the postindustrial society—the information society—is not merely characterized by a shift from goods- to knowledge-based industry, but particularly by the nature of this knowledge. The transformation of an industrial to a postindustrial or information society is accompanied by, if not caused by, an increasing dominance of scientific rationality in the political, economic, and social spheres. In industrial societies, most people are involved with the production of material, tangible goods. The postindustrial society, on the other hand, is led forward by information,
knowledge, and services. It is also dominated by science-based industries. Subsequently, the “old” industrial elites gradually yield to “new” technical elites whose human capital—their technological and scientific knowledge—places them at the top of the restructured social and economic hierarchy. While industrialization systematically kept certain segments of society in marginal positions to maximize profits, the postindustrial society emphasizes educational achievement for transcending social boundaries and leveling the social playing field. Supposedly, the new nature of capital would thus give everyone equal opportunities to benefit financially from the opportunities information and technology development provide.

Some scholars, convinced of the egalitarian powers of the postindustrial society, view the social, cultural, political, and economic effects of postindustrialism within utopian or dystopian perspectives. They suggest that the emphasis on merit, information, and technological development will eventually level the social and economic playing fields. Furthermore, they argue that the postindustrial society’s reliance on human rather than nonrenewable natural capital places less pressure on the world’s natural resources and is, therefore, much more environment-friendly than its predecessor.

Others believe that the leveling powers of the information society are exaggerated, even elevated to mythical levels. They think the intellectual (educational) demands necessary to be competitive in the information society—paired with a decreasing demand for manual industrial labor—put historically marginalized groups at an unbridgeable social disadvantage. Given the inherently capitalist nature of society, postindustrialism may improve the overall standard of living for the working and middle classes, they maintain, but for those at the top end of society, this will occur at a much greater rate. The gap between the lower and upper classes will thus actually increase. Furthermore, critics note that instead of relieving some of the damaging effects of industrialization on the environment and its resources, postindustrialism places different yet additional pressures on it.

Most Western societies are currently in or working toward postindustrialization, leading to a gradual realization that such utopian views of the postindustrial society are erroneous or, at least, too optimistic. Studies show that, often, historical economic and cultural privileges give industrial elites and those who benefit from industrialization the necessary human capital to take the lead in the developing information and service industries. Many of those who benefited the least from industrialization continue to face institutional roadblocks that hinder the necessary intellectual and technological development necessary to compete successfully in the new information society. It would appear that utopian views of postindustrialism falsely assumed that the information-based capitalist system is inherently different from, or not as competitive as, industrial capitalism.

The speed with which advances in information technology are taking place suggest that only those with the necessary intellectual and financial resources are able to keep or catch up with those already involved in the industry. Furthermore, inequality in educational resources available for students in the West, particularly in the United States, indicates that, as long as social class influences educational opportunity, the democratizing forces of the information society are limited. On a global scale, the growing (economic) dominance of information technology, and thus of educational achievement, means that the divide between rich and poor countries may widen further in years to come, making it increasingly difficult for industrial societies to catch up with those in postindustrialization or already postindustrial.

Finally, while some scholars maintain that service industries place less pressure on natural resources and are much more environment-friendly than their predecessors, the increasing standards of living in postindustrial societies have also led to an increase in waste that food and restaurant businesses produce or else do little to decrease their reliance on oil. In fact, increasing standards of living also increase demand for material goods, continuing to strain natural resources all over the world. In theory, the democratizing forces of the postindustrial, information society seem promising, though in practice, it would appear that postindustrialization in most societies has yet to effectively diminish socioeconomic inequality.

**Postmodernism**

*Postmodernism* is a complex term, and it is important to define its boundaries as it concerns social problems. Generally speaking, analysts examine the postmodern world with a focus on four areas: the self-concept; moral and ethical discourse; art and culture; and globalization. In the context of social problems, the conceptual development of postmodernism and globalization has been influenced by the ideas of such leading exponents as David Harvey, Jean-François Lyotard, and Michel Foucault.

Harvey describes modernity as the period after the end of the Enlightenment that began at the start of the industrial revolution and went well into the 20th century. The Enlightenment promoted thinking in a more rational, uniform way in order to achieve rational but conditional progress. Postmodernists, however, question the validity of such a single truth or uniformity. Society, to them, is more complex than belief in a rational, singular truth, and social problems have more causes than any formalized list. In the age of greater globalization, social problems have become international, with a greater comparative focus on issues such as education and poverty. The new postmodern conditions thus lead to a questioning of modern ideology.

Postmodern theory focuses on a critical, almost skeptical, view of society. Lyotard argued that grand narratives such as Marxism were in decline. Grand narratives are stories that contain knowledge or a discourse that supports a universal truth. A grand narrative is a story big enough to encompass social problems and provide potential social solutions. Lyotard highlighted the Marxist concept of class—in particular the division of society into the proletariat and bourgeoisie—and the argument that the working class would overthrow the middle class through class conflict and consequent social revolution. Marxism implied that history is progressive and knowledge is liberating. However, Lyotard questioned the notion of the emancipation of humanity and that knowledge produced by science is truth and therefore eternal. Lyotard argued that these arguments had lost respectability since the end of the Second World War. The Marxist argument that the proletariat would overthrow the bourgeoisie after a political and consequent social revolution did occur in some cases, but not universally. Lyotard suggested that people still believed in grand narratives, but as time progressed, society changed and the grand narratives fragmented. Indeed, grand narratives are visible in both nationalist and religious conflicts. Lyotard thus questioned the validity of grand narratives in a postmodern world that has witnessed enormous changes.

The construction of both modern and postmodern knowledge and its usage relates to social issues and problems. Foucault’s work examined the complex histories of social knowledge as codified within institutions. He argued that institutions (e.g., the penal system) could never be neutral. Foucault wanted a focus on how institutions were linked to operations of power in society. He argued that the self was intertwined with social structures. Power was visible through the knowledge of control (i.e., surveillance, rules, and regulations). Discourse, for Foucault, involves the institution (e.g., the prison service) putting language to use (e.g., the state formulating a prison policy), and a discipline (e.g., the law governing criminals). Foucault was interested in how knowledge evolved before, during, and after modernity. The control of knowledge has become a continuing political issue with its own discourse. In a postmodern context, times changed but the institutions remain, with little more than incremental changes. Discourses remain systems of exclusion (i.e., for criminals in jail), but the social categories that have been created (e.g., the criminal) remain. Foucault suggests that we question current discourses and examine forms of power and knowledge that are around us in society.
Globalization is nothing new and was certainly visible in the premodern and modern worlds within trade, commerce, and imperial conquest. However, creation of the World Wide Web enables us to see the nature of globalization through a postmodern lens. The social construction of knowledge has changed dramatically with the creation of new social spaces where knowledge can be disseminated, discussed, and critiqued. There are many truths, and the World Wide Web has witnessed the debate concerning what information and knowledge should and should not be controlled in a postindustrial age. China is an interesting example of a national state that has attempted to control knowledge dissemination on the World Wide Web.

Another example of the distribution of global knowledge concerns the pictures of the execution of Saddam Hussein in January 2007. Was it morally correct to telecast these images and the audio exchange between Hussein and his executioners? These images were posted on the World Wide Web, so the decision, be it a regulated or unregulated one, occurred without any political or ethical debate. Does the Internet give us the right to be a postmodern humanist; that is, having the moral and ethical right to make up our own minds on all social issues and problems? The World Wide Web, whether it is morally correct or incorrect, has widened social contexts because more individuals and groups can use this means of communication to express differing viewpoints. However, does this create more social problems than it solves? Postmodernist theories provide a critical theoretical framework that attempts to answer some of these questions.

**Post-Traumatic Stress Disorder**

Post-traumatic stress disorder (PTSD) is a psychiatric disorder that may develop after experiencing or witnessing a traumatic, violent, or life-threatening event. Traumatic events may be natural or human caused. Natural events may include earthquakes, hurricanes, or medical illnesses; human-caused events may include military combat, child sexual or physical abuse, rape, torture, domestic battering, or physical assault. Some of these traumatic events may occur at one point in time or may be ongoing, with repeated exposure to the trauma. PTSD often goes undiagnosed for a variety of reasons, particularly if the traumatic events are not readily apparent or occurred in the past. If untreated, PTSD may lead to other social issues such as alcohol and drug abuse, suicidality, and violence directed at loved ones or others, which in turn may affect an individual’s family situation, diminish job or school performance, and increase social isolation.

PTSD is a debilitating condition that can affect anyone at any age and has significant consequences for well-being and functioning. Data from the National Comorbidity Survey show an estimated lifetime prevalence of PTSD of 7.8 percent for adults between the ages of 15 and 54. Women are more than twice as likely as men (10.4 percent compared to 5 percent) to develop PTSD at some point in their lives. Prevalence rates of PTSD among children and adolescents range from 3 to 14 percent in community samples. Among children who have experienced specific stressors, however, the prevalence rates are much higher. For example, 35 percent of children diagnosed with cancer and 58 percent of children who experienced both physical and sexual abuse meet the criteria for PTSD.

Veterans are also at high risk for PTSD. For example, studies of combat veterans from the Vietnam War estimate a lifetime prevalence of PTSD of 19 percent. Veterans returning from Iraq and Afghanistan since 2002 have sought mental health treatment at higher rates than those returning from other deployments, such as Bosnia. More than 3 months after returning from Iraq, 17 percent of veterans reported mental health problems and 12 percent met the criteria for PTSD. Given the number of troops deployed to Iraq and Afghanistan in recent years, the number of veterans with PTSD will likely increase significantly.

According to the American Psychiatric Association’s Diagnostic and Statistical Manual of Mental Disorders,
PTSD symptoms are evident in three clusters: reexperiencing, avoidance, and increased arousal. Reexperiencing symptoms may appear as intrusive and persistent flashback memories, nightmares, or frightening recurring thoughts, particularly when exposed to triggering events or objects associated with the trauma. Avoidance symptoms include emotional numbness and persistent efforts to avoid stimuli associated with the trauma. Increased arousal symptoms include sleep disturbance, irritability, difficulty concentrating, hypervigilance, and exaggerated startle response that did not exist before the trauma. It is important to note that children and adolescents may have different responses to trauma depending on their developmental stage, and their symptoms may change over time.

Although PTSD symptoms often begin within 3 months of the trauma, some individuals experience delayed onset, where symptoms appear months or even years after the trauma and may reoccur. With delayed onset, the symptoms develop more than 6 months after the traumatic experience, and the prognosis is often worse. The development of PTSD depends on the severity and duration of exposure to the trauma and a complex array of risk and protective factors that may affect the individual’s response to the trauma.

Complete recovery occurs within 3 months for about half of those diagnosed with PTSD; however, many individuals have symptoms lasting longer than 12 months after the trauma. Co-occurring disorders such as major depressive disorder and alcohol or other substance abuse often accompany PTSD. Patients sometimes visit their primary care physician with symptoms such as headaches, gastrointestinal problems, immune system problems, chest pain, or dizziness. In these instances, the underlying cause of the physical symptoms may be PTSD but may not be discovered without a thorough exploration of the patient’s psychosocial history. Once properly identified, PTSD is usually treated with cognitive-behavioral therapy to help individuals change their thoughts and actions and learn new coping skills to manage the symptoms that may be affecting their quality of life. Depending on the duration and severity of the symptoms, some combination of individual psychotherapy to address the symptoms, peer support groups, and medication is effective in treating PTSD.

Studies show that after the traumatic event, a crucial early intervention is education for the survivor and family about PTSD and the possible effects that trauma reactions may have on them. This allows for recognition that PTSD is a medical disorder that occurs under extreme traumatic stress and opens the pathway for effective treatment. Early diagnosis, assessment, and treatment are essential to diminishing the effects of trauma. Research has shown that crisis intervention immediately after a traumatic event may reduce some symptoms and possibly prevent the development of the disorder. After the September 11, 2001, attacks on the World Trade Center, the New York State Office of Mental Health provided free crisis counseling services to people in New York City and the surrounding counties, including those not typically served by public mental health services. This flexibility on the part of the state mental health agency allowed many more individuals to receive help than would normally have been possible. Although prediction of such traumatic events is not possible, preparation by local, state, and federal governmental agencies to quickly respond can be effective to mitigate the effects of trauma.

Poverty

Poverty is one of the world’s most costly and serious social problems. It represents the vast unused and underused potential of millions of people; it costs societies in lost revenues, in lost productivity, in ill health, social dysfunction, and environmental degradation...
and in vast sums that must be spent either to alleviate poverty's worst symptoms through social welfare programs or to police or control its unruly victims.

Social scientists generally define poverty in two ways. Absolute poverty is the condition in which people are unable to achieve the basic necessities of life, such as food, clothing, and shelter. Relative poverty refers to some socially constructed norm of well-being in comparison to some proportion of a society thought to be lacking. The “poor” in the rich industrialized countries are not, for the most part, materially deprived in the absolute sense. With the help of government transfer programs, such as income support and food and housing subsidies, they may have an apartment to live in, enough food to eat, clothing, and even some amenities like television and cars. Yet in relation to the rest of the society, they are “poor.” Their housing is substandard, their neighborhoods are run down and high in crime, their stores lack the variety and quality of more affluent sectors, their clothing is limited to cheap clothing chains or thrift store hand-me-downs, and their potential is limited by poor schooling and health care.

A new definition of poverty as “social exclusion” has begun to take root among European social scientists and UN researchers. This concept implies that along with material deprivation comes exclusion from some or all of the avenues that ensure the development of one’s full human potential as well as one’s ability to participate in economic, social, and political life—conditions that the economist Amartya Sen calls “substantive freedoms.” The struggle to survive leaves poor people with no time to participate in the life of their communities or to exercise their citizenship rights. Social exclusion, then, connotes both lack of choice and lack of power.

Poverty as both absolute and relative deprivation has been part of the human condition for thousands of years, but it was only during the 20th century that poverty came to be recognized as a social problem for which there could be public remedies. Traditional societies met people’s needs through a combination of the individual’s own labor and the obligation of the kinship group to care for its own. In such societies, the poor were those who remained outside this sphere of care, set adrift through war, famine, or the loss of family. Others were at the bottom of culturally sanctioned strata systems, such as the Indian caste system or various kinds of slavery. In the feudal era, the lord of the manor was obliged to care for his serfs so that, although relative poverty existed, there was little poverty in the absolute sense.

The Emergence of Poverty Legislation

The destruction of the monasteries that had provided care for the poor and the emergence of capitalism in the West began to disrupt this age-old pattern. The enclosure of the commons in England and the mass evictions of peasants displaced large numbers of people from the lands that had sustained them. Some, unable to find work in the emerging industries of the industrial revolution, became beggars and vagabonds or turned to crime. The individualistic ethos that accompanied capitalism—derived from the Protestant ethic’s equation of prosperity with righteousness and “idleness” with sinfulness—ushered in a new attitude toward the poor. Most—especially able-bodied men who could not find work—were considered responsible for their poverty, leading to a new form of punitive legislation. Under the first such legislation, enacted in England in 1530, beggars old and unable to work received a beggar’s license, while poor able-bodied men were whipped and imprisoned.

The Elizabethan Poor Law of 1601 established public responsibility for the relief of the poor—an admission that economic and social conditions and not just personal culpability lay behind poverty. But the recognition was only partial. This and subsequent “Poor Laws” still made a distinction between the “deserving poor”—those whose poverty was not of their own making, such as widows, the old, the blind, the infirm, and orphaned children—and everyone else, the “undeserving poor.” These were sent to “poor houses,” little more than prisons with forced hard physical labor. If they refused, they were even more severely punished, sometimes even executed. The British Poor Law Reform Act of 1834 stipulated that the poor were never to be paid more than the lowest prevailing wage in the surrounding society, thus acting as a disincentive to choose public charity over work.

The attitude that the poor are responsible for their own poverty was carried to the United States and continues to shape U.S. attitudes and policies, despite the fact that the government now spends vast sums on social welfare programs. Poverty in the United States, however, was different from that in England, in that both indentured servants and Africans held in slavery were ineligible for poor relief. Slavery created a
castelike system based on skin color that, despite its abolition, continues into the 21st century to affect the chances for upward mobility of large numbers of African Americans.

Emergence of the Welfare State

During the latter part of the 19th century, labor organizers and social reformers called attention to the appalling conditions suffered by the poor in the age of laissez-faire capitalism. The growth of a social welfare establishment composed of charity organizations, settlement houses, and a social science research industry resulted. Fearing social unrest, German Chancellor Otto von Bismarck reacted by erecting the first welfare state in the 1880s, establishing obligatory health, accident, old age, and disability insurance programs, whose principles continue to guide the development of social policy in the industrialized world. The experience of the Great Depression spurred other countries, including the United States, to erect welfare systems that provided basic safety nets beneath their most vulnerable citizens and cushioned their economies against further depressions. The United States, however, is the least developed welfare state among all of the major industrialized countries.

Measuring Poverty

The way society measures poverty has both political and ethical implications. The poverty rate is a significant indicator of how well or how poorly a country’s economy is doing relative to its own goals and in comparison with others. Second, it is an indicator of how much priority governments place on mitigating inequality and relieving human suffering through welfare state provision. The collection of statistics on poverty, income, and wealth was necessitated by the international community’s recognition, following World War II, that poverty was a human rights issue, and by the need for cross-national comparisons accompanying the growth of globalization in the late 20th century.

Not until the mid-1960s, however, did the U.S. government create a poverty index by which to measure who should benefit from government programs targeted to the poor. Public concern about poverty grew as a result of the civil rights movement, urban rebellions, and Michael Harrington’s book, *The Other America*, which called attention to the persistence of poverty in the midst of economic growth. A government statistician, Molly Orshanksy, established the poverty line. She determined that in the mid-1960s the average family of four spent one third of its total living expenses on food. To arrive at the poverty line, she then multiplied by 3 the cost of the least expensive (and least nutritious) food basket established by the Department of Agriculture. The U.S. Census Bureau has used this formula—adjusted for family size, age, and inflation—to define poverty ever since. The poverty line serves as a rough gauge in determining who is eligible for a variety of income-targeted programs administered by the states.

Critics of the U.S. poverty index point to numerous flaws in its formulation. For one thing, the ratio of expenditures on food compared with other consumption items has changed over time. For example, families now spend more of their income on housing than on food, and more women are in the workforce, requiring greater expenditures for child care. Second, the formula does not recognize changes in regional living standards. Third, it does not take into account changes in household configuration—for example, the growth of single-parent and nonfamily households—and finally differences in out-of-pocket health care costs borne by different population segments.

For these reasons, the National Academy of Sciences proposed a change in determining the poverty index. Other researchers developed what they call the “Self-Sufficiency Index,” which they argue is a more accurate demonstration of need. This index reflects the differences in standards of living in different regions, by calculating how much it costs average families of various sizes and configurations to live at a minimum standard of living, including ability to purchase the basic necessities, but little else. Despite this, the original formula remains the standard, probably because budget allocations for poverty programs would rise if the poverty rate were adjusted upward.

For cross-national comparisons among developed countries, poverty is usually calculated as some proportion—usually 50 percent—of median disposable household income for households of the same size. This measurement recognizes actual incomes and accounts for changes in the standard of living, unlike the absolute measure used in the United States. However, the World Bank and the UN Millennium Development fund define poverty in Africa and Latin America in absolute terms—as those living on less than $1 and $2 per person per day and in Eastern and Central Europe as $2 and $3 per day.
Who Is Poor?

Poverty is unevenly divided across the world. The highest rates of absolute poverty are in Asia, Latin America, and Africa, while the lowest rates are in Western Europe, Canada, Australia, and New Zealand. The United Nations estimates that 2.7 billion people live on less than $2 a day and 800 million go to bed hungry every day, the greatest proportion living in sub-Saharan Africa. Despite its highest per capita income in the world, the United States has the highest rates of overall poverty and the highest rates of child poverty among the industrialized nations and is second only to Italy and Ireland in having the highest rates of poverty among one- and two-parent families and the elderly. This ranking results from most other industrialized countries having more extensive welfare programs that mitigate the unevenness of market incomes.

Poverty’s burden is also unevenly shared in the United States. White, non-Hispanics have the lowest rate of poverty, followed by Asian Americans, Hispanic Americans, and African Americans, whose poverty rate is generally 3 times that of whites. Females—especially those heading families—are more likely to live in poverty than males. One out of every 6 children in the United States faces the likelihood of growing up poor, and 1 out of 10 seniors over the age of 65 were poor in 2004. Poverty is highest in the southern states.

Causes of and Remedies for Poverty

The causes of poverty are the subject of fierce debate among social scientists. Beyond obvious causes such as wars, famine, political corruption, and economic collapse, the presence of persistent poverty finds explanation in several theories. Some attribute poverty to macroeconomic structures and policy decisions beyond the influence of individuals. Marxists argue that poverty is endemic to the system of capitalism, because to function it needs a “reserve army of labor” to keep wages low and the working class disciplined. Public welfare programs, in this view, serve as a way to regulate labor by expanding in times of labor turmoil and contracting when it subsides. Poverty elimination, in the Marxist view, can only occur through eliminating capitalism and replacing it with socialism.

World system theorists attribute global unevenness in the incidence of poverty to political and economic decisions made by colonial and neocolonial powers that drained large parts of the world of its resources to benefit the elites and developing middle classes of the colonial powers. Thus, over the centuries the countries of sub-Saharan Africa, Southeast Asia, and Latin America were deliberately robbed of their natural resources and their populations reduced to cheap labor to feed the industrial machines in the metropolitan markets.

In contrast, U.S. neconservatives argue that poverty is either the fault of some character flaw in the poor themselves (laziness, alcoholism, drug addiction, inability to defer gratification, loose morals, etc.), the fault of a “culture of poverty” that passes on such traits from one generation to another, or the fault of an overly generous social welfare system that acts as a disincentive to work. For conservatives and neconservatives, inequality is beneficial because it feeds the competitive spirit needed for economic growth. Their remedy for poverty is “tough love”—cutting social welfare programs to force people into the labor market.

Economic liberals, following the British economist John Maynard Keynes, argue that the normal workings of capitalism produce periodic booms and busts that throw large numbers of people out of work. Government can and should mitigate the ups and downs in the business cycle by using its fiscal policies (taxing and spending) and monetary policy (manipulating the money supply) to even out the business cycle and provide a safety net under the most vulnerable. Keynesian remedies, however, failed during the economic crisis of the 1970s, so liberals turned to other explanations for persistent poverty, attributing it to macroeconomic trends like deindustrialization, outsourcing, the failure of government to provide the supportive services needed to “make work pay” for the unemployed, and gender and racial discrimination. Their answer to poverty is to increase support for human capital (e.g., improved education and training) to “make work pay” while outlawing discrimination and providing affirmative action for those left behind.

With the growth of neoliberal globalization from the 1980s on, still other explanations arose to explain persisting poverty. Some point to the spread of epidemic diseases, such as AIDS, affecting large sectors of the productive-age population in the developing world. Critics of neoliberal globalization (not only civil society groups, but also many developing country governments) point to the decisions of policymakers and their corporate allies in the rich countries of the North to write the rules of global trade and investment so as to benefit the rich nations—especially their elites—at the expense of the poorer nations. They cite
onerous debt repayment schemes, structural adjustment programs, and rich country subsidization of key agricultural commodities as sources of the problem. What is needed, say these critics, is debt forgiveness, a fairer system of world trade and investment, and compensatory programs for less developed countries funded by the rich countries.

Poverty, Children Worldwide

According to the UN Children’s Fund, worldwide, about 1 billion children currently live in poverty. Of these children, 674 million are living in absolute poverty. Further, the International Labor Organization estimates that 218 million children engage in some form of illegal, hazardous, or exploitative child labor. The Joint UN Program on HIV/AIDS estimates that 143 million orphans live in Africa, Latin America, Asia, and the Caribbean, and that every minute a child under age 15 dies of an AIDS-related illness. The World Health Organization estimates that more than 10 million children under age 5 die each year from preventable or treatable diseases, such as diarrhea, malaria, measles, and pneumonia, while more than half of that number die from malnutrition. Clearly, as these statistics demonstrate, millions of children around the world live in poverty and are subject to exclusion, vulnerability, disease, and exploitation.

However, child poverty is not only a phenomenon in the developing world. Child poverty is also rising in the developed world. According to UNICEF, since at least the year 2000, in 17 out of 24 OECD (Organisation for Economic Co-operation and Development) countries, the proportion of children living in poverty has increased. Determining the poverty level in these countries is a combination of three factors: social trends, labor market conditions, and government policies. Unfortunately, commitments to reducing child poverty in OECD countries often do not match resources or social spending.

Poverty and Vulnerability

Poverty is a sustained low standard of living and lack of resources. In real terms, poverty is hunger, lack of shelter, no access to medical care, no access to education, no job, powerlessness, and lack of representation and freedom. Moreover, an intrinsic link exists between poverty and vulnerability. Because children are still developing and are dependent on adults for their survival, they are especially vulnerable to the impact of poverty. Research shows that children are more sensitive to and affected by poverty than adults generally appreciate or understand. Children keenly feel the effects of poverty from the lack of basic goods and services, as well as its associated divisiveness, stigma, and humiliation. Thus, any attempt to address child poverty must tackle the problem holistically, dealing with both physical and psychosocial needs.

Millennium Development Goals

Recognizing the need to eradicate poverty, achieve universal access to education, promote gender equality and empower women, reduce child mortality, improve maternal health, combat diseases, ensure environmental
sustainability, and build a global partnership for development, the international community committed itself to achieving the Millennium Development Goals (MDGs) by the year 2015. These goals serve as a framework for measuring development progress, since their achievement will have a significantly positive impact on the lives of millions of children around the world.

However, current poverty reduction strategies do not reach the poorest and most vulnerable. Most countries are currently off target to achieving the MDGs, especially those goals focused on the most poor. In some countries, the indicators are negative and gains have been reversed. Thus, achieving the MDGs by 2015, especially for children, will require new and innovative global partnerships—partnerships among governments, international organizations, nongovernmental organizations, the private sector, and individuals. In order to achieve the MDGs, many poor countries need financial and technical assistance and look to the rich and donor countries to provide it. In turn, rich and donor countries will need to respond to the needs of poorer countries.

Youth: The Forgotten Children

Although children over age 12 make up about 30 percent of children in the 0–18 age range in developing countries, they receive little attention. Youth are vulnerable to unemployment and idleness: lack access to and retention in school; engage in risky behaviors (early pregnancy, HIV/AIDS, violence, and crime); have few skills or prospects; and have limited participation in society.

In many poor countries, some progress has occurred in providing basic education to children. However, these school systems are ill equipped to face the learning needs of youth. Today, a big challenge for many countries is providing access to secondary education, especially lower secondary school. Notably, almost half of all unemployment is among young people of legal working age, with the unemployment rate for youth 2 to 3 times that of adults.

Given the size and vulnerability of this global group of youth, and the risks they face, targeted attention and programs are necessary to address their needs, such as programs promoting healthy behavior and life skills, as well as programs on livelihoods and employment, including nonformal and vocational education. Social tensions may increase around the world if governments are not able to meet the needs of their youth.

Combating Child Poverty

The World Bank maintains that children can flourish only if equipped with advanced skills beyond literacy. In order to stay healthy, they must face the challenges of new diseases, such as sexually transmitted diseases and obesity. Ensuring that children are well prepared for the future is vital to reducing poverty and increasing economic growth. Missing the opportunity to educate, prepare, and invest in today’s children will be costly to reverse. However, poverty and vulnerability are unlikely to be reduced unless adults and children have access to social services and protections.

In order to combat child poverty, parents and caregivers must have equal access to employment and livelihood opportunities so that they can provide for their children. Children and youth must have access to health care and safe, free, quality, and relevant education. Youth must have access to life skills training and employment opportunities. Governments must ensure that basic services (access to food, clean water, shelter, etc.) and social protections are available to all children, especially those who are poor and vulnerable, and that their rights are protected and respected.

Wordsworth, Daniel, Mark McPeak, and Thomas Feeny. 2005. Understanding Children’s Experience of Poverty:
Power lies at the heart of a political system. According to Max Weber, power is the ability to exercise one’s will over others. To put it another way, whoever can control the behavior of others is exercising power. Power relations can involve large organizations, small groups, or even people in an intimate association. Power plays a critical role in both creating and addressing social problems.

Max Weber’s Conceptualization

German sociologist Max Weber (1864–1920) established the widely accepted conceptualization of power as people realizing their own will in a communal action, even over others’ resistance. Critical to this notion of power is that it emerges from a social relationship. Power does not exist in the abstract but is exercised over others.

Weber did not contend that power is complete; rather he argued that it affected nearly all significant decision making. This qualifier of “nearly all” accounts for the limited influence of altruistic actions. Often these are actions such as relief drives to hurricane victims or creation of a homeless shelter that can obscure to the casual observer the social consequences of how power operates typically in a society.

Because Weber developed his conceptualization of power in the early 1900s, he focused primarily on the nation-state and its sphere of influence. Later scholars argued that power was exercised through a power elite of an interlocking network of government officials, the military, and big business. Scholars today recognize that the trend toward globalization has brought new opportunities, and with them new concentrations of power. Power as the ability to exercise one’s will over others is now exercised on a global as well as a national stage, as countries and multinational corporations vie to control access to resources and manage the distribution of capital worldwide.

Sources of Power

There are three basic sources of power within any political system: force, influence, and authority. Force is the actual or threatened use of coercion to impose one’s will on others. When leaders imprison or even execute political dissidents, they are applying force; so, too, are terrorists when they seize or bomb an embassy or assassinate a political leader. Influence, on the other hand, refers to the exercise of power through a process of persuasion. A citizen may change his or her view of a Supreme Court nominee because of a newspaper editorial, the expert testimony of a law school dean before the Senate Judiciary Committee, or a stirring speech by a political activist at a rally. In each of these cases, such efforts to persuade people are examples of influence.

The term authority refers to institutionalized power that is recognized by the people over whom it is exercised. Political scientists and sociologists commonly use the term in connection with those who hold legitimate power through elected or publicly acknowledged positions. A person’s authority is often limited. Thus, a referee has the authority to decide whether a penalty should be called during a football game but has no authority over the price of tickets to the game.

Social scientists have not limited their consideration of power to purely economic aspects of society. Italian Marxist Antonio Gramsci (1891–1937) argues that power, typically wielded through the nation-state, could determine the behavior and cultural values followed by the people, the masses. He referred to these values and beliefs as a hegemonic culture that becomes viewed by the general public as normal and common sense. Power creates a consensus culture that also serves to maintain the status quo and, therefore, the interests of those in power.

Power in the 21st Century

In the 20th century, large states, particularly Nazi Germany and Soviet Russia, came to be identified with maximizing nation-state power through their totalitarian governments. Yet in the latter 1900s and the 21st century, private corporations were as likely to be the focus of concerns about unbridled power. Motion picture documentaries focused on big box stores (Store Wars and Wal-Mart: The High Cost of Low Price) or fast food restaurants (Super Size Me) and their negative impact on society. This corporate power, rather
than being seen as reducing unemployment, is likely to now be identified with impacting the environment and people’s health in very negative ways.

The nation-state level of power analysis by Weber has also given way to the recognition of globalization, whether it is through multinational corporations and the continuing global influence of major economic powers like the United States. Superpowers and multinational businesses proceed in what they view as their best interests, with minimum interference worldwide. This kind of power challenges attempts to check or even regulate global economic and political powers.

Power also has assumed a new social significance as people feel their privacy invaded through surveillance of their own lives. Therefore, data-gathering agencies, whether they are government based or private, can influence people through the monitoring of their movements, financial dealings, or medical records. While sometimes this exercise of power is based on lofty motives, such as with the USA PATRIOT Act, others see this as an abuse of power.

Power Elite

Power elite refers to societal power under the control of a small number of actors or organizations sharing common interests. Working together, this elite can either create or ameliorate social problems. For many people, the very existence of a power elite would be a social problem.

Who really holds power in the United States? Do “we the people” genuinely run the country, through our elected representatives? Or is it true that behind the scenes, a small elite controls both the government and the economic systems? This is not an easy question to answer, for it is difficult to determine the location of power in a society as complex as the United States. In exploring this critical question, social scientists have developed two basic views of the nation’s power structure: the elitist and the pluralist models.

Elitist Models

The elitist view of power usually derives from the analysis of Karl Marx. For Marx, economics was the basis of society, with other social institutions like the family, law, and religion playing marginal roles directed by the economic elite.

The significance of the elitist perspective is that a relatively small segment of society exercises power. Furthermore, while decision making may be shared, those who exercise power are largely in agreement on major issues. So, for example, one might argue that elitists would be in agreement in efforts to avoid over-taxation but be less concerned about eliminating homelessness.

Karl Marx believed that 19th-century representative democracy was essentially a sham. He argued that industrial societies were dominated by relatively small numbers of people who owned factories and controlled natural resources. In Marx’s view, government officials and military leaders were essentially servants of this capitalist class and followed their wishes. Therefore, any key decisions made by politicians inevitably reflected the interests of the dominant bourgeoisie. Like others who hold an elite model of power relations, Marx believed that society is ruled by a small group of individuals who share a common set of political and economic interests.

Mills’s Model

Sociologist C. Wright Mills (1916–62) took the Marxist model a step further in his pioneering work The Power Elite. Mills described a small group of military, industrial, and government leaders who controlled the fate of the United States—the power elite. Power rested in the hands of a few, both inside and outside government. At the top of the power pyramid
are the corporate rich, leaders of the executive branch of government, and heads of the military (whom Mills called the “warlords”). Directly below are local opinion leaders, members of the legislative branch of government, and leaders of special interest groups. Mills contended that these individuals and groups would in essence follow the wishes of the dominant power elite. At the bottom of the pyramid are the unorganized, exploited masses.

The most striking difference from Marx is that Mills believed that the economically powerful coordinate their maneuvers with the military and political establishments to serve their common interests. Yet, reminiscent of Marx, Mills argues that the corporate rich were perhaps the most powerful element of the power elite (first among “equals”). And the powerless masses at the bottom of Mills’s power elite model certainly bring to mind Marx’s portrait of the oppressed workers of the world, who had only their chains to lose.

A fundamental element in Mills’s thesis is that the power elite is indeed a societal problem and not only includes relatively few members but also operates as a self-conscious, cohesive unit. Although not necessarily diabolical or ruthless, the elite comprises similar types of people who regularly interact with one another and have essentially the same political and economic interests. Mills’s power elite is not a conspiracy but rather a community of interest and sentiment among a small number of influential people.

Mills failed to clarify when the elite opposes protests and when it tolerates them; he also failed to provide detailed case studies that would substantiate the interrelationships among members of the power elite. Nevertheless, his challenging theories forced scholars to look more critically at the democratic political system of the United States.

In commenting on the scandals that have rocked major corporations such as Enron and Arthur Andersen, observers have noted that members of the business elite are closely interrelated. In a study of the members of the business elite of directors of Fortune 1,000 corporations, researchers found that each director can reach every other board of directors in just 3.7 steps. That is, by consulting acquaintances of acquaintances, each director can quickly reach someone who sits on each of the other 999 boards. Furthermore, the face-to-face contact directors regularly have in their board meetings makes them a highly cohesive elite. Finally, the corporate elite is not only wealthy, powerful, and cohesive; it is also overwhelmingly white and male.

Pluralist Model

While the notion of powerful elite interests does not seem as news breaking now as it did in the 1950s, criticisms of the power elite thesis have continued. The major criticism has been that decision making is more broadly shared (“the pluralist model”) or that even if power is concentrated there are counteracting interests (“checks and balances”).

Several social scientists insist that power in the United States is shared more widely than the elite models indicate. In their view, a pluralist model more accurately describes the nation’s political system. According to the pluralist model, many competing groups within the community have access to government, so that no single group is dominant.

Prejudice

*Prejudice* is a term with many connotations. The most common definition of prejudice in the social sciences is an attitude toward members of a given social group that rests on the fact that they are members of that group (e.g., members of a particular race, ethnicity, religion, or gender; individuals of a particular age, economic class, sexual orientation, or disability status). Generally, most researchers consider prejudice to
be the emotional component of reactions toward others based on their social category membership. It is also associated with stereotypes—specific ideas about the members of the group—and with discrimination—behavior toward the members of that group. Discrimination can be either overt (e.g., refusing housing or seating on a bus based on race) or subtle (e.g., administering job qualification tests that favor some ethnic groups based on criteria that are not job related). The notion of groups is central to the concept of prejudice; although prejudice can be felt for specific individuals, it is specifically based on their group membership.

The finding that prejudice often leads to discriminatory behaviors makes the study of prejudice a major focus in the social sciences. Indeed, classic research demonstrates that prejudice and behavior are related, although not always reciprocally. Contemporary researchers therefore seek to understand when prejudice influences behavior and when the situation or the personal characteristics of the perceiver override prejudice’s influence.

**Key Developments in the Social Scientific Study of Prejudice**

Several major recent trends have been noted in the research literature. Perhaps the greatest change in the study of prejudice has been a shift in the usual conceptualization of prejudice. Early researchers focused their models on extreme cases of prejudice, with the goal of understanding the “bigot” or prejudiced individual. The underlying model, usually implicit but sometimes explicit, was that prejudice should be considered a pathology, the source of which can be understood and ferreted out. Contemporary researchers, in contrast, suggest that prejudice is a natural—if oftentimes deleterious—by-product of normal patterns of human thinking. Accordingly, the social cognition literature is replete with evidence that human memory systems rely on social categories largely because such organization of information is particularly efficient. For example, individuals often use categorical thinking because they are “cognitive misers.” Upon encountering an individual from a given category, we can “know” quite a bit about him or her simply by accessing the many rich associations (i.e., schemas) we already have with that social category, saving a great deal of time and effort. This approach largely reconceptualizes prejudice from the extraordinary and deviant to the ordinary and normal. A problem arises, however, when a schema about a group is biased, not fully representative (i.e., weighted toward negative information about the group), inaccurate (i.e., based on myths about the group rather than facts), or—perhaps most damagingly—when the perceiver’s schema does not accurately depict a given individual.

The literature on prejudice has changed from an earlier viewpoint that prejudice is volitional. More recent research shows that attitudes toward outgroups can operate unconsciously or outside of a perceiver’s awareness, a result that illuminates the robust finding that reductions in conscious or expressed prejudice do not necessarily coincide with reductions in discrimination. That is, although an individual may resist the expression of prejudice consciously, he or she may harbor unconscious prejudice and consequently behave in discriminatory ways. The scientific study of such “implicit prejudice” is yielding interesting insights into the relationship between implicit and explicit prejudice and the behaviors that each one uniquely predicts.

Other interesting recent work finds that individuals differ in their motivations to respond without prejudice; for example, they may be internally or externally motivated. These differences in turn help explain expressions of prejudice.

The foci of research on prejudice have also evolved. Early researchers primarily studied the prejudice of majority group members toward minority group members, whereas recent work also examines the prejudice of minority group members toward other minority groups and the prejudice of minority group members toward majority group members. Other research examines how the prejudices of majority groups in society affect the targets of those prejudices. A classic and powerful study conducted by Kenneth B. Clark and Mamie P. Clark reported that black children as young as 4 preferred white dolls to dolls that were closer to their own skin color. Influential recent research on stereotype threat and related research on stereotype susceptibility examine how prejudice influences its targets via stereotypes. Other work considers psychological implications and emotional responses of being the target of prejudice, including coping, victimization, stigmatization, and feelings of social exclusion.

**Prejudice and Social Problems**

An understanding of prejudice is critical for resolving many pressing social problems because prejudice...
(a) contributes to many social problems and (b) is a consequence of social problems. These cyclical factors make prejudice ubiquitous in society.

**Prejudice as a Cause of Social Problems**

Negative prejudice directly contributes to social problems in the form of discrimination. For example, prejudice toward certain groups is associated with discrimination in employment. In one classic study, a cohort of white participants was assigned to interview either a black or a white job applicant. The research revealed that black applicants were treated differently than were white applicants. White interviewers of black applicants kept greater physical distance from black applicants, made more speech errors during the interviews, and ended the interviews sooner. Research demonstrates that prejudice toward groups influences employment decisions, educational disparities across groups (e.g., teachers’ expectations and student achievement), patterns of housing (e.g., residential segregation), political representation and under-representation, and even jury sentencing. Beyond these disturbing consequences, prejudice can motivate hate crimes, police brutality, and personal conflicts. Globally, prejudice played a role in some of the most heinous genocides from the Holocaust to those in Bosnia and Rwanda. Thus, prejudice can fuel both antipathy and active aggression.

**Prejudice as a Consequence of Social Disparity**

Social scientists have shown that prejudice not only contributes to social problems but also results from them. When people witness disparities between groups, such as disparities of poverty and educational achievement, they develop prejudices. For example, system justification theory argues that psychological and ideological motivations lead individuals to justify and preserve the status quo, often via unconscious prejudices and stereotypes. This is an example of a social problem leading to prejudice, because to maintain the existing social order in which the majority group enjoys dominance and privilege, both minority and majority members may experience prejudice against members of the minority group and for the majority group. Indeed, studies show that members of minority ethnic groups actually favor majority ethnic group members, thus perpetuating inequity. Additionally, because people are generally motivated to believe the world is fair and that people “get what they deserve”—the “just world phenomenon”—prejudice becomes an efficient way to justify the status quo. When the status quo includes a host of social problems, such as ethnic or gender stratification in work or education, the result is prejudice.

One can quickly identify a troubling state of affairs—a vicious cycle in which negative prejudice can contribute to social disparities that, in turn, contribute to prejudice. For this reason, negative prejudice is often considered a social problem, and breaking this cycle via prejudice reduction has been a major concern of social scientists and practitioners.

**Reducing Prejudice, Achieving Tolerance**

Even as evidence suggests the decline in some countries of certain forms of prejudice, other evidence suggests that more subtle, indirect, and pernicious forms of prejudice have emerged. Further complicating matters, prejudice has a multitude of causes. Characterizing searches for the causes of prejudice are two broad perspectives, one emphasizing individual differences and the other emphasizing intergroup processes. Based on these perspectives, scholars have theorized and demonstrated that many factors can contribute to prejudice, including competition for resources, power, or prestige; economic hardships; social categorization and subsequent social comparison processes; psychological processes; personality characteristics; social stereotypes; socialization influences (e.g., through families, classmates, or the media); and conformity motives. Although reducing such a multicausal problem as prejudice is not simple, programs to reduce prejudice are ubiquitous and can be found in employment organizations, schools, and society more generally, and in both private and public organizations.

One major approach to prejudice reduction is encapsulated in the contact hypothesis, which states that contact between majority and minority group members will decrease prejudice, but only when members of two groups have (a) equal status, (b) shared goals, (c) active cooperation with each other, and (d) the support of authorities. These conditions can be very difficult to fulfill in everyday life. Notably, research and theory on contact played a significant role in the U.S. Supreme Court ruling desegregating schools.

Importantly, a recent meta-analysis (an integrative examination of a variety of studies) found that intergroup contact effectively reduces intergroup
Beyond Tolerance

Historically, the term *prejudice* has connoted negative prejudice—negative thoughts, feelings, and behaviors toward the members of a group. To achieve tolerance across groups, research has primarily sought to reduce negative prejudice. But what lies beyond tolerance? Recent work on intergroup attitudes answers this question by investigating positive intergroup thoughts, feelings, and behaviors. Research on *allophilia* (from the Greek for “liking or loving the other”) has focused on such attitudes and finds that positive thoughts, feelings, and behaviors about members of other groups are as central to understanding positive behaviors across group divisions (e.g., proactive support of the “other”) as negative prejudices are to understanding negative ones. This work also suggests that negative prejudice and allophilia have distinct antecedents: what it takes to reduce hating across groups is different from what it takes to increase liking. In sum, this work supports a two-dimensional model of intergroup attitudes in which liking and disliking—allophilia and negative prejudice—are often negatively correlated, but also exhibit significant independence (different antecedents and different outcomes).

Whether the focus is on reducing the negative (e.g., employment discrimination) or on increasing the positive (e.g., increasing an individual’s comfort, kinship, and engagement with those of another group), the prejudice construct has been a vibrant, fertile, and productive area of inquiry for social scientists and a place where science has met practice in service of society.

**PREMARITAL SEX**

Premarital sex refers to sexual interaction between heterosexual men and women prior to marriage. Many scholars chart changes in both attitudes and behavior related to premarital sex to explore the connection between this issue and social problems, such as divorce and the spread of sexually transmitted diseases. Given the interconnectedness of sexual behavior and other important aspects of society, every society has guidelines for single men and women for what is permissible sexual behavior. Considerable cross-cultural variation exists in what is deemed acceptable sexual contact before marriage. Attitudes and behavior related to premarital sex also differ by race, social class, gender, religion, age, and historical time period. In many Western societies, prior to the 20th century, sexual activity before marriage was not socially acceptable. Communities and families both played a role in monitoring the sexual behavior of unmarried persons to ensure that a child was not born out of wedlock. In addition to the practical consideration of avoiding pregnancy, many religions strictly regulated sexual interaction among unmarried men and women. Despite the continued influence of organized religion, premarital sex changed from being forbidden to becoming the norm by the latter part of the 20th century.

Throughout the 20th century in the United States, there have been different rules for men and women with regard to sex before marriage. In the first half of the 20th century, the ideal was for both men and women to wait until marriage to have sex. However, men had more freedom to flout society’s rules; as a result, men were free to engage in sexual relations with prostitutes or other disreputable women. Society expected women, on the other hand, to remain virgins until their wedding night or risk ruining their reputations and chances of securing a husband. This sexual double standard governed the sexual behavior of single men and women, affecting what they were willing to do sexually, whom they would have a sexual relationship with, and the roles they would play during a sexual encounter. Typically, men would play the aggressor role by initiating sexual advances, and women would play the “gatekeeper” role by deciding how much they would allow a sexual encounter to escalate.

Over time, attitudes and behaviors related to premarital sex began to change. These changes were brought about by other changes in society. In the 1920s, dating replaced traditional courtship as the primary means for young men and women to interact. Unlike traditional courtship, dating took place in the public sphere, away from close parental supervision. This change, along with more young people moving to cities and attending college, allowed for a greater degree of sexual activity prior to marriage. The sexual norms for the dating era included kissing, necking, and petting; however, oral sex and sexual intercourse were still off limits. Despite these standards, Alfred Kinsey’s mid-20th-century reports on male and female sexual behavior shocked Americans by suggesting that many were not living up to this ideal. Although Kinsey’s study was not representative, his data indicated that more than half of women lost their virginity prior to marriage.

The decades that followed brought about the most significant changes in attitudes and behavior for premarital sex, particularly for women. Some of these changes were brought about by women’s rights activists in the 1960s and 1970s demanding equality with men in all areas of life, including sex. In this era, the increasing availability of birth control, including “the pill,” made it possible for sexual intercourse to occur without a significant risk of pregnancy. This technological advance fueled the change, which was
already underway, that sexual intercourse could be for pleasure, not just procreation. Attitudes toward premarital sex changed as a result of this sexual revolution. Youth cultures in particular began to reject premarital chastity as an ideal. At this time, it increasingly became socially acceptable for men and women to have sexual intercourse outside of the context of marriage.

Along with these attitudinal changes came changes in premarital sexual behavior. Martin K. Whyte’s classic 1990 study examined premarital sex rates among three generations of women and found that premarital sex became increasingly common throughout the 20th century. Approximately one quarter of women who were married from 1925 to 1944 had engaged in premarital sex, compared to one half of women who were married from 1945 to 1964. For women who married after the sexual revolution, from 1965 to 1984, approximately three quarters had engaged in premarital sex. Whyte characterized these changes as an “intimacy revolution” more than a sexual revolution per se, given that the majority of women from all three generations had sex only with their eventual spouses. Whyte did note that sex with someone other than one’s eventual spouse did increase significantly over time: one third of women in the latest cohort had engaged in “pre-premarital sex.”

By the turn of the 21st century, sex before marriage had become the norm for most men and women with the exception of those who were very religious. Young people remain single longer than ever before, with the median age at first marriage now at approximately 25 for women and 27 for men. Although men and women may delay marriage, they are often sexually active from adolescence (the average age of first intercourse is 17). People now spend a longer time sexually active and unmarried, thereby acquiring more sexual partners in their lifetimes than previous generations. Despite the increase in years for engaging in premarital sex, the context for sexual intercourse did not change from marriage-only to “anything goes” as is often assumed. Most Americans approve of premarital sex only in the confines of a committed relationship between consenting adults. Although premarital sex is increasingly common and accepted, significant differences still remain in how men and women are evaluated with regard to sexual behavior. Unlike women, single men continue to have greater freedom in sexual activity under a variety of circumstances without risking their reputations. The sexual double standard that dominated in the first half of the 20th century may have diminished, but it has not disappeared.

Prestige

Prestige is an intangible good (such as esteem or honor) accorded to high-status social positions and enjoyed by persons who occupy those positions. As such, prestige may be intertwined with other dimensions of social stratification.

Occupational prestige is a core dimension of socioeconomic status. Most research on occupational prestige uses public opinion surveys—such as the General Social Survey of the National Opinion Research Center—to measure respondents’ evaluations of occupations and to construct prestige scales across occupational categories. Methodological issues at stake include the dimensionality, reliability, temporal stability, and cross-cultural validity of occupational prestige rankings. Research also suggests that prestige may be accorded differently for sex-typical and sex-atypical pairings of individuals and occupations.

Like related concepts of power and status, prestige is inherently comparative. Prestige benefits recipients only at the expense of others. At the macro-level, this competitive quality of prestige is implicit in the ranking of social categories. At the micro-level, researchers in group dynamics regard prestige as one of the primary modes of differentiation in groups. Prestige may accompany high-status roles within a local hierarchy, such as the captain of an athletic team.
or elder member of a clan. It may also emanate from asymmetries in everyday social exchange, such as the exchange of deference for advice.

Research in social networks offers operational definitions of prestige for individuals or groups by applying methods of centrality analysis to patterns of social relations. Such methods may identify prestigious persons or roles within a group or reveal hierarchies of prestige among organizations embodied in historical structures of exchange. For example, several researchers have modeled prestige rankings of graduate departments by analyzing patterns of hiring across departments.

Collective action theorists posit that prestige may serve as an incentive for members to contribute to collective goods. For example, a group may give prestige to members who make important contributions to the group’s welfare, rewarding such efforts at little cost to the group. On the other hand, because prestige is inherently comparative, such rewards may impose costs on members who do not receive the rewards. This may lead to unintended side effects, such as when competitiveness undermines cooperation and informal norms emerge that punish the individuals who receive the most prestige.

Prison

A prison is both a physical container and an institution. A prison contains people, typically those who have violated criminal law and have been sentenced to a period of incarceration. Prisons, also called “penitentiaries” and “correctional facilities,” are distinguished from jails in the United States by length of confinement: jails incapacitate those who are charged with but not yet convicted of criminal offense or who are serving shorter sentences, typically one year or less. Prison and jail, along with probation, constitute the corrections component of the criminal justice system. Prisons have also been used as tools of governments seeking to incapacitate critics of their practices, hence the term political prisoners.

Originally used to hold persons before trial, the prison as a penal institution—that is, the modern prison—came into existence by the end of the 18th century. As such, it denies inmates a range of basic personal rights and privileges. Restrictions on prisoners can extend from solitary confinement, in which access to space outside one’s cell is held to an hour or less per day, to restrictions on one’s movement, as in the case of people who serve sentences in their homes—house arrest—but may be required to wear an electronic sensor attached to their ankle.

Prisons fall into several classifications, depending on the level of custody required for inmates. In the United States there are minimum, medium, maximum, and super-maximum security prisons, with more intensive control and security at each higher level. Prisons and jails also separate male and female inmates. States and local jails maintain separate facilities for juvenile offenders; there are no juvenile federal facilities. For the most serious crimes, prosecutors may sentence youth to prisons as adults.

According to the International Centre for Prison Studies, as of February 2005, the rate of incarceration in prison and jail—737 inmates per 100,000 population—ranks the United States as the nation most likely to use imprisonment, with a rate of imprisonment 6 to 8 times higher than other industrial democracies. Following a period of explosive growth in the prison population dating back to the implementation of mandatory, structured, and determinate sentencing policies in the late 1970s, as of 2006, more than 7 million people in the United States were under some form of correctional supervision, including probation, prison, jail, and parole. According to the Bureau of Justice Statistics (BJS), 2,385,213 people were incarcerated by the United States at the end of 2006, including prisoners in federal, state, and territorial prisons; local jails; military and juvenile facilities; facilities of the Bureau of Immigration and Customs Enforcement; and jails in Indian country.
U.S. prisons and jails incarcerate black and Latino/a people in numbers disproportionate to their presence in the U.S. population. African/black Americans constituted 12.4 percent of the U.S. population, according to the 2006 American Community Survey; whites made up 73.9 percent of the population and Hispanics or Latinos/as of any race, 14.8 percent. At the end of 2006, 42 percent of inmates in prison were black; white inmates were 33 percent, and Hispanics 21 percent. The over-representation of blacks and Latinos/as in jails is similar to prison: whites are 44.3 percent of the 2005 jail population, blacks 38.9 percent, and Hispanics 15 percent.

The BJS estimates that 32 percent of black males will be incarcerated in prison at some point in their lifetime, compared to 17 percent of Hispanic males and 5.9 percent of white males. Males are an overwhelming majority in prisons and jails, yet the rate of incarceration of females in the United States has increased dramatically in the past 30 years. According to the Institute on Women and Criminal Justice, the number of women serving sentences of more than a year grew by 757 percent between 1977 and 2004. Women currently make up 7 percent of all U.S. inmates.

The Logic of Incarceration: Punishment, Correction, or Incapacitation

Prevailing theories about human behavior, the causes of crime, and ideology about how to address criminal behavior have always influenced how and why society uses prisons. Prisons are intended to meet a variety of social goals, including incapacitation, deterrence, discipline, punishment or retribution, and rehabilitation or reformation.

The logic of incapacitation is simple on its face: if we contain people who would otherwise be engaging in criminal behavior, we will reduce the crime rate and improve public safety. Known as the “incapacitation effect,” the theory holds that by reducing opportunity—particularly during an individual’s prime crime years—crime will be reduced. Research evidence on this effect is inconclusive; there is also little evidence that incarceration deters future criminality. In terms of deterrence, the argument is that the threat of punishment, in this case, of incarceration, will dissuade people from engaging in criminal behavior in the first place. However, evidence suggests that the more incarceration experiences one has, the more likely one is to recidivate.

The notion that the punishment should fit the crime, sometimes known as retributive justice or lex talionis (“an eye for an eye”), is best understood as an attempt to retaliate with a punishment matching the level and quality of an offense.

In 1974, a now-infamous report by New York sociologist Robert Martinson asked the question “What works?” about prison reform. Because his answer to that question was “Nothing,” and in keeping with surveys that failed to find rehabilitation programs that successfully prevented recidivism, rehabilitation came under attack and public policy took a turn toward rational choice theory, which argues that criminals are rational actors who decide to engage in criminal behavior. Consequently, authorities dramatically reduced programs meant to reform offenders, including education in prisons.

Some social theorists are particularly critical of prison as actually a tool to warehouse people who otherwise lack a place in a capitalist economy. Incarcerated persons often suffer from both mental illness and poverty before prison; these theorists thus suggest that prison is simply a means to discipline a population that cannot and will not labor. Recent efforts at restorative justice—which seeks to involve victims of crime as well as the community of people impacted by wrongdoing—and alternatives to incarceration—which include community courts and programs that divert offenders from prison and jail—have shown some promising results.

Prison as a Social Problem

In keeping with the arguments of Marxist-influenced scholars, some maintain that prison is used as a stop-gap measure to deal with social problems that society and government have failed to adequately address, such as racism, poverty, and mental illness. In this view, as Ted Conover noted in his compelling journalistic work on his year spent as a corrections officer at New York’s infamous Sing Sing, prison itself has become a social problem.

According to the most recent survey of inmates in prisons and jails, jail inmates report the highest rate of mental health problems (60 percent), followed by state (49 percent) and federal prisoners (40 percent). Partly as a result of the deinstitutionalization of the mentally ill and the lack of community mental health services,
some say prison has become a de facto mental health system.

Prisons are often built in areas with high unemployment rates, and work in prison then becomes a major feature of the regional economy. The privatization of prisons has led many to question whether punishment should be profitable and left to the workings of the market. Prison labor has been another area of debate, with corporations criticized for exploiting the labor of prisoners, and prison officials supportive of any activity that occupies the time and attention of inmates.

Some theorists have gone beyond consideration of prison as a social problem and beyond the host of social problems that occur within prisons. Historian Mike Davis is credited with first using the phrase “prison industrial complex” to describe the collection of interests, mainly political and economic, that have fueled the expansion of U.S. prisons regardless of their efficacy or cost-effectiveness in preventing and reducing crime.

PRISON, CONVICT CRIMINOLOGY

Convict criminology is a new research perspective in criminology led by ex-convicts who are now academic faculty. They especially focus on how the problem of crime is defined, the solutions proposed, the correctional policies enacted, and the devastating impacts of those decisions on the men and women confined in prison. Stephen C. Richards and Jeffrey Ian Ross coined the term convict criminology in 2001, and 2 years later published an edited book, Convict Criminology, that included nine chapters by ex-convict professors. This was the first time ex-convict academics appeared in a book together discussing their own criminal convictions, time in prison, and experiences in graduate school and as professors at universities.

Next came the New School of Convict Criminology, informally organized as a writing and activist collective. Comprising this group are ex-convict professors, graduate students, undergraduate students, and “non-con” critical colleagues and friends including non-con academics who have contributed in many ways to the formation, growth, and activities of the group.

Convict criminology also includes ex-convicts or “non-convicts” who work outside of academia in government agencies, private foundations, or community groups, where they do research or administer criminal justice programs. Although these members do not hold full-time positions at universities, they may teach part-time or write research reports that contribute to academic publications or criminal justice policy.

The Convict Criminology Group also includes a growing group of men and women behind bars who hold advanced degrees and have published academic work about crime and corrections, often coauthored books and academic articles with “free world” academics. Presently, the group includes male and female ex-con academics from North America, Europe, United Kingdom, Scandinavia, Australia, and New Zealand. The United States, with the largest prison population in the world, contributes the most members.

Individuals voluntarily decide to associate with the group, which has no formal membership or leadership roles. Different members of the group lead or take responsibility for assorted functions, as lead author on an academic article or monograph, collaboration on a research proposal, organizing sessions at regional and
national conferences, conducting program assessment, mentoring students or junior faculty, or developing media contacts.

The Convict Criminology Group helps organize and support numerous groups and activities related to criminal justice reform, provides consulting services, and organizes workshops for criminal defense attorneys, correctional organizations, and universities. Collectively, the group has published books, journal articles, and book chapters using “autoethnographic” or “insider” perspectives. The group continues to grow as more prisoners exit prison to attend universities, hear about the group, and decide to contribute. Convict criminology, in fact, is now taught in universities and prisons.

PRISONS, GANGS

Most incarcerated individuals share several underlying characteristics, including delinquent and criminal histories, poverty, substance abuse, and lack of education, but it is their diversities that are most crucial within prisons. Inmate racial, ethnic, religious, and geographic differences become problematic to correctional administrators when they contribute to the formation or continuation of gangs in prison.

Most researchers describe two primary types of prison gangs, also known as “security threat groups” (STGs). Inmates can import their street gang culture into the prison environment or they can join prison gangs that function mainly inside the prison walls. Entering street gang members may seek to join up with their fellow incarcerated ex–street gang members on the inside. Other entering inmates may join a prison gang because of losing contact with family, friends, or jobs that may have functioned to inhibit street gang membership. These inmates find strength in shared philosophical beliefs, racial or ethnic origins, religious perspectives, or geographical locations advocated by the prison gang. The distinction between street gangs and prison gangs may be misleading, however, because many prison gang members and incarcerated street gang members form alliances, even entering into partnerships to further illegal enterprises within and outside the facility.

Accurate measurement of gang membership is difficult because of differences in measurement methods and definitions. One study estimates 1,625 validated gangs in U.S. prisons, while estimates of the numbers of gang members range from 15,398 to more than 16,000 in just the three states of Ohio, Texas, and California. The largest and most active prison gangs are Nuestra Familia, Aryan Brotherhood, Texas Syndicate, Mexican Mafia, and Black Guerilla Family.

Although gang members are a small proportion of all inmates, they represent a serious threat to institutional management and to the outside world. In 1998, for example, Nuestra Familia members ordered death hits and drug deals, orchestrated extortion rackets, and tampered with witnesses from inside a secure housing unit in Pelican Bay State Prison in California. A complex federal, state, and local investigation called “Operation Black Widow” uncovered these crimes, resulting in the indictments of 13 gang members on 24 federal counts.

Prisons employ identification of gang members, suppression efforts, and programming to control gang activities. Identification may occur during the classification process. Outward signs of gang affiliation, such as brands, tattoos, or other identifiers (e.g., cut eyebrows) are systematically documented. Intake officials also ask about current or prior gang affiliation, not only to ensure institutional safety but also to provide for the safety of the entering inmate. Most prison policies try to restrict mixing of inmates from rival gangs to reduce the possibility of violence related to gang rivalries. This de facto racial segregation may be difficult, however, due to a 2005 U.S. Supreme Court ruling (*Johnson v. California*) banning the long-term racial segregation of inmates.

Prisons, Overcrowding

Prison overcrowding, also called “prison crowding,” is a matter of great contention and concern in current criminal justice public policy debates in both Canada and the United States. Coming to public attention as a social problem most recently in the United States in the late 1970s, prison overcrowding has coincided with the unprecedented growth in the nation’s prison population over the past several decades.

Because of the “war on drugs” and mandatory sentencing, the United States has become the world’s foremost jailer. With just 5 percent of the world’s population, the United States has 25 percent of its prisoners, approximately 2.4 million, a number that steadily increases by about 3 percent each year. In 2006, federal prisons were operating at 37 percent above capacity.

The criminal justice system responded to what some jurisdictions call the “crisis” of prison overcrowding through diversion strategies, relying more heavily on jails for the overflow of prisoners, doubling up prisoners in one cell (also called double bunking), hotly debated early release strategies, and an increasing reliance on private (for-profit) prisons, to name a few. However, policy focus on capacity issues sometimes detracts from the actual conditions of privacy, security, and manageability (including meeting basic needs for nutrition, health, and sanitation) within prisons.

In 2006, the Vera Institute of Justice’s Commission on Safety and Abuse in America’s Prisons held public hearings, which included expert testimony on prison crowding. The conveners pointed out that no academic literature shows an established connection between overcrowding and violence. However, this research is not from the perspective of corrections officers and inmates whose daily experience may lead them to different conclusions. The debate on overcrowding in part thus hinges on experiential viewpoints and definition of terms.

The human experience of “crowding” or “being crowded” has both physiological and psychological components. Research studies show that among the many negative effects of prison overcrowding on inmates are competition for limited resources, aggression, higher rates of illness, increased likelihood of recidivism, and higher suicide rates. Prisoners in overcrowded prisons often cannot get prison work assignments, leading to idleness-related frustration and the higher likelihood of interpersonal conflicts, assaults, and rapes. Staff cannot monitor activities as effectively or identify prisoner problems. If they do identify a problem situation, they have few options to reduce animosities. For example, they may be unable to separate prisoners and place them in different facilities.

Certainly, the amount of space per inmate is a factor in determining at what point a prison contains too many inmates. In fact, the official definition of prison crowding relies on measures related to capacity: either design capacity, the number of inmates that the prison architect originally intended to be housed in that institution, or operational capacity, the number of inmates that a facility’s staff, existing programs, and services can accommodate. However, perceptions of crowding may be equally or even more important.

Experiencing a space as crowded or overcrowded—inside prison or not—is related to social density, exigent circumstances, and individual expectations. Residents of urban areas may have lower expectations of personal space than people living in less densely populated areas. Individuals housed in cells alone may feel less crowded than those housed in a large barracks with greater objective space but much less privacy.

Data from the end of 2005 showed 23 states and the federal prison system operating at 100 percent or more of their highest capacity. Despite some prisons operating below capacity, perceptions of crowding may remain, particularly as space inside prisons that was originally meant to house fewer inmates is converted to house more. Experts report that the average U.S. prisoner has living space of about 60 square feet, an area just slightly bigger than the size of a king-sized bed.

Prison overcrowding also includes a lack of appropriate programming available to the incarcerated. With high levels of illiteracy, few educational or substantive employment programs, as well as limited access to mental health resources, the potential for disorder in prisons is high. In addition, corrections staff may face greater difficulty in managing an inmate population that exceeds a building’s planned capacity, particularly if those professionals are understaffed or inadequately trained.

By the late 1980s, successful crowding litigation brought by prisoners’ rights advocates and prisoners

Further Readings

led to prisons in 36 states compelled by court order (or engaged in such lawsuits) to reduce crowding. In 2006, the states spent a combined total of nearly $35.6 billion on corrections, with a budgeted total of $37.6 billion for 2007. A major factor driving this increased spending is prison overcrowding.

At least eight states now transfer some prisoners out of state and often into private prisons to cope with crowded conditions. In 2007, a successful class action lawsuit on behalf of state prisoners in California resulted in a court ruling that inmate overcrowding contributed to constitutional violations of inadequate medical and mental health care in the state’s prisons.

Prisons, Pregnancy and Parenting

The number of adults under some form of correctional supervision has been increasing steadily. According to the Bureau of Justice Statistics, in 2006 more than 7 million people were on probation, in jail or prison, or on parole. This accounts for 3.2 percent of all adult residents in the United States. Prison authorities at the federal and state levels had more than 1.4 million inmates in custody. More than 1.5 million children under the age of 18 have parents incarcerated in state and federal prisons; children under the age of 5 years old made up 22 percent of these children.

Research indicates that when a family member goes to prison, the whole family suffers. Incarcerated females are more likely to have been the primary caretaker, so what happens to their children is different than for children of incarcerated male parents. For males, the children are more likely to be with their children’s mother. Children of females in prison are often placed in the care of other family members, typically grandparents (usually grandmothers). In many states, family members are not eligible for foster care money, so poor families who cannot afford another mouth to feed may not be able to take on this burden. The children may then be placed in foster care, where siblings may be separated and uprooted from all that is familiar to them. For some of these children, this may be the first time that they have been away from their mothers for any length of time.

Incarcerated parents, particularly mothers, face the problem of how to maintain the bond they had with their children before incarceration. Interestingly, males tend to get more visits from their children under the age of 12 years old than females. The mothers of the children of male prisoners tend to bring the children to see their fathers. Because mothers who are in prisons are usually the primary caregiver, they are less likely to have their children visit them. There are other reasons as well. Though their numbers have been increasing at a more rapid rate than their male counterparts, females still make up a significantly lesser proportion of the prison population. Most states have only one women’s prison, often in rural and/or suburban areas far from where these women lived. There tends not to be public transportation to the facilities. So even for those substitute primary caregivers who would like to bring the children to visit their mothers, it is a daunting, if not impossible, task. Another factor that may explain the lack of children visiting their imprisoned mothers is the stigma attached to a woman in prison. Some women inmates do not want their children to know that they are imprisoned, so they make up stories to explain their absence, saying they had to “go down South” or that they will be away for a while or that children are not allowed where they are.
Most research on parents in prisons focuses on the female. The majority of females in prisons are single parents, so their parental role is more obvious. Traditionally the male parental role has not received as much attention as that of the mother, but recent research shows that the long-term consequences of having either parent (or both) incarcerated are just as serious. Also, with an emerging pattern of intergenerational crime, in some prisons the parent and the child, and in some instances even the grandparent, are in the same institution. Parents in prison, for the most part, do not want their children to repeat their mistakes. Experts thus recommend the implementation of programs in prison that work toward maintaining and improving the parental bond between children and their incarcerated parents.

Mothers and fathers in prisons have similar concerns, but females face some gender-specific problems of parenting. Recent surveys by the Bureau of Justice found that 6 percent of women who enter jail and 5 percent of those entering prisons are pregnant. Health care for incarcerated women in general is horrendous, but for pregnant women, additional problems arise since there is little to no prenatal care. Women wishing to terminate a pregnancy (usually those in jails) may have stumbling blocks placed in their paths, and women who want to continue their pregnancy (usually those in prisons) may be encouraged to abort. Women who do continue the pregnancy may find themselves in situations threatening to themselves and or their fetus. Sometimes correctional officers may tell them that they are not in labor when they really are, thereby putting their babies in danger of being born without proper medical attention. Those who make it to the hospital find themselves shackled to the bed as they give birth, even when a correctional officer is in the room. Some women have their babies immediately taken away and placed in a foster home. Few prisons allow new mothers to keep their babies with them, even though research on such programs as the one at Bedford Hills Correctional Facility show the positive impact of letting mothers keep their babies for the first 18 or 24 months.

Incarcerated parents face challenges similar to parents in the outside world, but they also have additional hurdles. As more and more people become imprisoned, society must be cognizant that the long-term punishment of parents also punishes their children. Society in general, and children of incarcerated mothers in particular, may be better served by keeping nonviolent female offenders with children in community-based programs where they can pay their debt to society yet continue their roles as primary caregivers of their children. For those women who must be incarcerated, programs that maintain and strengthen the parent–child bond should be created. Parenting classes, visitation programs, nursery programs, and programs such as Girl Scouts Behind Bars are just a few of such programs. In addition, all re-entry programs should have a component that deals with parenting, especially for female offenders. Policies and laws that are more holistic and systematic are needed to deal with this social problem.

**PRISONS, PRIVATIZATION**

The term *prison privatization* commonly refers to the policy of contracting out the management and operation of prisons and jails to private, for-profit companies. Prison privatization is a controversial public policy issue, with ongoing debate over the ethics of delegating the punishment function of the criminal justice system to private actors, whether private prisons
cost less to operate than public facilities, and if the quality of security and conditions of confinement differ between public and private prisons. In 2005, approximately 200 private correctional facilities operated in the United States, housing a total of 107,000 inmates. Four companies—Corrections Corporation of America, Geo Group, Management and Training Corporation, and Cornell Corrections—provide more than 90 percent of private prison capacity. About 6 percent of all state inmates and 14 percent of federal inmates are incarcerated in privatized facilities.

The idea of privatizing prisons emerged in the 1980s as a policy remedy to the problem of growing incarceration rates, severe prison overcrowding, and constraints on increasing government funding of new prison space. Public investment in new prisons climbed eightfold from the late 1970s to the early 1990s, but was at or approaching its limits in many jurisdictions due to voter rejection of construction bonds, statutory ceilings on state debt, or general taxpayer unwillingness to support increases in government spending. With privatization used as a way of reducing costs and increasing capacity in other areas of government services—such as public works and infrastructure (e.g., utilities, building maintenance, and highway construction) and social policy (e.g., health care, pension plan management, and welfare services)—supporters of prison privatization argued that the benefits of privatization in those areas could apply to prisons as well. Private companies could build new prisons more rapidly than the government and draw upon private investors to help fund prison construction, while competition for contracts would help to contain costs and promote more efficiency in operations. On the strength of these arguments, the first private prison opened in 1984. Within the next 20 years, private correctional facilities arose in 33 states.

On the other side of the debate, critics of prison privatization argue that the profit motive of private companies encourages them to cut corners, resulting in diminished conditions of confinement for inmates, a risk to public safety, and more dangerous environments for both prison inmates and staff. Correctional worker labor unions are among the most vocal of private prison critics, with their opposition based in part on the fact that the wages of correctional officers in private prisons are generally lower than in public prisons. Correctional officer unions have organized campaigns to defeat prison privatization attempts in many jurisdictions. Reflective of their efforts, the number of private prisons around the country correlates inversely with labor unions’ strength: 47.5 percent of private prison beds are in southern states, 25.1 percent in western states, 17.7 percent in midwestern states, and 9.7 percent in northeastern states. Since the late 1990s, a number of faith-based organizations have also voiced opposition to prison privatization on ethical grounds, arguing that the business ethos of economy and efficiency is an insufficient rationale to drive policy in a criminal justice system founded on principles of justice and public service.

Research comparing the operating costs and conditions of confinement in public prisons and private prisons has produced mixed findings. Numerous studies, sponsored by state-level agencies, simply investigated whether states could save money by privatizing some of their prisons. While the studies generally indicate that private prisons are less expensive—by 8 to 15 percent—the true cost of operating either type of facility is difficult to ascertain due to substantially different procedures in private and public accounting. For example, the reported expenses of private facilities do not generally include indirect costs incurred by the government in providing services, such as contract monitoring and prisoner case management. Similarly, other state agencies may absorb some public prison costs (e.g., utilities, personnel management) that are not reflected in total correctional agency costs.

In noting the difficulty of making valid comparisons, the U.S. Government Accountability Office criticized the methodological validity of much privatization cost comparison research and concluded that the jury is still out on which type of prison is the more cost-effective. Other studies suggest that differences in facility size, age, and security level are more predictive of facility costs than private versus public ownership. Research on the quality of services provided by private prisons shows that, systemwide, private prisons generally provide a quality of inmate care on par with public facilities. Observance of low performance in individual private prisons appears to be more a result of poorly written contracts or inadequate contract monitoring than inherent differences between the public and private sectors.

The ethical issues surrounding prison privatization engage questions of values and beliefs not easily settled by empirical studies of costs and conditions. Supporters of prison privatization tend to place a high value on limited government and free market solutions to social problems. Conversely, opponents tend
to place greater value on the role of government in solving social problems. Where supporters have been successful in implementing prison privatization policy, opponents have been successful in moderating the extent of the practice.

Prison privatization has served as an expedient remedy for prison overcrowding in times of rapid growth in the correctional population. As the growth in incarceration rates began to slow somewhat at the end of the 20th century, growth in the private prison industry slowed accordingly. Post–September 11, 2001, concerns with illegal immigration have provided a boost to the private prison industry, with the federal government entering into new contracts with private companies to create more detention centers for illegal aliens. But as the ethical issues remain intractable, the debate over prison privatization will likely continue for some time.

Prisons, Riots

The first correctional disturbance reportedly took place in Simsbury, Connecticut, in 1774, in a prison constructed over an abandoned mine. Since this time, individuals have sought to define this phenomenon while seeking an understanding of its causes and solutions.

Experts have developed various definitions that describe the elements of a “riot.” An early definition was “an incident involving 15 or more inmates and resulting in property damage and/or personal injury.” However, one problem that emerged from the use of this definition was the omission of occurrences that did not meet the “15-inmate” criteria. Responding to this, the American Correctional Association (ACA) suggested three categories of violence and disorder that may occur within a correctional institution: incidents, disturbances, and riots.

An incident involves only one or a few inmates who control no portion of the facility for any period of time. A disturbance is larger than an incident, with more inmates involved who control little or no portion of the facility for a short time. A riot involves significant numbers of inmates controlling significant portions of the facility for significant periods of time.

The ACA classification produced a level of consistency when comparing events, such as numbers of inmates, time of the year, causes, property damage, and actions taken to end the riot. However, these classifications are somewhat ambiguous, requiring a significant amount of discretion from the individual or institution doing the reporting. As a result, researchers interested in studying this topic may get varying information.

Many situations and events may contribute to prison riots, from inmate dissatisfaction with institutional food to racial tension. On occasion, inmates react to rules, regulations, and policies of prisons by rioting, and the escape motive may be the cause of many more riots than is reported. Another major factor in riot causation is the continued emergence of inmate gangs, also known as “security threat groups.” Even mere rumors or the attitude that staff may have about security can trigger a prison riot. Because of the heightened level of violence, many inmates feel the need to fight for their safety and possessions. A riot can result from conflicts between correctional staff and inmates or inmate use of alcohol and other drugs. Finally, many riots have no known cause and seem to erupt spontaneously.

Prison riots have cost the American public millions of dollars. The accumulated research suggests that the trend of prison disturbances continues to accelerate in terms of the numbers of riots, inmates involved, violence, and monetary losses.
These realities suggest a pressing need for changes in the U.S. prison system.

Prisons, Violence

Prison violence occurs when prison inmates or personnel use, or threaten to use, physical force in violation of prison regulations and/or criminal law. Prison violence does not include the routine use of force by correctional officers in response to rule violations or disruptive behavior by inmates, although correctional officers sometimes “tune up,” or beat inmates who refuse to obey orders or threaten officers. Inmate violence may or may not involve the use of weapons. In maximum security prisons for men, fistfights are rare. Inmates frequently fashion homemade knives called “shivs” or “shanks,” or shape other objects such as broomsticks into weapons for self-protection. Incarcerated women are just as likely to fight as men, but they are unlikely to use weapons.

Inmate violence may be routine or nonroutine in nature. Routine violence among inmates occurs as a result of disputes over drugs, sex, or gambling debts. Prison gangs are often involved due to competition over the control of the distribution of illegal drugs in prison. Racial or ethnic tension often leads to gang violence, including sexual assault and murder. Inmates who are victims of sexual assault are often placed in “protective custody” to prevent further injury. Sex offenders, especially those who victimize children, are often victims of violence at the hands of other inmates. The prison informant, or “snitch,” may also require protective custody to avoid harm. Nonroutine violence such as riots, a form of collective violence, occurs infrequently, but when it does, serious injuries, many of them fatal, may result. Prison officials have authorization to use exceptional means, including deadly force, when facing serious threats to the safety and security of the prison.

The causes of prison violence depend on its source. Riots often occur during periods of rapid social change and corresponding rising expectations for inmates concerning better prison conditions and increasing prisoners’ rights. Routine inmate-on-inmate violence occurs due to alienation (powerlessness), prisonization (adaptation to the prison subculture), and overcrowding. In the 1960s, prison gangs formed as self-defense organizations during a period of heightened racial tension. Judicial reform and the expansion of prisoners’ rights in the 1970s made prison management more difficult. The failure by prison administrators to adapt to these changes created a power vacuum that prison gangs soon filled. Violent prison gangs, such as the Mexican Mafia and the Aryan Brotherhood, began to dominate prison life during this period.

The amount of prison violence has decreased in recent years. Increasing professionalism in the management of prisons contributed to this reduction, as unit management places case managers and correctional counselors in direct supervision of inmates. Furthermore, prison expansion has reduced overcrowding, and court decisions no longer permit correctional officers to rely on inmate trustees to maintain order through intimidation and violence. Correctional officers who use excessive force are now considered to be in violation of an inmate’s civil rights. As a result, prisons have developed use-of-force policies that restrict the use of force by correctional officers.

 PRIVACY

The concept of privacy has a prominent place in historical debates and numerous scholarly works. In the past decade, however, the issue of privacy ascended to the forefront of social debates, frequently centering on the impact of technology (the Internet, data mining, satellite observations), government surveillance, national security, and corporate intrusions into private lives.

The integration of the Internet and other technologies into the daily routines of citizens presents unique challenges to privacy rights. Many corporations, schools, and government and civic institutions now store personal information about their members, clients, and employees in databases that are accessible via the Internet. Camera surveillance systems in many cities monitor for various traffic violations, while some law enforcement agencies use it to monitor city streets in search of people who display suspicious or unlawful behavior. Some private institutions even want to monitor employee e-mails and files and track employee computer work habits. In recent years, some companies, worried about their images, fired employees because of content on the employees’ personal Web sites, blogs, or Myspace.com pages. Advanced surveillance technology monitors phone conversations and e-mails, and even allegations in the news speak to the U.S. government tracking consumer purchases, library reading lists, and travel itineraries.

Historical definitions of privacy are not uniform, and debate continues over the meaning, value, and scope of the concept of privacy. In the United States, one could argue that there are three main camps in the privacy debate: those who believe privacy is a legal right (and under attack); those who believe privacy is not a legal right (and citizens have too much privacy); and those who fall somewhere in between.

Scholars who believe privacy is a legal right argue that, although privacy is not explicitly mentioned in the U.S. Constitution, a right to privacy is implicit in the Fourth Amendment of the Bill of Rights, providing protection from unreasonable searches and seizures. Scholars who contend that privacy is not a legal right argue that because the Constitution does not mention the word privacy, citizens do not have privacy rights. They are also quick to point out that, regardless of how one interprets the Fourth Amendment, a compelling state interest must prevail over a person’s right to privacy in order to properly protect the underpinnings of liberty. Scholars who fall somewhere in between assert that the Fourth Amendment may protect citizens against actions by the state but that it rarely protects them from intrusions by other citizens, corporations, or the press.

For some scholars, privacy rights in the United States are being stripped away at an alarming rate. Many maintain that since the attacks of September 11, 2001, a pervasive government surveillance, with little oversight by the U.S. Congress, is sacrificing personal liberty and privacy for national security. Others contend that recent privacy debates are not historically unique. On the contrary, they argue that U.S. history is rife with instances of public authority violating citizen’s privacy, such as the actions of Federal Bureau of Investigation Director J. Edgar Hoover and Senator Joseph McCarthy.

Some people contend that the only reason people need privacy is so they can do things that are unethical or illegal. Others argue that because of technology, citizens have zero privacy anyway and therefore need to wake up to reality. Some even suggest that surveillance has positive consequences because it helps to establish reputations and credentials, which permit individuals to establish and maintain trust in strangers.

Most countries have laws that place limits on the privacy of citizens. For example, tax laws require individuals to provide detailed information about their income. In many countries, judicial rulings tend to treat privacy as a highly subjective and conditional commodity. Moreover, even where court precedents support a particular privacy right, the general public often ignores these rulings. For example, the U.S. Privacy Act of 1974 made it unlawful for federal, state, or local governments to deny an individual any rights or benefits for refusing to provide a Social Security number. Even though Social Security numbers are not officially a form of national identification, many citizens must provide this information in order to receive loans, fill out a job application, or rent a movie.

A recent example of the privacy debate at a global level centers on the Safe Harbor proposal between the United States and the European Union. Under the proposal, companies voluntarily self-certify to adhere to a set of privacy principles and, once certified, can continue to receive personal data from the European Union. Privacy advocates are critical of the European
Commission’s decision to approve the agreement, because it rests on a self-regulatory system through which companies promise not to violate their declared privacy practices. Critics contend there is little enforcement or systematic review of compliance policies. Individuals do not have the right to appeal or right to compensation for privacy infringements.

If a working definition of privacy refers to the ability of individuals or groups to preserve an anonymous identity, control the flow of information about themselves, and be unbound from unwarranted intrusions, it would appear that the laws in the United States and elsewhere need to catch up to technology.

PROBATION

Probation is a period of conditional release granted to some criminal offenders at the time of conviction. Probation involves the suspension of a sentence of incarceration contingent upon the offender’s agreement to abide by a number of conditions during a period of community supervision. If the offender violates any of these conditions of release, probation can be revoked, returning the offender to serve the sentence for the initial offense. The courts most often grant probation to those believed to pose a minimal threat to the community, such as juveniles and first-time offenders. More offenders are on probation than under any other form of correctional control.

Those on probation fall under the supervision of an agent of the court, known as a probation officer or agent. Probation agents fulfill a dual role: they assist offenders by connecting them with community resources while also monitoring offenders for violations of the conditions of their release. The extent of supervision will vary depending on the court-ordered conditions. For example, offenders who are considered low risk might be ordered to report to the supervising agent monthly, while those considered to pose a greater risk to the community might be subject to electronic monitoring and more frequent reporting.

Conditions of probation include but are not limited to an expectation that the offender will abstain from further legal violation. Common conditions include reporting to the supervising agent, fulfilling court obligations such as fines and court costs, and maintaining employment. Additional conditions are routinely tailored to the specific history of the probationer; for example, an offender convicted of drunk driving may be expected to abstain from the purchase, possession, and consumption of alcohol.

Probation was initially conceived as an alternative to punishment in cases for which it was believed that the offender could be successfully rehabilitated without serving a period of confinement. While precedents to probation exist in English common law, probation in its current form harks back to 1841, when a Boston shoemaker named John Augustus volunteered to supervise and assist a convicted offender whom he believed could be diverted from further criminality. The offender successfully reformed, and other men followed Augustus’s lead in volunteering to assist the reformation of convicted offenders. Massachusetts enacted the first probation legislation in 1878, with the rest of the United States following suit by 1925. Probation in various forms became widely adopted internationally in the early 1900s.

Recent concern regarding jail and prison overcrowding renewed interest in probation as a cost-saving alternative to incarceration. This resulted in the implementation of intensive supervision programs (ISPs) in an effort to expand the use of probation to more serious offenders. While ISPs vary by jurisdiction, their typical characteristics are frequent contact between probationers and supervising agents; the use of electronic monitoring to enforce curfews or house arrest; and a greater use of treatment programs than is characteristic of traditional probation.

*Julie L. Globokar*
PROHIBITION

The term **Prohibition** can refer to the Eighteenth Amendment of the U.S. Constitution, to the approximate historical era during which the Prohibition Amendment was in force, or to the political conditions, extant in this time period, in which the manufacture, distribution, and importation of alcohol were illegal. Constitutional prohibition of alcohol was in place for about 13 years. After ratification on January 16, 1919, the Eighteenth Amendment went into effect one year later, on January 16, 1920. With ratification on December 5, 1933, the Twenty-First Amendment to the Constitution repealed the Prohibition Amendment.

By the time that the Eighteenth Amendment was ratified, 33 states had already enacted legislation prohibiting alcohol within their borders. In fact, the Twenty-First Amendment stipulated that states, territories, and possessions of the United States that chose to continue to prohibit alcohol were free to do so when Prohibition ended.

The Volstead Act (passed October 28, 1919), referred to in its own text as the War Prohibition Act, specified the method of enforcement of alcohol prohibition that was to remain in place “until the conclusion of the present war [World War I] and thereafter until the termination of demobilization, the date of which shall be determined and proclaimed by the President of the United States.”

In giving the Volstead Act the title “War Prohibition Act” and linking its duration to the end of the war and the subsequent demobilization, Congress framed the prohibition of alcohol as a part of the war effort. Other social forces were at work, however, that contributed to its creation. In the mid-1800s, many temperance organizations began to move away from the ideal of moderation toward the more extreme idea that the only way to moderate alcohol consumption effectively was to prohibit the consumption of alcohol altogether; in 1867 the Prohibition Party was founded on this platform. There was also a movement to bring consumptive goods under legal control. The Federal Food and Drug Act of 1906 (the Wiley Act) targeted “adulterated or misbranded or poisonous or deleterious foods, drugs, medicines, and liquors.”

An anti-ethnic bias against the Irish and Germans was another important factor. Most U.S. breweries were German owned and operated, and German beer gardens, where the entire family would gather, scandalized pious Christians. Irish saloons, viewed as bastions of political corruption, and stereotypes about Irish heavy drinking also evoked condemnation from the “dries.”

Prohibition policies were by no means universally accepted. Demand for alcohol remained high, and organized methods of manufacturing and distributing alcohol arose to supply that demand. Met with forcible opposition from U.S. Treasury agents enforcing Prohibition laws, these distributors began to employ more violent and aggressive measures, giving rise to Al Capone and the infamous organized bootlegging syndicates. Thus Prohibition generated the social problem of racketeering; when Prohibition ended, these syndicates turned to organizing other illegal pursuits, such as narcotics.

PROPAGANDA

In its broadest sense, propaganda is simply “persuasion in bad faith.” That is, it is a species of persuasion, but one distinguishable from other varieties along several dimensions:

Accuracy. Propaganda is most commonly assumed to consist of willfully inaccurate communication. But
while propaganda can and often does involve deception, this is not uniquely indicative of propaganda. The selective and strategic use of truth and half-truth is as characteristic of propaganda as is untruth, and likely much more effective. Indeed, a recurrent theme among successful practitioners is that messages must be as accurate as their goal allows.

Method. Of somewhat more diagnostic value is propaganda’s emphasis on bypassing its target’s reasoning and critical faculties. Accordingly, it typically presents one-sided arguments that rely on nonrational influences such as instinctive or conditioned emotional responses to stimuli. Witness the ever-enduring efficacy of the atrocity story as a propaganda technique. In this light, it bears emphasis that successful propaganda is less a matter of changing the targets’ beliefs than of invoking their extant prejudices and anxieties to evoke the desired action from them.

Intent. The most definitive but least observable aspect of propaganda is that it is intended to induce the target to act in ways that are in the interests of the source alone. It is not necessary that a message be exclusively in the source’s interests, but only that the source’s interests be motivationally sufficient to the creation of the propaganda.

Scale. Least distinctive but still relevant is the fact that propaganda is primarily associated with mass communication media, and thus mass audiences.

Within these parameters, it is often useful to further differentiate between various kinds of propagandas along at least two other dimensions: in terms of transparency, propaganda comes in shades of white (overtly disseminated, accurately sourced), black (covertly disseminated, unsourced, or deceptively sourced), or grey (some admixture of the two). In terms of purpose, it can be agitative (inducing targets to act in opposition to a perceived threat or power) or integrative (aligning, unifying, and reconciling targets with an extant power). Relatedly, one can further distinguish between propaganda itself and sub- or pre-propaganda (messages intended to lay the cognitive and emotional groundwork for future propaganda campaigns).

The most obvious examples of propaganda occur during wartime, when it is used domestically to foster support, recruitment, and production for war, and externally to enlist allies, deceive enemy combatants, or persuade them to surrender. In peacetime, its most salient form is advertising, but propaganda is ubiquitous and polymorphic in the modern world—from political spin, lobbying, and voter suppression to commercial public relations and marketing, religious proselytizing, and bureaucratic reports. More expansive conceptualizations further extend the term to encompass most forms of education, journalism, and mass communication in general.

Its pervasiveness may well be an inevitable feature of the modern world. Integral to the Western democratic ideal is the privileging of public opinion as the basis for public policy and collective judgment, along with a reliance upon persuasion as its modus operandi—as manifest in Western culture’s historical emphasis on rhetoric in education, and as institutionalized in its constitutional protections of the rights of speech and assembly, its adversarial legal systems, and its elected and divided government. Meanwhile, the Enlightenment ideal of rational individuals has produced a world in which information is the most valuable commodity and instrument of persuasion. The consequent sovereignty of public opinion and power inherent in informational control has led those parties with political, commercial, or other interests in public policy or behavior to see propaganda as a necessary means to their ends. Greatly abetting the efficacy of propaganda at securing these ends are three other characteristically modern factors: the explosion of mass media technologies and their subsequent penetration of culture; the application of scientific methodology to social research, especially with regard to attitude formation and persuasion; and the reliance on market-based systems of media financing, which amplifies the leverage that interested parties can wield via concentrated ownership, promises to provide (or threats to revoke) sponsorship, and actual or threatened legal action in civil court. Finally, modernity may also create a complementary demand for propaganda among target citizens whom it has deprived of the identities, certainties, and purposes of traditional social arrangements, and which propaganda may in part provide.

The inevitability of propaganda is by no means a warrant for complacency about it. While it may be a predictable by-product of Enlightenment rationalism and democratic faith in public opinion, it is in a real sense antithetical to both. In its dependence upon peripheral means of persuasion, it reveals and endorses a decidedly counter-Enlightenment assumption that individuals are cognitively incompetent and manipulatable. In their willingness to use
such tools to sway public opinion to serve their interests at the expense of those of their targets, propagandists undermine the real and presumptive viability of public opinion as a basis of government, and thence of democracy itself. The defenses of abject cynicism or self-serving selective credulity that those subject to propaganda erect against it are no less ominous for democracy than is the obverse naïveté. To many observers, the prevalence of propaganda among a population that has developed a taste for the willful manipulation of its responses for entertainment purposes and that increasingly lacks the factual ammunition or theoretical footings to adequately challenge it presents a significant threat to democracy. The prominent role of propaganda in the debacles and horrors of the past century does little to assuage such concerns.

But the demonization of propaganda per se is as unproductive as is complacency toward it. Especially in its integrative forms, it is arguably not only inevitable but necessary to the creation and maintenance of the large, modern, and heterogeneous states that house, however imperfectly, the ideals of reason and democracy. Even in its agitative forms it has legitimate uses—it is likely better for all concerned that an enemy soldier peaceably surrender earlier rather than be killed later in a conflict. Furthermore, propaganda is a product of its environment. That is, it is as powerful as it is only because of the preeminent place of the individual and public opinion in modern society. History shows that in less “enlightened” environments, power and coercion take forms that are decidedly more direct, violent, and absolute. Indeed, modern abuses of propaganda have typically produced significant, albeit belated, counter-responses. Its pivotal role in WWI led to widespread public outcry and the establishment of the Institute for Propaganda Analysis. The Vietnam conflict led to a similar, if less institutionalized, response in the 1970s. Finally, the 1990s saw a reemergence of oppositional interest in commercial propaganda, and there are signs that a resurgence of interest in more political forms is presently underway.

PROPERTY CRIME

The Uniform Crime Reporting (UCR) program of the Federal Bureau of Investigation (FBI) defines property crimes as the offenses of burglary, larceny, theft, motor vehicle theft, and arson. (Shoplifting and vandalism are also property crimes but are not reported in the UCR.) These crimes do not involve force or threat of force against victims, and their purpose is generally the taking of another’s money or property. In 2006, law enforcement nationwide reported to the FBI a total of 9.98 million property crimes, accounting for an estimated $17.6 billion in losses. Two thirds of all these crimes were larceny-thefts.

In the United States, during 2006 an estimated 3,335 property crimes per 100,000 inhabitants occurred. These numbers, however, vary by environment. For example, in 2006, for every 100,000 inhabitants, the nation’s cities collectively had 3,991 property crime offenses, while suburban counties had 2,478 and rural counties had 1,667. Overall, according to Bureau of Justice Statistics data, property victimization rates have been declining since 1975, when the estimated number of victimizations per 1,000 households was more than 550. In contrast, in 2006, this number was 159.

The UN Interregional Crime and Justice Research Institute reports that with a rate of 10 percent (people victimized by property crime as a percentage of the total population), the United States has the seventh-highest property crime victimization rate (the top three are New Zealand, Australia, and Italy, with respective rates of 14.8, 13.9, and 12.7 percent). The weighted world average is 8.6 percent and points to the relatively small differences between nations. Also, crime statistics often do not reflect actual crime prevalence as much as they reflect the prevalence of law enforcement, the effectiveness of law enforcement, and the willingness of people to report crime.

The social response to property crime raises the issues of how law, law enforcement, and punishment
function as a protection system for property owners. On the one hand, classical criminologists point to property crime as commonly being a “crime of opportunity” and consider this evidence for a “rational choice” theory of crime. On the other hand, critical criminologists argue that modern Western societies are defined by large and far-reaching systems of social control, put in place by the organizational work of those who own the larger share of community resources (e.g., economic wealth, social capital). Critical criminologists characterize such social control work as an antidote to the problems of unequally distributed wealth and the lack of equal access to opportunity for all members of society. While the former consider the moment the crime is committed as central, the latter focus on the reality of class struggle; the presence of social, political, and economic inequality; and the impact of social-structural forces in the definition and management of crime.

Prostitution

Prostitution, known as the world’s oldest profession, exists in all countries and cultures, and is as old as recorded history. Prostitution consists of male or female exchange of sex or sexual intimacy for money or resources such as food, shelter, or clothing. It can take the form of street prostitution, escort prostitution, sex tourism, and a host of other varied forms. Prostitutes solicit customers at street corners or provide sexual services at the customers’ residences, in hotel rooms, or in brothels. A new and growing form of prostitution involves sexual services in developing countries for wealthy tourists from developed countries.

Feminists’ Views on Prostitution

Since most prostitutes are women, prostitution is a highly controversial issue in feminist thought and activism. Generally speaking, there are five camps of feminists who express their strong views on prostitution.

The first camp is anti-sex feminists such as Andrea Dworkin and Catharine MacKinnon. Proponents of this view claim that the very meaning of sex is male domination and that the nature of prostitution involves male power and female subjugation. According to Dworkin and MacKinnon, the act of sex, created by and for male supremacy, turns women into no more than objects.

The second camp, made up of pro-sex feminists, is anti-prostitution, arguing that prostitution robs women of control in sex acts and the ability to experience sexual intimacy outside of work. Selling sex acts and illusions of sexual desires leads to an impoverished sexual and emotional life that deprives women of the ability to experience sex in a non-instrumental way.

The third camp is romanticist feminists who argue that prostitution corrupts and undermines positive sex based on love. Prostitution, to them, is the antithesis of positive sex because sex should only be associated with love, intimacy, and affection. Feminists such as Kathleen Barry argue that positive sex can only emerge with trust and sharing rather than with cash and contracts. Prostitution encourages violence against women, thereby jeopardizing positive sexual experiences and contaminating the society like a virus. They thus advocate cleansing the society through abolishing prostitution.

The fourth camp is libertarian feminists who argue that it is women who have complete control in prostitution. The fact that men have to buy women’s attention with money is a confession of men’s weakness rather than a sign of their power. In other words, men feel powerless facing women’s sexual power. To them, prostitution is the source of women’s power rather than the root of oppression.

Feminists in the fifth camp represent a variation on the libertarian view. They argue that prostitutes threaten patriarchal control over women’s sexuality.
and invoke sexual subversion through prostitution. They contend that the state regulates and punishes women’s bodies by criminalizing non-procreative sex and restricting access to birth control and abortion. Prostitution is a terrain of struggle where women, far from being passive sexual objects, exhibit sexual agency and challenge the existing sexual order.

**State Policies**

Generally speaking, four types of official policies toward prostitution currently exist.

The United States, with the exception of the state of Nevada, represents the *prohibitionist policy*, making the buying and selling of sexual services illegal. Some feminists argue that in this system, law enforcement targets prostitutes rather than those who profit from their income and morally condemns women who choose prostitution. According to these feminists, illegality drives prostitutes underground and makes prostitutes totally reliant upon pimps and police officers.

A *regulatory policy* exists in such countries as Germany, the Netherlands, and Senegal. These countries legalize and regulate prostitution through registration, collection of taxes, and regular physical tests. Prostitutes by law must register with the police and have regular tests for sexually transmitted diseases (STDs), and they face penalties if they fail to do so. Some women choose not to register to avoid the accompanying stigma.

Some European countries, such as Sweden, the United Kingdom, and France, have an *abolitionist policy*. This policy rejects the state’s regulation of prostitutes but makes it illegal for third parties such as brothel keepers or pimps to be involved with prostitution. This view holds it immoral and unethical for the state to regulate prostitutes, recognizing them as victims of social and economic hardships. By making third parties illegal, it pursues a policy of discouraging prostitution while not prosecuting prostitutes themselves, who are considered victims.

A fourth policy, adopted by New South Wales, Australia, and New Zealand, is to legalize prostitution but leave it totally unregulated. This *decriminalization policy* acknowledges that women have the right to determine their lives and choose their profession. This policy is favored by many organizations in full support and protection of prostitutes’ rights, believing that criminalization of prostitution can only lead to exploitation, violence, and abuse. Thus exploitation and trafficking in women cannot be stopped unless the law recognizes and protects prostitutes’ legal and social rights.

**Prostitution in Western Europe**

Prostitution is legal in most of Western Europe, although most countries have restrictions against streetwalking and brothels. In Germany, hundreds of thousands of women from Russia and Ukraine are sex workers in escort agencies, apartments, houses, or clubs such as sauna clubs, massage services, and bars. Their income is taxed, and they are free to advertise their services in public media. Although the law does not require physical examinations for prostitutes, many brothels do require them.

In Western Europe generally, women are trafficked from Africa, Asia, South America, Iran, and the Caribbean. In Italy, for instance, 60 percent of all prostitutes are trafficked from Nigeria; in Belgium, the Netherlands, and Italy, Iranian women account for 10–15 percent of the prostitutes. In Amsterdam, even though non-European prostitutes without parents in residence are illegal, foreign women make up almost 90 percent of the prostitutes who are displayed in windows in the red light district. While this law is obviously not enforced, its intent is to provide economic protection for the Dutch prostitutes.

**Prostitution in the United States**

Prostitution is illegal in the United States except for the state of Nevada. In 12 counties of Nevada, there are more than 30 licensed brothels, and mandatory physical examinations are required of these registered prostitutes. Despite the prohibitionist policy, prostitution is common throughout the rest of the United States. Prostitutes may work alone, may be controlled by pimps, or may be associated with escort agencies. A common cause of prostitution is drug addiction. Escort prostitutes masquerade as entertainers or companion hostesses in escort agencies, bars, chiropractic offices, and massage parlors. A relatively new source of prostitutes in the United States is foreign-born women who are trafficked around the globe each year. An estimated 20 percent of the 1 million-plus females trafficked worldwide are smuggled into the United States to work in brothels.
Prostitution in Developing Countries

Many prostitutes in developing countries choose the profession to support their children, siblings, and parents, or because they are divorced or disowned by their families. Some children are even sold into prostitution by poor parents. In many developing countries, young girls between the ages of 10 and 16 are in high demand by clients. Many of these countries are both the source and destination for trafficking of women. For instance, women may be trafficked from Burma, Laos, Cambodia, and China to Bangkok, Thailand; from Nepal to East and South Asia, and the Gulf; and from Thailand and China to South Africa.

Because prostitution is illegal in many developing countries, it occurs in brothels camouflaged as massage parlors, hostess bars, karaoke bars, nightclubs, or teahouses. Prostitutes are subject to police harassment, incarceration, and HIV infection. Condom use is inconsistent among sex workers due to cultural norms, financial concerns, and the power hierarchy between sex workers and clients. While HIV prevention programs have been quite successful in countries such as Thailand and Uganda, most developing countries are experiencing an increase in HIV/AIDS infection due to the secret nature of sex work and political inertia.

Prostitution, Child

Generally, prostitution or involvement in commercial sex means sexual transactions for money or some form of material goods. Recent research into the problem of child prostitution confirms that, far from abating, its incidence may be higher than ever, particularly in the form of international trafficking of children for commercial sex. Precise information is difficult to obtain, since, by its very nature as an illegal and covert practice, it remains largely hidden. The involvement of children in prostitution exposes sensitive cultural areas, especially in the West, where ideas regarding childhood, the family, and sexuality have become increasingly defined. Many historians agree that the idea of childhood as distinct and requiring particular recognition and accommodation became established in the West by the end of the 19th century. The involvement of children in commercial sex clearly negates an image of children as asexual, dependent, and innocent.

Child prostitution often occurs where there is poverty, conflict, economic and social instability, and/or child labor. For example, in the late 20th century, instability and conflict in Eastern Europe increased the flow of both children and women into the commercial sex industries of the European Union. Generally, unequal power relations around gender, age, and market factors tend to make children vulnerable to adult control and exploitation and historically enabled their prostitution both inside and outside the family in the West and across the globe. Furthermore, the global mass marketing and commercialization of child prostitution enables a greater supply of exploited children from many parts of the world.

One of the first and possibly most notorious of national media exposés of child prostitution was in July 1885 in the London newspaper *The Pall Mall Gazette*. This series of articles reported a clandestine trade in young girls for brothels in London and Europe. The sensational and salacious “Maiden Tribute of Modern Babylon” stories excited the first national moral panic on the subject of child prostitution. These accounts helped entrench for the next century the dual depiction of children and young people involved in commercial sex as either abducted and betrayed innocents or tainted and corrupted. These “Maiden Tribute” articles and the events surrounding them provided the crucial force in Britain to ensure the final passage of the Criminal Law Amendment Act in 1885, which increased the age of consent from 13 to 16 (previously raised from 12 in 1875) and augmented police powers to deal with vice. The balance between control and protection became an enduring feature of debates on child prostitution and on youthful delinquency in general.
This issue of a mythology of the white slave trade with origins in the late 19th century remains widely held in modern society. This narrative has in part served to distort representations of the social problem of child prostitution by distancing it from connections with recognizable daily life. The story dramatized as the white slave trade in Britain, Europe, and the United States was of forced abduction of innocent young white girls and women, usually by foreigners, to work in brothels overseas. While this story had, and still has, a great deal to say about racism and social fears during the 20th century regarding increasing freedoms enjoyed by women, changing sexual mores, migration, and new locations of leisure activity, it reveals little about child prostitution. In the early 21st century, with Western governments increasingly concerned about human trafficking and the supply of children, the mythology of the white slave trade often serves to obscure more than it exposes real experience. The terminology of trafficking and of slavery remains a part of the debates on child prostitution, but the imperialist and racist emphasis on the victims as white has essentially ended. After the mid-20th century, trafficking became defined in terms of movement and exploitation rather than of color.

Historically, it is the international traffic in children that prompts the most forceful official action, although trafficking also occurs within a country, often from rural to urban areas, as well as across national boundaries. In 1953, the United Nations amended the League of Nations Slavery Convention of 1926, which highlighted the human rights issues of slavery and “slavery-like practices,” including the slave trade, sale of children, child prostitution, and the exploitation of child labor. During the 20th century, agencies working to combat the exploitation of children in its many forms multiplied, and the problem of child prostitution became part of the work of international organizations such as the UN Children’s Fund (UNICEF), the International Labor Organization, and also various nongovernmental organizations. Article 34 of the 1989 UN Convention on the Rights of the Child called for appropriate action to prevent the inducement or coercion of a child to engage in unlawful sexual activity. In the late 20th century, extraterritorial legislation sought to enable countries to prosecute their citizens for sexually abusing children while overseas, the so-called sex tourism. This was a major theme of the 1996 First Congress Against the Commercial Sexual Exploitation of Children, organized by ECPAT, UNICEF, and the nongovernmental Group for the Convention on the Rights of the Child.

**Psychoactive Drugs, Misuse of**

Any substance that chemically alters the functioning of the brain or nervous system is a drug. A _psychoactive drug_, also known as a psychotropic drug, is a chemical substance that affects consciousness, mood, perception, and/or behavior. Such drugs are often used to treat various forms of mental illness—including anxiety or bipolar disorders, depression, and paranoia—as well as to assist people in ending their addiction or overdependence on alcohol or other drugs. Other medicinal uses are in anesthesia, as painkillers, or as a prescribed stimulant to treat attention deficit disorder (ADD) or help curb one’s appetite. In addition, throughout human history people worldwide have used psychoactive drugs, especially hallucinogens, as part of their religious practices. Native Americans are one such group, and in the United States they alone may legally cultivate and use the hallucinogen peyote.

Depending on the substance, ingestion of a psychoactive drug can be accomplished orally (drinking an alcoholic or caffeine beverage; chewing [such as coca leaves]; or digesting [such as psychedelic mushrooms]; swallowing a capsule, pill, powder, or tablet) or through inhalation, injection, rectal suppository, or smoking. Though varying in intensity and impact, all...
psychoactive drugs have some specific effect on one or more neuroreceptors or neurotransmitters in the brain. That temporary effect is the targeted goal, whether medical or recreational. Some drugs are more addictive and dangerous than others. One danger is that drug abuse and long-term exposure to many psychoactive drugs may lead to desensitization or tolerance, encouraging the user to increased usage, then addiction, brain or other physical damage, even death.

The misuse of psychoactive drugs for recreational use is what constitutes a social problem. Moderate recreational use of some drugs—such as alcohol, caffeine, and, some would even argue, marijuana—does not pose as great a threat as experimenting with such addictive drugs as cocaine, crack, and heroin, or club drugs (synthetic drugs such as ecstasy, Rohypnol, GHD, and ketamine). These drugs are neurotoxic; they damage brain cells in parts of the brain critical to thought and memory. Increasing the dangers to one’s health is multiple drug use, most commonly the mixture of alcohol and other psychoactive drugs.

The National Survey on Drug Use and Health reported that in 2006 an estimated 20.4 million Americans (8.3 percent of the population) ages 12 or older were current (past month) illicit drug users, 125 million (50.9 percent) were current drinkers of alcohol, and 72.9 million (29.6 percent) were users of a tobacco product. With such extensive use, perhaps it is not surprising that the Drug Abuse Warning Network (DAWN) reported that in the same year more than 1.4 million visits to hospital emergency departments involved drug misuse or abuse in 2005.

PSYCHOPATH

Hollywood fueled popular perceptions of psychopathy with film representations of deranged serial killers such as Dr. Hannibal Lecter, played by Anthony Hopkins in Silence of the Lambs, and unhinged jilted lovers such as Glenn Close’s portrayal of Alex Forrest in Fatal Attraction. Off screen, the real-life characteristics of psychopaths can be equally mesmerizing, and include the ease with which the psychopath victimizes others without any remorse or empathy. This frightening characteristic was on display in high-profile crime cases of serial murderers such as Ted Bundy, who confessed to killing 28 women before being executed, and Dennis Rader, the “BTK Killer” from Wichita, Kansas.

The core characteristics of the psychopath are antisocial behavior coupled with the inability to connect with other human beings on an emotional level. For some, the allure of the psychopath is that it is inconceivable that people who appear so “normal”—or as one psychiatrist wrote, wear a “mask of sanity”—feel no guilt or remorse for their antisocial behavior.

Definitions of psychopathy ranged from “insanity without delirium” and “moral insanity” in the 18th century—both indicating moral deficiencies without subsequent deficiencies in intellectual functioning—to the mid-20th-century clinical profile of the psychopath, which contained 16 characteristics, among them egocentricity, lack of remorse, antisocial behavior, absence of delusions and other signs of irrational thinking, and untruthfulness. A more recent contributor defined psychopathy as consisting of characteristics along two dimensions: emotional/interpersonal and social deviance. Along with social deviance characteristics such as impulsivity, poor behavioral controls, need for excitement, and antisocial behavior are also the characteristics that address emotional and interpersonal areas. Among those are glibness and superficial charm, egocentrism and grandiosity, lack of remorse and empathy, deceitfulness, and shallow emotions.

While sometimes used synonymously, psychopathy may be distinguished from antisocial personality disorder (ASPD) as defined in the American Psychiatric Association’s Diagnostic and Statistical Manual of Mental Disorders IV-R. Criteria for ASPD emphasize behavioral characteristics such as disregard for the law, deceitfulness, impulsivity, aggressiveness,
irresponsibility, and lack of remorse. Unlike the concept of psychopathy, the ASPD does not include additional emotional deficits such as shallow emotions, superficiality, and grandiosity. Though there is much overlap among antisocial personality, psychopathy, and criminality, not all criminals are psychopaths. Research reveals that psychopathic offenders are more likely to be aggressive and violent than non-psychopathic offenders and also more likely to recidivate. The prevalence of psychopathy is estimated at 15 to 25 percent among incarcerated federal offenders.

The most well-known diagnostic tool for psychopathy, is the Psychopathy Checklist (PCL), first developed in 1980 and later revised. The PCL-R is a tool to aid clinicians and researchers in identifying psychopaths and is widely recognized as a reliable predictor for violent behavior. Other instruments used for risk assessment that feature a measure of psychopathy include the Historical, Clinical, and Risk Management Scale and the Violence Risk Appraisal Guide.

Psychoses

Psychosis is a state in which one loses contact with reality. Originating from either mental or physical conditions, its symptoms include delusions, hallucinations, disorganized speech or behavior, and a decrease or loss of normal functions. A hallucination can be hearing a voice that is not actually there, while a delusion is a fixed false belief that is not true. A decrease or loss of normal functioning may mean difficulties speaking and expressing emotions. Mental and physical disorders associated with psychoses include schizophrenia, psychotic depression, bipolar disorder, delusional disorder, and drug-induced psychosis. Those dealing with a psychotic episode often experience social withdrawal. In addition, they may not realize that they have a mental illness and go for years without treatment. At the same time, their mental state may affect their education, employment, and relations with friends and family.

Denial, stigma, and fear are barriers to seeking treatment. Psychosis can cause feelings of shame and stigma not only to those individuals but also to family and friends. In 1963, Erving Goffman described stigma as “deeply discrediting” attributes that are normally undesirable. Manifestations of stigmatization are embarrassment, anger, avoidance, fear, stereotyping distrust, and bias, any of which can reduce patients’ access to resources and opportunities, leading to low self-esteem, isolation, and a sense of hopelessness. Many people with serious mental illness deal with both internal and external challenges. That is, the disabilities and symptoms stemming from psychosis challenge them, as does dealing with the discrimination, assumptions, and stigma that result from misunderstandings about mental illness.

Fear and stigma about the mentally ill abound in society. Those experiencing psychosis often experience myths and misunderstandings about their illness. While societal understanding about different forms of mental illness has increased, the belief continues among many that people with psychosis are more violent now than they were in the past. Perceptions and misconceptions that people with psychosis are dangerous are a critical factor in others keeping or desiring social distance from them. As a result of these misunderstandings, people with mental illness often experience discrimination and lack access to the full range of opportunities such as employment, adequate health care, safe housing, and integration and/or socialization with diverse groups.

PUBLIC OPINION

Public opinion is a collective attitude or preference concerning political issues shaped by a varied and complex interplay of factors. Group membership, personal experience, gender, race, education, class, media, government officials, elites, religion, geographical region, culture, and political ideology all affect socialization and knowledge acquisition that influence and are influenced by public opinion. Public opinion tends to be stable over time, but historical and catastrophic events, economic or technological changes, personal experiences, and group replacement may cause it to shift. Polling is a primary means to collect public opinion, and, despite its shortcomings, most agree that polls are invaluable to democratic societies.

Public opinion is vital to the concept and practice of democracy. The U.S. Declaration of Independence, for example, decried the British Crown for not adhering to the people’s voice. However, the institutional structure of the U.S. political system hinders democratic responsiveness. Staggered elections, gerrymandering, the Electoral College, single-member winner-take-all plurality elections, voting discrimination, a non-elected judicial branch with the power of judicial review, a large non-elected bureaucratic sector, and unequal representation in the Senate are all structures that insulate policy making from public opinion. Moreover, representatives have no legal obligation to adhere to public opinion. Consequently, many Americans believe their opinions do not matter in policy making.

Media and Public Opinion

Most scholarship agrees that the media are central to opinion formation and expression. Critical theorist Jürgen Habermas conceptualized that a “public sphere” is necessary for democratic societies to deliberate and reflect on substantive issues to develop and ascertain the common good. The media play a crucial role in that public sphere, especially in large societies like the United States. Walter Lippmann observed that the media play a vital role in shaping the public’s reality of the world around them. Many scholars since then have documented the significant influence the media have in shaping public opinion. The media perform an agenda-setting function that does not necessarily tell the public what to think but has considerable power to tell the public what to think about. In short, the media make some issues more salient than others. Numerous studies demonstrate that issues receiving heavy coverage like drugs or crime often become top priorities in opinion polls, but that the news media disproportionately convey the views and interests of those with power. Corporate conglomerates own and control most mainstream news organizations, and political and economic elites often define and dominate the news. The result is an information system that reflects dominant interests.

In addition to shaping opinion, the media report public sentiments mainly through polling data. Opinion surveys have become so central to politics and the news that many media outlets operate their own polling organizations or frequently commission surveys. Media use of polling data, however, is selective. For example, polls are prominently featured, often in superficial “horse race” surveys, on matters of presidential and congressional elections. Yet polls lack this centrality when the media cover most areas of policy, because, as some scholars argue, public opinion does not coincide with elite preferences. Furthermore, this point highlights that individuals are not in a passive, vegetative state when consuming the media. They actively construct and interpret information and messages.

Elites and Public Opinion

Some well-known commentators such as Walter Lippmann believe that the public is best treated as spectators to political life, asserting they hold irrational and conflicting preferences. Though they would rarely disclose these sentiments publicly, according to
one Pew Research Center survey, the vast majority of policymakers polled agree with Lippmann that the public is incapable of making informed judgments about policy. Other analysts, however, demonstrate, mainly through aggregate polls, that the public often holds more rational or prudent views than most political and economic elites.

Despite declarations to the contrary, policymakers routinely ignore public opinion, especially in areas of economic and foreign policy. Research shows that political leaders track public opinion not to shape their policy positions to the public’s preferences, as is generally assumed, but to craft their policy message in order to move public opinion to the politician’s preferences. The objective is to minimize potential opposition to policies not supported by the majority of the public rather than to alter the policy. This threatens the very notion of popular sovereignty.

Many policy elites rely on the news media and other elites for public opinion rather than polling data. Scholars argue that the corporate community uses its structural, social, and knowledge advantages to articulate and convey its policy preferences to the public and government. Through policy-planning, opinion-shaping, and candidate-selection apparatuses, socioeconomic elites ensure more political access and policy responsiveness than the general public. Thus, policymakers’ indicators of public values are class biased and often do not represent the general public.

**Collecting Opinion**

Despite institutional barriers to political participation, technological advances have increased the possibility for greater public involvement in policy making. The United States is one of the most heavily researched societies in terms of public opinion, with the government alone conducting more than a million surveys a year. However, public opinion is a complex phenomenon and in a society of more than 300 million residents, collecting and ascertaining public opinion is not without its obstacles.

All forms of opinion collecting are indications and interventions of public opinion. Critics argue that pre-coded survey questions and forced-choice answer responses, the most widely used opinion measure, fail to capture the complexities of an individual’s decision-making process. For example, responses such as “strongly agree” and “agree” fail to empirically quantify the magnitude of public preferences. Furthermore, some polls construct opinions rather than capture them, because surveys may make an issue more salient than others, thus creating the impression of public importance.

Polling may not capture actual public sentiment, since research shows that Americans are misinformed on many policy issues. A notable example is citizens’ views toward U.S. foreign aid. Those polled preferred cutting foreign aid spending by half but perceived that it took up nearly 20 percent of the U.S. budget. In reality, the United States allocates less than 1 percent of its budget to foreign aid. The paradox for opinion measurement is that those polled prefer drastic cuts while simultaneously advocating massive spending increases.

An additional problem is framing. Research shows that the way questions are framed or worded may significantly affect the outcome of the answer and not capture true preferences. For example, programs for “the poor” receive significantly more support than “welfare” programs, despite referring to the same policies. The difference reflects the meaning of the terms, since most language lacks neutrality. Elite discourse, especially in the media, often influences and defines the terminology. At the extreme end of framing are “push polls”—loaded questions intended to influence the survey’s outcome. Measurement and sampling errors hinder accurate assessments of policy preferences. Sampling is important because of the high transaction costs that would incur gathering everyone’s opinion; accurate sampling is also important because public opinion is not homogeneous, varying by gender, class, religion, and other factors. Also skewing polls are the respondents’ private views and the preferences expressed, assuming they answer the questions at all. Thus, it may be difficult to determine genuine public opinion concerning sensitive topics because of participants’ unwillingness or fear of the potential costs of expressing actual sentiments. Furthermore, research shows that knowledge is unequally distributed and the resource rich are more likely to effectively link and express personal preferences.

In addition to shaping opinion, technology changes the collection of public opinion as cell phones, call screening devices, “Do Not Call” lists, and wariness toward strangers make it increasingly harder for pollsters to ascertain public preferences. The Internet, however, presents new avenues (and problems) to opinion collection and expression.

Polls measure what we claim to know but often fail to determine how and why we know it. They lack
context by focusing on opinion outcomes without considering the social forces and assumptions that inform those opinions. These issues are not to imply that polls are meaningless, but rather to acknowledge that surveys establish a specific framework for which opinion is measured and it is imperative to understand the limits and constraints of the frameworks. Moreover, the act of measuring opinion itself requires considerable resources that are mainly enjoyed by a small population segment.

PUBLIC–PRIVATE DICHOTOMY

Using the public–private dichotomy to describe social policies can be misleading.

Characterizing any dichotomy are two mutually exclusive parts that together comprise the whole. A public–private dichotomy fits a social policy system if its components are clearly public or private, but not both. Together, public and private exhaust all kinds of social policies. If any policies fall outside this either/or categorization, then it is a false dichotomy, or a mistake to use the dichotomy label.

The importance of social policies rests in their affecting welfare through provision and regulation. Social policies often provide such services as education, health care, and psychological counseling. Social policies may also provide income or in-kind benefits, such as food stamps, subsidized housing, or school vouchers. Social policies may regulate human behavior, particularly if enacted as law to regulate food quality, require school attendance, or mandate medical testing.

Conceptualization of public–private qualities of social policies considers five key characteristics: accountability, management, stimulus, eligibility, and who pays. Public implies democratic accountability. Public social policies are established, managed, modified, and sometimes eliminated by government officials who are either elected or accountable to elected government officials. Private does not mean a lack of accountability, but that another entity, perhaps the individual alone, is responsible for the program. For example, an individual can decide to establish a savings account for eventual retirement, how to invest the funds, and eventually when and how to withdraw the funds.

A key component distinguishing public and private programs is who or what manages the social policy program. Government officials or a government institution manage a public program, such as the federal government administering Supplemental Security Income, the Social Security public program that provides a pension to individuals who have low incomes. Private entities manage a private program; for example, for purposes of saving for retirement, an investment company forms a fiduciary relationship through contract when managing an investor’s savings.

Another key component for characterizing a social policy program as public or private is the program’s stimulus. Many public programs obligate an individual to participate. The Social Security program mandates that nearly all paid workers contribute to the Social Security program. In contrast, an individual is not required to place his or her earnings in a private savings account.

Perhaps the most visible components for characterizing a social policy program as public or private are eligibility and who pays. Typically, we think everyone
is eligible to enroll in a public social program or benefit from a public social service. A clear example is public elementary education. All children in the United States are entitled to a free and appropriate public education. In contrast, private schools establish procedures to decide on admission of a child, including application fees, admission tests, and interviews. The private school controls eligibility and can decline to admit an individual.

The last key component is who pays. Medicaid is a U.S. public health insurance program that is financed by federal and state government revenues. An individual who self-pays for private health care relies on his or her own funds and health and financial acumen to protect his or her well-being as the sole payer.

When applied to social policies, public and private labels can hide critical aspects of social policies, including similarities. As is true for public programs, the federal government does stimulate and manage many private social policy programs. For example, it obligates employers who offer defined-benefit pension programs to contribute premiums to the Pension Benefit Guaranty Corporation, a federal organization that insures payment of pensions in case the employer is incapable of doing so. The federal government regulates vesting and portability of employment-based health insurance and pension plans through laws like the Employee Retirement Income Security Act and other laws. Because government regulates many private social policies, it is incorrect to say that many public–private social policies can be categorized into one or the other.

Public–private designations can be confusing. An important example is who pays for Medicare hospital insurance in the United States. Medicare is the largest U.S. public health insurance program, yet the federal government does not pay for Medicare Part A. Employers and employees pay for Medicare Part A, which is hospital insurance, through payroll taxes. In contrast, U.S. employment-based health insurance plans are considered private, but these plans enjoy tax advantages paid for by U.S. taxpayers. In debates over the number of Americans without health insurance, spiraling costs, and Medicare’s uncertain future, what frequently goes unnoticed is the fact that many U.S. taxpayers financially support others’ private health insurance even when their own employers do not offer health insurance. Private health insurance is an example of a social policy in which it is difficult to exclude public from private efforts because social policy has purposely made it difficult to divide public from private efforts.

The public–private dichotomy can weaken eligibility and accountability. Across the country, many communities are responding to failing public school systems by offering vouchers to parents and caretakers to apply to a nearby school, whether that school is a public school, private school, or religious school. A problem with this voucher system is that many children are eligible only to attend the public school system where they reside. Most children cannot enroll in some of the private and parochial schools because they require supplemental tuition, which most low-income families cannot afford. Because of this barrier, many children are eligible only to receive education from public systems that their governments regard as failures.

In Zelman, Superintendent of Public Instruction of Ohio, et al. v. Simmons-Harris, et al., 536 U.S. 639 (2002), the U.S. Supreme Court ruled that the Ohio public voucher scheme does not violate separation of church and state because the state government does not directly fund parochial education. Instead, this public–private relationship allows the Ohio state government to transfer tax revenue to private individuals, who can then apply the tax revenue to a private, religious school. Because it is private and religious, the school’s curriculum is beyond democratic accountability; voters cannot hold school officials accountable for what is taught, despite the school receiving tax revenues. This voucher example highlights that private is a label not only for market, but also for religious and nonprofit undertakings.

With the potential harms of these social policy complexities, should we reject the public–private dichotomy? The public–private dichotomy is useful for identifying inconsistencies in and revealing inequities arising from social policies. An important example is the decision to have a child or adopt a child. Although considered among the most private of decisions, for some people becoming a parent is a public decision. Laws and social policies influence this decision and, in some cases, prevent choices. In the United States, strenuous debates continue on whether a gay couple has the right to adopt a child, with some states completely prohibiting adoption and some states requiring gay couples to follow a legal process. Public debate also centers on whether a parent or caretaker should be able to control a minor’s decision on whether or not to become a parent.
In nearly half of the states, a minor must have a parent’s consent to have an abortion, and in most of the remaining states, a minor must prove she has first notified her parents. What is a private decision for many people is a decision shaped by laws and social policies for gay couples and minors.

Despite these instances of government intervention into private matters, some decisions are still considered beyond the realm of public social policy. One instance is corporal punishment of children. If I strike a neighbor’s child, the police will probably charge me with assault. If I strike my spouse inside our home, the police will probably charge me with domestic violence. If I strike my child, however, it is not an assault, and inside my home, it is not domestic violence. The public–private dichotomy thus raises questions of why public intervention toward some groups is legal but toward other groups is not acceptable.

The public–private dichotomy is frequently used to define and designate social policy responsibilities. A review of key characteristics suggests the public–private dichotomy is a false dichotomy, because many social policies incorporate public and private efforts to provide benefits and services. Nevertheless, even if a false dichotomy, the public–private dichotomy may still be useful for exposing inconsistencies in and inequities arising from social policies.

**QUEER THEORY**

*Queer* is often used as an umbrella term by and for persons who identify as gay, lesbian, bisexual, intersex, and/or transgender, or by and for individuals who use the term as an alternative to LGBTI (lesbian-gay-bisexual-transsexual-intersex) labels. Some individuals, depending upon their race, class, personal experience, and also their generation, find the term derogatory. Recently, heterosexuals whose gender or sexuality does not conform to popular expectations have used the term *queer* to define themselves. Thus, queer theory is a framework of ideas that suggests identities are not stable or deterministic, particularly regarding an individual’s gender, sex, and/or sexuality. Queer theory focuses on critiquing and problematizing previous ways of theorizing identity. While heteronormativity assumes that heterosexuality and the relations of the binary masculine and feminine genders expected within it are secure and constant, queer theory is a discourse model that destabilizes the assumptions and privileges of secure heteronormative models of study and everyday life and politicizes and acknowledges the fluidity and instability of identities.

Queer theory is a part of the field of queer studies whose roots can be found in women’s studies, feminist theory, and gay and lesbian studies, as well as in postmodern and post-structuralist theories. In 1991, Teresa de Lauretis used the words *queer theory* to describe a way of thinking that did not use heterosexuality or binary gender constructs as its starting point but instead argued for a more fluid concept of identity. Most researchers consider the works of Michel Foucault and Judith Butler as the founding texts of queer theory. Lauren Berlant, Michael Warner, and Eve Kosofsky Sedgwick are also major early writers in defining queer theory.

Proponents of queer theory argue that it prompts the acceptance and understanding of the complex reality in which we live. Queer theory provides scholars, activists, and others with ways of thinking and talking about identity beyond simple binaries, especially in fighting homophobia and transphobia (unreasoned fear and hatred toward homosexuals and homosexuality, and transsexuals, transsexuality, and transgender people, respectively). Examples include doctors performing surgery on intersex infants to select their gender and LGBTI people as the targets of violence. Queer theory often serves as a framework to study transvestitism, drag performance, the disparity between desire and gender, hermaphroditism, and gender identity disorder and gender corrective surgery. However, queer theory can also extend beyond the realm of gender of sexuality; in particular, when studying the politics of racial, ethnic, or class identities, scholars may wish to “queer the subject” by writing about these identities as fluid rather than as rigid or binary subjects.

**Further Readings**

The term *race* in its modern sense was first used in the 1700s by Europeans and European Americans to refer to what is now also called a “racial group.” Initially, *race* referred to biological differences believed to exist as distinctions between individuals or groups; however, racial groups can be understood as identity groupings as well as government-protected categories. Although race was once believed to signify significant biological differences, nearly all social scientists now refer to race as a social construct.

Race as a social construct can also signify differences or distinctions in an existing racial hierarchy. In a society, the process of racial “othering” or differentiation of “us” from “them” often causes significant changes in major societal institutions through embedded forms of racial discrimination, prejudice, and stereotyping. Given a racial hierarchy—a system of stratification—substantial inequality among a society’s racially defined groups can persist for centuries. As a racial hierarchy can exist in various institutions, its effects continue as an outcome of inaccurate stereotyping and imaging. Although the initiation of racial stereotypes as a means of differentiating or categorizing individuals evolved centuries ago, they can still persist as a method of enforcement of a racial hierarchy.

As a concept, race is a societal problem in the area of social differentiation when manifested in racism, with its many types of discrimination. White-generated racism today takes various forms. *Symbolic racism* involves the beliefs held by many whites that blatant racial discrimination is no longer significant and people of color are now making illegitimate demands for social and racial change. A related view is *color-blind racism*. A consequence of symbolic or color-blind racism occurs through what some call “reverse discrimination.” *Reverse discrimination* is a recent term used to signify belief in the existence of unfair government remedial policies induced to benefit people of color at a direct cost to whites. Another term held by social scientists is *systemic racism*, which encompasses not only white prejudices and stereotypes but also white emotions, discriminatory practices, and discriminatory institutions that are integral to the long-term domination of African Americans and other Americans of color. The reality of systemic racism is visible in discriminatory practices in areas such as, but not limited to, housing, health care, education, labor markets, politics, and government.

In 1997, the Census Bureau revised its data collection methods of race to signify the self-selection of race by respondents. Now, the conception of race held by the Census Bureau reflects a social definition of race. The Census conception does not use biological or genetic criteria but refers to what an individual in question perceives his or her own race to be. Because of this change, the Census Bureau currently has racial categories of American Indian or Alaska Native; Asian; Black or African American; Native Hawaiian or Other Pacific Islander; and White. In addition, a new category of “Other Race” now appears on the Census questionnaire, as well as an ethnic category of “Hispanic” to encompass people of Latin American origin, who can be of any race.
Racialized Institutions

Racism as experienced in various societal institutions can have severe consequences for various racial groups. For instance, the educational system is one primary area of U.S. society that continues to reveal the significance of racism in the form of extensive racial segregation. Through a large number of whites moving to the suburbs (“white flight”), school segregation is an ever-pressing issue that typically leaves children of color with substandard educational facilities, inexperienced teachers, and inadequate books and supplies. Not only is segregation an issue in elementary and secondary education, it exists in higher education as well. Given the increasing white accent on symbolic and color-blind racism, admissions policies and practices have changed and often exclude certain racial groups primarily because of scores on standardized tests and grade point averages. These policies often allow historically white institutions to remain predominantly white.

Race is also significant in the U.S. criminal justice system and in other U.S. government programs. In the early to mid-20th century, for example, U.S. social security programs were designed to ensure the economic security of older Americans, yet often excluded many African Americans and other people of color from receiving many of these benefits because their employers seldom made contributions to the system. U.S. governmental decisions dealing with welfare, work, and war during the 1930s and 1940s excluded or differentially treated African Americans—often playing a role in their becoming more disadvantaged vis-à-vis whites with the emergence of the modern middle class during and after World War II. After World War II, the government and private employers often excluded workers of color from many better-paying jobs. After decades of this exclusion, the rise of the 1960s civil rights movement (organized primarily to insist upon the rights of African Americans and other racial groups in society) and new government policies such as affirmative action helped to end openly discriminatory practices against individuals or groups based on race, ethnicity, nationality, or religion. With the introduction of affirmative action and other remedial policies, race as a means of overt and blatant exclusion was generally no longer acceptable.

In the area of the U.S. criminal justice system, racial profiling continues to be a significant problem for society. Racial profiling can best be understood as a practice in which law enforcement agencies treat a person as a suspect because of race, ethnicity, or nationality. This system is problematic because of the targeting of certain racial and ethnic groups more than others, as revealed by the disproportionate number of people of color targeted, harassed, or arrested by the police.

As history informs us, the United States was built on economic oppression in the form of the institution of slavery. From its incarnation, slavery oppressed African Americans by or through the systematic dominance of their labor. Several early intellectuals, such as Immanuel Kant and Thomas Jefferson, often wrote about the racial hierarchy that innately existed in our new society; this hierarchy places whites at the top and all people of color at the bottom. Thomas Jefferson, one of our country’s founders and a slaveholder, often spoke of the superiority of “whiteness” through his early writings on race. When the institution of slavery ended with the Civil War, soon thereafter Jim Crow (legalized segregation) sought to keep African Americans separate from whites through the introduction of laws. These laws were designed and instituted to keep African Americans, and later other people of color, in inferior racial positions. Jim Crow segregation was in place until the civil rights movement, when civil rights laws benefiting all individuals in society were fought for and eventually instituted. Although the civil rights movement made significant societal progress, racism is still far from eliminated.

W. E. B. Du Bois was the first U.S. social scientist to write about the social psychological aspects of race. He coined the term double consciousness, the two-ness felt by African Americans and other people of color. For Du Bois, this term represented the difficulty felt by black Americans in being defined as “black” (by whites) and yet trying to be themselves (as Americans) in a country that was not accepting of African Americans. Du Bois also pioneered in the early 1900s what can be understood as “whiteness studies.” Yet, it has only been in the past 2 decades that whiteness as a social construct has been significantly researched. Today, many social scientists view whiteness as a privileged category when understanding the significance of race and racism.

Race-Blind Policies

Race-blind policies, also referred to as color-blind policies, are policies that seek to eliminate racial or ethnic categories and preferences from admissions or applications processes. Race-blind policies are a response to affirmative action policies that use race as one of the factors in determining admission to an institution or in awarding government contracts. The integration of these policies is usually debated at the collegiate level, where recent events at the University of Michigan and in the states of California and Texas illustrated the ongoing controversy over these policies. Debates over the two types of policies thus provide information on current attitudes on the status of race and racial equality within the United States.

A distinct set of values, concerns, and political practices drives the proponents and opponents of race-blind policies. Often the debate about the integration of race-blind policies coincides with debates about affirmative action policies. Two recent Supreme Court rulings on affirmative action profoundly influenced advocates on both sides of the issue. In the 2003 Grutter v. Bollinger court case, the Supreme Court ruled that a university benefits from diversity, and thus a points system for admission factoring the race of the applicant into the process is constitutional. In another 2003 court case, Gratz v. Bollinger, the Supreme Court ruled that the points system applied at the University of Michigan to underrepresented racial groups—including African Americans, Hispanics, and Native Americans—was not “narrowly tailored” to achieve the university’s goals of diversity and was thus unconstitutional. Both Court cases present the complexities associated with the integration of race-conscious policies at the university level. In response to race-conscious policies, proponents of race-blind policies argue that this type of policy will alleviate the problems created by affirmative action.

Those in favor of race-blind policies argue that diversity and racial inequality are no longer important in determining or informing admission to colleges and universities. Proponents argue that racial inequality is no longer present in the United States, and therefore race-blind policies will create an even playing field for applicants. Many supporters of race-blind policies also argue that current affirmative action policies are a form of reverse discrimination denying whites access to institutions, thus causing them to experience institutional discrimination. This side of the debate also espouses the value of a meritocracy in which individuals should gain admissions slots and contracts based solely on each individual’s qualifications and achievements, not racial status.

Another group appears to espouse neo-segregationist ideas in their argument for the inclusion of race-blind policies at the collegiate level. They argue that the presence of students of color in the classroom lowers the standard of education for all students. This argument rests on the assumption that university or college students of color are not as qualified as their fellow white students, thanks to an application process concerned only with avoiding institutionalized racism. This group focuses on the belief that students should be held to a high standard of education, regardless of their race.

Opponents of race-blind policies argue that race is still an important factor in determining how a society’s resources should be distributed. They insist that the United States is still a country in which certain races have unequal access to society’s resources. Those who seek to retain policies acknowledging race in the application process believe that affirmative action policies work against the institutionalized racism that students of color otherwise face, thus working to end institutionalized racism and discrimination at the collegiate level.
Other opponents of race-blind policies argue that diversity is an important aspect of higher education and that policies that ensure racial diversity on a campus should be protected. They argue that institutions should thus use race as a determining factor in the admissions process to ensure a diverse student body. The Supreme Court supported this viewpoint in the 1978 court case Regents of the University of California v. Bakke. Justice Harry Blackmun argued that universities already supported policies that provide preference toward other groups, including alumni, the wealthy, veterans, and athletes. Similarly, universities also have the right to show preference to students of color to illustrate their support for a diverse learning environment. For opponents of race-blind policies, race-conscious policies provided a forum in which racial equality could be valued and pursued at the institutional level.

As the debate over affirmative action continues in the United States, so too will the debate over the integration of race-blind policies. In her remarks on the decision of the 2003 case of Grutter v. Bollinger, Justice Sandra Day O’Connor offered the hope that the United States would eventually reach a point of racial equality in which the policies of affirmative action were no longer necessary. Until racial equality is reached, the debate between race-blind policies and race-conscious policies will remain.

Racial Formation Theory

Racial formation theory is a theoretical perspective created by sociologists Michael Omi and Howard Winant that focuses on race relations in the United States. By racial formation, they refer to the sociohistorical process by which racial categories are created, inhabited, transformed, and destroyed, and they treat the concept of race as a middle ground between extreme social construction and a rigid, fixed biological definition. Omi and Winant argue that extreme social constructionism, embraced by both right-wing and left-wing ideologues, leads to an understatement of how deeply racialized U.S. society is. On the other hand, they continue, proponents of the idea of race as a fixed biological constant, also covering the range of the political continuum, underestimate the contested and changing nature of the structure and meanings of racial categories. To rectify the problem with each position, Omi and Winant propose racial formation theory.

Racial formation theory conceptualizes two dimensions of race in the United States: (1) contest and struggle over distribution of resources, institutions, and political power along racial lines and (2) contest and struggle over the applied cultural meanings and the signification of race to individual identities, issues, and experiences. These two distinct but interrelated processes underlie what Omi and Winant call “racial projects.” Racial projects encompass attempts to redefine group-level racial identity as well as to reorganize or redistribute resources along lines delineated by racial identity. Racial projects link the meaning of race to the organization of social structures. Various social actors such as elites, political groups, cultural organizations, or intellectuals may initiate racial projects, which take place on both macro- and micro-levels. At the micro-level, individual identity interacts with race at the macro-level of social structure. Racial injustices and inequalities at the macro-level, for instance, compel actors at the micro-level to mobilize social movements that challenge the racial order. Such projects reorganize the sociopolitical meanings of race, generating a new racial order. However, the new racial order itself then becomes the subject of future contention.

Racial formation theory emphasizes the role of the state in shaping and creating racial categories, as these are not constant across time. Importantly, governmental policies, laws, and institutions have racial categories written into them as a basis for the allocation of resources. For instance, the Federal Housing Authority Manual of 1934 restricted loans to African Americans while guaranteeing them to European Americans in a practice commonly known as “redlining.”

Scholars criticize several aspects of racial formation theory, particularly its heavy focus on racial
categories while ignoring the centrality and deeply rooted systemic nature of racism. Racial formation theory conceptualizes racism as an ideology instead of a social system around which U.S. institutions are organized. While racial formation theory acknowledges the construction of racial categories, the theory downplays the genesis of race in the 17th-century American colonies during the dawn of capitalism. By failing to acknowledge the invention of race and the inherently hierarchical and unequal design of racial categories, racial formation theory promotes the idea of their permanency, thereby making the concept of race into something concrete. One of the strengths of this approach, however, is pointing out that the meaning of race changes over time and that the state plays a role not only in shaping those meanings but in distributing resources predicated on those meanings.

**Further Readings**

**Racial Profiling**

Racial profiling is the increased scrutiny or selective enforcement of rules, norms, and laws for members of specific social groups. The increased scrutiny or selective enforcement results in the increased likelihood that these racial groups will experience significantly higher levels of negative sanctions than would be expected given their numbers in the population. The cumulative effect of these higher levels gives the impression that these groups are more prone to deviance than other groups. Such selective rule enforcement has led some to associate a culture of poverty or deviance with the group. Racial profiling, a more subtle form of racism, occurs in many countries besides the United States, including England, France, Japan, Germany, Mexico, Russia, Sudan, and Zimbabwe.

Evidence of this systematic singling out of racial and ethnic non-elites for differentially negative sanctions exists throughout the United States. While most recent research and concern focus on police and crime, a well-documented, long history of racial profiling exists. Sustained efforts, led by the American Civil Liberties Union (ACLU), resulted in the initiation of multiple lawsuits, passage of a series of laws, and numerous policy changes. Unfortunately, as long as racial profiling is treated as a problem and not a symptom, few actual remedies will be forthcoming. To treat racial profiling as the problem, much like smokers’ cough, is to treat the symptoms. Racial profiling is part of a larger, more ingrained problem in Western culture.

In the raging debate over racial profiling, it should be understood that most Americans, both racial elites and non-elites, agree that racism is bad, that vestiges of racism yet remain, and that laws and their enforcement should be racially neutral. The degree to which groups and individuals assess such neutrality is dependent upon which side of the racial divide they find themselves. As in the 1995 O. J. Simpson trial, many racial elites view the criminal justice system as fair, while many racial non-elites view the same system as being unfair. Most racial non-elites know with certainty that police, the courts, and the laws unfairly target, systematically restrict, and regularly harm members of their groups. Alternatively, most racial elites know with certainty that their only protection from an increasingly hostile and criminal underclass is the police, the courts, and the laws.

Although several factors may account for these differences, the force of the news media cannot be ignored. Evidence seems to support the vilification of racial non-elites. Specifically, blacks and Hispanics are more likely to be presented as criminals than as victims or more positively. These types of perceptual biases have dire and negative consequences when racial non-elites confront the legal system. Thus both blacks and Hispanics are more likely to be stopped, searched, and charged with trivial offenses simply because they are members of racialized non-elites.

These types of observations are not limited to the United States but rather are universally associated with racial and ethnic discrimination. For example, research conducted in South Africa documents how racial elites inflate their own superiority by deflating that of racial non-elites. Consequently, while they perceive themselves as superior, they describe racial non-elites as greedy, lazy, sexually aggressive, deviant, disrespectful, irresponsible, dependent, and backward. Further, as seen in Russia, when racial elites...
also dominate the police, these types of attitudes can result in selective enforcement, extremism, and ethnic intolerance. Globally, since September 11, 2001, a fear of immigrants and anti-immigrant hostilities has increased. Xenophobic fears have surfaced in Belgium, Denmark, England, France, Italy, and the Netherlands, to name but a few. Xenophobic fears in the United States since 9/11 have led police, customs, and other entities to target Arabs and Muslims, particularly men, at airports and other ports of entry, under the presumption that they pose a threat to national security.

Within organizational culture, specific code words reflect racial profiling. Important promotions and recommendations for hire are often couched in terms that on the surface seem innocent, but in reality reflect the racial bias of the dominant group. Often, the parties involved suggest that they are reflecting the “best interests” of the company and the individual, when they say that one candidate is “ready” for a “stretch” while another might be more “risky.” Often, the candidates suggested as encompassing the most risk are also the racial non-elite, with whom the racial elite feels the most uncomfortable.

Racial profiling in hiring can be more complex. That is to say, managers (regardless of race) often are more likely to hire whites than blacks. Further, non-black managers (i.e., Asian, white, and Hispanic) tend to hire significantly fewer blacks than do black managers. While the researchers note larger racial gaps in the South, all regions and store types reflect these patterns. Racial profiling also negatively affects black and Hispanic welfare recipients in their attempts to secure viable jobs. White workers benefit most from welfare-to-work programs, suburban location of employer, and higher skills or salary thresholds. Alternatively, minority-owned or governmental subsidies tend to erase some of these differentials for both black and Hispanic workers. Racial non-elites may also be more critically scrutinized for promotions than their white counterparts. By implication, a presumption of guilt or incompetence exists with regard to racial non-elites and one of innocence or competence with regard to racial elites. The constant battle to prove oneself worthy of credit, employment, housing, admissions, promotions, and so on represents a constant struggle for legitimacy.

In retail, security officials and store personnel also may employ racial profiling, as they are more likely to concentrate on the race of their customers than their conduct. Within these establishments, racial non-elites are targeted and therefore may be more likely to be caught. Therefore, “shopping while black,” another form of racial profiling, may lead to the increased likelihood of blacks being caught, while the failure to monitor whites will give the impression that whites are less likely to commit the same crimes. Some store security personnel use codes to signal that a black, Asian, or Hispanic has entered the store. When, for example, one hears “Code 3,” store personnel have instructions to monitor suspects of particular racial or demographic groups.

Racial profiling, regardless of form, continues to stigmatize, restrict, and further marginalize group members. Consequently, what seems on the surface to be random or coincidental in actuality preserves racial hierarchies.

RACISM

Racism refers to ideologies, actions, and policies that create and maintain a system of social inequality based on race (socially constructed categories on the basis of physical characteristics imbued with social significance). As a social problem, racism has been connected to substantial inequalities between whites and African Americans, Native Americans, and Latinos/as in such areas as life expectancy, education,
employment, health, housing, income, poverty, and wealth. These disparities have remained remarkably consistent in the United States in recent years. Racism is also manifest in unequal access to and treatment by criminal justice, health care, political, and economic institutions, as well as in the impact of policy decisions (e.g., housing, transportation, and location of environmentally hazardous sites). On a societal level, analysts connect racism to the loss of human potential, the economic costs of poverty- and inequality-related social problems, and the social conflicts stemming from segregation and division.

The Changing Nature of Racism

As Michael Omi and Howard Winant observed, the nature of racism varies according to historical and social context. Consequently, it is useful to outline how both racism and scholarly thinking about racism evolved over time. Most observers agree that the use of race-like categories for differential treatment stretches far back into history; however, the use of such categories was by no means widespread or consistent. Perhaps the most significant development in the history of racism was the late 18th-century emergence of a more systematic racist ideology. Often termed classical racism, this perspective held that (a) the human race could be divided into biologically distinct subspecies; (b) members of each race inherited shared physical, intellectual, cultural, and moral traits; and (c) races could be rated as “superior” or “inferior” in terms of these inherited traits. Accompanying the rise of classical racism was a flurry of “scientific” activity (later discredited) that purported to prove the superiority of Northern Europeans and the inferiority of other races. Socially, theories of racial superiority were used to legitimize European colonization and the dispossession of native peoples, the practice of slavery in the Americas, and other forms of domination such as racial segregation and exclusion. In Europe, classical racism reached its peak with the Aryan racial superiority theories of the Nazis in Germany in the 1930s and 1940s, which provided the justification for the genocidal murder of millions of European Jews during the Holocaust.

Countering classical racism in the mid-20th century were emerging scientific attacks against its basic claims, most notably by anthropologists such as Franz Boas, Ruth Benedict, and Ashley Montagu. Benedict is often credited with the first use of the term racism in her 1943 critique of classical racism. Subsequent events, including post–World War II decolonization and the civil rights movement in the United States, and additional work by scientists led to the further decline of classical racism, to the extent that its present support is generally limited to a few scholars and marginalized groups of white supremacists.

Given changes in society and in the nature of race relations, scholars have attempted to describe the changing nature of racism. Beginning in the 1950s, much of the attention of mainstream social science focused on racism as individual prejudice and discrimination. This in turn led to social-psychological research that attempted to understand the roots of prejudice. One significant development in the 1960s was the emergence of a distinction, first proposed by Stokely Carmichael and Charles Hamilton, between individual and institutional racism. In contrast to individual racism, institutional racism is the cumulative and unequal effects of institutional policies and practices in such areas as housing, education, health care, politics, employment, and the environment. This is evident in unequal rates of treatment for disease, approval of mortgage loans, graduation, arrest, prosecution, and sentencing and in exposure to environmental hazards. Subsequent work distinguished between direct institutional racism, such as the system of segregation in the U.S. South prior to the 1960s, and indirect forms, such as a system of public school attendance and funding that, in concert with other social forces, creates a significant number of public schools that are highly segregated and unequally funded. One final distinction often made is the difference between overt and covert racism, the former being unequal treatment that is obvious and blatant, the latter being discrimination that may be invisible to the victim (e.g., telling a prospective tenant that a vacant apartment has already been rented because the landlord does not want to rent to individuals from certain racial groups).

Following the civil rights movement, researchers continued to study the changing nature of racism in the United States. One strand of investigation attempted to explain the paradox between an apparent decline in individual racial prejudice among white Americans, as manifest in survey results that showed increasing acceptance of African Americans as political leaders, neighbors, and even family members, and continuing white opposition to policies such as busing and affirmative action that were designed to promote
racial integration and increased equality. This led to the notion of symbolic or modern racism, which described an individual belief that rejected the ideas of classical racism but maintained that racial minorities, especially African Americans, experienced social and economic problems because they failed to conform to traditional U.S. values of hard work, persistence, and relentless pursuit of success. Instead, minority group members made excessive demands for government action and requested preferential treatment that violated basic ideas of fair play and equal treatment. Some scholars working in this tradition also suggested that symbolic racism was driven by overt or covert fears that gains for minorities would come at the expense of whites. Although it was quite popular in academic circles, symbolic racism theory was also criticized for its individualistic focus and lack of a clear causal mechanism.

Another, more recent, perspective on racism began with the assertion that racism was subsiding as a significant factor in U.S. society in the face of declining prejudice and social and economic gains for racial minorities. Thus, it is only a matter of additional time before racism and racial inequality would be eliminated. One important variant of this perspective is the position that the persisting racial inequality in the United States is an effect of social class more than racial barriers. This “declining significance of race” thesis, whose most notable proponent was the sociologist William J. Wilson, maintained that while racism is declining, the impact of past racism and current social changes (deindustrialization, globalization) have combined to create a minority underclass for whom social and economic progress is very difficult. Both of these positions are also compatible with the assertion that racial inequality is due to the cultural deficiencies of minority communities.

During the past decade, significant analytical attention centered on what has been characterized as color-blind racial ideology or color-blind racism. Indeed, for many scholars of race and ethnic relations, color blindness is viewed as the dominant racial ideology in the contemporary United States. As described by Eduardo Bonilla-Silva and others, the core of color-blind racial ideology is the claim that race no longer matters in any meaningful way in U.S. society. What remains is a superficial identity that can serve as an indicator of “diversity” in organizations or communities but is not connected to life chances or social experiences. If racism does persist, it is in the form of prejudice or hate crimes by individuals who may be of any race and who will face condemnation from most members of society.

A key question for color-blind racial ideology is that if race no longer matters, how does society explain the persistence of racial inequality? One type of response is “naturalization,” the claim that racial patterns in such areas as housing and health care or the impact of disasters such as Hurricane Katrina would have been faster had the victims in New Orleans been white. In each case, charges of institutional racism or that an individual is a racist carry an extremely negative valuation and become a serious matter for all concerned. Critics of color-blind ideology have asserted that it ignores the realities of persistent institutional racism and makes it possible for white advantages to continue without significant challenge.

**Racism and Racial Politics**

Despite a mainstream belief in the declining significance of race, claims regarding racism continue to play an important role in U.S. racial politics. Indeed, it could be argued that the discussion of the nature of racism and what constitutes racism takes on even more importance as a political question than as an academic issue. Given the discrediting of classical racism, charges of institutional racism or that an individual is a racist carry an extremely negative valuation and become a serious matter for all concerned. In recent years, U.S. society experienced a series of “racial events” that triggered extensive national discussions of issues of race and racism. Examples of this include comments by entertainers and public figures such as Michael Richards and Don Imus, the debate regarding allegations (all charges were eventually dropped) that white members of the Duke University lacrosse team raped a black woman, and the claim that the government response to Hurricane Katrina would have been faster had the victims in New Orleans been white. In each case, charges of
racism produced an intense debate between those who adopt a color-blind perspective and those who believe in the continuing significance of racism in the United States. Once a claim of racism is made, it generally initiates a debate regarding whether or not the act was racist and a series of counterclaims regarding the initial accusation. One common response is denial; that is, the assertion that race had no bearing on the actions or policies in question. A second reaction is minimization, either by stating that any offense or harm was unintentional or to suggest that those claiming injury are oversensitive or “always bring race in” to the discussion. Countercharges are also a frequent tactic, including the allegation that the claim of racism constitutes “name-calling” or the suggestion that the individual or group making the claim is “playing the race card” for personal or organizational gain. On a more general level, advocates of color-blind racial ideology have claimed that racial categories are a form of racism and have even proposed legislation, such as the unsuccessful Proposition 54 in California to ban the collection of racial data by government agencies. Another general claim is that the problem of racism would be minimal if advocates would stop making claims about racism and racial inequality in the United States. Given trends in the recent past, it is likely that U.S. society will continue to experience a series of racial events and debates between those who minimize the role of race and those who make claims about the persistence of institutional racism.

Racism and Social Change

It seems apparent that the 21st century will bring changes to race relations in the United States. The estimated 15 million immigrants per decade in the 1990s and the 2000s, approximately 50 percent of whom are from Latin America and another 25 percent from Asia, have and will continue to change the racial demography of the United States. If current trends continue, the U.S. Census Bureau projects that by 2050 non-Hispanic whites will be a bare majority of the population and that shortly thereafter no majority racial group will exist in the nation as a whole (a situation that is already true in California, Texas, and Louisiana). These demographic changes, in concert with such other changes in the distribution of groups, the increasing number of multiracial individuals, and the slow movement of minority group members into higher social, economic, and political positions, carry the potential for significant local, regional, and national changes in intergroup relations.

What is less apparent, however, is how the nature of race relations and racism in the United States will change. Certainly issues of immigration and racial diversity will dominate the political arena in the near future; however, their direction remains to be determined. It is possible to foresee increased racial conflict as whites, threatened by a loss of power, seek to defend their current advantages in face of increasing claims from a rapidly growing minority population. It is also possible to envision increased racial equality amid shared political and economic power in a pluralistic society. Some scholars of race and ethnic relations have suggested a more nuanced view. Bonilla-Silva argues that the United States in the future will undergo a “Latin Americanization” of race relations with various Asian and Latino/a groups occupying an intermediate position in a more complex racial order. George Yancey asserts that the key issue in the future will be the division between blacks and “non-blacks” and that many recent Latino/a and Asian immigrant groups will be absorbed into the dominant white group. Both arguments contend that racial inequality will remain a fact of life, either through a blurring of boundaries and privilege or by expanding the relative numbers and power of the dominant racial group. How the U.S. racial order adapts to social and demographic changes in the coming decades will be the key factor in shaping the nature of race relations and racism in the future.

Rape

Rape is a pervasive and serious social problem, brought to greater attention with the second-wave women’s movement of the 1960–70s. The connection between rape and gender inequality is one of control. Rape, and the fear it produces, is a mechanism of social control that men in a patriarchal society use to maintain gender stratification. This type of social control occurs when women restrict their movements and behaviors due to the threat of rape. For example, women may be restricted from working late into the evening in fear of not getting home safely after dark. If a woman does not take responsibility for protecting herself by restricting her actions, and an assault does occur, she is made to feel responsible for the assault because she took such a risk. In a male-dominated society, rape both reflects the low valuation of women and contributes to their subordination in the sexual stratification system. Research shows that the lower the status of women relative to men, the higher the rape rate.

At present, the Federal Bureau of Investigation (FBI) legally defines rape as gaining carnal knowledge of a female forcibly and against her will. This definition only takes into account heterosexual rape of an adult woman. However, some states now define rape in sex-neutral terms to include sexual assault on a male victim, usually by another male. Some states have laws that distinguish among various degrees of sexual assault, each carrying a different penalty according to the seriousness of the offense. Although we know that men and children are also victims of rape, the most common form of this crime is rapes perpetrated by men with women victims.

Most rapes occur between persons who know one another. Women are most frequently raped by their husbands, ex-husbands, current or past boyfriends, relatives, and acquaintances. Stranger rapes do occur, but they only account for approximately 20 percent of all rapes. Rapists and victims tend to be of the same race and age group. Additionally, most rapists are “normal” in personality, appearance, intelligence, behavior, and sexual drive.

Consent

Since the vast majority of victims know their attacker, the main legal issue is not identity of the rapist but rather that of consent. Did the victim consent, or agree, to have sex with her attacker? Unfortunately, the courts often adjudicate rape cases from the standpoint of the accused, not the victim. Feminists object that the legal question in rape is not about the man using force to have sex with the woman (girl) against her will, but rather whether the man had reason to believe (or convincingly say he believed) the woman (girl) consented to have sex. Given this standard, defense attorneys routinely allege that victims led rapists to believe they consented. Whether a woman actually consented is less critical than the “acceptability” of a defendant’s claim that he believed she did. Given this dynamic, many contend that such legal collaboration lets rapists off the hook and fosters a “second assault” of rape victims.

Current Statistics

In 2006, although local U.S. police departments reported 92,455 cases of forcible rape and attempted rape in the Uniform Crime Reports (UCR), federal victimization surveys found that many more incidents occurred. The 2006 NCVS (National Crime Victimization Survey) uncovered 115,010 rapes and sexual assaults of women, 24 percent more than the number reported by the FBI in data gathered from
local police departments. The newest estimate comes from the National Women’s Survey, which estimates the total number in all years of completed forcible rapes in 1990 to be 683,000 (1 out of every 145 U.S. women). The methodology for this survey was different from the UCR and NCVS data collection methods. The National Women’s Survey interviewed 4,008 women, who were chosen as a cross-section of the American adult female public, over the phone. Regardless of the exact figures, the point is that rape is a pervasive social problem that is under-reported in the United States.

The variability in these statistics is due to differences in methodology, sample size, and estimating procedures. The UCR data only account for those rapes reported to police, but rape is a highly under-reported crime. The NCVS data include a survey of victims that includes those rapes not reported to the police, but critics argue that these statistics also are too low. The Bureau of Justice Statistics estimates that 49 percent of all violent crimes go unreported, often because the attack was by a spouse, partner, boyfriend, or another family member. Such victims are unwilling to report crimes to police because they see the offense as a private or a personal matter. Other victims may avoid the police because they feel stigmatized by the sexual attack or anticipate police insensitivity.

Campus Rape

The National College Women Sexual Victimization (NCWSV) survey carried out in 2000 gathered data by telephone from a randomly selected, national sample of 4,446 women attending a two- or four-year college or university during the fall of 1996. The researchers concluded that 4.9 percent of college women are the victims of rape or a rape attempt during any given calendar year, and 20 to 25 percent of college women are victimized during the course of their college careers. Asked if they considered the incident rape, 46.5 percent of victims said they did, 48.8 percent said they did not, and 4.7 percent were uncertain. The failure of nearly half of the victims to define their victimization as rape does not, however, mean that it was not. Factors such as embarrassment, ignorance of the legal definition of rape, unwillingness to consider the offender a rapist, and the belief that they contributed to their own victimization can keep victims from acknowledging assaults that are legally rapes as such. The NCWSV study was consistent with prior surveys in finding that most victims were acquainted with the men who had committed the rapes. Other studies of campus rape have found that 90 percent involve the use of alcohol by the perpetrator, victim, or both.

Theories of Rape Causation

Several theories concerning the causation of rape are important because they beget strategies for rape prevention. Psychopathological explanations of rape focus on individuals, while sociocultural explanations emphasize the importance of the social structure.

Psychopathological explanations make the assumption that male aggressive sexual behavior is unusual or strange. These approaches remove sexual violence from the “everyday” norm, portraying sexually violent men as outsiders and thus eliminating any connection or threat to “normal” men. Such models view rape as no more than a collection of individual problems, thereby ignoring the cultural and structural contexts in which rape occurs. Consequently, these theories of individual disorder cannot account for the vast number of rapes committed in the United States. Nor can theories predicated on individual pathology account for the norms and values of the larger culture concerning rape. It is precisely these individualistic theories that produce rape myths.

Sociocultural theories rest on a presumption of normality rather than pathology and generate questions from the experiences that women, not men, have of rape. The primary assumption of the sociocultural perspective is that rape is a socially learned behavior. The fundamental premise is that all behavior is learned through direct association with others as well as indirectly through cultural contact (behavioral techniques, rape myths).

In this view, U.S. culture produces rapists through the socialization of its societal members when it encourages men to subscribe to values of control/dominance, callousness/competitiveness, and anger/aggression and when it discourages expression by men of vulnerability, sharing, and cooperation. At the same time, it socializes women to be submissive/indecisive, empathetic/giving, and subtle/non-aggressive and not to be authoritative, strong willed, and assertive. We then throw such differentially socialized individuals into dating situations and expect everything to go smoothly. When it doesn’t, we blame the
individuals. From a sociocultural perspective, such blame is ludicrous.

Those who adhere to the sociocultural model explain date or acquaintance rape as the logical extension of a cultural perspective that defines men as possessors of women, thus making women legitimate objects of sexual aggression. The American dating system, in particular, places females in the position of sexual objects that men purchase. Women are groomed to compete for men who will shower them with attention and favors, men who are socialized to expect sexual reward (or at least try for that reward) for their attention to women. This perspective presents the woman as a legitimate object of victimization: if a man is unable to seduce a woman and yet has provided her with certain attention and gifts, then he has a right to expect sexual payment. Only the situation of rape by a total stranger escapes the influence of this reasoning.

Research reveals many gender attitudinal differences about date rape. For example, males are significantly more likely than females to hold attitudes condoning aggressive sexual behavior. The sociocultural model suggests that these gender differences are the result of gendered socialization and education. Sex role socialization regarding dating behavior leads to a rape-supportive culture in which the use of coercion and physical force to obtain sex is seen as normative rather than deviant behavior. Traditional sex roles, sex role expectations, and attitudes toward women all play a part in molding one’s attitudes regarding rape.

The common thread through all of the findings is that these attitudes and behaviors are learned. Rape is not the result of some uncontrollable impulse, but rather, a socially constructed behavior that men learn. Therefore, this is behavior that can be unlearned.

Solving the Social Problem of Rape

Among the many solutions offered to prevent rape, or serious injury if rape is imminent, women learn never to walk unaccompanied at night, to stay out of certain neighborhoods, to take self-defense courses, and to carry mace or use keys as weapons, to name a few suggestions. They hear conflicting messages about how much physical force a “would-be” victim should use. Local police departments tell women to submit if rape is imminent to avoid further injury or death. At the same time, many courts demand evidence of resistance before defining the offense as rape.

One common theme to these solutions is that women in some way need to alter their own behavior in order to avoid rape. Another commonality is their assumption of stranger rape, which completely ignores the vast amount of acquaintance rape. In any case, all of these solutions define rape as a woman’s problem and neglect to confront the behavior of the assailants, namely men.

One solution that focuses on both women and men is education about rape, and research suggests that a feminist education program can counter the effects of gender-based socialization and definitions of rape that are shaped in the context of sexual inequality. Ideally these educational programs would start in high school and continue at the college level.

A more far-reaching solution to the social problem of sexual assault is to continue to work toward gender equality. Only true gender equality will dismantle the mechanism of rape as a form of social control.

Rape, Acquaintance or Date

Acquaintance rape, commonly known as “date rape,” is a form of sexual violence. Acquaintance rape is nonconsensual sexual intercourse where penetration is achieved with the use of or threatened use of force, occurring between individuals known to one another, such as a current or former friend, acquaintance, spouse, dating partner, or relative. While many theories, including social, biological, and situational theories, have been postulated as to why acquaintance rapes occur, there is no single explanation.

Criminal justice professionals and the general public often perceive acquaintance rape as less severe and less prevalent than stranger rape. This is problematic
because it subtly perpetuates the belief that this form of sexual violence is acceptable. While the fear of stranger rape is greater, it is more likely that the victim will be raped by someone she knows. Women and girls are most often victimized, particularly high school- and college-age girls in the context of a date or party, although it should be noted that acquaintance rape is not limited to females and heterosexual encounters or relationships.

Accurate statistics on date rape are difficult to compile because victims are less likely than stranger rape victims to report the incident to the police, crisis centers, school officials, and friends and family or may not perceive themselves to be victims, depending on the circumstances surrounding the incident. Prosecuting an acquaintance rape case is difficult because a victim must prove she did not give consent for sexual intercourse. Unlike stranger rape, rape shield laws do not necessarily apply. Legally, date rape carries the same penalties as stranger rape.

Research demonstrates that a variety of factors, including peer pressure, alcohol and drug use, and pre-existing beliefs are associated with young women’s increased risk for being date raped. Some research indicates the women can correctly determine the risk of victimization for other women but not for themselves.

Alcohol and/or drug use, particularly Rohypnol and GHB, are correlated with an increased likelihood of date rape occurring because of lowered inhibitions of the victim and perpetrator, victim’s loss of motor control so she may be unable to resist an attacker, or unconsciousness. Some perpetrators use alcohol and/or drugs as a justification for their behavior. Oftentimes, both offender and victim have consumed alcohol.

Research shows many males and females believe acquaintance rape is acceptable under certain circumstances, such as if the boy spent a substantial amount of money on the girl, if the girl has a real or perceived promiscuous sexual history, or if the male and female have been dating or are married. A victim may experience secondary victimization from the police, prosecutors, and friends and family; she may be blamed for her behavior, the way she dressed, or for being alone with a man. Consequences include victims blaming themselves for the incident and depression. Finally, some males may think that when a girl says “No” she really means “Yes” to intercourse. Some males may not even realize that they have committed sexual assault.

RAPE, MARITAL

Marital rape (also called “wife rape” or “spousal rape”) is forced, nonconsensual sex in which the perpetrator is the victim’s spouse. Marital rape was criminalized in all U.S. states by 1993 with the deletion of the “spousal exemption” that had defined rape as forced intercourse without the consent of the woman other than one’s wife. However, the spousal exemption remains in effect in most non-Western countries. Marital rape is the form of violence against women with the greatest cultural and legal support, and it is not recognized as a social problem in most of the world.

Marital rape prevalence rates indicate a global epidemic of sexual violence within intimate relationships. Researchers estimate that 10–14 percent of married women in the United States have been raped by their husbands. One-third to one-half of women in battered women’s shelters report being sexually abused by their partners as well. A 2005 WHO (World Health Organization) study documented rates of sexual violence by a partner that ranged from under 10 percent in urban Japan to over 50 percent in rural Bangladesh and Ethiopia.

Research indicates that women who are raped by their intimate partners are usually assaulted numerous times and, at least in the United States, experience forced oral and anal as well as vaginal sex. Researchers have identified three basic types of marital rape. Force-only rape involves only as much physical force as necessary to coerce compliance. Women report having arms pinned down, faces smothered by pillows, and overall differences in body weight as means by which their resistance is overcome. Battering rapes take place in the context of more severe physical assaults. Sexual assault may occur during or after a beating as a means of inflicting more harm. Subsequently, threats of such violence may be used to force sexual compliance. Finally, obsessive/sadistic rapes are those in which physical violence is sexually arousing to the perpetrator and may involve pornography, perverse acts, and torture.

Evidence from interviews with marital rape survivors indicates that these assaults have serious immediate
and long-term consequences that can be more traumatic than sexual assault by a stranger. Physical injuries include genital or rectal tearing and hemorrhaging, sexually transmitted disease (STD) or HIV infection, miscarriage, and unwanted pregnancy. Emotional consequences include shock and disbelief, intense fear, anxiety, depression, and post-traumatic stress disorder (PTSD). Furthermore, marital rape is experienced as a betrayal and a violation of trust, effects that are felt for years as women try to build new relationships.

Despite the high rate of marital rape, specific services for wife rape victims are virtually nonexistent, and rape crisis shelters or battered women’s shelters do not fully meet victims’ needs. Attention to forced sex in marriage is increasing with wider recognition of its relation to the spread of HIV/AIDS. The UN Declaration on HIV/AIDS calls for women’s sexual autonomy as a key to stemming the global pandemic.

Rape, Statutory

Statutory rape refers to sexual relationships occurring between two individuals when at least one of the individuals cannot legally consent to sex. While common belief holds that a uniform age separates an adult from a minor in regard to making decisions about one’s sexual behavior, several factors determine this, depending on the state or country in which the behavior occurs, including age of consent, the minimum age of the victim, the age differential between sexual partners, and the minimum age of the defendant in order to prosecute. Only 12 states in the United States have a single age of consent, meaning that once individuals reach this age, they may engage in sexual intercourse with another person above the age of consent. The remaining states may consider the other three factors in their statutes. To complicate matters, few states use the term statutory rape in their criminal codes; rather, the codes identify the legality of explicit sexual offenses.

Age of consent (between 16 and 17 years of age) is the age ordained by law that a person can agree to have sex. In addition to variations by location, the age of consent varies by sex (gender) and sexual orientation. Males may legally have sex at a younger age than females, and gay males and lesbian females may be subject to different statutes because of their sexual orientation. Below the minimum age (between 10 and 16 years of age), an individual cannot consent to sex under any circumstances.

The use, or threatened use, of force is a distinctive component in most rape cases; however, in a statutory rape case consent is typically not the issue. The rationale for statutory rape laws is grounded in the belief that below a certain age an individual does not have the mental maturity to make informed decisions for him- or herself. An older individual may exploit and manipulate the younger person’s naiveté, so laws exist to protect the younger partner from this imbalance of power.

Historically, statutory rape cases focused on young women as victims. In patriarchal societies, if a woman lost her virginity and/or was impregnated before she married, she would be perceived as both morally ruined and shameful to her family. Sexual relationships or encounters involving young males were often overlooked and inherently perceived as less troublesome; however, in recent times this social stance has changed, as indicated by high-profile cases often involving female teachers and male students. Other social problems stemming from underage minors having sex with adults is the prevalence of out of wedlock teen pregnancy and parenthood and sexually transmitted diseases, each carrying a host of correlated problems.

Other problems include the unwillingness of victims to prosecute partners and the perception by police, prosecutors, and the general public that statutory rape is less harmful than forcible rapes or other sexual offenses involving children, thus designating less prioritization to such cases.

Renee D. Graphia
Rational Choice Theory

Rational choice theory (RCT) is a social-scientific approach that explains social phenomena in terms of deliberate decisions that self-interested individuals make.

One of the key assumptions of RCT is the notion of the purposeful actor. Rational choice theorists portray social actors as distinct entities with knowledge of alternative courses of action available to them, as well as their possible consequences. These actors are conceived to have given preferences (i.e., wants, goals) organized in a hierarchical order. Between two alternatives, say, A and B, the actor either prefers A to B, or B to A, or remains indifferent. In their actions, social agents have the immediate purpose of attaining ends consistent with their preferences. In other words, the actions of social agents are intentional and reflect actors’ preferences.

Utility maximization, another key assumption, relates closely to the idea of the purposeful actor. Actors’ preferences represent a utility function that assigns a numerical value to each possible alternative facing the actor or decision maker. The assumption of utility maximization holds that an actor’s choices or decisions attempt to maximize this mathematical function.

An important part of the choice process is the existence of constraints. In attempting to achieve their goals, social agents often act on the basis of the information that they have within specific institutional settings. This information and setting limit the feasible set of available actions. At its simplest, the relationship between preferences and constraints is that of a means to an end. Since individuals cannot achieve everything that they want, they must make choices in relation to both their preferences and the available means for attaining them.

The assumption of rationality follows from these axioms. When rational choice theorists speak of rational behavior, they mean that individual actors consider their preferences vis-à-vis the constraints they face and attempt to optimize their utility functions.

RCT provides several benefits to researchers. Although variations occur in particular empirical applications, RCT provides scholars with a unifying, general theory. The investigators clearly know the elements of the theory, and how they should carry out the analysis. This explains why RCT, long a dominant paradigm in economics, has become popular in recent decades in such disciplines as political science and sociology.

However, for other scholars, RCT presents some serious problems. Critics find its behavioral assumptions to be highly unrealistic. Assuming that individuals are primarily utility maximizers, they argue, neglects the possibility of other goals directing social agents. Rather than maximizing something, people often engage in habitual, value-oriented, or affectual action. Instrumental rationality thus cannot give a complete account of social action.

Critics also contend that the rational choice approach suppresses most real-world complexities by leaving out anything that it cannot model. Scholars whose approaches are inductive and empirical are particularly critical of this reduction of social phenomena to an outcome of agents’ self-interested actions. Such analysis, they maintain, omits much of the rich historical, contextual detail that they meticulously assemble.

Another stream of criticism attacks the notion of preferences. While rational choice theorists contend that social agents act with the purpose of reaching ends that are consistent with their preferences, this does not explain why actors have those preferences in the first place.

REASONABLE SUSPICION

Social problems can arise from many sources; one of the most interesting of those sources is the official manifest structure of social control, the legal system. In U.S. law, with its foundations primarily in English “common law” traditions, the use of reasonable suspicion to justify governmental interference with the liberty of persons is one such social problem. The implications of reasonable suspicion can be understood by looking at its definition in legal terms, the legal debates surrounding this doctrine, illustrations of its extension to other areas of social life, and, finally, some of the reasons to consider this development as a social problem.

Legal Terms

The use of reasonable suspicion as a standard to justify police intervention initially received official recognition in the U.S. Supreme Court decision Terry v. Ohio, one of a series of opinions issued by the Warren Court as part of the “due process revolution.” This “revolution” refers to the Warren Court’s use of the Fourteenth Amendment’s due process clause to place limitations on state actions that interfere with individual rights when they violate federally protected rights considered to be fundamental rights. Accordingly, when the Court determines that a right found in the Bill of Rights is fundamental to the concepts of liberty, that right is “selectively incorporated” into the Fourteenth Amendment’s due process clause. It thus protects these rights from state government interference, just as the Bill of Rights protects them from federal government interference.

So why is this case sociologically intriguing as a social problem and perhaps an example of selective social control? In Terry v. Ohio, the Warren Court was asked to determine “whether it is always unreasonable for a policeman to seize a person and subject him to a limited search for weapons unless there is probable cause for an arrest” under the Fourth Amendment. This legal question arose from the facts of the case. Codefendants Terry and Chilton had been stopped by Cleveland Police Detective Martin McFadden after surreptitious observation. The detective testified that while he was unable to say what initially drew his attention to the defendants, their behavior made him suspicious enough to stop and watch them more closely. In his professional opinion, they exhibited behavior consistent with “casing” the area for an armed robbery. After watching the defendants for a short time, the detective confronted the men, who “mumbled something” in response to his challenge. Officer McFadden then patted down the exterior of Terry’s clothing, feeling a pistol in the process. In the search of the second defendant, Chilton, he found another revolver. In the subsequent search of a third man, Katz, he found nothing, and this suspect was ultimately released. Both Chilton and Terry were eventually charged with carrying concealed weapons.

The Supreme Court affirmed the trial court’s denial of the defendant’s motion to suppress the evidence found in these searches. The motion was not denied because the trial judge agreed with the prosecution’s claim that these facts amounted to probable cause; rather, the Supreme Court instead agreed with the trial court’s determination that when the police have “reasonable suspicion” that is based on “specific and articulable facts which taken together with rational inferences reasonably warrant that intrusion,” the search does not violate the Fourth Amendment. Further, the Court said that a limited search, or pat-down of the clothing, of the person(s) being stopped is also protected by the Fourth Amendment. Such “frisks” will only be permitted where there is “reasonable suspicion” that the person stopped might be armed and dangerous to the police officer who has stopped them, thereby justifying the search to protect the safety of the officer.

Legal Debate

Legal experts criticize this decision as expanding the area within which the government may lawfully interfere with citizen rights. They point to Bureau of Justice Statistics, for example, that show, on average, about one-fifth of U.S. citizens over the age of 16 reported that they had contact with police, more than half for traffic stops. They assert that so many interactions allow for a significant expansion of police authority, a significant widening of the social control net, and that this widened net increases the range in which police can justify coerced interactions with people and that it disproportionately impacts minorities.

Defenders of the Terry decision agree with the Supreme Court’s reasoning that these stops and frisks
are essential law enforcement tools if police are to be able to keep the peace. They argue that the police need this authority to investigate and proactively prevent criminal behavior. They contend that police must have the authority to stop and speak to those whom they have a reasonable basis for suspecting of ongoing criminal behavior and, because it is a “limited” search and “limited” stop, that the authority to do so is not overly broad, thus making it a reasonable application of the protections of the Fourth Amendment. In recent years authorities have pointed to the need, in a post–September 11 world, to use interdiction against potential terrorists who have the potential of disrupting society and causing significant injury to innocent bystanders. They cite this specific example of the compelling societal interest served by granting police this authority.

**Why Does This Matter?**

Widening the net used by police to limit ability of the members of society to encompass ever more aspects of social life is disturbing in and of itself, since it represents the significant social problem of ever more social control by the government. However, this is only one area of controversy that arises when looking at decisions that apply the “reasonable suspicion” standard to governmental intrusions into the private activities of people. Another is the socially constructed nature of the interactions between the citizen and the official agents of social control. Here issues of race, age, gender, and many other variables come into play and beg the question of the “reasonableness” of the justification for the police interactions. Is being African American enough “reason” to stop a person who may only resemble a suspect because of skin color? Does shying away from the police, who may not be held in the highest esteem in that neighborhood, become a reason for a coerced stop and frisk?

These questions show the relativity of the *Terry* standard and point to the significant social control implications of it and its progeny. The legal system may wish to believe it is blind, but defendants in such cases and under such circumstances perceive the “law” as being used to selectively oppress certain easily identifiable segments of society. Many groups may find such legally sanctioned intrusions harmful: minorities of various types, the poor, males, Muslims, and many others. This may be the most compelling reason why many consider this legal doctrine to be tantamount to an invitation to the police to engage in selective social control.

Recidivism

Recidivism refers to the repetition of behaviors that society sanctions, particularly those related to criminal offenses and substance abuse. In criminology, recidivism refers specifically to the rate at which people who have been released from prison are rearrested, reconvicted, or returned to prison (with or without a new sentence) during a specified period of time following the prisoner’s release. Those persons are also known as “repeat” or “chronic” offenders.

According to the U.S. Bureau of Justice Statistics (BJS), which conducted a groundbreaking study of recidivism in 15 states in 2002, of the 272,111 persons released from prisons in 1994, 67.5 percent were rearrested for a new felony or serious misdemeanor within 3 years of release. Of those 272,111 persons, 46.9 percent were reconvicted of a new crime and 25.4 percent were resentenced to prison for a new crime. In addition, 26.4 percent were back in prison within 3 years because of violations of some technical condition of their parole, such as failure to attend an appointment with a parole officer or failing a drug test.

Most studies of recidivism focus on individual-level characteristics and find that people with prior offenses, drug addictions, and low levels of education tend to offend again. The 2002 BJS study found that men were more likely than women to recidivate in each of the four measurement categories they selected: rearrested, reconvicted, resentenced to prison for a new crime, and returned to prison with or without a new prison sentence. Black people were more likely than whites to recidivate. Higher rates of recidivism occurred among prisoners who were younger when released from prison. These data may underestimate the rate of recidivism, as the measures were based on statistics gathered from only 15 states and the Federal Bureau of Investigation (FBI). Official crime data, including the Uniform Crime Report, are known to underestimate the crime rate, as demonstrated by surveys of victims, such as the National Crime Victimization Survey, as well as by self-report surveys of criminal involvement.

In a now-classic study that defined the concept of “career criminals,” Marvin Wolfgang and his associates followed the criminal careers of a cohort of 9,945 boys born in Philadelphia in 1945 from birth until age 18. The most widely recognized finding of this research was the identification of the “chronic offender”: today referred to as “the chronic 6 percent”; a group of 627 boys from the total sample were responsible for 52 percent of all the offenses committed by the cohort.

Today, criminologists increasingly focus their research on desistance from crime or strategies for deterrence from crime rather than recidivism. The contemporary thinking is that by focusing on recidivism, or why people repeatedly engage in behaviors that return them to prison, we fail to consider the factors that lead people away from criminal careers. Desistance is conceptualized as the causal process by which people cease engagement in criminal activity. Most popular in current criminology are developmenta theories that consider criminal careers across the life span. This research asks why and how people first engage in, continue in, and eventually terminate criminal activities. Crime deterrence strategies are popular with the law enforcement community and by proponents of the rational choice theories in criminology. In this view, people who engage in crime are rational actors who choose to break the law after weighing the costs of benefits of such behavior. The theory, in keeping with classical theories in criminology, assumes that the threat of punishment will influence and control decisions to engage in crime. One model in particular, specific deterrence, advocates meting out harsh punishment for people convicted of crime, arguing that severe sanctions will ensure that people who commit a crime and pay a high price for that deed will not repeat an offense.

Unfortunately, research finds that people who serve prison sentences do not have lower recidivism rates than people who serve more lenient community service sentences for the same or similar crimes, particularly in the case of white-collar criminals. In some instances, harsh sanctions have also provoked defiance instead of deterrence. The more times a person has been in prison, the more likely that person will return to incarceration within a year of release.
U.S. public policy now focuses on incapacitation, supplanting the goal of rehabilitation, since apprehension and punishment have had little effect on chronic offenders. The problem with this approach is that no confirmation exists that such policies as mandatory sentencing for violent or drug-related crimes and “three strikes” policies either reduce the crime rate or incarcerate only a small percentage of people who commit the most crimes.

With more than 7 million people under some sort of correctional control in 2005, and more than 2 million people incarcerated, approximately 600,000 people are released from U.S. prisons each year. In a process called “reentry,” persons released from prison often return to live in the neighborhoods they left when they were arrested. Access to employment upon release is one important factor in desistance from crime. Unfortunately, funding for reentry programs fails to meet the demand, thus perpetuating the phenomenon of the revolving door of prison.

Redistricting, Congressional Districts

Article I, Section 2 of the U.S. Constitution calls for representation to the House of Representatives to be apportioned among the states according to the respective number of individuals residing in each state. The initial apportionment, or assigning of seats to individual states, gave 10 districts to Virginia, 8 to Massachusetts and Pennsylvania, 6 to Maryland and New York, 5 to Connecticut, North Carolina, and South Carolina, 4 to New Jersey, 3 to New Hampshire and Georgia, and 1 each to Rhode Island and Delaware. For subsequent Congresses after 1790 and then repeated every 10 years, the enumeration has relied on a census of the population. The census is an actual count, rather than a sample, of every person—citizen and noncitizen alike—residing in each of the states. As such, the danger exists of some groups of people undercounted or others overcounted.

The Constitution as originally written called for one district for roughly every 30,000 residents and a guarantee of at least one representative per state. Elections were to be held every 2 years in the districts to elect members who would then serve in the House of Representatives. Unlike the Senate, vacancies due to death or resignation must be filled by a special election, not by appointment.

Apportionment

Over time, the number of districts increased as the population grew and new states entered the Union. In 1911, Congress arbitrarily set the total number of congressional districts at 435, and states would thereafter gain or lose representation in the House based on relative population growth or decline. The House temporarily increased to 437 seats when Hawaii and Alaska entered the Union.

Once the census is complete, each state is initially assigned one representative irrespective of population. Then, since 1941, the rest of the 385 seats are distributed according to the “method of equal proportions.” According to the U.S. Census Bureau, this system ranks the states by assigning a priority value calculated by dividing the population of each state by the geometric mean of its current and next seats. The 51st district is then assigned to the state with the highest priority value, and the process is repeated until all
435 districts have been distributed. Prior to 1941, different methods were used, and states stood to gain or lose seats depending on which method Congress employed to assign districts. When the size of the House was initially capped at 435 members, the average district size was 210,000 persons. As of the 2000 census, there were about 650,000 residents per congressional district.

**Redistricting**

The practice of drawing district lines for political (or other) gain has been around since Governor Elbridge Gerry of Massachusetts sketched the first gerrymander around 1810. However, most modern redistricting is shaped by a trio of Supreme Court cases from the 1960s. In 1962, the court ruled in *Baker v. Carr* that the drawing of districts was in fact open to judicial interpretation. Two years later, in *Reynolds v. Sims*, the resulting “one-man one-vote” doctrine required the populations of legislative districts to be as equal as practicable. This standard was then applied to congressional districts in the 1964 case *Wesberry v. Sanders*. Afterward, nearly every state with more than one district was forced to redistrict to comply with the new rulings.

Redistricting plans can be either partisan or bipartisan and are implemented by state governments, redistricting commissions, or the courts. Partisan gerrymandering, which has the goal of attempting to remove as many minority party incumbents as possible, strengthens the average electoral security of some minority party incumbents while causing others to lose their seats. The idea is that greater safety for a few minority party members leads to a less efficient use of their political power overall. This procedure causes the minority party as a whole to be worse off (as measured in terms of the effective number of wasted votes), since they are “packed” into highly partisan districts, while at the same time making individual members more secure. Bipartisan plans, which generally occur under divided government, strive to make incumbents of both parties as safe as possible.

Unlike legislatures, redistricting commissions and courts are not subject to the same electoral and institutional constraints in the districting process. For example, commissioners are often not elected officials and, in some cases, are not even allowed to hold elected office for several years after the districting cycle. This in turn weakens their ties to voters and the party since they are not beholden to either group as a result of the “one-shot” nature of the redistricting process. However, in other instances, commissions are made up of members of the state legislatures and representatives from the governor’s office. When commissions are independent from the legislature, the districts they draw can differ from those drawn when the commission is made up of elected officials.

While one cannot expect judges or commissioners to always behave in a nonpartisan fashion, their means of selection makes it less likely that they will be susceptible to influence from the political parties compared to the behavior of elected representatives. In addition to electoral factors, commissions are also subject to a variety of institutional constraints in terms of the redistricting process. For instance, commission-drawn plans and their underlying goals may vary for states that employ these mechanisms in redrawing district lines. Among states employing commissions for the purpose of redistricting, variations persist in terms of tie-breaking rules, overriding objectives, and deadlines for submitting completed plans. At other times, commissions may get involved in the districting process only when the legislature and the governor cannot agree on a plan by the specified deadline. If good government groups get their way, we might expect to see more districts drawn by commissions rather than legislatures in the future.

**Redistricting, School Districts**

The term *school redistricting* refers to the redrawing of school district boundaries, typically with the intent to increase student diversity. As such, it is one of several methods for reallocating students and resources
within the educational system of a geographic area. In recent years, redistricting typically sought to redress the various inequalities stemming from the residential segregation of students by race, ethnicity, and class. Unlike political redistricting, which typically seeks to consolidate the power of a single interest by decreasing voter diversity within a political boundary, school redistricting usually seeks to equalize student performance by increasing student diversity within an educational boundary.

The structural issue at the heart of school redistricting is the U.S. system of local funding for public schools. Because Americans exhibit a high degree of residential segregation by class, local funding tends to relegate children from the least materially advantaged backgrounds to schools with lower per-pupil expenditures, while more privileged students tend to live in areas with higher per-pupil spending. Higher per-pupil spending correlates with the ability to attract more experienced and qualified teachers, better infrastructure, better and more extensive technological resources, and more diverse programs for assisting students occupying a broad spectrum of abilities and needs, which in turn produce better student outcomes on measures such as grades, graduation rates, standardized test scores, and college attendance rates.

While other methods of student redistribution (such as voucher programs) address the problems of geographic disparities in funding by making per-pupil school funds portable to other school districts and/or to private and parochial schools on a strictly voluntary basis, school redistricting instead addresses the problem by redrawing the boundaries themselves. As such, redistricting ameliorates the problem of selectively helping only those of the best abilities or motivation; however, redistricting necessarily entails an involuntary redistribution of students and resources across unequal school contexts, a zero-sum game that is almost universally unpopular.

Adding to the politically and emotionally charged nature of school redistricting is the issue of unequal educational access and outcomes by race. De jure public school segregation, ending with the Brown v. Board of Education decision of 1954, gave way to de facto segregation that persists to this day, abetted by continued residential segregation and persistent inequalities of power and resources.

In the past, a natural racial division legitimized segregation, reflecting the preferences of parents and students of all racial groups. More recent arguments against attempts to ameliorate segregation by redistricting supplant the racial logic of segregation—that is, that students prefer to associate with members of their own racial group—and replace it with a class-based (albeit still heavily racialized) logic that attempts to justify segregation on behalf of minority students as well as poor and working-class whites by invoking students’ preferences and abilities. First, it is argued that lower-status students would not be well served in school settings with a large proportion of privileged students, because they will feel their own difference more acutely and thus be at a social disadvantage. Second, because some students are coming from inferior schools and thus are more likely to need remedial academic services, combining them with more privileged students will increase the academic diversity of schools to the disadvantage of students at either extreme of the spectrum of academic abilities. Upper-middle-class parents may spearhead efforts to maintain class-distinct schools, but the underlying logic of different social preferences and abilities compels both professional-class and working-class parents to resist efforts at redistricting.

When redistricting attempts to address both race and class disparities, the actions and preferences of parents and administrators become complicated, as illustrated by the recent case in Omaha, Nebraska. An amendment to legislation reiterating the boundaries of the Omaha school system in 2006 divided the system into three districts on racial-ethnic lines (one white district, one black district, one Latino/a district). Supporters of this redistricting effort, among them Nebraska’s sole African American legislator (who authored the amendment), asserted that it would restore local control of student education, increasing the power of black parents and educators to oversee and control the education of their own children. Critics of the move were incensed by the explicitly racial character of the schools and felt that it could not help but impoverish the identifiably minority schools through the continuation of administrative negligence of minority students. Additionally, they pointed to the designations of “our” children as a racial designation as making racial divisions in the city more concrete. Almost immediately, the National Association for the Advancement of Colored People (NAACP) moved to block the implementation of the law by filing suit in federal court on the grounds that it violated the 1954 Brown v. Board of Education that ruled against the principle of “separate but equal” educational facilities; later that year, an injunction from the district
court temporarily halted the implementation of the law, which is scheduled to take effect in 2008.

Redlining
Redlining primarily refers to an illegal discriminatory practice by real estate lenders or insurance companies who decide that certain areas are high-risk investments. Despite strong credit qualifications of would-be borrowers, lenders refuse to give mortgages to buyers wanting to purchase properties in those designated areas or to give building improvement loans to the current owners. Similarly, insurance companies redline when they refuse to issue property insurance policies to applicants who live in those areas. The term is also used when large supermarkets abandon low-income communities, leaving residents with limited access to affordable, quality food.

Redlining originated in 1935 when the Home Owners’ Loan Corporation, at the request of the Federal Home Loan Bank Board, created “residential security maps” between 1935 and 1940 to identify the level of risk for real estate investment in 239 U.S. cities. It put out maps with underwriting guides that were color-coded as A (blue), B (green), C (yellow), and D (red) levels of credit worthiness. “Type A” neighborhoods were the most affluent, while “Type D” neighborhoods were the highest-risk, low-income, and often predominantly black neighborhoods.

Even more influential than the maps, which had a limited distribution, was the Federal Housing Administration’s Underwriting Manual, whose biased appraisal guidelines lenders had to follow if they wanted to receive FHA insurance. Whatever its cause, redlining played a role in the decay of America’s cities in the mid-20th century with frequent denial of funds for improvement and/or redevelopment.

In the 1960s, consumer activists in Chicago spearheaded reform, and congressional scrutiny led to corrective legislative action: the Fair Housing Act of 1968 and the Home Mortgage Disclosure Act of 1975. The Community Reinvestment Act of 1977 was intended to end all redlining practices by requiring banks to apply the same lending standards in all neighborhoods. Critics contend, however, that such discrimination persists.

After a six-month investigation of 24 million mortgage records and 200 interviews, U.S. News & World Report in 1995 reported the continuance of redlining, prompted in large measure by urban crime, vandalism, and declining property values. As a result, poor and minority homeowners were 50 percent less likely to secure full-coverage property insurance than the residents living in predominantly white, middle-class areas. Seven years later, a 2002 study—after controlling for business size and credit quality, industrial mix, and neighborhood income—revealed that small businesses in black neighborhoods still received fewer loans. A 2003 study also reported the continuance of racial profiling in the banking and insurance industries. Though not as blatant or prevalent today, evidence suggests the continued presence of redlining.

REFUGEES

The UN High Commissioner for Refugees (UNHCR) currently recognizes 27 million persons as refugees (persons who have sought refuge across national boundaries) and another 26 million as internally displaced persons (IDPs) (persons who have sought refuge within their own countries). These people have fled war and political persecution based on ethnicity, religion, or race. Sometimes refugees result from natural disasters that force the migration of people into regions away from their homes. The Geneva Convention of 1951 defines a refugee as one who, “owing to a well-founded fear of being persecuted . . . is [living] outside [their] country of nationality.” Advocates for refugees suggest the broadening of the convention definition to include IDPs.

Most of the world’s displaced persons (refugees and IDPs) are found in Africa, Asia, and Europe, with a disproportionate number in the developing world. Ninety per cent of war refugees exist in the developing world, with the poorest countries—such as Malawi, Pakistan, and Zaire—harboring that same percentage. In 1999, about 9 million refugees existed in Africa, as a result of conflict in Rwanda, Liberia, Somalia, and Sudan. Asia harbors 8 million refugees who fled political persecution and war in Afghanistan, Iraq, Iran, and Palestine. In Europe, the conflict in Bosnia-Herzegovina and in the Caucasus region (Armenia and Georgia) resulted in the creation of 8 million refugees. Significant numbers of IDPs are in Sudan, Sierra Leone, Liberia, Azerbaijan, Armenia, Algeria, Ghana, Nigeria, Republic of Congo, India, Myanmar, Cambodia, and Croatia.

A significant cause of the refugee crisis around the world is ethnic, political, and military conflicts fostered by the process and ideology of nation and state building. For example, the partitioning (boundary revising) of Africa by Europeans at the 1878 Berlin Conference ignored the territorial and ethnic collectivities of African social groups, thereby dividing traditional ethnic communities and encompassing socially distant African communities into a common territory (“nation”). This nation-building process set off conflict between the dominating colonial governments and the subjected Africans, as well as conflict between culturally different ethnics forced to live together in the arbitrarily drawn African nations.

Throughout the 20th century, the conflict between the colonized Africans and European colonizers manifested into the major African independence movements of countries such as Rwanda, Burundi, Angola, Namibia, Rhodesia, South Africa, and Mozambique and exacerbated the conflict between the culturally diverse Africans living within the same territorial and political boundaries. An example of this bi-ethnic conflict is the ongoing war between Hutus and Tutsis in Rwanda. The mass slaughters in 1994 of Tutsis by Hutus resulted in a forced migration of millions of Rwandans into Zaire, Burundi, and Uganda.

Although the ideology of nationalism assumes the right of nations to protect their people (“citizens”), its extreme version often creates a refugee crisis. In the 20th century, for example, ethnic nationalists interpreted this vying for nationhood as a right to expulsion, abuse, genocide, exclusion, and political persecution, leading many people to flee into neighboring countries.

The Phases of the Refugee Experience

A common framework in the study of refugees is the delineation and characterization of phases in the refugee experience. The pre-flight phase involves economic hardship and social disruption caused by war and political persecution. During this phase, by stealing livestock, closing down stores, and threatening violence, enemy soldiers undermine residents’ ability to make a living. Schools close, family members are killed, and people are forced to leave their homes and become refugees. Characterizing the flight phase of the refugee experience is emotional turmoil caused by an uncertain future, a longing for the culture left behind, the sometimes impersonal interrogation of UNHCR interviewers, and the harsh conditions of the passage to the country of asylum. Women are especially vulnerable to violence and rape during this phase.

Next is the settlement phase; at this time, governments, nongovernmental organizations (NGOs), or
international agencies guide the refugees to settle in the country of asylum. Often, for example, in sub-Saharan Africa, refugees are settled in the camps of border countries or choose to “self-settle” there as farmers seeking to integrate with the indigenous population. Generally, self-settlers fare better economically and socially than the camp refugees, who develop identities based on a sense of victimization and dependence vis-à-vis the helping nations and agencies. Some refugees remain in camps for more than 5 years.

In the last phase, resettlement, the government or nongovernment entities might place the refugees in a third country of asylum (often a neighboring country) or help to repatriate them into their home countries. Repatriation is the most durable and cost-effective solution to the refugee crisis. Except for the refugees for whom repatriation is a viable option, cultural conflict, employment difficulties, and prejudice characterize the experiences of refugees in the resettlement phase.

Refugee Children

According to the United Nations’ 1996 report, Study on the Impact of Armed Conflict on Children, women and children constitute the majority of displaced persons (refugees and IDPs). Likewise, the Beijing Platform for Action recognized that 80 percent of the world’s refugees and IDPs are women and children. Children make up the largest age group in refugee camp populations, and half of these children are under the age of 16.

Refugee children—traumatized by war and sometimes separated from their parents or orphaned—arrive in countries of asylum undernourished, sick, dehydrated, and sometimes maimed by the landmines often used in contemporary warfare. A 1996 UN Children’s Fund report identified 1 million such children, reporting that 5 percent of the refugee population consists of “unaccompanied” children. The disruption of refugee children’s familial, religious, and school networks undermines their developing sense of community, identity, and safety. NGOs attempt to join children separated from their parents with distant relatives or organize them into groups under the watchful eye of a benevolent local community. Studies show that refugee children cope best with the experience of conflict and forced migration when they have family and peer support, a personality that is goal-oriented and sociable, and when camp practices reflect sensitivity to the emotional and social needs of children.

Refugee Women

The 1985 Nairobi Conference, 1970s UN Decade for Women, Fourth UN World Conference on Women, Beijing Conference on Women, and the UNHCR’s 1991 Guidelines on the Protection of Refugee Women all highlighted the sexual violence, economic inequality, and human rights violations that refugee women experience. Mozambican, Ethiopian, and Thai refugee women have told their stories of forced prostitution, sexual favors, and domestic violence. In Djibouti, border guards, policemen, or soldiers raped Eritrean and Ethiopian refugee women. At peril is the physical safety of women who must walk through desolate and long paths to collect food or fetch water. Refugee women legitimately claiming their share of food relief often come into conflict with local men who disproportionately keep greater shares for themselves. Men taking over most of the income-producing work in the camps displaced Eritrean refugee women from their traditional and income-generating roles.

Advocates for refugee women interpret the sexual violence, economic inequality, and persecution of these displaced women as human rights violations resulting from gender bias and male dominance. On the policy level, advocates suggest the managing and control of food relief distribution, spatial camp designs that foster the physical safety of women, and broadening the international definition of persecuted groups to include women.

Further Readings

Whether one is talking about the latest actor, politician, or average person, the term rehabilitation is likely to pop up in casual conversation. This is testimony to how quickly the term has entered the pop culture lexicon. Partially because of this, it is difficult to disentangle the different meanings associated with it. After all, everyone has a feeling that rehabilitation cures something. That “something,” however, can range from substance addiction to any number of social problems. This variation occurs in the social scientific community as well, partly because of the link between rehabilitation and disability as social constructs.

Like rehabilitation, disability has several definitions. For example, the Americans with Disabilities Act defines disability as difficulty in performing expected tasks. Using that definition, disability affects 12.6 percent of all working-age adults in the United States. Additionally, the number of days with some role impairment varies by condition. Seven of the top 10 leading causes of role impairment in the United States are physical illnesses, while three are mental illnesses.

Despite the various uses of rehabilitation in both popular culture and the social problems literature, most experts agree that the goal of rehabilitation is to return a body, individual or social, to a condition of health and well-being. What marks a social scientific approach to its study as a social problem is the focus on how social factors and culture make the rehabilitative process problematic for different societal groups.

Rehabilitation Perspectives

In the social sciences, a diversity of analytic and theoretical models of rehabilitation exists. Some contemporary research focuses on how discourse constructs rehabilitation, while others focus more broadly on processes of social construction. Given this dichotomy, offering a single summation of rehabilitation as a social problem is difficult. What complicates matters even more is the scope of much research in the field. Some focus on the psychological state of those who experience rehabilitation, while others focus on the effects of group dynamics on the rehabilitation process. Also, much research focuses on specific types of rehabilitation, while other research focuses on rehabilitation as a more general process. As a result, research on rehabilitation as a social problem developed concepts that focus both on specific rehabilitation practices and theories and on rehabilitation itself. That division points to some fundamental questions. For example, is vocational rehabilitation as a social problem the same as it is for substance abuse rehabilitation? How similar are the constructions of rehabilitation as a social problem for the mentally ill and the physically impaired? How might they differ?

Traditional views of rehabilitation as a social problem often led to building models that identified the different stages individuals move through to adapt to their disability or addiction. Problems arise when individuals are stuck in one stage or another. Such an approach is based on a medical model that defines disability and addiction as illness. The Americans with Disabilities Act has such a model at its base. However, many rehabilitation researchers have increasingly abandoned this stage modeling approach in favor of a quality of life perspective that focuses on an expanded conception of adaptation and life satisfaction.

Developed in part as a rejection of the medical model of disableity, the quality of life perspective comes in large part from social psychologists. Their studies focus on the impact of the rehabilitation process on the self. Research in this tradition draws attention to the multidimensionality of the self and its social construction, focusing on issues of self-esteem, stigma, self-concept, mastery, and the like. These models highlight a social constructionist approach and make the case that rehabilitation, as a social problem, affects not only the person undergoing rehabilitation but also the assorted social relationships in the environment in which the rehabilitation occurs.

Rehabilitation and Criminology

Rehabilitation has had a long history among criminologists. The criminological view loosely defines rehabilitation as providing treatment that will allow ex-offenders back into society without the risk of future criminal behavior. This perspective has been
criticized as a theoretical “blind alley,” lacking in empirical support and opposed by research findings that suggest the impossibility of reforming criminals. Recently some have argued that rehabilitation as treatment is again in ascendancy and displacing competing views offered by labeling, social constructionist, and critical perspectives.

Alcohol and Drug Rehabilitation

Rehabilitation from drugs or alcohol has received a great deal of attention by both the lay public and social scientists. This is largely because of the extent and variety of social problems associated with drug addiction and alcoholism. Family disruption, lost lives, ruined careers, and antisocial behavior are often by-products of substance abuse. According to the National Council on Alcoholism and Drug Dependence, more people die and are disabled from substance abuse each year than from any other cause.

In counterdistinction to other rehabilitative treatments, rehabilitation of the alcoholic or addict is likely to take place in self-help groups such as Alcoholics Anonymous and Narcotics Anonymous. Not only are these groups fairly successful in their efforts, but they have become household names and now serve as rehabilitative models for treatment of other conditions, ranging from anger to sexual addiction. These groups, often alone but sometimes in combination with medical treatment centers, have as their focus the holistic treatment of the alcoholic or addict consistent with the quality of life and social constructionist perspective. Their goal is to make whole both the addicted persons and their relationships through a recovery process that recognizes how each is embedded in the other. Key to this process is the reintegration of the individual back into the group by requiring the addict or alcoholic to make amends for past wrongful behavior.

Critical Perspectives on Rehabilitation as a Social Problem

Critical social scientists, including some criminologists concerned with issues of domination and inequality, raise the possibility that rehabilitation as treatment and diagnosis can subordinate groups by providing rationale for increased levels of surveillance and social control. Here rehabilitation as a social problem emanates from unequal power relations in society and the capacity of powerful groups to label the behavior of subordinate groups as problematic. From this perspective, rehabilitation serves as a mechanism of social control by hiding the impact of class, race, and gender on relatively powerless groups through its common focus on individual behavior. One example is the different penalties attached to drugs of choice by blacks before the 2007 Supreme Court ruling ended this disparity.

A Rehabilitation Industry?

The individual deficit model implicit in most rehabilitation therapy is also problematic from a social science frame, because it creates experts, therapists, and treatment expertise. From this perspective, as therapists come to define the rehabilitation process, they simultaneously create criteria to define its boundaries and assessment measures of success. One result has been the growth of a rehabilitation industry. The rehabilitation industry relies on creating disabilities and their treatment. This transformation of rehabilitation from treatment to commodity has had a dual impact: the development of a popular industry of rehabilitation and the proliferation of the number and types of rehabilitation. Both trends culminate in the ability of individuals to self-diagnose their condition and to choose a suitable rehabilitation treatment. Selling rehabilitation as a product leads to an estrangement of self by producing a body constantly in need of repair and one that is not quite sure of its normality, health, and happiness.

Associated with promoting rehabilitation through self-help programs and books is a culture and style of life that in turn defines the rehabilitation process. One aspect of this culture is that those who have a condition of disability cannot cure it. The goal is to manage the condition. This approach thus reinforces an individual deficit model of disability—a medical model of sickness. However, constructing “recovery” from the condition is social treatment, often entailing the adherence to new norms and reestablishing status in relevant social networks. The degree that this “spoiled” identity is negotiated determines the social integration of the individual but is not the main criterion for rehabilitative success. Success is defined by ending the problematic behavior and making amends to others for the damage caused by that behavior.

Growth in the rehabilitation industry as a social problem encapsulates many of the themes discussed. A focus on the self and the structural context that
informs it will remain vital to the study of rehabilitation as a social problem. Accordingly, stigma, self-esteem, treatment, and inequality will continue to occupy attention in its study.

Relative Deprivation

The theory of relative deprivation proposes that people view their well-being as compared to the situations of others. If individuals perceive themselves to be worse off than their comparison (reference) group, then they will feel relatively deprived. This is opposed to absolute deprivation, in which a person measures his or her well-being against an objective standard. Relative deprivation theory has been used extensively in fields such as sociology, political science, economics, and social psychology.

Samuel Stouffer coined the term relative deprivation in his study of the U.S. military, although the concept predates his work. Stouffer found that members of the U.S. Air Force who did not get promoted felt more relatively deprived than those in the U.S. Army who did not. This resulted from more frequent promotions in the Air Force than in the Army and military personnel viewing their own situations as compared to others around them. The first in-depth exposition of the theory of relative deprivation was the work of Walter Runciman, who gave the conditions for relative deprivation to occur and laid the foundations for its applications to criminology and other fields. His conditions for person A to feel relatively deprived of X are as follows:

- Individual A does not have X.
- Individual A knows of other persons who have X.
- Individual A wants to have X.
- Individual A believes obtaining X is realistic.

The most widespread use of relative deprivation theory in sociology is in criminology. Because some areas or countries with lower levels of absolute deprivation have higher crime rates, experts argue that inequality in the United States has led to increased crime for reasons of both opportunity and mass anger. The “opportunity” aspect of crime arises from inequality creating more opportunities for lucrative property crimes by poor individuals. The “mass anger” hypothesis seeks to explain violent crime as a result of feelings of relative deprivation fostered by increasing inequality.

Sociology and political science also use relative deprivation to explain social movements and revolutions. This work began in the early 1800s with Alexis de Toqueville’s work on France and Germany. He found that one of the reasons for a revolution occurring in France but not in Germany was that the social conditions had been improving for the French (but not the German) peasantry. The improving situation in France raised the expectations of French peasants, and when these expectations were not fulfilled, the French Revolution followed. This type of process is known as a “revolution of rising expectations.” Such revolutions are a concern in countries like China that are experiencing rapidly rising expectations. If economic growth and social progress stalls in China, social unrest may occur.

Relative deprivation can explain social movements in general. Social movements occur when individuals believe they are not getting their fair share of political or economic power, especially in a time when others are making gains. In fact, this problem worsens when conditions improve in a country, as one group feels relatively deprived because another group’s situation improves more than their own. For example, some analysts have used this theory to explain the civil rights movement (with regard to voting), the women’s
rights movement (with regard to equal wages), equal rights demands by gay and lesbian groups, and the “living wage” movement. One of the problems with this theory is that it fails to explain why some groups of relatively deprived people form social movements and others do not.

Economists also have many uses for the theory of relative deprivation. The relative income hypothesis, for example, proposes that individuals’ consumption is based on that of their peers or neighbors, which can have the negative effect of people spending more than their incomes can support and result in unsustainable levels of debt. The common phrase “keeping up with the Joneses,” taken from a comic strip in the early 1900s in which a couple tried to keep up with the luxurious lifestyle of their neighbors, typifies this concept. John Maynard Keynes applied relative deprivation to his theory of how workers react to changes in wages, proposing that workers resist cuts in real wages specific to either them or their industry, but not ones that affect all workers. Some analysts have even used relative deprivation to explain why people move; individuals feel deprived if they are poorer than their neighbors. Relative deprivation also served as a basis to construct new poverty indexes based on incomes relative to median household income, not on absolute standards.

RELIGION, CIVIL

Civil religion in the United States is a concept most closely associated with Robert N. Bellah, whose 1967 seminal work argued that a “religion”—separate and distinct from church or synagogue—provides the unifying civil underpinning that bonds and guides U.S. society. According to this argument, a “biblical republicanism” was expressed from the outset in the conviction that the Creator gave inalienable rights to be realized and protected by these United States and a higher, sacred force continues to permeate, evoked by the words and rituals that celebrate and reaffirm the nation. The founders, the protectors, the martyrs—Thomas Jefferson, George Washington, Abraham Lincoln, John F. Kennedy, Martin Luther King Jr.—inhabit the pantheon, with the defining events memorialized and re-created in communities throughout the country, thereby institutionalizing the history and values that serve to form the cultural union.

As with so many foundational concepts in the United States, civil religion has its philosophical and political roots in Enlightenment thought. The “civil religion” of Rousseau’s Social Contract included belief in God—and rewards and punishment as sanctions to safeguard desired norms. Montesquieu argued that virtue was essential to a republic—both flowing from and creating love of country. The “Creator,” “Nature,” “God” of social contracts, however, was deistic and not explicitly a Christian god. While Christianity—indeed Protestantism—was indisputably the dominant and dominating religion of the minority who were “churched” in early America, civil religion turns to a god of morals and oaths and battles, leaving the particulars of Christ to private worship. The exceptional secularism of the United States—its dual clause of freedom from religious dominance and freedom to exercise religious beliefs—uniquely enabled the a-specific nature of this moral force while nurturing its strength.

The sociological roots for civil religion rest firmly with Émile Durkheim, who posited that religion was both the product and the producer of social cohesion. In The Elementary Forms of the Religious
Life, Durkheim argued that the sacred is something “added to and above” the real—an ideal above the profane world in which humans function, but of their own thought and making. According to Bellah, U.S. civil religion provides the ideal, the sacred authority and imperatives that function above the mere “will of the people.” America is for truth, justice, freedom, equality... ideals above the politically profane.

The shape and content of U.S. civil religion inevitably changed and re-formed itself over time. Its religiously nonparticular nature enabled this accommodation. U.S. civil religion is, on the other hand, not aggressively secular. It is not a “cult of state” that eschews allegiance to all but itself rather than protecting against the pull of religion (as with French laïcité); it in fact assumes religion. The question of the day, however, is, does it assume—or can it accommodate—the episodic surges in diversity and intensity of the cultural and religious allegiances existing outside of but pressing upon the public realm?

Peter Berger’s “sacred canopy” suggests that, as competing ideas are taken up, the enveloping tent of unified values and beliefs weakens and tears. Over time, waves of immigration and shifts in the geographic and cultural origins of that immigration have challenged the fabric of civil religion as well. A nation of Protestants has become a nation of Protestants (and Evangelical Protestants) and Catholics and Jews and Muslims and Hindus and Buddhists and Wiccans and so on—with atheists and agnostics in good measure as well. And a “melting pot” nation defined by Northern European culture is redefining itself in a veritable eddy of races, ethnicities, and religious traditions. The traditions Durkheim looked to as transmissions of culture from one generation to the next are now as competitive as they are unifying. The “they” out there—shared enemies of World Wars I and II and the cold war, which fanned the unifying forces of conflict—are less clear. The unifying ceremonies and mourning triggered by the attacks of September 11, 2001, remain in flag displays and car decals, but they too are losing their grip as some of “us” are so easily mistaken for “them.” Recent research on today’s “second generation” notes that the children of immigrants are not quick to identify themselves as Americans—a label they identify with a white bread existence they do not share.

How, in the face of these changes, these tugs on the canopy, does civil religion continue to be the glue of social cohesion? The specifics of the “higher power” must become vaguer and vaguer as competing religions vie for space in the public realm—the specifics of the culture and values likewise being heatedly debated. Social dynamics as problematic as these compel a rephrasing of Durkheim from declaration to question: If the old gods of civil religion are “dead or dying,” are there “new ones yet to be born”?

RELIGION AND CONFLICT

Conflict and religion both are ubiquitous social processes, but at first they may appear to be autonomous, even contradictory, social processes: Conflict presumes division, distress, and discord; religion presumes cohesion, tranquility, and peace. However, conflict can also be integrative and religion can move actors to challenge and overturn the social and political order. Consequently, following Lewis Coser’s observation that all social life “always involves harmony and conflict, attraction and compulsion, love and hatred,” analysis reveals a similar dichotomous affinity between conflict and religion, one that can be observed at all levels of the social structure: individuals, groups, social classes, societies, and civilizations.
Individuals

Recognizing that religious action has an individual as well as a social component, Sigmund Freud locates the very origins of religion in a primordial conflict between a human being’s instinctual impulses and the necessary restraints each person must impose on his or her expression to gain membership in an accepting and orderly social world. The gods and religion enter to compensate individuals “for the sufferings and privations which a civilized life in common has imposed on them.” But religion at the same time diquets them with its normative demands. In past ages, religious imperatives moved the likes of Arjuna, Siddhartha, Confucius, Muhammad, Ignatius Loyola, and countless others to disregard prevailing worldly or profane logics to exert themselves to conform the ways of the world to the demands of the sacred as they understood it. Similarly, in modern times, it is the felt force of compelling normative directives that, for example, oblige a pharmacist to refuse to honor a prescription for the “morning-after” contraceptive because of its putative abortifacient qualities.

Finally, religion as an agent of both social conflict and social integration at the level of individuals exists in Santería as practiced among many of Latino/a heritage in the United States. Santería had its origins in a syncretic amalgam of the religion of the Yoruba people of West Africa brought as slaves to Cuba and the Catholic religion that the Spanish slave owners imposed on them. Centuries later, carried on the waves of the Cuban diaspora in the latter half of the 20th century, Santería’s appeal widened to encompass other groups, particularly other Spanish-speaking U.S. immigrant communities. Taking refuge in the spells and magical practices of Brujería, the dark side of Afro-Cuban religion, served to relieve tensions arising out of interpersonal disagreements and hostilities; and the traditional religious practices and meanings of Santería, once established in the new land, served to restore a sense of cultural coherence to members of these communities amid the anomie of their marginalized social status.

Groups

When conflict and religion intersect at the level of communities embedded within larger, more encompassing societal configurations, it can occur either within such groups or between them.

Within-Group Conflict

Early Christianity was fragmented by widely divergent understandings of what could legitimately be accepted as orthodox and what should be condemned as heresy. Absent any means of arbitration, each body thought its version was “the truth” and had its own scriptures to back up its claims. The struggle among groups adhering to these varieties of belief—Ebionites, Marcionites, Gnostics, and, last, those that came to be accepted as orthodox—endured until the fourth century, when a clerical hierarchy under the church at Rome achieved the dominance necessary to promulgate an authoritative canon of scripture and formulate statements of faith to which all believers must adhere. Those who continued to hold to beliefs that were not assimilated into the newly proclaimed orthodoxy were regarded as deviants and were relegated to the outgroup; the ingroup found strengthened cohesion in its sense of doctrinal purity.

Between-Group Conflict

While acting out division, between-group conflict concurrently increases the antagonists’ intragroup cohesion by reinforcing unity of purpose in the face of assault on the group’s boundaries. Illustrative of this process is U.S. politics, which, according to many analysts, beginning in the last quarter of the 20th century and running into the first decade of the 21st, has become increasingly polarized, and in which the two main political parties have become ideologically both more homogenous and more adversarial.

Marking much of the division between the parties is its manifestly religious coloring, although many of the issues separating the parties, on their face, are religiously neutral. Often gathered under umbrella terms like “family values,” battle lines are drawn over controversies such as contraception, abortion, and end-of-life decisions; prayer in schools and school vouchers; evolution and embryonic stem cell research; homosexuality, same-sex marriages, and premarital sex; and feminism and capital punishment. On none of these matters are normative postures based on explicit scriptural warrants, nor do they come with traditional doctrinal formulations. However, each is fraught, at the level of culture, with unresolved disputes as to life’s origin and end, its nature and meaning, and appropriate ethical organization of the social world during the span that bridges life’s alpha and omega.
The growing conflict and polarization between the parties is a consequence of intensifying cohesion as each group faces off against a threatening enemy. The political right sees giving any ground to the left on what it considers core moral norms as another step on a slippery slope to moral relativism. The political left sees subjecting the progress of reason and science to limits arising out of the right’s position on contested matters to be little more than surrender of social progress to atavistic superstition. Each group strives to make its norms prevail in the broader community at a time of anomie when governing social norms appear to be ambiguous or changing in ways thought undesirable by the contending parties.

Classes
The concept of class conflict—a specific type of between-group conflict that served as the motive force for social change in his theory of history and society—was Karl Marx’s legacy to sociology. Perhaps the most important significance of religion in Marx’s notion of class conflict is indirect. Ludwig Feuerbach argued in *The Essence of Christianity* that it is not God who created man, but man who created God; that humans are ruled by their own creations, not by an independent, all-powerful God. Marx later took this insight of Feuerbach and concluded that, if the structures of society (state, economy) that eviscerate vast swathes of humankind are the product of human action, then human action (revolution) can change them.

In the *Social Principles of Christianity*, Marx spoke directly to the relation between religion and the class struggle: the ruling class uses religion as an ideological device to suppress the underclass. In what is perhaps Marx’s most oft-quoted comment on religion, he wrote in *Critique of Hegel’s Philosophy of Right* that religion “is the opium of the people.” He exhorted the working class to reject their false consciousness, to refrain from taking refuge in the promises of happiness in an afterlife, and instead focus on the realities of their current circumstances and the causes of their misery, and act to change them.

It is an ironic twist in the history of ideas that it was local Catholic bishops in Latin America along with their lower clergy (as the principal theorists and practitioners of liberation theology) who responded to Marx’s exhortation in *Critique*. They counseled the poor and oppressed to reflect on the conditions of their lives, and, by growing in understanding that God does not will it thus, to recognize their state of dependency and oppression and to develop the capacity among themselves to act rationally and self-reliantly to alter that reality. However, in yet another example of within-group conflict, by the late 1980s the Roman Catholic Church’s governing hierarchy reined in the movement for fear that it threatened its own legitimacy.

Societies
War is the ultimate social conflict. As does conflict at other levels in the social order, war intersects with religion. The Palestinian-Israeli conflict, now over half a century in duration, is an example: two peoples, each self-identified as followers of an Abrahimic religion, engage in deadly pursuit of incompatible goals. Israel’s goal in the struggle is to guarantee the security of its borders as a nation-state within the territory of the former League of Nations mandate for Palestine. By contrast, Palestinians seek precisely to eliminate not individual Israelis but Israel as a nation-state within traditional “Palestina.”

Through the 1967 Arab-Israeli war, Israel united Jerusalem as its capital and increased the territory under its control by three and a half times its original size. Since then, various initiatives sought final resolution of the conflict in terms of a land-for-peace principle: assuming that both parties wanted peace, Israel would exchange territories captured in the war for guarantees from the neighboring Arab states that Israel would be secure within its borders. While Egypt and Jordan negotiated individual treaties of peace with Israel, the central conflict between Israel and the Palestinian people has remained without resolution. The land-for-peace principle does not permit resolution of their conflict because the combatants’ goals are incompatible.

Internal politics make it untenable for Israel even to consider sharing Jerusalem, and the same politics require Israeli leaders to equivocate about surrendering the West Bank, the covenanted lands of Samaria and Judea, to a Palestinian state. Conversely Palestinians developed a sacralized political claim on the land as a driving force in their emergent solidarity as a nation. The targeted outcome for each side is political control over the entirety of the land. The mutual incompatibility of the two goals (reclamation of the Abrahimic covenant versus Palestinian sovereignty) makes
unworkable a land-for-peace exchange and its implicit vision of two independent states, side by side, sharing ancient Palestine.

Civilizations

The concept of civilization refers to a complex social grouping that subsumes all other forms of structured social activity including nationality, kinship, ethnicity, and, in particular, politically organized societies. Today, obvious to all is a split between the umma—the totality of Muslims in the world—and historically non-Muslim populations. In another irony of history, what some in Islamic civilization see in modernity, Christianity, and the West as evil is itself the spawn of conflict within an earlier civilization, Christendom, a half-millennium ago.

The precursors and leaders of the Reformation acted to shift the locus of authority from a centralized papacy to local institutions responsible in varying degrees to individual believers. Martin Luther and England’s King Henry VIII by their ecclesial defections fractured papal political sway over huge swatches of Europe’s territory. Soon bourgeois revolutions in the political sphere followed revolutions in the religious sphere to realign the balance of power from feudal nobility and monarchy to new classes made influential and wealthy by economic changes. Economies, characterized through the Middle Ages and into the Renaissance by medieval guilds, mercantilism, and chartered corporations, were freed from these constraints by the rise of modern capitalism, first commercial, then industrial.

In parallel with these transformations, intellectual emancipation from ecclesiastical and political dominance was precipitated by Francis Bacon’s Novum Organum, the economic thought of the Scottish Enlightenment, and the political thought of the French philosophes. Christendom’s social cohesion, embodied in Pope Gregory VII’s paradigm of the monarch’s dominance in earthly matters and the church’s dominance in heavenly matters, was forever lost to the secularized, contradiction-laden logics of modernity’s autonomous value spheres.

Religion, then, does not obviate the likelihood of conflict but offers fertile soil in which the dichotomous dynamics of conflict—both division and cohesion—can take root and flourish. In many historical cases—seen especially among monotheistic traditions—religious groups, viewing themselves as the only legitimate religion, have erected both structural and cognitive frameworks to maintain an “ingroup/outgroup” dichotomy and to ensure internal purity. In other cases, although claiming commitment to a transcendent relationship with an ultimate reality and a constructive relationship with others in the world, religious people for religious reasons have and continue to turn violent and destructive.

RELIGION AND POLITICS

Religion and politics share a common concern: the order of human beings in the social world in order to avoid the problem of chaos. If at least one definition
of politics is the means by which we order our community and even our personal conduct through the formulation and acceptance of certain rules, laws, and institutions that oversee them, then religion has always had a political function by structuring the world—both inner and outer—in order to provide or enforce some kind of organizing order and meaning of the community. Dominating premodern or pre-Enlightenment concepts of religion and religious life was the notion that the individual was ensconced in a broader order of things, one ordained supernaturally that structured communal relationships as well as personal attitudes toward authority and social power by linking that order of things to some transcendent authority. Religion possessed a political function precisely because it served as the undergirding rationalization for law and the ways that social relationships were governed and organized within the community.

At the same time, religion also, and most important, provided an inner sense of obligation on the part of individuals that legitimized certain forms of social power and hierarchy. The separation between the inner or private life and the outer or public one was always unified in traditional religious societies, or at least mostly so. The result was that ritual and belief served a political purpose in the sense that they provided a legitimation for authority, since they were able to unite the political hierarchies that existed within the community with a cosmological schema. Thus, the relation between religion and politics has always dealt with the problem of value orientations: individuals must orient their subjective values, at least in some degree, toward the acceptance of the order in which they live. Both religion and politics therefore find a common ground in that they seek, albeit in different ways, to orient individuals toward social order and in some way to legitimize that order.

The word religion is a compound of two Latin words: re (“again”) and ligare (“to bind”). In this sense, it denotes a strong connection with origins, with the foundations of the past, as an authority for grounding or validating the present. But its connection with politics becomes more explicit when we realize that the past participle of the verb ligare is lex (“bound”), which is the Latin word for “law.” Religion, therefore, becomes more than simply a metaphysical doctrine informing the other—to the extent that, in some cases, as in ancient Egypt, little distinction existed between religious understanding of the universe and social order and political authority.

The relation between religion and politics becomes a distinct problem once politics becomes secularized; that is, once the foundations of political meaning and authority no longer synchronize with religious worldviews. In Western political history, this begins with the closing decades of the Renaissance and, most explicitly, with the writings of Thomas Hobbes, who provided a rationalization of politics outside the bounds of religious authority, and Benedict Spinoza, who argued against the sacred authority of religious moral teachings. Religion bases its claim to moral authority not upon social conventions, institutions, and values, which are created by humans themselves, but on God or god(s) as a transcendental source of moral authority. As a result, religion and secular politics can come into conflict, since they offer different grounds for moral and ethical duty and obligation as well as different rationalizations for the sociopolitical order.

Max Weber rigorously pointed this out in his discussion of “other-worldly ascetic religion.” For Weber, the key problem was that individuals who cling to religious belief as the rationalization of the social world come into tension with the secular world. The sanctity of religious conventions comes into a dissonant relationship with secular social and political institutions and values. Indeed, for Weber, the key problem was that of secularization, or the “disenchantment” (Entzauberung) of the world through the spread of rationalism and modernity. The encounter with modernity (i.e., with secularism, rationalism, and so on) therefore tends to undermine the traditional authority of religious worldviews, and the political function of religion must compete with the autonomy of secular politics. This can give rise to religious extremism and/or other forms of religious life and activity that engage, in a critical way, secular political and ethical life.

A different approach to the relation between religion and politics stems from the work of Émile Durkheim. Durkheim’s idea about religion was that it constituted a symbolic order that served as a mode of
social cohesion. Religion serves a social function since it provides a continuity of belief through which social order is maintained. From this theoretical perspective, religion and politics become a problematic mix once political institutions and ideas begin to change their modes of cohesion. Secularization therefore leads to a problem of a certain incommensurability of value claims, since it rationalizes the structure of social relations differently from religious systems.

Although distinct from one another, the rise of both religious fundamentalism and religious extremism thus becomes understandable as a response to a crisis in social meaning and modes of cohesion. Once the forces of secular modes of social ordering begin to fragment sacred or religious modes of cohesion, religion becomes deprived of its political function. Traditional forms of social cohesion are then called into question by the emergence of secular social and political institutions and by the cultural and social pressures brought on by the process of secularization. Religious worldviews become challenged, and a crisis of meaning begins to take place. The radical return to religious values to combat the emergence of secular worldviews becomes a major field of contention and plays itself out, sometimes through violent means.

This breakdown of the relation between religion and politics can also explain less radical forms of religious resurgence. In liberal societies, issues such as abortion, attempts to include religious morality into public education, and other related attempts at blending politics and religion are also responses to this breakdown of collective meaning. Since liberal societies allow for the plurality of worldviews through tolerance and an avowed separation of church and state, there emerges a perceived breakdown of moral cohesion. The rise of religious conservatism and its increasing political activity and influence—as exemplified in U.S. politics during the closing decades of the 20th century and beyond—can therefore be seen as a reaction to this “fragmentation” of ethical meaning as prescribed through religious worldviews.

However, the religious response to political life is not always of a reactionary or conservative character. Religious, ethical worldviews can also transform political life in progressive ways. Sometimes it is simply a rhetorical device, clothing more secular political arguments, such as in the U.S. civil rights movement, when the power of the pulpit in black communities was particularly important in mobilizing opposition to racial segregation. The essential critique of the institutions of racial segregation was always basically liberal in character, but when clothed in religious language, it became a potent mobilizing force. Similarly, what is known as “liberation theology” in Latin America was a reshaping of the teachings of Catholicism to provide a political vision of liberation from tyrannical political regimes and institutions during the 1970s.

In the end, however, the relation of politics and religion consists in what can be called the “political function of religion”: in the ability of religion to offer an alternative interpretation of both social order and subjective value orientations that legitimate social relations and the sources of moral authority. To the extent that there is some dissonance between religious worldviews and secular political worldviews, the possibility of social problems arising from the relation of religion and politics is always a lingering concern.

**Religious Extremism**

Religious extremism is a radicalized and intolerant viewpoint that typically sanctions the use of violence to promote a defined, religiously motivated political agenda. Religious extremist groups share several
interlocking characteristics. Among the most important are a sense of persecution, a sense of injustice suffered at the hand of a larger force or ideological entity (such as secularism, the state, a colonial power, or an invading military force), a perceived lack of cultural or political control over one’s preferred way of life, a perceived loss of traditional values and mores, and finally, the idea that sacrifice is necessary to achieve the ends of the group. Religious extremists usually do not identify themselves as extremist. Rather, they identify themselves alternatively as victims, defenders, and saviors.

Religious extremist groups and organizations tend to place adherence to a single religious interpretation as the basis for all other relations. In other words, these groups will embrace and promote a single interpretation of a religious text or ideal that differs significantly from that of the mainstream religion. Acceptance of this interpretation is a key criterion for membership. Religious extremist groups usually have distinct political goals derived from and defined by this interpretation. Acceptance of these political goals is another criterion for membership.

Some people mistakenly identify religious extremism with fundamentalism. However, while extremists tend to promote violence as a means to a political end, fundamentalists need not embrace a religiously motivated political agenda, violent or otherwise. While some extremist groups are fundamentalist, not all fundamentalists are religious extremists. People also confuse religious extremist groups with terrorist organizations. Although many extremist religious groups endorse terror as a means of furthering their religious and political agendas, it would be a mistake to label all groups who use terrorism as religious extremists. For example, the Tamil Tigers, a terrorist organization in Sri Lanka, identify as Tamil nationalists against their enemies, the Sinhalese. While it is true that most Tamils tend to be Muslim and most Sinhalese tend to be Buddhist, the Tamil Tigers’ mission and identity center around nationalist and secular lines, not religious ones.

Thinking of religious extremism as a modern phenomenon is a controversial interpretation. Medieval history, for example, is rife with violence in the name of religion. The Crusades and the Inquisition in its various forms and stages are but two examples. By the same token, Muslim expansion into Western Europe during the eighth through twelfth centuries and Europe’s Thirty Years War between Catholic and Protestant nations in the 17th century could also be described as extremist. Yet to expand the definition of religious extremism to include these and many state- (or civilization-) sponsored wars waged for geopolitical and imperialist ends, even if they were fought in the name of a particular religion, is not helpful in understanding the nature of religious extremism as a contemporary social problem.

The work of Samuel Huntington, a prominent U.S. scholar, supports this view. In 1993, Huntington wrote a watershed article in the periodical Foreign Affairs in which he claimed that the end of the cold war spelled the end of secular ideologies (such as liberalism and communism) as the fault line for violence. In their place, “civilization” would arise as the new identity marker and rallying point for violence. Huntington defined civilization as comprising ethnic, national, religious, linguistic, and geographic identities. Implicit in his argument was the sense that the modern era, with its emphasis on reason, secularism, enlightenment, and science, for a time was able to quash ethnicity, nationalism, and religion as primary identity markers but it did not eradicate them. Huntington predicted that the end of the ideologically driven cold war, waged by the United States and Western Europe on the one hand and the USSR and Eastern Europe on the other, would bring the resurgence of these preexisting civilization-driven identities and, it may be added, the creation of new ones.

In the contemporary world, religious extremist groups embrace extralegal and violent means to further their ends, which often clash with the state’s goal of keeping the peace and maintaining a monopoly over the means of violence. This is not to say that religious extremist groups exist only in recognized nation-states. These groups can spring up in failed states, or in territories unrecognized as states, or where state control is lax due to geography or lack of resources. Hamas, which stands for Islamic Resistance Movement, is one such example. It is the largest Palestinian militant organization, and its political goal is to establish an Islamic state in place of Israel. Hamas has a large network of social services that provide aid to the Palestinian poor. It promotes its own interpretation of Islam, emphasizing jihad (sacred war) against the Zionists, and it uses terrorism to further its political and religious agenda.

Many popular views concerning the nature of religious extremism are rife with misunderstanding. A common mischaracterization of religious extremism among many in the Christian West is that Islam lends itself to extremist views more than do other religions.
This view has been particularly rampant in the United States since the terrorist attacks in New York and Washington, D.C., on September 11, 2001. The attacks brought the discussion of religious extremism and terrorism to the forefront in political, academic, and popular circles. Political leaders and others of influence in the West have perpetuated, or at the very least not refuted, claims that it is within the nature of Islam itself to be violent. Yet moderate Muslims worldwide are no more prone to violence than are moderate Christians or Hindus. Religious extremist groups, regardless of religious affiliation, have more in common with each other than they do with the mainstream religions that spawned them.

Examples of Religious Extremist Groups

Religious extremist groups spring from almost every major world religion. Four examples—one each from Christianity, Judaism, Islam, and Hinduism—illustrate this point. The list is far from exhaustive, as many different religious extremist organizations exist for almost every world religion. As these four examples illustrate, religious extremist groups often reinterpret the tenets of the mainstream religion to justify their violent political agendas.

Army of God

Original mainstream religious affiliation: Christian
Rallying point: Pro-life activism
Religious interpretation: Biblical passages must be interpreted literally and inform everyday practice (Christian fundamentalism).
Political goal: To make abortion illegal in the United States
Religious goal: To desecularize U.S. society by emphasizing the evils of birth control, abortion, and feminism and to place the nuclear family at the center of U.S. values
Means endorsed to achieve political goal: Targeted assassination, notably the murder of doctors who perform abortions, and intimidation, including the physical blocking of entrances to clinics that provide Planned Parenthood services

Jewish Defense League

Original mainstream religious affiliation: Judaism
Rallying point: The Five Principles: Jewish unity and indivisibility; upholding pride in Jewish faith, culture, history, and land; self-sacrifice for their greater good; discipline and willpower; and faith in the indestructibility of the Jewish people
Religious interpretation: The Torah clearly delineates between good and evil and right and wrong. Wrong is all things harmful to the Jewish people. Right is all things that promote the Jewish people.
Political goal: To reserve the land of Israel for Jews. Thus no concessions to the demands of Palestinians or Jews promoting compromise should be made.
Religious goal: Those who harm Jews and thus the faith must be overcome by any and all means necessary.
Means endorsed to achieve political goal: Self-sacrifice, the targeted use of force, and murder

Al Qaeda

Original mainstream religious affiliation: Islam
Rallying point: Muslims must be freed from the corrupting influence of the West.
Religious interpretation: Militant Sunni Islam
Political goal: To end Western presence in, and unify, the Middle East
Religious goal: The creation of a new pan-Islamic caliphate as the legitimate successor to Muhammad
Means endorsed to achieve political goal: Self-sacrifice through targeted terror attacks

Bajrang Dal

Original mainstream religious affiliation: Hinduism
Rallying point: Their official motto is Seva, Suraksha, Sanskar, which translates to “Service, Security, and Embellishment.” The youth arm of the Vishva Hindu Parishad (VHP), Bajrang Dal serves as its security force.
Religious interpretation: True Hindus choose death before relinquishing freedom.
Political goal: To reverse imperial incursions of Christianity and Islam in India, and to restore disputed places of worship to Hindu control.

Religious goal: To defend downtrodden and victimized Hindus from those who do not respect Hinduism in India, notably Muslims, Christians, and moderate Hindus.

Means endorsed to achieve political goal: Terrorism, particularly indiscriminate communal violence against Muslim and Christian enclaves.

Religious Holidays as Social Problems

The holiday of Christmas has become a global social problem because it invites terrorism and other forms of violence. In fact, violence is a part of many religious holidays. On Purim in 1996, Palestinian terrorists killed 13 people and injured 125. During 2006 Ramadan, the spike in U.S. military deaths showed how religious holidays can motivate violence. Around the world, people remember Christmas violence—in the United States, Indonesia, Philippines, Tibet, Mexico, Romania, Algeria, the United Kingdom, Bosnia, Pakistan, Iraq, and Israel.

Puritans of colonial Massachusetts insisted that no proof existed of Jesus’ birth on December 25 and outlawed Christmas in the second half of the 17th century. They were also protesting what they considered the pagan orgy of Christmas misrule. Elsewhere, the commemorations often led to relaxed norms against public excess and worker unrest. Drinking and mumming were central commemorations between colonial and Civil War eras. Mummers were rowdy groups of poor young men who sang carols or shouted rhymes and demanded food and drink from the wealthy, whose homes they boisterously entered. Insufficient “gifts” would cause mummers to riot through homes. Such commemorations thus inverted and perpetuated violent class relations.

As industrialization developed, observance of the Christmas holiday changed. Mythmakers like Washington Irving and Clement Moore borrowed the image of Santa Claus from German immigrants, and stories, poems, and drawings popularized Santa, the Christmas tree, presents, and family. By the 19th century’s end, Christmas was codified in law, and a commercialized, family holiday replaced boisterous Christmas commemorations.

Throughout the 20th century, Christians continued periodic Christmas protest, fighting secularism and commercialism. In the contemporary United States, Christmas philanthropy increases, but conflict persists. Feminists target domestic violence even though scientists debate whether there are holiday spikes. Anti-suicide activists claim Christmas season as their bane, even though scientists deny a holiday spike. Christians resent deletion of Christmas carols from school assembly programs, while non-Christians object to nativity displays on municipal tax-supported property.

Recently, neoconservative Fox News anchors Bill O’Reilly and John Gibson and televangelists Jerry Falwell and Pat Robertson organized a two-pronged Christmas campaign. First, a legal team zealously defended Christmas celebrations that had been banned. Second, a cultural team politicized Christmas commercialism. The televangelists’ previous campaign was “keep Christ in Christmas”; their newer campaign asked to keep Christ commercialized, sponsoring boycotts of stores that refused to change advertising or in-store greetings from “Happy Holidays” to “Merry Christmas.” By 2005, campaigns successfully changed advertising and store practices, and according to Gallup polls, induced a major change in public opinion.
U.S. Christians may protest on a peaceful Christmas, but elsewhere, Christians more likely link Christmas and overt violence. Christmas terrorism emerged in the Far East on Christmas Eve 2000, when bombs exploded during Catholic and Protestant church services in Jakarta and five other Indonesian cities, killing over a dozen people, wounding hundreds, and worsening religious relations in the predominantly Muslim country. In 2004, in a Philippine port city, a bomb exploded in a market packed with Christmas shoppers, killing 15 people, injuring 58. In this predominantly Christian nation that had seen little terrorism, authorities blamed Muslim terrorists from the South Philippines. On Christmas 1997, a bomb exploded in the Tibetan capital, the biggest explosion in a series of previously ignored terrorist incidents. This Christmas bombing, however, brought international attention and meant Beijing could no longer ignore the problem of Buddhist terrorism.

Christmas violence in Mexico helped topple a government. Repression of Zapatista protesters occurred before, but the “Acteal massacre” was especially brutal. On Christmas Day 1997, in Acteal, Chiapas, Indians buried their dead after government paramilitary troops killed 45 unarmed Indian peasants, including 15 children. Politicians initially denied foreknowledge, defined it as a family feud, orchestrated arrests, and promised investigations. However, Christmas repression ignited the citizenry. Protests prompted the president to fire several top officials, but public outrage continued. Two weeks later, thousands protested the Christmas Day massacre; protesters threw rocks, and police returned fire, killing one woman and injuring her baby. That Christmas Day massacre and its aftermath sparked public outrage and created an electoral end to corrupt leadership.

In 1989, regime change deposed communist dictators in Hungary, Poland, East Germany, Czechoslovakia, and Bulgaria. None did so with the violence as the mostly Christian nation of Romania, whose citizens’ fight for freedom succeeded after a Christmas Day massacre that took hundreds of revolutionary victims. Romanians remember Christmas 1989 as the brutal day they overthrew an evil dictator.

Algerian Islamists specialized in Christmas terrorism. Between 1991 and 1994, Algerian radicals attempted a coup to remove Christian immigrants and instill a Muslim theocracy. On Christmas Eve 1994, they hijacked an Air France jet, demanded release of political prisoners, executed three passengers, dumped the bodies on the runway, and flew to France, where they planned to crash into the Eiffel Tower. When they landed to refuel, police stormed the plane and killed the terrorists. During Christmas 2000, a young Algerian Frenchman was arrested in a failed plot to bomb the cathedral in Strasbourg, France.

Christian terrorism has outpaced Muslim terrorism in the United Kingdom. While they promised an official Christmas Day ceasefire, the Irish Republican Army (IRA) or splinter groups such as the Irish National Liberation Army or Real IRA for decades annually planned to explode bombs during the Christmas season. The IRA vowed attacks until Ireland was liberated from British rule. Annual IRA promises of a Christmas Day ceasefire were overshadowed by increased violence around the holiday season. Bombings targeted London shopping areas and disrupted the economic system. Shoppers stayed home. Armed soldiers protected shopping areas. Bombs continued. For more than 20 years, until the peace accords in 1998, the pattern continued. In 2000, officers began an overt public relations campaign, including a holiday advertising campaign to warn of Real IRA violence. The following year, officers arrested six men who planned to detonate six car bombs during the Christmas season. The success story continued; in 2002, police arrested four Real IRA members for Christmas bombing plans.

Muslims in Bosnia consider warlord Naser Oric a hero for defending them, but Serbians (90 percent of whom are Christian) blame him for the “Bloody Christmas” massacre of January 1993. Oric’s men assassinated many Serbian leaders and led ethnic cleansing of many Serbian villages. The most notorious was the raid on Orthodox Christmas, when Oric’s men killed at least 30 Serbians and looted and burned the town. The brutality of the attack was not especially greater than others, but the symbolism motivated a massive Serbian retaliation that established the first demilitarized safe zone in the war. After the war, Muslim mujadeen regularly harassed returning Catholic Croatians; a mujadeen killed a Croat family as they were getting ready to attend Christmas Eve mass.

Most Jihadists were college educated, but in Pakistan this was less so. Al Qaeda and others recruited undereducated Pakistani to drive out the Christian minority. In 2002 on Christmas Day, two terrorists dressed in women’s clothing threw hand grenades into a Christian church, wounding 11 and
killing 3. In 2003, Islamist terrorists attempted to assassinate the Pakistani president on Christmas Day. Before the war began in 2003, Christian Iraqis (who make up less than 5 percent of the population) helped celebrate Ramadan, and Muslims regularly celebrated Christmas as a secular and religious holiday. Jesus the prophet was celebrated as Muslims attended Christmas pageants that reenacted the nativity scene. Muslim celebrations commonly included secular symbols like Christmas trees, gift exchanges, and the Muslim version of Santa, Baba Noel (who drove a reindeer and stopped only at good Muslims’ houses). However, churches experienced periodic bombing, and many Christians fled the country, essentially extinguishing Iraqis’ Christmas celebration.

After stabilizing leadership of the Palestinian Authority in 1995, Yasser Arafat regularly attended Christmas services in Bethlehem. However, he could not control radicals; their annual Christmas bombings and hijackings disrupted pilgrimages to Bethlehem. Beginning in 2002, Israel again occupied Bethlehem and banned Arafat from attending Bethlehem services. Palestinian attacks continued, and on Christmas Day 2003, Israel killed a senior Jihad militant in the Gaza Strip, preventing a major Christmas Day terror attack. In 2004, radical Palestinians claimed responsibility for killing four in a Tel Aviv Christmas Day suicide bombing.

Terrorists attack on religious holidays because they seek a moment defined as sacred by the terrorized. Taking part in Christmastime violence reinforces terrorists’ plans to join a cosmic war. Terrorists gain power if people view them as more evil, committed, dangerous, or powerful because they attack innocents on a sacred holiday. In part because of our reactions, usurping a sacred holiday increases the terror level of a potentially violent act. Religious holidays should be protected so that they retain sacred meaning and are enacted through free public expression. How that protection is secured can be debated, but one promising solution is institutional. Leaders must operate political, religious, cultural, and economic institutions in ways that acknowledge, empower, and incorporate religious outsiders. The public must demand that leaders transform institutions to incorporate religious outsiders. If institutions fail to incorporate religious outsiders, then religious holidays will likely be transformed into social problems.

Religious Prejudice

The gap between the humanitarian ideals of most religions and the often inhumane actions of their practitioners is wide and widely observed. Religious people are clearly not immune to the tendencies toward biased judgments, intolerance, contempt, and even violence that are apparently universal features of human societies.

The specific relationship between religion and prejudice, however, is complex. During the past 4 decades, social science research has focused on the following sets of questions: If religiosity correlates with higher levels of prejudice, as many studies show, is that correlation a matter of individual personality features or intergroup dynamics? Are some religious worldviews more likely than others to foster prejudice; that is, does what they believe affect the kind and degree of prejudice found among religious people? Are different groups—racial or ethnic minorities, gays and lesbians, or religious others, for instance—more or less likely to be targets of prejudice among various religious groups?

Historically, most research on religious prejudice focused on the racial and ethnic bias of religious people. Recent work on religion and prejudice suggests that findings in that area cannot be generalized to religious groups’ attitudes toward other forms of difference, and that besides psychological and social factors, researchers must consider theological and philosophical aspects of religious worldviews in order to define, recognize, and understand religious prejudice.

Definitions of prejudice usually include both cognitive and affective aspects—ideas about a person or group in the absence of relevant information as well as feelings for or against that person or group. Religious prejudice can refer to the ideas and judgments that
religious people hold toward others or to the prejudices of nonreligious people toward those who are religious. Although most research shows a high correlation between religiousness and prejudice, important definitional challenges emerge when worldview—rather than such traits as race, ethnicity, or even sexuality—defines the targets of negative responses. At issue is whether or not negative assessments about what others believe should be understood as prejudice.

Because it emerged from the field of social psychology, unsurprisingly, research on religion and prejudice most often sought personality-based explanations. Redirecting most of this research was Allport and Ross’s 1967 study that found a high rate of prejudice among those whose religious orientation the authors characterized as “extrinsic”; that is, defined by motivations (social status, a sense of belonging, etc.) unrelated to the authentic teachings of a religion, and decreased levels of prejudice among those with “intrinsic,” or sincere and mature religious faith. Despite challenges to, and the complexity of, the intrinsic–extrinsic model, religious personality trait analysis remains a prominent tool in the study of religious prejudice. Additional scales using categories like authoritarian, orthodox, fundamentalist, and “quest” personalities also show correlations with various levels and types of prejudice.

Most recent studies show little or no correlation between religion and racial or ethnic prejudice regardless of personal religious orientation, a finding that coheres with the egalitarian teachings at the core of most religions. When the target is sexual minorities, however, prejudice runs high among those with both extrinsic and intrinsic religious orientations, as well as among fundamentalists and those with orthodox beliefs. Negative attitudes toward gays and lesbians cut across these various scales and therefore must be understood in terms other than individual personal religious dispositions. Some research shows that whether the teachings of religious groups proscribe or tolerate prejudice toward gays and lesbians has a significant effect on the attitudes of members, although other studies suggest that the controlling factor is right-wing authoritarianism, not the specific ideologies of any religious group. Also, researchers have found that anti-gay prejudice exceeds that mandated by the religious ideologies of many of those who express it, suggesting a persistent personality component to this type of prejudice.

Sociological dimensions of religion come to the fore when offering intergroup rather than interpersonal dynamics as explanatory models for understanding negative attitudes held by religious people toward those who are different. Marketplace models of religion posit that competition for members and for the social resources that accompany religious affiliation fosters high levels of commitment to ingroups and negative judgments toward religious outgroups. In particular, researchers have analyzed the strict boundaries drawn between insiders and outsiders (and negative views of the latter) by fundamentalist groups in terms of their ability to protect ingroup identity and self-esteem in times of social upheaval and crisis. This approach helps explain the negative attitudes those of one religious group hold toward those of others, a type of prejudice found to be pervasive among religious people regardless of individual religious orientation.

The question remains, however, whether or not there is anything properly religious about this religious prejudice. That is, do religious worldviews themselves, independent of personality types and intergroup dynamics, predispose people to judge negatively those who are religiously different? The positions taken by different religious communities and different individuals within those communities on the question of religious others are diverse and complex. Since the 1980s, theologians and philosophers of religion have employed a typology of exclusivism, inclusivism, and pluralism to classify these positions. Exclusivists believe that their own religion has unique access to religious truth and salvation, whereas inclusivists see other religions as imperfect though valid routes to a truth revealed most perfectly in their own. Pluralists affirm that no single religion has privileged access to truth, and that there is no a priori basis for denying the validity of any religious path. While particular religions may tend explicitly or not to foster one of these attitudes more than another, they exist within nearly all major religions. For instance, Evangelical Christians are most often exclusivist, while several liberal Protestant denominations affirm pluralism, and the position taken by the Catholic Church at the Second Vatican Council was explicitly inclusivist. Similarly, there are exclusivist and pluralist Hindus, inclusivist and exclusivist Muslims. Furthermore, inconsistencies often exist among the positions on religious others taken by religious institutions, texts, leaders, and individual members of religious communities.
Religious worldviews, unlike race and, by most measures, sexual orientation, have a significant volitional element; people adopt sets of religious beliefs and practices because they find them to be meaningful and enriching to their lives. Negative assessments of alternative views may, in that sense, be inevitable. The person who believes firmly in only one god will tend to view negatively those traditions that teach there are many, and he or she may maintain that position in spite of positive feelings for, and relationships with, those who believe differently. Modes of religious knowing, rooted as they often are in spiritual experiences irreducible to rational analysis, may thus involve a priori judgments, but not necessarily interpersonal antipathy. Studies of American interreligious relations, for instance, show surprisingly high levels of respect and tolerance for religious others among those with strongly exclusivist belief systems. Furthermore, pluralist affirmations of religious difference are not always as conducive to harmonious intergroup relations as might be expected. The pluralist premise that no religion has unique access to truth and that such claims are metaphorical or simply wrong strikes many as its own form of prejudice, if not intellectual imperialism.

These incongruities raise important questions about how best to reduce religious prejudice. Simply defining all negative assessments of other worldviews as prejudice shuts down the conversation with most religious people. As with any form of social bias, exposure to and education about religious others is a necessary but insufficient condition for improving interreligious relations. The most successful interfaith dialogues in the United States have occurred when people collaborate on projects of mutual importance, whether building a community homeless shelter, passing a piece of legislation, or, in the growing number of U.S. interfaith households, raising a family. Recent trends in American religion toward less institutionally defined, more individualized spiritualities may diminish the intergroup dynamics that foster religious intolerance. To the extent that individuals find themselves not only exposed to, but incorporating aspects of, different religious traditions into their own eclectic spiritualities, the category of religious “other” itself becomes less significant.

The most helpful research on religious prejudice in the coming years will be that which (a) expands beyond the current and historical focus on North America and on Christian groups to develop truly cross-cultural and multireligious models; (b) explores the significance of new patterns of eclectic spirituality and religious combining; and (c) distinguishes carefully between the truth claims of religious people and their attitudes toward those who do not share them.

Reparations

Loosely defined, reparations are something done or paid to compensate or make amends for a wrongdoing. More specifically, the term *reparation* refers to compensation given for loss, suffering, or damage suffered by an injured party. Reparations exist in different forms. For example, war reparations are payments from one country to another as compensation for acts of war. In the legal system, reparations can refer to compensation for civil damages or restitution to the victim of a crime. A third situation, which may be the form of reparations most people are familiar with, is reparations for oppression based on a group’s race or ethnicity.
Reparations in the United States

The subject of reparations is controversial in contemporary U.S. society, particularly when discussed in the context of oppression. In some cases, reparations can directly compensate individuals or groups for economic losses suffered as a result of oppression. More frequently, they involve symbiotic payments that officially acknowledge wrongdoing by the dominant group and investment in efforts to address present-day inequalities that have resulted from past injuries. Reparations can thus symbolize a step toward equality, but there is disagreement about whether oppressed groups need to be compensated in order to achieve equality.

Despite the controversy over whether oppressed groups should be compensated or not, there are some cases of the U.S. government giving reparations to address violations of justice and equality in localized settings. For example, in the late 1860s, Russia sold Alaska to the United States without any consideration of the native inhabitants’ rights or ownership of the land. The Alaska Native Claims Settlement Act (1971) restored 44 million acres of land and $1 billion to Alaska Natives. Also, in 1994, residents of Rosewood, Florida, an all-black town destroyed by lynchings and property damage in 1923, received monetary compensation from the state of Florida for their loss of property. Most contemporary discussions of reparations focus on two examples of national inequity, namely Japanese American internment and African American slavery, that have been addressed in contrasting ways.

Japanese American Internment

After the bombing of Pearl Harbor by Japan in 1941, the United States entered into a war with Japan, Germany, and Italy. Many people questioned Japanese Americans’ loyalty to the United States. In February 1942, President Franklin D. Roosevelt issued Executive Order 9066, authorizing the relocation of all U.S. citizens of Japanese, German, or Italian ancestry to internment camps. The order required that Japanese Americans, German Americans, and Italian Americans living in designated regions leave their businesses, homes, and many of their belongings to live in poorly constructed, cramped living quarters for an indefinite period of time. While the order did affect the lives of citizens of German and Italian ancestry, the order had a more far-reaching effect on the Japanese Americans. For the duration of the war, more than 120,000 Japanese American families, both immigrants and American born, were held in internment camps in Colorado, Washington, Oregon, California, and Arizona.

Civil Liberties Act of 1988

The Executive Order 9066 was rescinded in 1976, and in 1980 the Commission on Wartime Relocation and Internment of Civilians was established to conduct a governmental study on the effects of Executive Order 9066. In 1983, the commission concluded that Executive Order 9066 was unjustified and that Japanese Americans were victims of discrimination by the federal government. As a result of the commission’s recommendations, the Civil Liberties Act of 1988 was passed by Congress and signed by President Ronald Reagan. The act, which granted reparations to Japanese Americans interned during World War II, consisted of an official government apology, $20,000 paid to surviving internees, and the creation of a public education fund to inform children and the public about this period in U.S. history. Although the Japanese American internment was legal during the war, it violated the principles of equality and private property. The money given to internment survivors did not cover the full value of lost property during internment, but it did serve as a symbolic acknowledgment of the loss. It also helped restore the dignity of Japanese Americans who had suffered through the disgrace of internment camps.

African American Slavery

The negative impact of slavery on African Americans was not only troubling but also far reaching. Slaves were denied the right to marriage, families were scattered when partners or children were sold to another plantation owner, and many masters sexually exploited enslaved women by forcing them to reproduce the enslaved population. African American labor was also exploited, as the enslaved worked under deplorable conditions without compensation. Evidence of their labor exploitation continued even after slavery was abolished in 1865, when 4 million newly freed African Americans were sent away from the plantations empty-handed, without payment for their services, and without land to cultivate in order to earn a living.
**Forty Acres and a Mule**

Immediately following the Civil War, reparations for slavery involved efforts to promote economic self-sufficiency through agricultural production, commonly referred to as “forty acres and a mule.” Field Order #15, issued by Williams T. Sherman on January 16, 1865, was originally intended for two purposes. First, newly freed black families were to be given 400,000 acres of tillable land. This federally confiscated land stretched 30 miles inland from the coastlines of South Carolina to Florida. Working their own land, freedmen had an opportunity to gain economic security and wealth through land ownership, thus counteracting the poverty resulting from unpaid slave labor.

Second, Field Order #15 also encouraged freedmen to join the Union Army to maintain their newly won freedom. This move to help free black families was simultaneously a political move to strengthen the Union Army’s ranks and also punish the South by attacking and harming the source of southern culture and wealth: the plantation system. Radical republicans who supported reparations argued that southern leaders who supported secession had no right to the land because the South lost the war. Freedmen were given the southern rebel leaders’ land. Although the rebels accounted for less than 5 percent of white families, the impact of freedmen earning a free living apart from white plantation owners would be felt by most southern whites.

The new black land owners did well, making good profit, but President Andrew Johnson revoked the order in 1865. Without land, they could continue to serve as a ready source of very inexpensive labor. Thus, blacks’ overall economic status changed little from their economic status during slavery.

**Modern Slavery Reparations Claims**

In recent years, some civil rights advocates have promoted reparations for the legacy of economic and political disadvantage caused by slavery. There are two types of reparations: public and private. Public reparations include a formal apology for abuse of human rights, direct payments by the government to descendants of slaves, and an investment in programs like education, jobs, and housing to benefit African Americans. Private reparations most often occur with public apologies by corporations who benefited from the institution of slavery, such as banks, railroads, insurance companies, and newspapers that ran advertisements for runaway slaves. There have been several lawsuits in federal and state courts since 2000. For example, in 2002, Aetna, an insurance company that issued life insurance policies on slaves to masters, expressed deep regret in a public apology.

**Perspectives on Slavery Reparations**

As a group, African Americans have historically and systemically been limited in their pursuit of upward mobility through access to equal education, opportunities for equal employment, and the accumulation of property and wealth. Progress made by the civil rights movement has been helpful in establishing African Americans’ equal status in society; yet the legislation that resulted from the civil rights movement did not effectively address black people’s legacy of economic disenfranchisement and disadvantage. Although civil rights legislation made it illegal to prevent African Americans from owning land and buying houses, without ensuring the money to do those things, the legislation was limited in effecting real change in social interactions. Thus several organizations rallied for financial support and even demanded reparations for slavery.

Proponents of reparations for slavery suggest that, much like Japanese American internment, slavery was legal at the time but nevertheless a violation of equality, with consequences that still resonate in contemporary society. Opponents to reparations for slavery acknowledge how grievous slavery and Jim Crow were for blacks who lived during those times but argue that the descendants of the enslaved have no claim to compensation. Opponents also note that the task of determining who should receive reparations and how it should be distributed would not only be challenging; the task would also be time consuming and expensive.

**Repatriation**

The term *repatriation* refers to the return of individuals, human remains, cultural property, or other artifacts to their homelands or to their original owners. Repatriation applies to such processes as the return of the bodies of foreign soldiers after a war; the restoration of Native American artifacts from museums to their proper burial places; or the replacement or reimbursement of currency, art, and other items of worth to Holocaust survivors. Repatriation of refugees, displaced persons, and migrants involves the deportation of a populace from a country of residence and their resettlement in their country of origin. This may be a voluntary return or a forced return migration. In the United States, mass repatriation has occurred with Mexican migrants, especially during economic downturns. Internationally, repatriation has become the de facto policy of the UN High Commissioner for Refugees (UNHCR) in its approach to the issue of refugees and displaced persons.

### U.S. Repatriation of Mexican Migrants

There are several periods of mass deportation and repatriation in U.S. history, most notably the repatriation of Mexican migrants in the 1930s. During the peak years of the Great Depression, the Hoover administrations adopted the policy of “American jobs for ‘real’ Americans.” By means of social and political pressure, harassment, raids, and roundups, nearly one-third of the Mexican population in the United States was repatriated. Those repatriated included Mexican nationals as well as U.S. citizens of Mexican descent. Trainloads of returnees were left in unfamiliar towns in Mexico with little or no economic means. In 2005, California passed the Apology Act for the 1930s Mexican Repatriation Program. While offering no reparations for the loss of properties, the divisions in families, and the death of an untold number in transit, the bill did offer an official acknowledgment of the harm caused by the policies of the 1930s.

Deportations and repatriation of Mexicans continue today. Since 2004, the United States has repatriated more than 14,000 Mexican nationals annually under a homeland security program aimed at limiting undocumented Mexican migration. This effort to reduce the number of illegal border crossings offers migrants the option of “interior” repatriation to their hometowns rather than apprehension and release at the border. These repatriations include flights from the United States to Mexico City or Guadalajara or bus transportation to the hometown of the migrant. In 2004, the program cost the U.S. government more than $15.4 million and has been criticized as largely ineffective in curbing undocumented migration.

### Global Refugee Repatriation

During the past 15 years, the UNHCR has successfully assisted in the return of millions of refugees to their countries of origin. Largely displaced during the collapse of the Soviet Union, and as a result of civil wars, conflicts, and natural calamities in the global South, the refugee and asylee population peaked in the 1990s. Driven by political pressure of Northern countries, the policy of the UNHCR toward refugees has been that the optimal, “durable” solution is repatriation rather than asylum.

Former UN high commissioner for refugees Sadako Ogata referred to the 1990s as the “decade of repatriation.” Mass repatriation of refugee Afghans, Bosnians, Cambodians, Croatian Serbs, Eritreans, Ethiopians, Guatemalans, Mozambicans, Palestinians, and Russians were documented during this period. In all, there were nearly 15 million estimated returnees during the 1990s, as compared to fewer than 4 million from the period 1975 to 1989. This policy of return and resettlement continues today, with between 1 and 2 million refugees repatriated each year since 2000. The majority of returnees in the past 5 years have been Afghans, displaced during the long civil war in which more than 20 percent of the population fled to neighboring Pakistan and Iran. Since 2001, more than 4.6 million Afghans have returned with UNHCR
backing. As a result of the policy of repatriation and continued resettlement efforts, the world’s refugee population dropped from its peak of nearly 17.8 million in 1993 to just over 8.3 million in 2006.

According to the UNHCR, return to the home country—even in situations in which the cause of the original flight may still be a factor—has been “voluntary” for the refugee. Yet, debate continues over whether the policy of repatriation has left the returnees without means in what remain as hostile countries to them. As with the mass deportation of Mexican migrants from the United States to Mexico in the 1930s, repatriation has involved resettlement to areas of the home country that are not considered “home” to the refugees. This internal displacement, as well as the varying amounts of assistance and monitoring provided by the UNHCR, has led to continued issues of economic and social disadvantages for some returnees and has severely limited the reintegration of repatriates in their homelands.

As a result of the documentation of problems in earlier repatriation and reintegration of refugees, the UNHCR initiated the “4Rs” approach in 2002. In collaboration with the UN Development Programme and the World Bank, the approach called for refugee repatriation and reintegration, followed by rehabilitation and reconstruction of the country. While repatriation and reintegration efforts have been ongoing since the 1990s, officials recognize that, without the rehabilitation or restoration of the social and economic infrastructure, reintegration efforts would fail. Moreover, without support, the establishment of political order and economic institutions to maintain a long-term sustainable development would not be possible.

RESETTLEMENT

The Oxford English Dictionary’s definition of resettlement, to “settle or cause to settle in a different place,” implicitly recognizes that moving can be voluntary or involuntary. Voluntary movers are generally called immigrants; involuntary movers are called refugees.

Resettlement countries are typically preoccupied with selecting those immigrants most likely to make a contribution to the country and with establishing the legitimacy of refugee claims. They pay comparatively scant attention to what happens after opening their doors.

Resettling in a new country is ever-changing and, according to some authorities, a lifelong process. The process involves establishing economic and social independence, creating capacities to build a future, establishing family and community networks, and developing tools, such as language, that make participation in the larger society possible.

Although a general consensus exists that integration is the end goal of successful resettlement, differing definitions of the term create confusion. Governments, typically preoccupied with the economic and demographic benefits of immigration, define integration as...
the realization of human capital. Canada’s gross annual immigration level equals roughly 0.7 percent of its total population. The comparable U.S. figure is about 0.3 percent. Both countries experience net economic benefit: over the course of a lifetime, the average immigrant family pays more in taxes than it consumes in services and benefits. Economic class immigrants (to use the Canadian term, which corresponds to “employment-based immigrants” in the United States) tend to be remarkably successful: men achieve economic parity with native-born Canadians within 2 years, and women within 5. Selecting immigrants on the basis of human capital attributes such as education and employable skills is part of the explanation. However, selection is no guarantee of success. Despite their generally high levels of education and job skills, about one-third of immigrant families live in poverty for at least a decade before they begin to achieve economic parity with persons born in the United States and Canada.

About 1 in 4 new settlers enters the United States or Canada as an economic immigrant. Others, including “family class” immigrants and refugees, integrate more slowly and, on the whole, encounter even more bad luck and blocked opportunity than their economic class counterparts.

Service providers are more concerned about factors such as linguistic ability and health, not only because they are intrinsically important, but because they help ensure successful resettlement. Proficiency in a resettlement country’s language is, for example, one of the most potent predictors of economic integration. According to the 2000 U.S. census, 21 million people did not speak English “very well.” Language training is obviously important, but, in the United States, less than half the demand for English-language training is being met. On the whole, immigrants are in better health than native-born residents of Canada and the United States. However, the health of some immigrants deteriorates significantly over time, probably because of a combination of predisposition and exposure to unhealthy diets, new environmental pathogens, and adopting sedentary habits. Immigrants resettling in North America and Europe are at high risk for tuberculosis, a disease that compromises their own health and poses a significant public health challenge. Immigrants and refugees underutilize preventive and curative health services, thereby further compounding their health risks.

Civil rights advocates tend to focus on social integration, which encompasses topics such as equity, identity, and civic participation. About 1 in 5 visible minority immigrants reports significant encounters with discrimination during a five-year period. Blacks report an even higher rate: 1 in 3. Experiences with discrimination tend to increase ethnic identification and to militate against the development of national identification.

The politics of identity has assumed increasing prominence in a post–September 11 world. Concerns center on topics such as whether encouraging retention of heritage cultures and permitting more than one nationality militate against the evolution of civic nationalism. Canada, with its long-standing multicultural “mosaic” policies, and the United States, with an avowed “melting pot” ideology, are frequently cited as natural experiments for studying the effects of national values on integration. Immigrants in Canada are more likely than their U.S. counterparts to become citizens, more likely to acquire some knowledge of the country’s official language(s), more likely to form friendships that cross ethnic lines, and more likely to participate in politics. These findings are, however, far from definitive statements about the relative benefits of multiculturalism. Below the level of official policies, immigrants and minority groups in Canada and the United States face similar public misunderstandings and challenging experiences.

Although poverty, lack of linguistic fluency, and discrimination are enormous resettlement challenges, a deficit model that focuses only on stresses cannot do justice to the complexity of the resettlement process, and it certainly cannot explain why resettlement stories are more likely to be narratives of success than of failed integration. As one example, poverty is probably the single most powerful social predictor of children’s mental health and behavioral problems. However, despite the fact that immigrant and refugee children in Canada are almost 3 times more likely than their native-born counterparts to live in poverty, they have fewer emotional and behavioral disorders. New settlers’ personal and social resources are an important, but poorly understood, part of the explanation. During the early years of resettlement, immigrants with access to a like-ethnic community of significant size enjoy better mental health than immigrants who lack this apparent advantage. Emotional support and the maintenance of self-esteem are likely explanatory mechanisms.

People everywhere are on the move. Existing research and knowledge can and should help make resettlement as painless as possible for immigrants and refugees and help ensure maximal benefit for
receiving countries. Newer trends, such as transnationalism, and concerns about how immigrants transform the societies in which they settle, together with the persistence of problems such as immigrant poverty and societal discrimination call for an ongoing interplay among research, enlightened policy, and informed public debate.

**Resource Mobilization**

During the 1980s, analysts developed the resource mobilization perspective to better understand and explain the emergence, significance, and impact of the social movements of the 1960s and 1970s. Resource mobilization is at root a theory explaining how individuals and groups overcome resource inequalities and organize themselves to pursue desired social, cultural, or political change.

A social movement is a set of preferences for social change within a population. Individuals who share those social change preferences are called adherents, while those who contribute resources of support are constituents. Bystanders are those who watch from the sidelines. A key analytical issue for resource mobilization theory (RMT) is understanding how social movements turn bystanders into adherents, adherents into constituents, and constituents to active participation. Such tasks of mobilization are undertaken most often by social movement organizations (SMOs). Many SMOs have professional staffs and substantial resources. However, the vast majority are small, are voluntary, and operate locally. All the SMOs pursuing social movement goals are called a social movement industry (SMI). SMIs vary greatly in size and capacity, with some quite large, like the environmental or women’s movements in the United States, and others much smaller, like the movement to abolish the death penalty or promote homeschooling.

SMOs gain access to resources in multiple ways, and RMT highlights four mechanisms. In self-production, social movements produce resources themselves by the efforts of existing organizations, activists, and constituents. They also aggregate resources by getting individuals and groups to contribute their separate resources that are then pooled to support collective actions. Social movements often appropriate or co-opt resources by utilizing previous connections to other groups and organizations. Finally, patronage refers to foundation grants or large private donations provided by specific individuals or groups.

Resource mobilization analysts conceptualize five distinct types of resources. Moral resources include things like legitimacy, integrity, solidarity, support, sympathetic support, and celebrity. For example, receiving awards like the Nobel Peace Prize confer legitimacy on an SMO and its leaders, while celebrity endorsements increase media coverage, generate public attention, and open doors to policymakers and resource providers alike. Cultural resources include relevant productions like music, literature, and humor, as well as “savvy” and “know-how” that facilitate the recruitment and socialization of new adherents and help movements maintain readiness for collective action. Social-organizational resources include social networks and formal organizations that enable movements to connect, communicate, and coordinate actions. Human resources include recruiting individuals to participate and the labor, experience, skills, expertise, and leadership they bring with them.
Material resources are money and physical property like office space, equipment, and supplies.

Currently, resource mobilization theory has three complementary branches. Political process theory focuses on how changes in political opportunity both influence social movements and are exploited by them. Collective action framing emphasizes how social movement actors conceptualize issues and communicate their concerns to both motivate adherents and draw in bystanders. The organizational/entrepreneurial branch examines how individuals who share preferences for social change gain access to resources to organize themselves and take action. Resource mobilization theory predominated in the rapidly growing sociological subfield of social movement research during the 1980s and 1990s and remains a vibrant perspective within the broader conflict paradigm in sociological theory.

Restorative Justice

During the past several decades, restorative justice has emerged as an important new approach to criminal justice theory and practice. It is based on the goal of repairing the harm of crime rather than the traditional criminal justice goals of assigning blame and imposing punishment for criminal transgressions. Advocates of restorative justice maintain that it is more than a program for reform; it is a new way of envisioning criminal justice that involves the victim, the offender, and the affected community in a search for solutions.

Restorative justice practice generally consists of informal, voluntary face-to-face encounters among the victim, offender, and relevant community members, in which the parties come to greater understanding and empathy, offenders express remorse, and a plan for repairing the harm of crime is negotiated, resulting in an agreement that emphasizes reparative solutions such as restitution, apologies, and community service rather than punishment.

Basic Principles

The critical difference between restorative justice and traditional justice is its focus on the offense as a source of harm to people and not simply as a violation of the law. Under traditional criminal justice theory, a criminal offense is against the state rather than the individual victim. The state, critics claimed, has “stolen the conflict” from those directly involved and established a system of coercive punishment dedicated to maintaining order rather than resolving conflicts, compensating losses, and reintegrating offenders. While numerous reforms in recent years attempted to redress the historic neglect of victims, the restorative justice approach takes this concern for the victim to a new level of involvement by positioning the victim as a central decision maker in cases in which the defendant admits criminal culpability.

The restorative justice alternative is essentially informal and nonpunitive. The offender becomes accountable for his or her conduct not through passive submission to punishment but by taking active steps to repair the damage she or he caused, including the damage to the victim’s self-respect. In so doing, the offender not only redresses the losses to the victim and the community but advances his or her own social rehabilitation as well.

By offering itself as a radical alternative to conventional criminal justice, restorative justice has attracted a multitude of criminal justice critics and reformers in search of fundamental change. As a result, there is no “standard” definition of restorative justice. While some definitions emphasize a unique restorative justice process that requires the involvement of the victim, the offender, and the community in search of restorative solutions, a more expansive definition emphasizes the central objective of restoration: repairing the harm of crime.

Restorative Justice Programs

The essential tools of restorative justice consist of victim–offender mediation (VOM), family group conferencing, community circles, and victim–offender panels. Presently, 1,500 such programs exist worldwide, with more than 300 in the United States alone.
Private agencies, probation departments, or court personnel usually administer them. The vast majority of these programs involve juvenile offenders and property offenses, and, since restorative justice is not a system of adjudication, these programs are not applicable to contested cases.

The function of VOM is to enable the offender and the victim to meet with each other under the supervision of a trained mediator (or “facilitator”) to search for a plan for reparation. The format typically involves several stages of encounter. In the first stage, the victim is encouraged to tell his or her story and communicate the full emotional and psychological extent of the psychological and emotional losses suffered, following which the offender tells his own story and, typically, expresses remorse. In the second stage, the participants devise a way to make things right to the extent possible, including the adoption of a plan of restitution, in-kind services, rehabilitation, and monitoring procedures. The mediator helps to reduce the agreement to writing, which is enforced through the court system.

While VOMs require only the presence of the victim and the offender under the guidance of a mediator, the aim of family group conferencing is to include as many interested parties as possible, including the victim, the offender, their friends and relatives, and representatives of the community, clergy, and schools. On occasion, family group conferences include the participation of the police, probation officer, and judicial personnel as well. Community circles, typically used in more traditional societies, such as Aboriginal and Native American groups, involve the participation of a number of community members to discuss both the interpersonal and the community-wide dimensions of the problem and to propose comprehensive solutions.

Evaluations performed on many of these programs during the past several decades have generally indicated positive effects on reducing recidivism, on compliance with restitution orders, and, perhaps most important, on victim satisfaction. Because the programs under consideration typically involve juvenile offenders and property offenses, it remains to be determined whether these positive effects can be demonstrated with respect to adult offenses and more serious offenses. Additionally, as restorative justice attempts to move into the mainstream of criminal justice practice, other issues to be considered include whether the goal of informal, personalized criminal justice can accommodate the values of proportionality, equality of treatment, due process, public safety, and adherence to the rule of law, and whether the goal of restoration can be reconciled with the use of punishment, which many citizens regard as a necessary component of criminal justice.

RETIREMENT

Retirement is an economic-based term that traditionally refers to the ending of paid work, often signaling the end of one’s professional or work career. In the United States, retirement is usually accompanied by the receipt of Social Security to provide income, Medicare to cover some health care costs, and private retirement accounts or pensions to supplement savings.

One basic aspect of the retirement process is the question of a retirement age. Two concepts must be the mandatory retirement age and “full” or “normal” retirement age. Issues of a mandatory retirement age center around changes in the Age Discrimination in Employment Act (ADEA). In 1967, passage of the ADEA addressed age-related issues in the workplace by preventing hiring and firing practices based on age. In 1978, the focus of the act expanded with an amendment to the ADEA preventing companies from enforcing mandatory retirement upon employees before they reached 70 years of age. More recently,
in 1986, an amendment to the act prohibited companies from setting a mandatory retirement requirement based on age.

Due in part to ADEA legislation, the United States currently has no mandatory retirement age. However, the Social Security Administration (SSA) does set an age for entitlement to full Social Security benefits. The SSA uses the term **normal retirement age** or **full retirement age** to describe the age at which a person can receive full retirement benefits. Retirement before such age incurs a penalty and deductions, while retirement after such age offers increased benefits. According to the SSA, as of 2006, the normal or full retirement age is 65 years of age for those born in the year 1937 or earlier. For those born after 1937, the normal or full retirement age increases by monthly increments. For those born in 1960 and later, the retirement age reaches 67 years.

**Early Versus Phased Retirement**

According to the U.S. Census Bureau, before the 1990s, the trend was toward early retirement; that is, people retiring before eligibility for full benefits. Now the trend has shifted toward **phased retirement**—simply reducing hours of work gradually and easing into the retirement role. According to the Employment Benefit Research Institute’s (EBRI) 2006 Retirement Confidence Survey, although current employees favor more retirement options, such as phased retirement, companies are only beginning to offer phased retirement plans.

Although phased retirement may be preferred, obstacles such as laws and regulations prevented widespread access to phased retirement options. Early versions of the Employee Retirement Income Security Act (ERISA) prevented taking monies from one’s pension while working. Also, if a retiree was working at a part-time job, Social Security benefits were reduced. In 2000, passage of the Senior Citizen Freedom to Work Act addressed these obstacles. It relaxed restrictions for collecting pension monies while working in retirement. Under the Senior Citizen Freedom to Work Act, individuals can work in retirement without a deduction taken from their Social Security benefits. In addition to phased retirement, the combination of all factors (pensions, laws, acts) is leading to what is now called “late retirement,” where individuals retire well past age 67 and sometimes in their 70s and 80s. Also common are “bridge jobs”—those jobs that help one transition from a lifelong career into retirement.

**Baby Boomers as They Retire**

Issues of ways to retire have come to the forefront because a large segment of the U.S. population is reaching retirement age: the baby boomers, those born post–World War II during the years 1946 to 1964. According to the U.S. Census Bureau, the first wave will reach 62 in 2008 and will reach 65 in 2011. In fact, the Census Bureau estimates that in 2020, individuals ages 60 to 64 will be double the number of those at that age in 2000. The number of those 65 and over in 2030 will be twice that of 2000, increasing in size from 35 million to 75 million. This sheer number of potential retirees has made lawmakers, companies, and individuals rethink the way they previously viewed retirement. The retirement of the baby boomer group is often cited as a drain or loss of a large percentage of the skilled and experienced labor force.

**Retirement Uncertainties**

Two trends are leading to uncertainties in retirement. The first is the sheer number of people or segment of the population reaching retirement age. The second is the trend toward increased life expectancy. The volume of retirees has led to questions about the ability of federal programs, such as Social Security, to sustain the current aging population financially. Those considering retirement are concerned that Medicare will not cover all their health care costs.

Second, as life expectancy increases and individuals live longer, many individuals feel they cannot retire and then afford to maintain their current lifestyles for an additional 20 or more years based on income gathered from Social Security, pensions, and savings. Retirees are often unsure of the terms of their employer-based pension accounts even when the terms have been explained to them. To cover these self-estimated costs, 70 to 80 percent of persons expect to work during their retirement, according to surveys of current workers.

**Individual Views on Retirement**

Literature tends to rate individuals’ views on retirement initially as positive, hopeful, and favorable, despite the previously mentioned uncertainties. Some
theorists have long held that retirement (the end of the “Second Age”) gives way to a period of increased renewal and personal growth (the “Third Age”) in which personal achievement and development are possible. Activity theory, which suggests that retirement is a time when increased formal and informal social interaction can provide enhanced enjoyment because of the adoption of new and fulfilling social roles, can also apply to this period of the life course.

Qualitative studies reveal that attitudes toward retirement change after the individual retires. Many first see retirement as positive (when new or proposed), but due to postretirement changes, the positive attitude declines and some individuals experience an identity crisis due to the role change. In fact, some studies show that retirement is one of life’s top 10 stressors. In other words, the initial positive views toward one’s retirement are offset by the accompanying role change, isolation, and stress the retiree experiences.

Notably, most empirical studies mention this generally hopeful and optimistic view of retirement is strongly affected by the individual’s social class, gender, race, and marital, occupational, and health statuses. The inequalities experienced over the life course carry over to the retirement period as well. Those of higher social class (with higher levels of education, income, and occupational prestige) carry additional income sources and higher social status over to their postretirement identity. Women, especially those in the early baby boomer cohorts, may not have worked outside the home because of the gender norms of the time and tend to be widowed—causing them to have less retirement security than their male counterparts. In terms of race, inequalities in pay for African Americans and Hispanics translate into less certain financial retirement outcomes. As for health status, poor health causes individuals to retire earlier with fewer benefits; those in better health report greater satisfaction during their retirement years.

Demographic changes, laws, private industry’s retirement and pension plans, along with descriptive characteristics of the individual, provide insight into the variety of factors shaping the retirement experience.

Riots

Riots arise when groups of people are committing, or may be about to commit, a variety of violent and/or unlawful acts in relation to an apparent grievance or complaint, and/or out of opposition to some form of authority or practice. Riots have occurred for many reasons: from poor working conditions, substandard living quarters, state domination and coercion, taxation, conscription, conflictual race relations, religious conflict, and the outcomes of sporting events. Sometimes riots are distinguished by type: race riots, police riots, prison riots, student riots, “hooliganism,”
and mass street fighting. Generally, a riot is known by acts of violence, property damage, arson, looting, assault, and even murder.

Riots are different from civil disobedience, as the latter is often directed at solving problems through nonviolent means. However, civil disobedience can transform into rioting. Riots can be distinguished from panic brought on by sudden terror or disturbances like disaster situations, such as a fire. Riots can also be distinguished from mobs. Mobs are crowds whose behavior is directed toward a specific, violent end, such as the mob violence of lynchings during the 19th and 20th centuries in the United States. Riots are also different than mass hysteria whereby people respond in similar patterns, such as the Salem witch trials or the “red scare” of McCarthyism.

Different kinds of explanatory and conceptual theories regarding riots have been introduced, developed, and fallen out of favor over the years. One of the earliest explanations for riots was “breakdown theory.” This perspective held sway from the genesis of sociology under Auguste Comte to the functionalism of Émile Durkheim, Talcott Parsons, and Neil Smelser, from the Chicago school of sociology of Robert Park and Herbert Blumer, and to the European tradition of Gustave LeBon and Gabriel Tarde. The “breakdown” approach explains riots as the result of various social mechanisms failing to restrain the masses.

LeBon’s explication of breakdown theory was slightly more specific. Introduced in 1895, “contagion theory” proposed that crowds exerted a hypnotic influence and that the frenzy of the crowd was supposedly contagious like a disease. This resulted in irrational, emotionally charged behavior constitutive of a riot. There are several problems with this theory. First, contagion theory presents individual rioters as completely irrational. Second, riots are seen as instigated and guided by sole individuals. Third, the theory grew out of elite responses to mass upheaval and social change and thus framed riots as illogical and inappropriate threats to the social order.

Developed by Ralph H. Turner and Lewis M. Killian in the late 1950s, “emergent-norm theory” argues that a combination of like-minded individuals, the anonymity provided by a crowd, and shared emotion lead to riots. This approach is couched within the symbolic interactionist framework that posits that people come together with specific expectations and norms, but in the interactions that follow in the development of the riot, new expectations and norms emerge, allowing for unexpected behavior. Rather than viewing riots as entities governed by randomness and primal “ancestral savagery” (LeBon), Turner and Killian saw riots as rational and norm governed. In trying to recuperate validity from “breakdown” theories due to rising critiques, Daniel Kahneman and Amos Tversky offered “prospect theory” in the late 1970s. This idea maintains that people make decisions to revolt or riot based on their surmise of possible gains or losses from their status quo. The theory argues that the prospect of losses looms as a greater force than possible gains. However, the theory fell out of favor in the 1970s due to its inability to explain riots as they were unfolding.

A new perspective arose in the 1970s called “resource mobilization.” This paradigm argued that riots occurred not from societal breakdowns but from groups vying for political positioning. This became the dominate theory of explaining riots by the 1980s. Its chief proponent was Charles Tilly, who argued that solidarity (i.e., networks and identity) within groups rather than insufficient social integration provides the necessary preconditions for riots. Resource mobilization theorists also tend to emphasize riots’ “positive attributes” for bringing about social change.

In the early 1990s, Ernest Bormann developed “convergence theory.” This paradigm argues that a riot is not an emergent property of the crowd but is a result of like-minded individuals converging in a single area. In other words, a crowd riots not because the situation encouraged or enabled violence, but because people who desired violence came together in the crowd. The primary criticism of convergence theory is that there is a tendency for people to do things in a crowd that they would not do on their own. Crowds have an anonymizing effect on people, leading them to engage in behavior only “normal” within the setting of a riot.

Recently, David Snow et al. advanced a new version of breakdown theory that incorporates ideas from prospect theory and cultural theory (drawing largely from the notion of “habitus” vis-à-vis Pierre Bourdieu). The synthesis states that riots are more likely to occur in conditions of social breakdown when (a) losses are experienced as deeply felt deprivations in social actors’ lives, and (b) when social actors’ confidence in the accustomed routines of “normal” social life that provide a satisfying or retributive future is undercut.

In studies of riots as social problems, the following are often considered of great import: context (urban versus rural conditions), questions of a level of
“critical mass,” the presence of pre-protest organizations, the role of counter-hegemonic ideology, lack of authoritative or official responsiveness, social cohesions and network solidarity, perceived threats and/or grievances, failures in the social order to provide to its citizenry, quality and quantity of social deprivation, and other factors such as political, religious, racial, economic, gender, sexual, or other actions deemed to directly “spark” rioting.

The worst riot in U.S. history, with respect to lives lost (more than 100), was the “New York Draft Riot” that occurred from July 13 to July 16, 1863. Also known as “Draft Week,” the riot was composed of a series of violent disturbances in New York City that was the culmination of discontent with new laws passed by Congress to draft men to fight in the ongoing Civil War. In the 20th century, the 1992 Los Angeles riots lasted 6 days; many regard them as the worst in recent U.S. history. Examples of other riots across the globe are the Sydney riot of 1879, over an international cricket match in Australia; the 1967 Hong Kong riots that took place over a labor dispute between pro-communist leftists and supporters of British colonial rule; the Stonewall riots in 1969 in New York City between police officers and members of the lesbian, gay, bisexual, transgender, and queer community; the Brixton riot of 1981 in London, involving a confrontation between police officers and a spontaneously forming crowd; and the 2005 Paris incident in which the death of two teenage boys of African descent at the hands of French police sparked a riot that spread to major cities all over France and even to Belgium and Germany.

Further Readings

Road rage is any spontaneous, assaultive behavior arising from instances of aggressive driving, traffic annoyances, and/or altercations that begin on roadways or parking lots. Examples of roadway annoyances can include, but are not limited to, arguments, threats, rivalry over parking spaces, inappropriate lane changes, tailgating, speeding, interference of lane changes, slow driving, and horn honking. In other words, road rage occurs when drivers perpetrate acts that annoy or threaten to injure or damage property of another driver or passenger as a result of a roadway incident. Road rage encompasses elements of violence or threats of violence as well as potential and real property damage to other motorists and passengers. Similarly, research on aggression contends that trivial matters have the capability to escalate into physical confrontations that could lead to serious injury of one of the parties involved.

Road rage refers to spur-of-the-moment violence between strangers, which is a salient dynamic between the aggressor and the victim. The reference to strangers highlights an important dimension: it filters out individuals who may have a violent outburst due to a preexisting relationship rather than a suddenly discovered dissatisfaction with each other’s driving conduct. A central characteristic of road rage is that the aggressor’s target is initially anonymous. Furthermore, the anonymity of the highway as well as the privacy of the car can stimulate further actions. The relative anonymity, ease of escape, and mobility of the automobile offers some drivers the temptation to victimize others on the road. Although the target of a road rage incident is not known initially, only one of the targets has to be the driver of a vehicle. The road rage incident may take place between (a) two drivers; (b) a driver and passenger(s) of either vehicle; (c) a driver and a pedestrian; and (d) a driver and a cyclist. Occasionally, it is passengers who take on the mantle of outrage.

The definition of road rage encompasses the dimensions of violence and anonymity of drivers (and/or passengers), and it also may include the threat or destruction of property. The drivers may use obscene
language or gestures, flash headlights at others, tailgate, change lanes, and/or steal parking spaces from other drivers. Because destruction of property is a potential result, it is important to note that not all road rage incidents occur on the road; some incidents may arise “off the road” in parking lots and continue on the roadway. However, violent altercations stemming from a dispute over a parking space also take place in parking lots. At this time, eight states have aggressive driving statutes.

Role Conflict

Role conflict refers to a condition in which competing and incompatible normative expectations associated with the enactment of social statuses are imposed on an individual. The most noted, though not the only, condition under which this circumstance might occur is when an individual is required to enact simultaneously at least two roles, each of which has competing expectations. The results of such a condition may be psychological stress, role abandonment, or social change.

Though experienced by individuals occupying certain roles, the causes of role conflict may exist at the individual or societal level. At an individual level, role conflict results from a particular set of circumstances associated with an individual situation. At a societal level, role conflict may be symptomatic of underlying social problems or arrangements or the result of social change; it is best alleviated when these structural conditions are addressed.

Generally, social life is arranged so that individuals are called upon to enact one role at a time. This is achieved by either compartmentalizing roles or scheduling the enactment of roles so as to keep them from conflicting. To the extent that this arrangement is maintained, role conflict is avoided; however, there are times when this is not possible. For a particular individual, a change in circumstance may lead to role conflict. For example, a promotion at work may place an individual in a circumstance requiring the supervision of friends. Role expectations of a workplace supervisor, such as hiring and firing others, may conflict with role expectations associated with friendship, such as loyalty.

While experienced by individuals occupying certain roles, causes of role conflict may exist at a societal level as a result of social conditions or arrangements. Role conflict is then experienced by a category of people occupying certain roles affected by certain social circumstances. For example, the roles of employee and parent often conflict. Those occupying these roles are often torn between parental obligations such as staying home with a sick child and going to work. Such role conflict may be experienced by many working parents and may be the result of social conditions such as economic need, the nature of family arrangements, changes in gender expectations, or the absence of viable alternative arrangements.

Resolutions to role conflict are varied. Resolutions are most effective when they are formulated at the level at which the conflict is created. At the individual level, one may abandon one role to meet the requirements of another or recompartmentalize or reprioritize roles to avoid undue conflict. At the societal level, organizational change, collective action, or changes in social policy may need to occur to eliminate role conflict effectively. Often individuals are required to resolve role conflict on their own even when the conflict is created at the societal level. While role conflict is problematic for individuals, it is often the impetus for social change that leads to an improved social condition.

ROLE STRAIN

Role strain refers to a condition whereby an individual experiences unease in fulfilling role expectations. For various reasons, the expectations associated with a role may be mutually incompatible or undesirable, leaving a person with feelings of discomfort as she or he is called upon to fulfill role obligations. There are numerous causes of role strain, some avoidable and others inevitable. Feelings of stress and the sense that one is unable to fulfill role expectations are problematic for the individual and for society.

Sources of role strain may originate with the individual or with the expectations of a role. In some cases, an individual may feel unable to successfully meet role expectations because he or she does not accept or is not committed to the underlying values that justify the expectations. The role expectations may contradict an individual’s values or call upon one to behave in an undesirable manner or at an unavailable time. For example, lawyers operating under the rules of confidentiality may be privy to information they are professionally required to keep confidential but personally feel compelled to reveal.

Role strain can be a consequence of social arrangements that create a situation in which an individual experiences strain. In this case, the source of the strain resides with the role expectations. An individual may experience role strain when expectations associated with a role are incompatible, competing, or ambiguous. In this case, an individual may want to fulfill expectations but is unable to do so due to a lack of clarity of expectation. For example, expectations associated with the role of parent are often ambiguous. In trying to be a good father, a man may be torn between earning a living to support his family and spending time with his children. Both are expectations of a good father, and both may be impossible to uphold. The ambiguity surrounding expectations of roles such as father creates the stress of role strain but also allows for individual expression of a role.

In some cases, individuals can resolve role strain by seeking clarification of role expectations, ordering expectations in a hierarchy, or adjusting one’s own expectations of the fulfillment of a role. However, there is a certain amount of role strain that characterizes a society and its roles and is beyond the ability of an individual to eliminate. Role strain and attempts to reduce it may be the cause of certain problems experienced by individuals, but it may also be the source of change leading to solutions to problems. The processes of role strain resolution may result in innovative or alternative role expectations. A working father, for example, may negotiate an arrangement with an employer allowing for a work schedule that allows him to spend time with his children and still meet the work expectations of the employer.

RUNAWAYS

Runaways are children under the age of majority who leave home without the permission of their caretakers. The simplicity of this definition belies the complexity and diversity of the situations that are sometimes covered by this term. Disputes arise over such dimensions of runaway behavior as duration, distance, and root causes. For example, the concept of homeless youth has been introduced to distinguish children, usually older teenagers, who leave home for extended periods of time, sometimes permanently, from short-term runaways (who are usually gone a few days). Chronic runaways or recidivists describe youth who run away from home many times. Shoveouts, pushouts, castaways, and throwaways have been used to distinguish runaways who have been excluded from, locked out, or otherwise forced from their homes by their
caretakers from those who voluntarily leave their family residence.

In some studies, researchers substitute the label throwaway for throwaway in order to focus on the action of an adult caretaker rather than on the characteristics of the child. Street youth has been used to describe teenagers who have become acculturated into a street subculture and are often involved in prostitution, petty crime, and other seemingly deviant behaviors. In framing the street youth problem, child advocates sometimes characterize them as being victims of their circumstances. They argue that children are driven to criminal acts because of lack of resources—for example, reframing prostitution as a matter of survival sex. Law enforcement agents and other authorities are more apt to recognize the agency of the child and characterize his or her behavior as delinquency. In spite of all the differences, these various terms are sometimes used interchangeably with runaway youth.

While these terms are used primarily by social scientists, in legal settings, running away falls under a larger rubric of behaviors known as status offenses. Status offenders describe youth who are engaged in a variety of behaviors that can be regulated only because of the youth’s status as a minor. In addition to running away, status offenses include such activities as truancy, violating curfews, and disobeying parents. Status offenders are often described as being beyond the control of their parents, incorrigible or ungovernable, or, alternatively, in need of supervision. Since the mid-1970s, the preferred intervention with status offenders has been to divert them from the juvenile justice or child welfare systems whenever possible.

The reasons children run away from home vary. However, researchers have repeatedly documented common problems such as family conflict; physical, emotional, or sexual abuse; substance abuse by either the parent or the child; parental intolerance of the youth’s sexual orientation, sexual behavior, or choice in friends; and difficulty in school. The severity of these problems can range from minor to significant.

Children who leave home briefly, do not travel far, go to relatives or family friends, and return home quickly are generally not considered in danger; however, serious problems have been associated with running away in the population of youth who leave home repeatedly or for longer periods of time. Since social scientists studying runaways often obtain study samples from high-risk environments, such as runaway youth shelters, drop-in centers, and street outreach units, runaway behavior has been correlated with a variety of negative outcomes. These include dropping out of school; being at risk for victimization and exploitation; engaging in sexual risk behaviors (resulting in HIV or other sexually transmitted diseases [STDs], and pregnancy); abusing alcohol and drugs; suffering physical health problems, including both acute and chronic disorders; experiencing mental health problems, including depression, suicide ideation, and self-mutilation; and incurring increased risk of adult homelessness and criminal activity.

Running away is sometimes characterized as a gateway behavior that can lead to increasingly problematic and risky activities. The primary concern is the cumulative effect of these assorted risk factors. For example, children who repeatedly run away are more likely to drop out of school, which can diminish their future employment opportunities, increase the likelihood that they will turn to criminal activity or be victimized on the street, and increase the likelihood of adult homelessness.

Current programs targeted specifically at runaway and homeless youth include crisis shelters, transitional living programs, drop-in centers, street outreach programs, and runaway hotlines or crisis phone lines (such as the National Runaway Switchboard). In general, the philosophy behind these services is to make them not only easily accessible by youth but also voluntary. Youth are not ordered into treatment by a judge or a parent but rather must request help themselves. Most runaway shelters are located in urban areas, although smaller communities sometimes set up “host homes” willing to take in a child temporarily. However, even in urban settings, research has shown that youth have trouble accessing basic services such as health or mental health care. One reason for this difficulty is that parental signatures are generally required for minors receiving treatment or entering into a contract (including one for a lease, loan, or employment), an impediment for youth who are on their own.

In addition to being at risk themselves, runaway children can pose certain risks to those adults who are inclined to help them. Most states have criminal laws against custodial interference, endangering the welfare of a minor, or harboring a minor. These laws make it a crime for adults to interfere with the parent–child relationship. Thus adults who provide shelter or aid to runaways can be subject to criminal prosecution. Many states make special provisions for runaway shelters or other short-term care facilities in order to circumvent these restrictions.

SAME-SEX MARRIAGE

Same-sex marriage challenges the definition of marriage. Conservatives oppose it on moral grounds, claiming it threatens the structure of the Western institution of heterosexual marriage. Others identify the social problem as the institution of marriage itself. Supporters of same-sex marriage identify the social problem as heterosexual hegemony and discrimination against gay, lesbian, bisexual, and transgender people.

Although the institution of marriage versus same-sex unions has been critiqued for centuries, in the late 20th century criticisms began with the feminist and gay/lesbian rights movement and the sexual revolution of the late 1960s. Non-procreative sex and sex outside of marriage, particularly for women, redefined monogamous marriage. Radical feminists viewed marriage as an oppressive institution of patriarchy. The heterosexual monogamous lifestyle was challenged by the strengthening of alternative living arrangements. The focus moved to creating equal rights for lesbian, gay, bisexual, transsexual and transgender, and later intersexed, queer, and questioning people (LGBTIQ). In recent decades, that focus changed to legalization of same-sex marriage.

Same-sex marriage differs from civil unions and domestic partnerships. Domestic partnership refers to policies passed by private businesses, local or state governments, and universities that provide legal protections such as health insurance benefits for same-sex couples and unmarried heterosexual couples. However, it doesn’t provide constitutional rights such as a guarantee to due process, marriage as a fundamental right, freedom of association, and the right to equal protection. Some domestic partner benefits require that the employed partner pay taxes on the dependent partner’s benefits.

Civil unions are legal partnerships recognized by local or state governments but do not carry the same weight as marriage. Only marriage allows for the 1,138 federal benefits such as Social Security survivor or spousal benefits, workers’ compensation, and public assistance; the ability to file a joint tax return and other tax benefits; estate benefits; immigration rights; military and veteran’s benefits; and coverage under the Family and Medical Leave Act. The argument for same-sex marriage is likened to ending anti-interracial marriage laws in the United States in 1967 as evidenced in the Loving v. Virginia decision. Meanwhile, civil unions allow states to circumvent constitutional amendments that define marriage as a union between a man and a woman.

The current debate over same-sex marriage focuses on federal policies, court rulings, state laws, and city ordinances. The 1996 Defense of Marriage Act, or DOMA, creates an exception to the Full Faith and Credit Clause of the U.S. Constitution, which allows for enforcement of contracts and other state laws across state lines. DOMA defines marriage as a union between one man and one woman for purposes of federal law and allows states to refuse to acknowledge the legality of same-sex marriages performed in other states. DOMA passed in reaction to a 1993 Hawaii supreme court ruling stating it was gender discrimination to deny lesbian and gay couples the right to obtain a marriage license. In 1998, Hawaii
passed a constitutional amendment outlawing same-sex marriage.

The Federal Marriage Amendment seeks to further fight state efforts to legalize same-sex marriage by amending the U.S. Constitution. Introduced in 2003, it would make only different-sexed marriage legal. To date, it has not passed either house of Congress.

However, three 2003 landmark court rulings paved the way for the recent focus on same-sex marriage: (1) Ontario, Canada, granted same-sex couples the right to marry under the Charter of Rights; (2) the U.S. Supreme Court stated anti-gay sodomy laws violate the U.S. Constitution’s right to privacy; and (3) the Massachusetts supreme court stated denial of same-sex marriage violates the constitutional guarantees of equal protection and due process.

Mayors in several U.S. cities defied state law and issued marriage licenses to same-sex couples. Beginning in San Francisco in 2004, the mayors issued marriage licenses followed by civil ceremonies. These acts of civil disobedience renewed the national debate.

States passed constitutional amendments to ban same-sex marriage. Only 11 states had avoided anti-same-sex marriage legislative activity by 2004; several states passed “Super-DOMAs.” Conversely, Massachusetts recently legalized same-sex marriages; Connecticut, New Jersey, and Vermont legalized statewide civil unions.

The lack of recognition of same-sex marriage is also a threat to heterosexual transsexuals. Prior to 2002, if a state allowed the marriage of a post-transition person to the opposite sex, the U.S. government honored it for immigration purposes. In 2002, the United States ended this practice. Rulings against this policy exist; however, it is still enforced.

In the United States, marriage is both a civil and religious institution. The legislation discussed applies only to civil marriage. Just as some religious bodies do not recognize divorce or interfaith marriages, some also do not recognize same-sex marriages. Some religious denominations—Reform and Reconstructionist Judaism, Unitarianism, select United Church of Christ congregations, and Episcopal congregations—have sanctioned same-sex marriage as a religious contract.

Several countries have pro-same-sex couple laws, including Australia, Belgium, Brazil, Canada, Croatia, Denmark, Finland, Germany, Hungary, Iceland, Israel, Netherlands, New Zealand, Norway, Portugal, Slovenia, South Africa, Spain, Sweden, Switzerland, and the United Kingdom. Internationally, Mexico City legalized it.

Whether same-sex marriage violates the values of those who see it as mimicking a heterosexually privileged institution or those who see it as a threat to the foundation of traditional marriage and the nuclear family, or finds support from those who see it as denying equal rights to same-sex couples and their children, it has created a flurry of policy changes. This attention has changed the face of civil rights discourse for LGBTIQ people.

Sanctuary Movement

The sanctuary movement was a religious and political movement of approximately 500 churches of different Christian denominations in the United States, during the years of 1982–92, that assisted in the sheltering of hundreds of Central American refugees from Immigration and Naturalization Service (INS) authorities. The movement originated along the U.S. border with Mexico in Arizona but was also strong in Chicago, Philadelphia, and California. It flourished
among Roman Catholics, Presbyterians, Methodists, and Baptists, although various denominations of Jews, Quakers, and Mennonites were also involved.

The national sanctuary movement was originally conceived in 1981 by the collaborations of Rev. John Fife of the Southside United Presbyterian Church in Tucson, Arizona, and Jim Corbett, a retired Quaker rancher. They were responding to an influx into the United States of Central American refugees who needed political asylum but were being deported by the INS. Corbett became involved with the Central American refugees in May 1981 after a friend picked up an El Salvadorian hitch-hiking refugee in the Nogales, Arizona, area. Fife became involved after a news story broke of a professional “coyote” (the Spanish name given to those commercial smugglers who help aliens cross the United States–Mexico border for a fee) abandoned a group of 26 El Salvadorians in the Sonora Desert of Arizona in summer 1980. Half of the refugees died of dehydration, and the other half were placed in detention by the U.S. Border Patrol and processed for deportation. For many people, this story was their first encounter with the INS’s treatment of undocumented aliens, and also with the violent political culture of Central America and the U.S. government’s support of repressive regimes in Guatemala and El Salvador.

Fife’s church started a weekly prayer vigil for the refugees, and the prayer meetings soon transformed into a gathering for immigration lawyers and refugees. In the spring of 1981, the Tucson Ecumenical Council (TEC) created a Task Force on Central America and began to raise money to bail refugees out of detention and to fund paralegals to help with the asylum application process. Yet, after $750,000 in bonds and $100,000 in legal expenses were raised and spent, the TEC declared the efforts futile.

Corbett and Fife began to challenge others to do more than help after refugees were arrested and to be more proactive. Noting that they had worked with the INS in a cooperative manner and exhausted all existing avenues, they began to advocate that church members should take in refugees and protect them from arrest. At first, refugees were taken into members’ homes, but soon after church members were transporting refugees away from the border, from the border into the church, and even across the United States–Mexico border.

In the fall of 1981, a group of churches, including the University Lutheran Chapel from Berkeley, California (a sanctuary church for war resisters during the Vietnam War), the Sather Gate Churches, composed of Berkeley pastors, and others, gathered together to form the East Bay Sanctuary Covenant. In November 1981, St. John’s Presbyterian Church in Berkeley secretly sheltered a refugee family, Southside United Presbyterian Church in Tucson publicly declared it would be a sanctuary, and University Lutheran Chapel publicly welcomed a refugee family into the church.

The sanctuary movement had its official beginning on March 24, 1982. By the end of 1983, there were nearly 70 public sanctuary sites, more than 600 supporting congregations, and 50 local organizing committees. At the height of the movement, more than 200 religious orders and more than 600 religious organizations (such as the National Federation of Priests’ Councils) across the nation publicly declared themselves in favor of sanctuary. Key supporters, like the Reverend William Sloane Coffin Jr. issued a challenge to broaden the focus of the movement to include the poor and minority groups; he drew parallels between foreign and domestic U.S. policies and called for an end to “unexamined sloganism” of anti-communism. Another supporter, Professor Robert McAfee Brown of the Pacific School of Religion, made a striking connection between the call to action of religious believers and the repressive actions of the state by expressing that uncritical allegiance to the government is “idolatry of the state.”

Refugees themselves did not directly criticize the movement, but they made it clear that they were opposed to any attempts to make them mere objects of interest for a political or religious mission. Many remarked that they were committed to telling their personal testimonies as public witnesses of suffering and human rights abuses, but they also maintained that they were physically and emotionally drained from these required retellings and often asked for clarification of the sanctuary movement mission. Many challenges arose, from churches being raided by the INS and refugees and members being arrested, a lack of sufficient communication and attention to the various churches for fear of arrest or prosecution, the screening of refugees as potential candidates that caused many divisions between Mexican and Central American aliens, to a tension in movement missions between the Chicago Religious Task Force on Central America and the Tucson Ecumenical Council Task Force on Central America.

In January 1985, a federal grand jury handed down a 71-count indictment (including conspiracy,
smuggling, harboring, and aiding “illegal aliens”) against 16 movement supporters, including two priests, three nuns, Fife, and Corbett. The following year, in 1986, eight of the sanctuary workers were convicted; Corbett was acquitted, and Fife was sentenced to 5 years of probation. Southside Presbyterian Church took the U.S. government to court and later won a lawsuit on the basis that the government possessed no right to spy on church activities.

Over the following years, the movement dwindled in support due to reduced media coverage, internal conflicts over intensity and direction, government repression, failure to recruit new supportive members, and the notion that the movement “won” after a December 19, 1990, decision to cease all deportations of El Salvadorians and Guatemalans. Despite these tensions and critiques, a theology of the ministry of sanctuary seemed to emphasize four key themes: (1) the provision of physical security and services for refugees, (2) a new ministry under a platform of social justice, (3) an emerging role for the church as a domestic political protest vehicle, and (4) the church as a vehicle for protest of U.S. foreign policy in Central America.

**Sandwich Generation**

The “Sandwich Generation” refers to those people who are simultaneously caring for family members at both ends of the life span—children and elders. The stress associated with being in the sandwich generation can constitute a social problem. Moreover, holding a job in addition to multiple family care responsibilities is a situation that affords its own set of challenges, and it is one that employers are beginning to recognize as a significant concern. At the same time, it is important to recognize that rewards result from caring for both children and elders, and that both the children and the elders can contribute positively to the well-being of the family.

Although being sandwiched between caring for children and elders (specifically aging parents) is not a “typical” situation, no official prevalence estimates exist. Although the U.S. Census details the characteristics of households, it does not include family care arrangements that occur outside of the household, as is the case with most sandwiched people whose aging parents or other elderly relatives tend to live independently or, in some cases, in a care facility. Estimates vary considerably, depending on the population sampled (e.g., the entire adult population, only women, only employees, only caregivers to elders), whether there is an age criterion for “elder” (e.g., 50, 60, 65), whether only aging parents or other elders are considered, how “elder care” is defined, whether there is an age criterion for either the caregiver or the child, or how child care is defined. Generally, taking all of these variables into consideration, estimates ranged from 10 to 20 percent of the population being “sandwiched” in some way.

Several factors contribute to the phenomenon of being sandwiched, thereby fueling the interest of public policymakers, employers, and researchers about this population. These include (a) the aging of the U.S. population, the aging of the workforce, and the increased care needs of an older population; (b) delayed and reduced childbearing in the U.S. population, the resulting increase in the ages of parents of young children, and the decrease in the number of siblings available to share in the care of aging parents; (c) an increasing number of women, the traditional caregivers of both children and elders, who have entered or returned to the labor force and the related increase in the number of families in which both the husband and the wife are working—that is, dual-earner couples; (d) an increase in multigenerational households; (e) rising health care costs and the increased pressures on families to provide care; and finally, (f) growing documentation of the dynamic interplay between work and family demands and the effects on individuals’ health and well-being as well as on organizations’ bottom lines in the form of absenteeism, turnover, and overall market performance.

In general, research shows that the stress associated with combining work and family care roles is related
to negative individual outcomes such as decreased mental health and increased stress and strain, both on and off the job. In addition, work–family conflict is related to negative work outcomes such as increased absenteeism, decreased job satisfaction, and increased turnover. Limited research, however, exists specifically on workers in the sandwich generation. That which does exist reveals higher levels of stress, absenteeism, and decreased mental and physical health among workers caring for both children and aging parents. At the same time, evidence also exists to show that the beneficial effects of multiple roles can buffer this stress.

In the United States, responsibility for addressing workers’ and their families’ needs is shared among individuals, employers, nongovernmental organizations, and, last, government agencies. This is in stark contrast to most other industrialized nations that view responsibility for addressing workers’ and their families’ needs as in the public domain, with the government assuming leadership and legislating provisions for family care.

Advocates argue that sandwich generation families need assistance in managing their work and family role demands to alleviate potentially negative associated health outcomes. This requires recognition that work–family stress is a major public health issue related to social problems. Thus, they contend, the U.S. government should assume a level of family support comparable to that of other industrialized countries. Furthermore, employers can help by increasing work schedule flexibility and job autonomy, minimizing long work hours, and training supervisors in family-supportive supervisor behaviors. By providing both governmental and organizational support to families caring for children and elders, improvements in family well-being should result that will ultimately have a positive impact on public health and social problems.

SCAPEGOATING

The most detailed definitions of scapegoating are in the literature on intergroup prejudice, family therapy, and group therapy. Simply, scapegoating can refer to a situation in which anger and frustration felt toward one person is displaced onto another, often someone less powerful than the person causing the frustration. In the first half of the 20th century, social psychologists tried to translate this idea (also known as projection) into one that would explain intergroup prejudice, but this analytical approach proved too simplistic to explain the complexities of prejudice.

However, scapegoating is a well-developed concept in family therapy and group therapy literature. Based on clinical case studies, psychoanalytic and systemic thinking usually underpins such work. Projective identification (a psychoanalytic concept) occurs when a person onto whom feelings are displaced comes to be regarded as actually possessing these characteristics or difficult feelings. For example, others may begin to see that individual as an angry or frustrating person. Triangulation (a systemic concept) occurs when a relationship between two people or groups is in danger of splitting apart because of unexpressed conflict. One or both of the parties may employ a third person or group to stabilize the relationship. They do this by displacing uncomfortable feelings onto this target until the original conflict is addressed directly. So, when tensions between two warring factions threaten group unity, a scapegoat may emerge and come to be seen as “the problem.” In this way, the family or group is held together until the real problem—or power battle—is resolved.

Clearly, scapegoating can have a negative effect on its targets, ranging from feelings of anxiety, inadequacy, and insecurity to the experience of verbal abuse, discrimination, and physical harm. The difficulty is in knowing how best to prevent it and how to manage it when it happens. For example, group
therapists see it as an integral part of group development. Furthermore, therapy literature usually construes it as a process of which the attackers are not fully aware. Further research into this ubiquitous and painful process would be useful.

For example, could the displacement of anger felt toward one person or group onto another less powerful person or group explain the numerous examples of prejudice witnessed throughout world history, such as Christians in ancient Rome, Jews in 20th-century Europe, and more recently, illegal aliens in the United States? Past and present examples abound of political ideologues using propaganda to blame societal ills on some group. Over the years in major immigrant-receiving nations—such as Australia, Canada, Germany, Italy, the United Kingdom, and the United States—a variety of racial and ethnic groups have been targets. One explanation might be that the true source of the frustration is too ill defined or too powerful, and consequently the frustrated individual or group redirects anger against a socially sanctioned target that is unable to strike back. Similarly, scapegoating might offer an explanation of sports events in which fans or commentators can be seen to single out an individual player as the cause for a loss.

**School Dropouts**

Since the mid-20th century, concern in the United States has escalated about students who leave the formal education system before completing at least a high school diploma. Recent high school dropout rates are often described as a “crisis,” particularly in big cities, where the figures may be as high as 50 percent. Nationally, a common statistic is that around 30 percent of those who start high school never complete a regular high school diploma, although different methods of calculating the rate yield dramatically different estimates. The numbers also vary substantially by gender, socioeconomic status, and ethnic background.

Still, a large share of dropouts—upward of 50 percent—do eventually attain a high school–level credential, most often by completing the general education development (GED) credential. Since the 1970s, the percentage of young adults earning GEDs has gone up, statistically offsetting a small rise in the dropout rate during the same period. But GED preparation often is not as rigorous as ordinary high school curriculum, and experts do not consider it a true equivalent to earning a high school diploma.

**Reasons for Concern**

Most often the problem of dropping out is cast in economic terms. In the eyes of many sociologists and economists, the link between years of education and personal earnings is irrefutable, at least in aggregate statistics. Extending this logic, people who do not reach a certain level of education are relegated to the least desirable and lowest-paying jobs. A range of ideas have been put forward to explain why this is the case. For example, some consider education particularly important due to the rise of so-called knowledge work in white-collar jobs. Whatever the reasons, dropping out appears to drastically reduce chances for upward economic mobility; it is a decidedly negative factor in the U.S. opportunity structure—a factor all the more troubling because it disproportionately affects minority groups.

A related line of thinking ties education to U.S. competition in the world economy. Many people believe the U.S. education system plays a central role in ensuring the country’s economic strength; the country cannot “afford” to have undereducated workers. Valid or not, this is an enduring argument and produces characteristic calls to increase both the quantity and quality of general education.

Historically though, rationales for formal education were not all economic. The public school movement of the 19th century emphasized education’s role in shaping an informed public. Education was
perceived as a requirement of a healthy democracy. Another argument for compulsory education was to protect children from exploitative labor, and a related motive, to prevent adults from losing their jobs to low-wage young workers. At different times religion has also been a stimulus to education, as has the general wish for a “liberal” or well-rounded education. All these ideas are notable in their relative absence from the contemporary framing of school dropouts.

**Research on Dropouts**

Because the issue has held such a high profile, a large amount of research has been done on this subject. Much of this work attempts to identify subgroups of students who are likely to drop out, along with combinations of factors that increase or decrease their chances of doing so. Four themes emerge in the research:

1. **Social integration**: the relationships that a student has with teachers, other students, and administrators.

2. **Academic engagement**: the practices and norms of being a student, such as enjoying school, getting good grades, having good study skills, and participating actively. This might also mean having the “cultural capital” to know how to negotiate the arbitrary rules of school and behave in ways teachers expect.

3. **Family background**: attributes like socioeconomic status, the student’s household composition, parents’ interest in and support for schooling, and the general nature of the student’s home life.

4. **Personality factors**: self-esteem, self-confidence, aspirations, sense of commitment, and whether the student feels in control and effective in life.

Each of these areas can have positive or negative effects on the chances of dropping out, and they may be closely intertwined. Students might be singled out for disciplinary actions because they are perceived as disruptive (low academic engagement), but the initial reason for the behavior might be lack of interest shown by the teacher (low social integration). Eventually this can lead to students being “pushed out” of school, where the “dropout” is effectively expelled or given onerous terms of attendance. No generally accepted explanation accounts for all these factors. In fact, most studies are quite specialized; social psychologists tend to look at personality issues, while economists and sociologists are more likely to study income inequality, school resources and management, and family patterns.

One issue drawing increased attention is the phenomenon of “stopping out,” when students leave school for a spell but then return and finish at a later time. Sometimes those who go on to earn a GED are included in this category, and to understand the full picture, one must consider how students use adult education and community college programs either to complete a diploma or to embark on a vocational track. Less studied than dropping out, this pattern involves many of the same factors. Experts believe that employment among low-income students is a common reason for stopping out.

While college dropout rates have not drawn as much attention, research supports many of the same types of explanations at the postsecondary level. Parental factors are still important, and new problems arise concerning student finance since, unlike in public high schools, college students usually must obtain funding for tuition and possibly living expenses. Keeping exact statistics on college-level dropouts is also more complicated because multi-institution attendance is almost the norm; in this case figures like the percentage of 25-year-olds with a college degree can be more informative than a given institution’s graduation rate.

SCHOOL FUNDING

In most jurisdictions, formal schooling does not operate within the market economy. Rather, it is provided, directly or indirectly, by government at negligible direct cost to students and parents. How this service is funded is largely a political decision.

Political responsibility for school systems tends to reside primarily with the level of government also primarily responsible for their funding. Countries with national education systems (e.g., France, Finland) fund schools primarily from national revenues; those with state or provincial systems (e.g., Germany, Australia) with a combination of national and state or provincial revenues; and those with local school districts (the United States, Switzerland) with a combination of national, state or provincial, and local revenues.

Local funding can be popular when it allows more local control of schools. But, the smaller the jurisdiction responsible for funding schools, the more likely there are to be equity concerns. Local jurisdictions with a strong tax base can more easily fund schools than those with a weak tax base.

If, for example, school revenues come from property taxes, jurisdictions with large, wealthy property owners (e.g., industrial plants, shopping centers) and few students can fund their schools easily even with a weak tax effort (i.e., a low tax rate). By contrast, jurisdictions with high levels of poverty, many children of school age, and few wealthy property owners may be unable to adequately fund their schools even with a strong tax effort (i.e., a high tax rate).

This disparity is exacerbated in U.S. metropolitan areas where wealthier families have more residential options. School districts may compete to attract net fiscal surplus residents—highly employable, steady taxpayers, with few children in need of public services—and repel net fiscal deficit residents—marginally employable, unsteady taxpayers, with many children—through restrictive zoning regulations that raise the entry price for housing out of their reach.

Few school systems provide all educational goods and services completely free of charge to students and parents. The amount of private expenditure on schooling varies from small fees required for optional “extras” (e.g., expenses for sports equipment or field trips) to most of the cost at independent private schools in systems that receive no government subsidy. Generally, a tradeoff exists between government funding and independence from government rules and regulations. Some countries have three types of funding regimes: virtually complete government funding for government-run schools, some government funding for privately run schools that meet government rules and standards (i.e., charter schools), and no government funding for schools free of government rules and standards.

The proportion of school funding provided privately also tends to rise with grade level. This relationship acknowledges that some human capital is more socially beneficial and some more individually beneficial. Conventional wisdom holds that it is in society’s interest to educate its young to that level at which they become contributors rather than burdens. But, past that point, the returns to education may accrue more to the individual, and many feel that education consumers should pay their own way for higher and professional education.

In the United States and elsewhere, the amount of government funding provided each school is determined largely by student headcount per formula—the most common type being a foundation formula. The “foundation” is the amount of funding provided a school for each regular student enrolled. Per-student funding then increases by some fractional increment above the foundation to accommodate the needs of students in special circumstances (e.g., those with disabilities, in vocational education, economically disadvantaged, non-native speakers) that require greater expense.

A popular indirect method of funding schooling is through tax expenditures—measured as the amount of potential government revenue forgone due to a tax exemption. For example, educational institutions, even those privately run, may be freed of some of the tax obligations imposed on non-educational organizations. For another example, student expenses for tuition or fees, or revenue from scholarships, may be allowed as income tax deductions or credits.

Education accounting nomenclature divides expenditures into functions, or activities, and objects—things and people. Total expenditures are also classified as current (i.e., recurring items) or capital (i.e., long-lasting items, such as buildings and furniture). Debt service is the periodic payment of principal and interest on bonds.

Richard P. Phelps
School Prayer

As a social problem, the term school prayer refers to the controversy surrounding the presence or absence of religious practices in U.S. public schools. The debate over the appropriateness of prayer in public schools stems from the “establishment clause” of the First Amendment to the U.S. Constitution, which states that “Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof.” This clause is commonly interpreted to mean that U.S. society should feature a “separation of church and state,” though this term does not appear in the Constitution and was coined later by Thomas Jefferson in his private correspondence. The inclusion of the establishment clause in the Constitution ensured religious freedom, in contrast to the persecution suffered by immigrants from England in their native country.

The U.S. Supreme Court has grappled with this issue repeatedly in recent decades. In 1963, the landmark case of Abington Township v. Schempp disallowed the recitation of the Lord’s Prayer and the Bible in public school classrooms. The case established the “secular purpose” and “primary effect” tests to determine whether a particular public school practice is compatible with the establishment clause. To be in accordance with the Constitution, a law or practice must be clear in its secular purpose and not promote or inhibit a particular religion. In the 1985 Wallace v. Jaffree case, the Court struck down the Alabama statute setting for students a daily period of silence for private prayer. Though conceding that a moment of silence for voluntary prayer is not itself unconstitutional, the Court ruled that this particular statute existed for the sole purpose of advancing religion and was therefore unconstitutional. In 1992, the Court barred prayers at public school graduation ceremonies, and in 2000 the Court struck down student-led prayers prior to school athletic events. The most recent school prayer controversy surrounds the Pledge of Allegiance and the inclusion of the phrase “under God” therein.

Despite these rulings, 58 percent of U.S. teenagers favor the presence of a spoken non-denominational prayer in school, and 84 percent support a moment of silence for voluntary prayer or meditation. Nearly half of U.S. teenagers (44 percent) support the presence of prayers that specifically mention Jesus Christ. Adults are less tolerant of these practices: 53 percent of the general public supports a moment of silence, about 20 percent favors a non-denominational prayer that mentions God, and only 6 percent advocates prayers that mention Jesus Christ. Nearly 1 in 5 adults believes that schools should avoid all types of prayer entirely, including the moment of silence. Interestingly, the main objection to school prayer is not the separation of church and state that concerns the Supreme Court, but rather the more emotional view that school prayer embarrasses and isolates students whose religion is different or who belong to no religion.

School Segregation

School segregation occurs when minority or subordinated groups of individuals are separated from majority or dominant groups in formal schooling institutions. The segregation may occur between schools (interschool segregation) or within schools (intraschool segregation). A historically salient example of interschool segregation in the United States occurred during the period of Jim Crow (early 20th century) with the state-sanctioned formation of “colored” schools and “white” schools. Intraschool segregation occurs within a single schooling facility when students from subordinated or dominant groups are “tracked” or steered into particular classes based on their group membership, typically derived from ascribed characteristics such as gender, race, or class status, not interest or aptitude. Historically, the benefits and drawbacks of school segregation have been vigorously debated; the conclusions of such debates tend to reflect cultural belief systems, particularly beliefs regarding the dynamics of race, ethnicity, and gender and their relationship to social inequality in contemporary society.

Relationship of School Segregation to Inequality

Social theorists and researchers have long examined the relationship between formal education and social inequality. With the movement from agrarian economies to industrialized economies dominated by bureaucratic organizational structures, the role of formal education as a credentialing system steadily gained importance. Although education and upward social mobility are highly correlated in more industrialized societies, research consistently shows that schooling institutions in such economies tend to reproduce and maintain existing social inequalities. That is, although upward mobility is possible, most students improve their social standing little, if at all, as a result of their schooling experiences. The reproduction and maintenance of social inequalities is most evident in societies where historically subordinated groups are prevented from participating in formal schooling institutions or are subjected to inferior schooling opportunities as a result of segregation. Given the powerful relationship between schools and inequality, a historical examination of the political, economic, and social dynamics that resulted in de jure (mandated by law) and de facto (in reality or fact) school segregation is necessary to understand contemporary inequalities.

De Jure School Segregation

In many instances, formal schooling institutions have been forcefully segregated along race and gender lines for a variety of cultural reasons that are then substantiated when sanctioned by the state. A brief examination of U.S. schooling history that focuses on the causes and effects of interschool segregation along racial and gender lines reveals how political, economic, and social forces can converge to produce persistent social inequality.

Racial Segregation

In the United States, “colored” students were legally prohibited from attending “white-only” schools during the late 19th and early 20th centuries because of prejudicial cultural beliefs regarding the social roles and rights of “colored” citizens and freed slaves. In 1896, the Supreme Court sided with the state of Louisiana, which had ruled that Homer Plessy, a legally identified “colored” man, could not ride in a train car reserved for “whites” only. This landmark ruling ushered in the Jim Crow era, which manifested itself most visibly in the construction of “separate but equal” public facilities, most notably schools. From the beginning, these segregated schools were racially distinct but never equal. “Colored” schools received far fewer resources than their “white” counterparts, and because schools serviced specific neighborhoods, a by-product of most students walking to school, their construction helped propel and maintain the racialized neighborhood segregation already underway in many urban, suburban, and rural communities.
The doctrine of “separate but equal” persisted until 1954, when the Supreme Court unanimously ruled in Brown v. Board of Education of Topeka (Brown I) that separate schools were “inherently unequal.” In 1955, the Supreme Court determined in Brown II that desegregation should occur with “all deliberate speed,” although critics argue that this follow-up to Brown I failed to delineate how and when such desegregation should take place. Facing opposition from a number of southern political leaders, President Dwight Eisenhower in 1957 publicly demonstrated his support of the Brown decision by ordering the National Guard to escort nine black students attending a predominantly white high school in Little Rock, Arkansas. Throughout the 1960s and 1970s, several Supreme Court cases clarified what Brown II did not, identifying the means by which desegregation might take place (Green v. New Kent County, 1968; Alexander v. Holmes County, 1969; Swann v. Charlotte-Mecklenberg, 1971; Keyes v. Denver, 1973).

However, beginning in 1968 with Green v. County School Board of New Kent County and in 1974 with Milliken v. Bradley, the Supreme Court’s decisions have, in effect, resulted in undermining the goals of Brown. Although the intent of the Green decision was to end school segregation “root and branch,” elements of the ruling were used in subsequent Supreme Court decisions that effectively exempted districts from complying with Brown. Essentially, Green outlined the criteria by which schools could determine their success or failure in achieving desegregation. Using these guidelines, subsequent Supreme Court decisions determined that a number of districts had achieved desegregation “to the extent practicable,” therefore allowing them to declare “unitary” status and reclaim local control. As a result, schools that experienced only marginal desegregation in the Northeast, Midwest, and West have remained racially and ethnically segregated, and schools in the South, the only region that had significantly desegregated in the 1960s and 1970s, have slowly resegregated.

**Gender Segregation**

At one time or another, girls and women in nearly all cultures with formal schooling institutions were prevented from attaining a formal education. Cultural beliefs regarding the familial and occupational roles of women in society, which were then sanctioned by state policies and laws limiting girls’ and women’s access to schooling, fundamentally shaped their educational opportunities.

Historically, even when educational opportunities for men and women to attend college reached near parity, as they did in the early 1900s in the United States, rarely were men and women attending the same institutions. That changed in 1972 with passage of Title IX, an amendment to the Higher Education Act of 1965. Title IX strictly prohibited elementary, secondary, and postsecondary schools receiving federal funds from denying students admittance into a program or participation in an activity solely on the basis of their sex. As a result, a number of male-only colleges and universities began to admit women in the 1960s and 1970s. Although much analysis of Title IX’s influence has focused on sexual harassment rights and athletic opportunities for girls and women, it also impacted gender desegregation of colleges and universities by fundamentally altering and improving the educational experiences of girls and women in the United States.

**De Facto School Segregation**

Many of the cultural beliefs and laws that resulted in de jure segregation contributed significantly to de facto segregation, which has persisted long after laws and policies supporting segregation were overturned. Urban researchers have systematically revealed the social processes resulting in residential racial, ethnic, and class segregation in many industrialized countries. Tracing local histories, they describe how the disappearance of manufacturing in many communities resulted in a loss of jobs and local tax revenue, leaving pockets of concentrated poverty. Additionally, such regional poverty took on a racialized dimension when subordinated groups, including citizens who represented racial minorities or recent immigrants, were more likely than citizens comprising the racial majority to live in these areas due to their limited resources and the discrimination often faced from realtors, landlords, and bankers. Because schools service neighborhoods, the likelihood that school populations would reflect the reality of these impoverished racially and ethnically segregated neighborhoods increased. Educational researchers emphasize that segregation by race or ethnicity almost always involves issues of concentrated poverty and linguistic segregation as well, issues that contribute to the creation and maintenance of social inequalities. For
example, according to findings from the Civil Rights Project at Harvard University, at the end of the 20th century, only 5 percent of U.S. students attending segregated white-dominated schools experienced concentrated poverty, whereas 80 percent of students attending segregated Latino/a- or African American-dominated schools were living in impoverished neighborhoods.

Furthermore, even in schools that successfully attract racially diverse student bodies, evidence of segregation along gender, racial, and ethnic lines frequently exists in the “tracks” or set of classes to which students are assigned by teachers and administrators. These differences are most evident in secondary schools, where, in most countries, students select or are steered toward a course of study to prepare them for employment, trade school, or college. Research consistently reveals that members of subordinated groups are more likely than members of the dominant group to be segregated into tracks preparing them for employment in the low- or middle-wage sector. Although de facto gender segregation is diminishing in many fields, it still exists in a number of schooling programs, most notably nursing, engineering, and early education.

School Violence

Experts once defined school violence conventionally as a serious crime (i.e., murder, rape, assault, robbery, and theft) that occurred on school grounds. However, as social and political awareness focused more rigorously on investigating the phenomenon of school violence, the definition of school violence expanded. The broadened definition rested on research indicating that the threshold for injury for children is much lower than for adults. Compared to adults, children have less emotional maturity and physical ability to defend themselves, making them more vulnerable to emotional, mental, and physical injury. Therefore, even minimal exposure to violence in a school setting may have lasting detrimental effects on a child’s development. Traditionally, peer harassment (physical and verbal), sexual harassment, bullying, and fear were accepted as school cultural norms. However, such behaviors are becoming less accepted as a normal part of the “school experience.”

Detrimental developmental and educational outcomes occur for students who endure school violence. Exposure to school violence correlates with diminished educational attainment, mental health, general adolescent development, school attachment, and a negative impact on the overall educational process as well as the student’s life course. Dropping out, suicide, drug use, and future involvement with delinquency and adult criminal behavior each correlate with school violence. Because school violence may severely impair a student’s educational and life outcomes, an understanding of the individual and school environmental factors that make students more or less vulnerable to school violence is important.

Data and Trends

The best sources of data about violence in school come from government agencies. Notably, the U.S. Department of Justice, Bureau of Justice Statistics, publishes the School Crime Supplement to the National Crime Victimization Survey, one of the most comprehensive sources of data available about victimization.
The Bureau of Justice Statistics in cooperation with the National Center for Education Statistics also publishes an annual report on crime occurring in and on the way to and from school called “Indicators of School Crime and Safety.”

Contrary to popular perception, most varieties of school violence declined in the past decade. Although multiple homicides in schools appeared in news media headlines, school-related homicides actually declined drastically. In fact, schools are among the safest places for children. Students ages 12 to 18 are more likely to be victimized outside of school than in school. In the past decade, the percentage of students carrying weapons to school and engaging in physical fighting also declined.

Despite popular conceptions of schools as violent places, the majority of crimes that occur on school grounds are property crimes such as theft. Like violent offenses, most varieties of property offenses have also declined. These declines in violent and property offense in schools were consistent across gender, grade, and race/ethnicity, although younger, male, and African American or Hispanic students continue to engage in a higher rate of delinquency than their older, female, and white or Asian American counterparts.

Stratification of School Violence

Evidence suggests that school and student characteristics structure a hierarchy of vulnerability to school violence. At the school level, findings illustrate that students attending larger, urban, relatively poorer schools, with predominantly a racial and/or ethnic minority student body, are more likely to be victimized. At the student level, grade, gender, and sexual orientation are individual factors associated with exposure to school violence.

Racial/ethnic and economic segregation remains a prevalent dilemma in the United States. Research shows that segregated communities have higher rates of crime, violence, and victimization. In turn, schools serving minority students report relatively higher incidences of violence, fear, and victimization. In addition, younger students are more exposed to school violence than older students, even within the same school. For instance, freshmen students in high school and incoming students in middle school report the highest rates of bullying.

Gender also plays an important role in determining risk of school violence, as male students are found to be more frequent victims and victimizers. However, research suggests that each gender is exposed to different forms of school violence. For example, male students are more likely to be exposed to physical violence, while female students are more likely to experience verbal harassment. Further, sexuality plays an important factor, as studies indicate a correlation between student sexual orientation and school violence. Regardless of gender or race/ethnicity, students who report being homosexual or perceived as gay by other students are more likely to experience both verbal and physical violence while on campus.

The Role of the School

Schools are a mirror of their communities because they reflect many of the social mechanisms, cultural values, and behavioral patterns occurring in the world at large. Faculty, students, staff, and administrators share common activities and routines, influence one another, and are ideally connected by the “ethos of caring.” The collective relationships create a sense of trust and belonging to a larger community, and this in turn influences the school’s overall effectiveness, efficiency, safety, and climate. Although schools are increasingly studied as community-like, the larger community served by the school also influences what goes on there. Research provides evidence that schools are influenced by a community’s social stratification such as the nature and extent of crime, local economy, local culture, community organization, discrimination, unemployment rate, racial and ethnic composition and segregation, and poverty, all of which correlate with school violence.

Media and School Violence

In the past decade, the news media periodically focused on high-profile mass murders occurring in schools, such as the 2007 Virginia Tech massacre and the 1999 Columbine High School shootings in Colorado. School shootings are among the most salient of news events, and although they occur infrequently, they capture the public attention. The Columbine shooters erroneously personify the current generation of violent youth and serve as a starting point for public discourse about school violence and larger social problems such as delinquency and youth disaffection. The irony is that, while concrete evidence from the past decade indicates consistently declining rates of school violence and the relative safety of schools, the popular perception is that schools are increasingly violent places.
While mainstream America may suffer from the mistaken fear that the turn of the millennium has spawned a new breed of youth superpredators who now stalk our schools, another irony is that youth themselves do not report increased fear of victimization in school. In fact, even immediately following the Columbine shootings, researchers did not find an increased fear of victimization among youth ages 12 to 18. The popular press has suggested the existence of the “Columbine Effect,” or increased fear of violence in schools, but this increased fear does not seem to have touched the students as much as adults.

**Policies**

There have been varying policy responses implemented to reduce school violence. Perhaps the most punitive approach has been the institution of zero-tolerance policies, such as suspension or expulsion following the first violence offense. Increasingly evaluated, these policies often are determined to be inflexible and ineffective. Another popular policy is placing in schools police school resource officers who work with students to prevent and deter violence. In addition, schools may rely on electronic means to control violence, such as installation of metal detectors and surveillance cameras. Besides punitive measures, many schools instituted other measures to combat the problem. Notably, school uniform programs have been effective, although they often raise legal issues related to students’ right to free expression. Finally, many schools also institute educational programs, such as conflict resolution education and hiring additional counselors.

**SCHOOL VOUCHERS**

School vouchers are government-funded tuition certificates that parents can use to fund their children’s attendance at private educational institutions. Considerable debate surrounds the use of public funds for education in private institutions. A key issue of debate involves the effectiveness of school voucher programs for students, primarily students from disadvantaged backgrounds. Another major debate issue is whether the use of public funds for religious private institutions violates the principle of separation of church and state.

Economist Milton Friedman is credited as one of the key originators of the concept of school vouchers. The idea emerged from negative views on governmental intervention in the realm of education and the desire to empower people who use the education system. Friedman believed that a free market approach, which allowed competition from private markets, would increase both school quality and citizens’ access to quality schooling. While Friedman proposed the school voucher system in the 1950s, general satisfaction with the education system stifled advancement of his idea. Increasing dissatisfaction with public education during recent decades, however, influenced the creation of such programs. While the discourse surrounding school vouchers is plentiful, the number of voucher programs is relatively small, particularly when compared to other reform programs such as
charter schools and homeschooling. Most current U.S. voucher programs target poor or disadvantaged families.

General support for school vouchers rests on principles of choice and free market forces that create competition between private and public school institutions to improve student outcomes and empower disadvantaged families. One of the principal claims of supporters is that private education provides superior educational outcomes for students in the form of increased grade point averages, graduation rates, and standardized test scores. These improved outcomes therefore greatly benefit disadvantaged families as they gain wider access to educational opportunities.

Voucher supporters are in general agreement about the failure of the current public education system, as illustrated by the introduction of the 2006 America’s Opportunity Scholarship for Kids legislation to Congress. This legislation, which ultimately did not pass, sought to allow children in schools consistently failing to meet requirements to receive funds toward private education. Many voucher supporters believe problems with the current public school system stem from governmental and bureaucratic conflicts that ultimately limit the ability of teachers and administrators to create proficient programs. Supporters feel that the current educational system has fundamental flaws not likely to be changed through traditional reform programs. They feel that the only way any significant positive change of the education system will occur is through a radical shift in both thinking and organization.

For proponents, school vouchers represent the concepts of choice and freedom for families, allowing parents to pick schools that will potentially provide better opportunities and outcomes for their children. Parents can thus choose a school with sufficient resources, a strong organizational structure, engaged teachers, and smaller class sizes. In addition, supporters claim that vouchers empower parents to choose schools that more closely match their own values. These values may include the choice of a religious school that mirrors their moral values or, say, a school that emphasizes fine arts education. Ultimately supporters argue that the freedom to choose will greatly empower disadvantaged populations by allowing them to leave underperforming schools. Proponents believe that a school voucher system will equalize the playing field for families that do not have access to private education.

Choice not only provides parents with a better opportunity to meet their children’s needs; supporters claim that the free market system will also benefit the entire education system. Free market competition will force public schools to enact change in order to compete with private schools for funding. Supporters argue that the absence of this competition suppresses innovation in public schools and ultimately leads to a lack of significant reform.

Overall, opponents of school vouchers question whether the free market approach will create greater outcomes for students, particularly those from disadvantaged backgrounds. They challenge the claim that private schools will increase student outcomes, noting that research is inconclusive regarding the relationship between private schools and academic outcomes. Additionally, opponents reject claims that the public school system is in a ruinous state requiring radical change and that the focus should be on making the public system better, not giving up on the schools or systems having problems. Furthermore, diverting funds away from public schools that desperately need them to private schools through a voucher program will cause further deterioration of public school systems.

Opponents also strongly challenge the assertion that voucher programs will help empower families who are most negatively affected by shortcomings in the educational system. They feel a voucher system will further hurt the disadvantaged by greatly increasing stratification and segregation that already exist in schools. Families that have greater access to resources, such as information about programs and transportation to schools, will benefit more than families that lack these resources. Families with greater resources will be more likely to seek out and participate in voucher programs, and this will reinforce inequality and stratification rather than empower the disadvantaged.

Opponents also point out that some voucher programs do not provide enough money to completely cover the tuition of the private schools. If families must cover the difference in cost, this may once again reinforce stratification by leaving disadvantaged families unable to equally benefit from voucher programs. Another factor that might lead to the reinforcement of stratification is the ability of private institutions to turn away student applicants. If private schools can eliminate the applications of troubled students, these students must attend public schools. Opponents argue that this will lead to private schools getting the “cream of the crop,” leaving public schools to deal with the troubled students. Combined with earlier arguments of the harmfulness of the diversion of funds, critics believe this would leave public schools lacking
resources and catering to a population of students that need the most assistance. Students who would benefit most from claims of empowerment may be left behind in public institutions due to their lack of social capital, inability to make up tuition differences, and denied applications.

Last, the issue of the public funding of private schools with religious affiliations is a common concern in the debate over school vouchers. Some see such usage of funds as a violation of the principle of separation of church and state. Further, opponents fear that students may be excluded from certain opportunities because of a lack of religious agreement between the institution and the family. Some argue that empowering students requires equal access for all students to attend all participating institutions.

Beyond public and political discourse, issues regarding school voucher programs have played out in the judicial system. In 2002, the U.S. Supreme Court heard the case of Zelman v. Simmons regarding Ohio’s Pilot Project Scholarship Program. The challenge to this voucher program rested on the argument that the use of public funds to support private religious school organizations violated the establishment clause in the Constitution against laws supporting religion. The court ruled 5–4 that the program did not violate the establishment clause and was neutral in terms of religious and nonreligious schools, since the program gave parents freedom to select between numerous religious and nonreligious organizations. Furthermore, the religious institutions did not exclude participants based upon individual students’ religious beliefs. The dissenting opinion argued that, since 96.6 percent of the vouchers went to religious schools, it was tantamount to funding religious programs with public funds. In addition, the dissenting opinion believed that conflict between religious sects would be a likely by-product of using public funds to support religious programs.

Yet, other rulings on the state level are mixed about the use of public funds for religious educational programs. In the 2005 case of Bush v. Holmes, the Florida Supreme Court ruled against a voucher program on the grounds that it violated the Florida state constitution. The court ruled that the program rerouted public funds away from the public education system. In addition, the court stated that the voucher program undermined the integrity of the public system by using public funds for a competing system. The 2006 case of Anderson v. Town of Durham challenged a Maine

program that funded only nonreligious private institutions. The Maine Supreme Court ruled that the program, which provided funding for students to attend private nonsectarian institutions in situations where no public high school was available, was not a violation of the First and Fourteenth Amendments of the Constitution. However, the Maine court also ruled that families could not use public funds for private schools in other situations, thereby restricting free choice and free market access.

Scientific Management

Scientific management involves study of the production process in an effort to discover means to eliminate waste of workers’ time and effort. Evolving from research on conservation of production resources, the field surged in 1911, when Frederick Winslow Taylor published The Principles of Scientific Management. Here and elsewhere, Taylor critiqued traditional managerial roles for leaving responsibility for production methods to “wasteful” workers and advocated a more active role for management.

Taylor recommended that managers observe the most productive workers (usually with “time studies” of task elements), determine and standardize the “one best way” to perform each task, match workers to positions according to their capacities, train them in
procedures, and ensure their cooperation by providing help, supervision, and daily bonuses for meeting targets. Principally, Taylor encouraged managers to remove the “brain work” from manual labor and to concentrate it among a separate pool of production planners (to whom workers could make suggestions). In doing so, he noted that planners would invariably suggest further task segmentation and that managers would take over much or all of workers’ decision-making responsibilities.

Comparatively, other pioneers in scientific management, Frank and Lillian Gilbreth, were more concerned with the condition of workers—seeking to increase productivity by eliminating unnecessary fatigue. Their “motion studies”—accomplished first with descriptions and illustrations and then with “micro-motion” films—illuminated a range of variables (in addition to time) with room for elimination of waste. In their most celebrated research, they reduced bending and lifting among bricklayers and tripled their hourly output.

Scientific management vastly increased productivity. However, the mutual economic benefit predicted by its earliest pioneers did not materialize, as employers received the bulk of economic rewards. In any case, social scientists have long argued that workers have desires apart from money and that scientific management techniques deny their needs. In the 1920s, Mary Parker Follett drew attention to workers’ non-economic needs and potential to contribute, and Elton Mayo’s Hawthorne studies demonstrated that positive attention to these needs could enhance productivity—a topic subsequently taken up by the human relations school of management.

Since that time, it has become clear that scientific management has had overwhelmingly negative consequences for the experience of work. Optimistic confidence that the approach would engender mutual respect between workers and managers has given way to the realization that workers forced to “check their brains at the door” are often deprived of dignity at work and have little leverage to bargain for better conditions. The potential for negative consequences heightens when existing job structures do not allow all workers to rise to their level of ability as Taylor presumed. The result is often withdrawal of cooperation, including absenteeism, strikes, and withholding of information and effort—sometimes characterized as the irrationality of an overly rationalized system. Paradoxically, some of the solutions proposed and employed—including internal labor markets, quality of work life programs, job rotation, and worker participation regimes—include aspects of the work relationship proposed in the writings of Taylor and the Gilbreths.

SECONDHAND SMOKE

According to the U.S. Surgeon General, secondhand smoke, also known as “passive smoking” or “environmental tobacco smoke” causes disease and premature death for nonsmoking adults and children, because tobacco smoke contains toxic chemicals that increase health risks. With it widely recognized as harmful to an individual’s personal health, smoking now constitutes a universal public health risk.

The U.S. Department of Human Services reports that nicotine is detectable in 43 percent of the nation’s nonsmokers. It also notes the exposure of almost 22 million children to secondhand smoke. The Environmental Protection Agency (EPA), National Toxicology Program, and the International Agency for Research on Cancer (IARC) all identify passive smoking as a “known human carcinogen” (cancer-causing agent). Other health risks include asthma, stunted growth, coronary heart disease, and lung cancer.

Even brief exposure could detrimentally affect an individual’s health. The American Lung Association states that secondhand smoke causes approximately 3,400 lung cancer deaths and 22,700–69,000 heart disease deaths among U.S. adult nonsmokers. These claims offer support to policymakers who want smoking bans, concerned workers in establishments
where smoking is prevalent, and politicians who respond to public concerns. While support keeps growing for tobacco control policies, many individuals and establishments nonetheless oppose anti-smoking legislation.

**Secondhand Smoke as a Social Problem**

Takeshi Hirayama published the first study that examined the relationship between passive smoking and lung cancer in 1981, concluding that wives of heavy smokers were more likely to develop lung cancer than wives of nonsmokers. This discovery spurred an increase in scientific research on secondhand smoke in the following decades. While many scientists supported Hirayama’s conclusions, others countered his claim. The most notable opponents were those funded by the tobacco industry and related businesses.

Scientific findings often gained attention through news media. The sustained interest in secondhand smoke remained in media headlines following claims proposed by nonsmokers’ rights groups such as Americans for Nonsmokers’ Rights (ANR), the U.S. Surgeon General, and other advocates, in conjunction with counterclaims made by the tobacco industry. While scientific discoveries had an impact on public interest in secondhand smoke as a social problem, it was the media that often transmitted these discoveries, especially from the proliferation of conflicting claims. The argument of secondhand smoke as a public health issue convinced employees of smoking establishments as well as the general public that passive smoking posed a serious health risk. Shortly thereafter, they persuaded policymakers to take legal action against smoking in public places.

Despite the general public’s contribution to tobacco control policies, many rejected the scientific findings and did not support public smoking bans. Antagonists presented their opinions through legal, moral, and economic frameworks. First, smokers were upset by bans because they believe smoking is a First Amendment right. Second, establishments that depend on a high proportion of smoking clientele argued that their businesses would suffer from the legal restriction. Similarly, the tobacco industry also fought smoking bans on grounds it would hurt their industry.

In particular, the tobacco industry challenged a 1993 report issued by the Environmental Protection Agency (EPA) stating that 3,000 lung cancer deaths result from passive smoking each year. This report encouraged many private establishments and communities to pass smoking bans. Representatives of tobacco companies claimed that EPA manipulated scientific findings by selecting only cases that supported their hypothesis. In 1998, U.S. District Court Judge William Osteen sided with the tobacco industry, declaring that EPA did not follow accepted scientific procedures. Nonetheless, the U.S. Court of Appeals for the Fourth Circuit overturned this decision in 2002 on technical grounds.

**Smoking Bans**

The first smoking bans in the United States, in the late 1980s, restricted smoking on domestic flights. In the following decade, EPA, the U.S. National Institute of Occupational Safety and Health, and other government agencies joined the U.S. Surgeon General in the fight against secondhand smoke. In 1995, New York City and California became the first major regions to enact tobacco restrictions in restaurants; several years later they extended the ban to other public places.

One of the strongest arguments that pushed public smoking bans was from the employees of smoking establishments. Workers argued that their health was in jeopardy from constant exposure to the secondhand smoke of others in their workplace or patrons of the establishment. Proponents for smoking bans argued that the removal of environmental tobacco smoke is necessary for several reasons. Aside from the danger in certain establishments, where smoking would interfere with flammable materials or general cleanliness, workers claimed that passive smoking increased health risks of heart disease, cancer, and respiratory-related problems. For example, in New York City, Mayor Michael Bloomberg supported employees who framed passive smoking as a safety issue. As a former smoker himself, Mayor Bloomberg advocated for the New York City Clean Air Act of 2003, which then expanded to a statewide ban several months later.

In the United States, each state has jurisdiction to enact smoking bans. Currently, 47 states have laws that restrict smoking in public places, which may include bars, restaurants, or workplaces. All 50 states prohibit smoking in government buildings, while 39 restrict smoking in private workplaces. Similarly, other countries such as Australia and Canada regulate smoking state by state. Other regions, like the United Kingdom, have countrywide regulations. Internationally, more
than two dozen countries presently ban smoking in public places.

In addition to public smoking bans, taxation, media campaigns, increasing law enforcement for underage users, advertisement restrictions, youth education, and cessation services also may contribute to reducing secondhand smoke. Other programs, laws, and policies focus on prevention and helping current smokers to quit. However, “clean air” acts or smoking bans specifically address secondhand smoke. These regulations ban smoking in public places such as restaurants, bars, hospitals, schools, and public transportation. Although smoking bans intend to benefit “passive” smokers, some research suggests that “clean air acts” also encourage cessation among current smokers. Proponents suggest that overall smoking rates decline from reduced opportunity and growing moral disfavor for smokers. Others argue that smoking rates do not change because tobacco users will simply find elsewhere to smoke.

Research Perspectives

Research on secondhand smoke covers a variety of perspectives. Chemical and biological scientists evaluate the health effects of environmental tobacco smoke and the chemical composition of emitted fumes. Policy analysts decipher the level of public support of smoking bans, if businesses comply with legislation, and what additional policies aid overall effectiveness (e.g., media campaigns, tobacco taxes).

Social scientists study patterns of smoking use by social identities (e.g., age, race/ethnicity, gender, class, national origin, religion), psychological factors (e.g., mental history, addiction), or family and neighborhood characteristics. However, so far little research evaluates the effect of legislation on particular social groups.

Researchers find that smoking bans, taxation, and media campaigns have the greatest deterrent effect on smoking rates. They argue that states with smoking bans use cigarettes less per capita than states without similar legislation. Businesses that implement smoking bans report reductions in quantity and frequency of cigarettes smoked. Studies in countries outside the United States show similar usage patterns. Research also suggests that smoking bans affect youth smoking.

The effect of smoking bans varies by the strictness of legislation. Policies that do not ban smoking completely but include areas specifically designated for smokers affect smoking rates far less than total bans. Enforcement also influences policy success. Government involvement to enact legislation is more successful than private organization policies. Therefore, individual compliance is more likely under public laws compared to private rules. However, businesses do not always agree with government policy. Widespread legislation imposes policies that some private businesses often disfavor or zealously challenge.

After the implementation of smoking bans, studies found mixed results regarding their success. While the industry and related businesses feared economic losses, economic repercussions varied by cultural climate, type of business, and location. Areas that showed greater support for smoking bans generally did not result in declining patronage. Evaluations that reviewed compliance with the new legislation also found mixed results. Overall, claims from business owners did not support actual reactions to public smoking bans.

Secondhand smoke remains highly contested among anti-smoking advocates, scientists, smokers, the tobacco industry, and business owners. Empirical evaluations of the policy’s effect on cessation, compliance, social acceptance, and economic effects are inconclusive because of the legislation’s short history.

Further Readings

The concept of the *second shift* describes an unequal division of labor prevalent among heterosexual dual-earner couples in which women perform the bulk of unpaid household labor and child care in addition to their paid employment. Also referred to as the “double day,” the second shift marks an important form of gender inequality brought about by changing gender roles. Over the past four decades, as women’s labor force participation escalated, men’s participation at home increased only slightly. Consequently, women’s heavy responsibilities in paid and unpaid work expose them to role conflict and role overload, disrupt their attempts at leisure, and disadvantage their pay and promotion chances in the workplace.

Social scientists have researched the division of household labor through time diary studies, surveys that ask respondents to estimate the time they spend on various tasks (less accurate due to inflated responses), and in-depth fieldwork on women’s and men’s relationships in everyday life. Despite a cultural shift toward more egalitarian gender roles in the public realm, researchers agree that a “gender lag” exists at home: most routine household and childrearing tasks continue to be typified as women’s work. Even though women now spend fewer hours per week on unpaid household labor and child care, their time commitment still doubles or triples what men do, on average. Moreover, traditional “male” tasks (mowing the lawn or taking out the trash) offer men far more discretion over their time than women. Time-consuming “female” tasks such as cleaning, cooking, and caring for children frequently demand repeated and simultaneous action. Even when couples pay others to do their household labor, they mostly hire women to do it. Many quantitative studies fail to measure emotion work (tending to family members’ feelings) and the “invisible work” of planning and organizing family members’ activities. Qualitative studies have clarified how these forms of unpaid household labor disproportionately fall to women.

Patterns in the division of household labor show that the second shift is greatest in heterosexual households where women’s contributions to family income are low; under this condition, women trade their unpaid domestic labor for men’s financial support. As women’s incomes grow closer to their male partners’, the gender gap in the division of household labor shrinks (women decrease and men increase their domestic labor) but does not disappear. Paradoxically, researchers find that in relationships where males earn less than females, men do not perform more unpaid domestic labor in exchange for women’s financial support. When women earn all of the family income, men may perform even less household labor than males who out-earn their female partners. A crucial factor in these households is whether men depend voluntarily or involuntarily on women’s income. In cases where men do so voluntarily, their household labor may exceed women’s. But males who involuntarily experience extended unemployment may perform far less household labor, and their female partners may increase theirs in response. Although few qualitative and quantitative studies of the division of household labor adequately include lesbian and gay couples, researchers find that their arrangements are more likely to be egalitarian, especially among lesbians.

When examining couples’ race and ethnicity, researchers find that men who reside in immigrant ethnic enclaves are more likely to support patriarchal gender arrangements and perform less unpaid household labor than men living in more heterogeneous communities. Among African American heterosexual couples, the overall pattern of women performing more unpaid domestic labor than men still holds, but the gender gap is smaller. African American dual-earner couples are more likely than white couples to share household labor, primarily because African American men spend more time performing a greater variety of household tasks than white men do, on average. Some studies of dual-earner Chicano/a couples report a similar pattern of Chicano males doing more household labor than Anglo males but less than African American males. Aside from the possibility of ethnic and class influences on couples’ gender ideologies, members of minority dual-earner couples are more likely to earn comparable incomes and, out of financial necessity, operate more cooperative households.

Why does the gender gap in household labor persist? Cultural assumptions about gender matter more than any other factor. When men hold power in the public sphere (through their income), their public success translates into power at home. Many women honor men’s breadwinner status by performing most of the household labor and child care, even if they also work full time outside the home. But, when women hold higher status in the public realm, they do not necessarily garner more power and privileges at home.
Their higher status may instead be regarded as a liability that undermines their male partners’ traditional masculine role and renders the couple gender deviant. Only when male partners value the importance of women’s paid contributions and occupational status do they willingly take on an equal or greater share of household labor.

Social constructions of masculinity also matter. In most Western industrialized cultures, men often accomplish masculinity by avoiding being feminine. By strategically avoiding or resisting domestic labor, men can reproduce heterosexual masculine status and preserve traditional privileges and power at home. As a result, men may define their household labor as optional, not required, in sharp contrast to women.

For women, the roles of wife and mother ideologically inform how they should demonstrate their love, care, and concern for others. Caring becomes a criterion for evaluating the moral worth of women who are mothers, spouses, and romantic partners; consequently, women who feel overwhelmed by the second shift and want to cut back their household labor face the accusation of being cold, bossy, neglectful, and unloving. The cultural weight of motherhood is such that, even in studies that exclude actual time spent caring for children, women’s household labor increases far more than men’s when young children are at home, regardless of income.

Overall, the consequences of the second shift confer more benefits and privileges to men and more obligations to women. Women, on average, pay a higher price in terms of lower compensation for their paid work, greater responsibilities at home, and a diminished amount of uninterrupted leisure.

Secularization

The term secularization entered formal discourse at the Peace of Westphalia in 1648, when territories transferred from religious to secular political authorities. Previously, the Latin word saecularis distinguished profane from sacred. The term secularization subsequently developed wider meaning as philosophers and then sociologists used it to assess social changes.

Secularization refers to the diminishing significance of the role of religious precepts and rites in the daily activities of individuals and groups. Early sociologists perceived a steady rise in secularization, while noting that religion in varying ways continued to possess social value. Their theories of society punctuated the view that religion was no longer meeting the concerns of modern living.

The modern secularist view stemmed from the 18th-century movement called the Enlightenment. Developments in science and technology, growing literacy, and progress in the articulation of individual rights gave rise to disparate voices challenging the worldview that extant social relations reflect a divinely inspired, ordered hierarchy. Voltaire (1694–1778) challenged the logic of religion and the political authority of the church. Adam Smith (1723–90)
provided an economically sound blueprint for arranging social relations. Thomas Jefferson (1743–1826) advanced the idea of inalienable rights. The ideas of these thinkers and many others, including G. W. F. Hegel’s (1770–1831) conceptualization of progress in history, Auguste Comte’s (1798–1857) positivist sociology, and Friedrich Nietzsche’s (1844–1900) deconstruction of the history of morality, created fertile ground upon which to observe the workings of society.

Detaching from the machinery of society in order to observe it led to the dispassionate examination of religion. The rational nature of detached examination led to a form of thinking that made issues such as faith a matter of personal choice rather than an assumed aspect of reality. Building on the ideas of Hegel and Ludwig Feuerbach (1804–72), Karl Marx (1818–83) focused on religion as an ideology. By his oft-cited statement that religion is the opiate of the masses, Marx was primarily noting that religion can mask or soothe the sting of alienation and exploitation without ameliorating it. Marx’s interest in religion centered primarily on its relationship to the political economy.

Contemporary examinations of secularization echo back to a number of observations made by early sociologists. Three theories dominate the literature on secularization. The first theory suggests that as scientific, technological, and individualistic thinking increasingly pervades culture, symbols and events formerly associated with sacred meaning become more rational, relative, and relegated to the background of everyday activities. If the social and individual orientations of people living in modern industrialized nations are compared to cultures that are not technologically advanced and are more sociocentric than egocentric, their sacred meanings appear to be more personal, private, and, for many people, configured around fulfilling secular responsibilities and enjoying secular activities.

The second theory of secularization advances the idea that changes in religious conceptions and practices do not necessarily indicate the decline of religion in society. While people in advanced industrial nations tend to pick and choose their religious orientation and have lost an immediacy of belief, religion still holds value in developed nations, and people are not any more or any less religious than earlier generations. While the social arrangements by which humankind lives may become more sophisticated, humanity’s existential condition remains the same. Even if the form and content of religious beliefs and practices change—become more privatized and relative—religion continues to be important for people. In the process of change, religious beliefs and practices may ebb and flow. Sometimes secularization may appear to be advancing, while at other times it appears to be on the decline.

A third theory states that secularization is a self-limiting process that gives way to religious revival, such as the schismatic formation of new sects, or religious innovation, such as the formation of new religions or cults. Revivalism, or the rise and assertion of religious orthodoxy among people of many faiths, is occurring currently around the world. According to this theory, modernity has not stripped away the desire among people to affirm the reality of the supernatural. People of faith will allow their religious ideas and practices to mix with the secular world only so far before they feel a need to reassert the importance of the sacred.

Theories of secularization arrive at different conclusions depending upon whether the focus of analysis concerns the individual, social organization, or society. Worldwide comparisons suggest that, at the societal level of analysis, most Western European nations are secular states; however, at the individual level of analysis, interest in issues typically categorized as religious continues. Modernity’s challenge to traditional religious structures may intensify individual interest in existential well-being.

Tensions between religious and secular orientations exist both within and between many nations, such as France and Turkey, which are secular states with growing populations of traditional Muslims. Israel not only contends with tensions that exist with some of its neighbors but also experiences tensions due to conflicting values between Orthodox and Reform Jews. Likewise, the United States contends with religious conflicts both within and beyond its borders. The United States is the most pluralistic and religiously oriented nation in the industrialized world. Its unique status may be due to its historical separation of church and state. While social and political tensions occur periodically because of this dividing wall, it nevertheless provides the space for such debates to be heard.

An ongoing debate in the United States concerns the role of religion in deciding public policy. A central aspect of secularization is the diminishing role among religious leaders to affect political decision making. Compared with Western Europe, the United States is
distinctive in its support of leaders who convey a traditional Christian message. A complex social issue concerns the assertion of traditional values and norms that may threaten the rational-legal procedures that underpin democratic freedoms.

Segmented Assimilation

Segmented assimilation as a middle-range conceptual perspective emerged in the early 1990s with the publication of “The New Second Generation” by Alejandro Portes and Min Zhou in the Annals of the American Academy of Political and Social Sciences. The theory is built on the empirical observations that the host society is highly stratified by class and race, that the host reception is more contingent upon circumstances than inclusive of all newcomers, and that immigrants arrive with different amounts and kinds of resources to cope with resettlement and incorporation, resulting in different rates of success.

Unlike the classical straight-line assimilation theories that posit an irreversible and unidirectional path leading to the eventual incorporation into an undifferentiated, unified, and white middle-class mainstream by all immigrants, the segmented assimilation theory conceives of the mainstream society as shaped by systems of class and racial stratifications. It emphasizes the interaction between race and class and between group membership and larger social structures that intentionally or unintentionally exclude nonwhites. It attempts to delineate the multiple patterns of adaptation that emerge among contemporary immigrants and their offspring, accounts for their different destinies of convergence (or divergence) in their new homelands, and addresses the ways in which particular contexts of exit and reception of national origin groups affect outcomes.

From this perspective, the process of assimilation may take multiple pathways, sometimes with different turns, leading to varied outcomes. Three main patterns are discernible:

1. The time-honored upward-mobility pattern dictating the acculturation and economic integration into the normative structures of mainstream middle-class America. This is the old-fashioned path of severing ethnic ties; unlearning “old world” values, norms, and behavioral patterns; and adapting to the culture of the Anglo-Saxon core associated with the white middle class.

2. The downward-mobility pattern dictating the acculturation and parallel integration into the margins of U.S. society. This is the path of adapting to native subcultures in direct opposition to the core Anglo-Saxon culture or of creating hybrid oppositional subcultures associated with native groups trapped in the host society’s margins or the bottom rungs of the society’s mobility ladder.

3. Socioeconomic integration into mainstream America with lagged and selective acculturation and deliberate preservation of the immigrant community’s values and norms, social ties, and ethnic institutions. This is the path of deliberately reaffirming ethnicity and rebuilding ethnic networks and structures for socioeconomic advancement into middle-class status.

The unique contexts of exit and reception determine into what segment of society the immigrant or ethnic group assimilates. The context of exit entails a number of factors, including premigration resources that immigrants bring with them (such as money, knowledge, and job skills), the social class status already attained by the immigrants in their homelands, motivations, and the means of migration. The
context of reception includes the national origin group’s positioning in the system of racial stratification, government policies, labor market conditions, public attitudes, and the strength and viability of the ethnic community in the host society. Segmented assimilation theory focuses on the interaction of these two sets of factors, predicting that particular contexts of exit and reception can create distinctive cultural patterns and strategies of adaptation, social environments, and tangible resources for the group and give rise to opportunities or constraints for the individual, independent of individual socioeconomic and demographic characteristics.

While the unique contexts of exit and reception lead to distinct modes of incorporation for immigrant and refugee groups, different modes of incorporation explain variations in the contexts within which individuals strive to “make it” in their new homeland. For example, to explain why immigrant Chinese or Korean children generally do better in school than immigrant Mexican or Central American children even when they come from families with similar income levels, live in the same neighborhood, and go to the same school, one must look into the unique contexts within which these children grow up. Among the various contextual factors that may significantly influence academic outcomes, one stands out among Chinese and Koreans: an ethnic community with an extensive system of supplementary education, including nonprofit ethnic language schools and private institution in academic tutoring, enrichment, standardized test drills, college preparation and counseling, and extracurricular activities aiming mainly at enhancing the competitiveness of children’s higher educational prospects. The ethnic system of supplementary education is built not only on the strong human capital and financial resources that Chinese and Korean immigrants bring with them to the new country but also on their experience with a competitive educational system in the homeland. In contrast, the Mexican or Central American communities lack similar ethnic social structures that generate resources conducive to education. Moreover, the children of Mexican or Central American immigrants who live in the same neighborhoods as Chinese or Korean immigrants are largely excluded from these ethnic resources.

Empirically, segmented assimilation is measured by a range of observable socioeconomic indicators, such as educational attainment, employment status, income, and home ownership. For the children of immigrants, indicators of downward assimilation include dropping out of school, premature childbirths, and being arrested or sentenced for a crime. These variables are strong predictors of future low educational attainment, low occupational status, low income, and low likelihood of home ownership. Numerous qualitative and quantitative works have produced evidence in support of segmented assimilation predictions—that the second generation is likely to assimilate upwardly, downwardly, or horizontally into an American society that is highly segmented by class and race and to do so in different ways.

From the segmented assimilation perspective, downward assimilation is only one of several possible outcomes. Curiously, the segmented assimilation theory is often misinterpreted as suggesting and predicting a single outcome—downward assimilation—and thereby is criticized as being overtly pessimistic about the immigrant second generation. Nonetheless, to refute the segmented assimilation theory or state that the second generation will sooner or later move into the mainstream middle class, one must demonstrate that both of the following cases are false: (1) that the proportions of those falling into the major indicators of downward assimilation—high school dropouts, teenage pregnancies, and arrests for breaking the law—are insignificant for each national origin or ethnic group; and (2) that the differences in outcomes are randomly distributed across different national origin or ethnic groups, regardless of the group’s modes of incorporation.

Segregation

Segregation is the separation of groups based on social characteristics. These characteristics may be either ascribed, such as race, or achieved, such as economic status. In a segregated society, the separated groups may have little or no contact with each other. It is this lack of contact between groups that contributes to the social problems associated with segregation. This occurs primarily through two dimensions: lack of exposure and unequal access to resources.

The separation of groups limits contact between groups, potentially leading to the development of prejudices and the continuation of stereotypes. Segregation separates members of groups and in doing so may perpetuate stereotypes by denying them opportunities to interact. Social networks that exclude specific groups may be perceived as biased or discriminatory because networks integrate individuals into the greater social context and segregated networks limit the exposure of individuals to the “other.”

When groups are segregated spatially, separate institutions also emerge, and this can lead to unequal access to society’s resources. Following the U.S. Civil War, many southern states enacted Jim Crow laws enforcing previously informal norms of segregation of blacks and whites. These laws justified racial segregation using the argument that public facilities such as railroads and schools could be “separate but equal.” The Supreme Court case of Plessy v. Ferguson in 1896 upheld this doctrine. It would not be until 1954 (Brown v. Board of Education) that public school segregation would be declared unconstitutional. The Civil Rights Act of 1964 signaled the end of the Jim Crow laws.

In the U.S. context, the civil rights movement of the 1960s explicitly addressed segregation based on ascribed characteristics of race and gender. Yet, even when legal support for equal opportunity exists, segregation in the form of social exclusion may occur. With social exclusion, individuals may experience not physical segregation but social marginalization that limits employment and earnings opportunities.

Dimensions of Segregation

Segregation has social, cultural, and spatial contexts and occurs as the result of law (de jure segregation) or by cultural practice (de facto segregation). Many dimensions of segregation, including age, gender, disability status, race, ethnicity, and economic status, can be identified in societies worldwide. In the United States and Europe, segregation in housing and segregation in education are two of the most commonly studied forms of segregation.

Researchers are increasingly focusing on segregation as a multilevel phenomenon. This reflects the reality that individuals are embedded in social contexts that shape their access to other individuals and resources in society. While individual and group-level characteristics are often the focal point of segregation, segregation occurs through social institutions such as schools, occupations, and residential communities. For example, the housing opportunities available to minorities are framed in the context of housing segregation, which is often examined from a neighborhood and community context; glass ceiling effects for women are framed in the context of gender segregation in the workplace and occupational context.

There are both voluntary and involuntary causes of segregation. Voluntary segregation often occurs at the individual or group level in terms of social networks. Involuntary segregation occurs when individuals and groups are denied opportunities because of one or more characteristics. At its most basic, voluntary and involuntary segregation can be cast in terms of individual preferences versus discrimination. For example, in the United States, minority residents may prefer to live in mixed neighborhoods, but whites may be unwilling to sell their homes to minority families.

Multiple dimensions of segregation may also interact. For example, residential segregation by race can be compounded by economic segregation. A long-standing debate continues about the relative importance of race and socioeconomic status. Increases in levels of segregation are often attributed to factors rooted in group tensions and institutionalized discrimination. Decreases in segregation reflect changes in social policies as well as social norms such as increasing tolerance and more egalitarian gender norms.

Measuring Segregation

An increasing number of indices measure segregation. Although the Index of Dissimilarity is the traditional measure of segregation, researchers now recognize that no single summary measure fully characterizes all dimensions of segregation. At the same time, different indices may produce different results, and researchers are increasingly turning to multiple measures in framing their studies. The preferred method depends on both the type of segregation being measured and the
focus of the particular study. To analyze spatial patterns of segregation, researchers increasingly combine segregation indices with the use of mapping techniques.

In examining residential segregation, Massey and Denton distinguish among five distinct dimensions of segregation: evenness, exposure, concentration, centralization, and clustering. The Index of Dissimilarity is a measure of evenness. It measures the extent to which different groups inhabit categories or areas of interest and ranges between 0 and 1 with values above 0.60 reflecting high levels of segregation. In the context of residential segregation, the Index of Dissimilarity can explain the proportion of one group that would have to move between areas to create an even racial distribution.

The Isolation Index and Correlation Ratio are examples of measures of exposure. The Isolation Index measures the extent to which a group has contact with another group in an area. Like the index of dissimilarity, the index of isolation ranges from 0 to 1, with higher values (0.30–1.00) indicating greater levels of isolation. The correlation ratio measures the degree to which an area is composed of homogeneous units. Values range from 0 to 1, with values close to 1 reflecting larger differences between areas. A variation on the correlation index applied to income segregation is the Neighborhood Sorting Index. Measures of concentration, centralization, and clustering are distinct but related concepts that represent the physical space occupied by a group, the centrality of that space, and the adjacency of a group’s space to other groups, respectively.

**Segregation as a Social Problem**

Segregation, per se, may not necessarily be bad for a group. Many of the negative consequences of segregation stem from the embeddedness of forms of involuntary segregation in the social fabric. In the United States, institutions that have a history of segregation include education and housing. Many public school districts are based on neighborhoods that are racially and economically segregated. Inner-city neighborhoods may be populated by concentrations of poor minorities with little social capital or opportunity to move. In such involuntarily segregated communities, segregation can lead to negative outcomes such as lower levels of education, more unemployment, and single parenthood.

Yet, voluntary segregation may serve a supportive function for a group. Ethnic enclaves have internal economies that assist in adjustment for immigrant groups. They may offer support, social capital, and opportunities for upward mobility. In education, proponents of single-sex public education argue that single-sex schools may increase learning because they lessen the pressure to meet gender stereotypes.

Segregation can serve as a barrier for members of segregated groups that leads to social exclusion and a lack of opportunity for social mobility. Members of advantaged groups may protect their advantages by discriminating against nongroup members and excluding them. Policies such as affirmative action sought to explicitly address historic inequalities by gender and race. Some argue that affirmative action is no longer necessary and can be replaced with policies that promote “equal opportunity” in hiring and school admissions. Others assert that while minorities and women have made gains, they are still over-represented in service and lower-prestige occupations and under-represented in many high-prestige positions and occupations.

Understanding the basis of segregation can help better understand its consequences. Voluntary segregation may offer group members support they would not easily find in the larger society. Involuntary segregation can be based on either legal justification or socially condoned discriminatory behavior. In either case, differential status is assigned to groups based on their race, gender, age, or economic status. Since an individual’s social networks are relatively homogeneous, individuals embedded in a segregated society have limited exposure to individuals unlike themselves. They live with people like themselves, attend schools with people like themselves, work with people like themselves, and are shielded from either the disparities that exist or the means to overcome them.

**SEGREGATION, DE FACTO**

The term *de facto segregation* refers to the separation of individuals, typically based on a characteristic over which the individual has little or no control and that exists in fact as customary practice. It differs from *de jure segregation*, which has a legal basis. De facto segregation is also more widespread, encompasses a greater number of individuals, and is harder to eliminate. As with *de jure segregation*, the areas involving *de facto segregation* include employment, education, housing, and public accommodation.

Oppressive systems can, and often do, include both types of segregation. For example, the U.S. Supreme Court’s desegregation order in *Brown v. Board of Education* in 1954 constituted the first major victory in the battle to end *Jim Crow* laws. Yet, the battle over the separation of individuals not required by law on the basis of such factors as race or sex, which first came to national attention during the civil rights movement, continues to this day.

At the height of the movement, the Supreme Court struck down numerous *de facto* practices in such cases as *Johnson v. Virginia* in 1963, *Hamm v. City of Rock Hill* in 1964, and *Griggs v. Duke Power* in 1971. In *Johnson*, the Court ruled that a black man could not be held in contempt for refusing to sit in the area of courtroom traditionally “reserved for Negroes” and, in *Hamm*, that black people sitting at a department store lunch counter could not be convicted of trespassing. The justices concluded in *Griggs* that a company could not impose new job requirements (including IQ and personality tests) on black applicants seeking jobs historically limited to whites, since white applicants were never required to meet those requirements.

In recent years, the U.S. Supreme Court has issued mixed rulings with respect to *de facto* segregation. Among the cases in which such practices were declared unconstitutional are *United States v. Fordice* in 1992 and *U.S. v. Virginia* in 1996. In *Fordice*, the justices found that Mississippi state colleges were still segregated with more than 99 percent of white students attending historically white campuses and 92 to 99 percent of black students attending historically black campuses. The policy contested in *Virginia*, which excluded all female students, had existed at the Virginia Military Institute since 1839.

Examples in which the U.S. Supreme Court did not eliminate *de facto* segregation include *Wards Cove Packing Co.* in 1989 and *Johnson v. California* in 2005. After noting in *Wards Cove* that the predominantly white noncannery workers and the predominantly nonwhite cannery employees live in separate dormitories and eat in separate mess halls, the justices determined that the plaintiffs had not presented sufficient proof of racial discrimination. Also important was the Court’s decision in *Johnson*. At issue was the policy of the California Department of Correction of racially segregating prisoners for up to 60 days each time they enter a new facility. Rather than ruling on the policy, the justices specified the standard that a lower court would need to adjudicate the case.

**SEGREGATION, DE JURE**

The term *de jure segregation* refers to the separation, imposed by law, of individuals, typically based on a characteristic over which the individual has little or no control. The application of such laws can include employment, education, housing, and public
accommodation. Implicit in the notion of de jure segregation are the following assumptions: that the characteristic in question separates people into members of superior and inferior groups; that inferior group members are entitled to few, if any, benefits; and that integration is detrimental to superior group members. Examples of de jure segregation include Hitler’s ghetto and concentration camp policies, South Africa’s apartheid system, and, in the United States, Japanese internment, the American Indian reservation system, and Jim Crow.

Among the most legally contested was Jim Crow. Shortly after the Civil War ended, the federal government granted former slaves and their descendants numerous rights and enforced them through military occupation of southern land. After the withdrawal of federal troops in 1877, southern states and local governments passed laws to undermine federal racial equality laws. The U.S. Supreme Court upheld the ability of states to take such action in Plessy v. Ferguson in 1896. The ruling affirmed a Louisiana law that required railroad passengers to be racially segregated since the segregation was deemed equal and occurred within state lines.

U.S. Supreme Court rulings issued in the aftermath of the separate but equal doctrine established in Plessy reveal variety in the laws that constituted Jim Crow. Some were located in provisions of state constitutions mandating racially segregated public schools, including one in Mississippi discussed in Gong Lum v. Rice and another in Georgia referenced in Cumming v. Board of Education. Others were found in legislative action such as the decision by state officials to reconfigure Tuskegee, Alabama, to exclude nearly all its black residents, challenged in Gomillion v. Lightfoot. Comprising a third type were city ordinances like the one disputed in Buchanan v. Warley that barred anyone who was not of the same race as the majority of people living on a city block from living in a house on that block. Palmer v. Thomson and Watson v. City of Memphis also involved city-mandated racial segregation. The former concerned parks in Jackson, Mississippi, and the latter parks and facilities in Memphis, Tennessee.

The first strike against de jure segregation in the United States occurred in 1954 with the U.S. Supreme Court’s ruling in Brown v. Board of Education, brought to the court by the National Association for the Advancement of Colored People (NAACP). The ruling was a major victory for the NAACP and other members of the civil rights movement. Among their attorneys was Thurgood Marshall, who later became the first person of color to serve on the U.S. Supreme Court. The prohibition of de jure segregation in the United States, begun with the Brown case, occurred after passage of the Civil Rights Acts of 1964 and 1968.

Segregation, Gender

Gender segregation is the separation of individuals according to their gender or sex. It takes many forms in various social contexts, including schools, workplaces, religious organizations, sporting activities, and health facilities. The physical construction of public spaces, such as single-sex changing rooms and bathrooms, both reflects and reinforces gender segregation, as do cultural beliefs regarding the social roles of men and women. These divisions along gender lines result in part from historical and cultural assumptions about the meanings of gender (a term that emphasizes the socially constructed dimension of what it means to behave like a man or woman) and sex (a term that emphasizes the biological dimensions of designation as a man or woman).

As a result of these assumptions and beliefs, women and men may experience horizontal or vertical segregation. Evidence of horizontal segregation is the disproportionate number of women found in jobs or fields of study perceived as requiring nurturing qualities, such as elementary teacher or nurse, or of men disproportionately found in jobs or fields of study perceived as requiring manual labor or rational reasoning skills, such as construction or engineering. An example of vertical segregation is when men are more likely than women to hold leadership or supervisory positions within the same educational or job environment. Analysts frequently cite gender segregation as an influential determinant in maintaining contemporary
inequalities, particularly in the economic sphere. However, in some instances gender segregation may ameliorate social inequalities. For example, a number of women’s colleges and historically black men’s and women’s colleges remain gender segregated as a means of countering prevailing norms imposed by dominant social groups.

**Gender Segregation in Schools**

In most cultures, girls at some point in history were denied access to institutions offering a formal education to boys. As a result of cultural beliefs regarding women’s familial roles, girls with economic means were often dissuaded from pursuing educational goals and instead steered to finishing schools and seminaries that would provide an education in morals and etiquette. In the United States during the latter part of the 19th century, abolitionist and women’s rights movements gained momentum, resulting in a number of colleges and universities opening their doors to women and racial minorities. Simultaneously, the number of women-only colleges steadily grew to accommodate the increasing number of women seeking higher education. However, during the mid-20th century, women’s access to colleges and universities slowed until demands for gender equality increased again in the 1960s. Most notably, the Civil Rights Act of 1964 and Title IX of the Educational Amendments of 1972 enhanced women’s access to and within educational institutions. Title IX essentially prohibited schools from denying women both admittance and equal access to resources within publicly funded educational institutions.

In the United States, although girls and women have gained entry into most educational institutions, gender segregation continues in the subjects that students study and in how children play and work in schools. Researchers examining the social interactions of young children in traditional learning environments have long noted that boys and girls segregate themselves and that teachers or staff members sometimes encourage students to divide along gender lines. When in gender-segregated situations on the playground or in the classroom, boys and girls often differ in their actions and control of space, simultaneously fulfilling and creating gender “norms” in the process. Gender segregation also occurs in the later years, when students choose elective classes, sports activities, and programs of study. During the onset of adolescence, fewer girls than boys enroll in subjects such as math and science, and most sports activities are gender segregated (e.g., track, swimming, tennis) or single-sex (football, hockey, wrestling). In vocational programs, gender segregation is particularly visible, with a disproportionate number of girls studying child care and cosmetology and boys studying automotive repairs and woodworking. In colleges and universities, women have steadily enrolled in traditionally male-dominated programs, such as business and law, since the early 1970s. However, men are not moving as steadily into female-dominated fields, such as early education or nursing. Although more women than men currently receive postsecondary degrees, they remain underrepresented at prestigious colleges and universities in educational programs leading to lucrative careers. Understanding the interrelationship of gender segregation and educational institutions with the construction of students’ educational aspirations is necessary to understand vertical and horizontal workplace gender segregation and gender inequality.

**Workplace Gender Segregation**

As with education, occupational gender segregation in the United States remained relatively stable until the 1970s, when it began to steadily decline, partly the result of changing cultural perceptions regarding women’s and men’s social roles and affirmative action policies and legislation. However, many researchers challenge the presumption that declines in occupational gender segregation represent substantial change in the gender segregation of the workplace. Women may have moved into all levels of occupations, but the jobs they attain within those occupational categories often remain divided along gender lines. For example, although many women are now entering the field of medicine, they tend to be clustered in lower-paying specialties such as geriatrics or general medicine. Additionally, men are more likely than women to have managerial authority and autonomy in the same workplace. Such horizontal and vertical gender segregation has dire economic effects for women, whose jobs often pay less than those traditionally held by men.

Although gender segregation, in part, may result from “supply side” or workers’ actions and preferences, researchers within the past 30 years have focused their attention on examining “demand side” or employers’ actions. Frequently, employers consciously or subconsciously make hiring and promotion decisions
based on employees' gendered personality characteristics or perceived family obligations (e.g., as breadwinner or caretaker). Such decisions frequently produce vertical and horizontal gender segregation. Even in countries with strong family policies, such as Sweden and Norway, workplace gender segregation persists, which demonstrates the deep-rooted processes producing both segregation and inequality. Consequently, recent theorists of gender segregation have focused on the gendering not only of individuals but of interactional and organizational processes at all levels of analysis—micro, meso, and macro. Understanding how processes and not just individuals are gendered provides important insights as to how social institutions play a role in the creation and reproduction of gender and gender segregation.

Segregation, Occupational

Occupational segregation refers to the unequal distribution of positions in the labor force. It is historically associated with exclusionary practices that excluded women from men’s jobs and people of color from whites’ jobs, and with practices that relegated white women and racial ethnic groups to jobs subordinate, if not subservient, to white men. Indeed, occupations associated with women and/or racial and ethnic minorities are generally associated with lower social rewards than positions held by white men, as indicated by measures of prestige, autonomy, income, and other benefits.

For example, the feminization of an occupation describes changes in the gender composition correlated with lessening the value and prestige of that occupation. As women enter a predominantly male occupation, the work becomes more closely supervised and deskilled and relatively less rewarded, as documented with the change from male to female predominance in public education and clerical work. Scholars have documented trends that show the occupational pattern of gender segregation is from male-dominated to female-dominated occupations.

A racial caste system characterized occupational distribution in U.S. society through the mid-20th century. Occupations associated with the lowest racial status groups in society were the lowest paid, most segregated, and given the least regard, or occupational prestige, of all jobs. These occupations were often the “dirtiest” and most dangerous, least secure, and allowed some of the most virulent forms of abuse.

Conversely, the most prestigious and well-paid occupations in U.S. society are associated with the highest race and gender status group: white males. Although the civil rights movement led to new legislation that led to a decline in occupational segregation, patterns of race and gender dissimilarity persist. White males remain dominant in jobs associated with the best working conditions and remuneration both within and between social classes and remain at the top of the occupational hierarchy. For example, the U.S. Bureau of Labor Statistics reports that in 2005 whites and Asians dominated professional managerial occupations, respectively holding 36 and 46 percent of the related occupational positions. In contrast, blacks and Latinos/as together held 48 percent of service occupations and 36 percent of production and other labor, and Latinos/as were more likely than any other group to work in occupations associated with natural resources, construction, and maintenance.

Although the Bureau of Labor Statistics shows more women are in professional and managerial occupations—up to 35 percent of women by 2004—the jobs they hold remain overwhelmingly female and are often considered “semi-professional” such as nurse, librarian, and teacher. Among professional and managerial workers, women were more likely than men to be employed in education and other lower-paid fields, while men—particularly white and Asian
American men—were more likely than women to work in high-paying fields such as computers and engineering.

Occupational segregation exists between and within occupations—such as the greater preponderance of men as physicians and women as nurses, and the gendering of particular types of physician or nurse as well. White-collar jobs dominated by women are called “pink-collar work”—lumping “semi-professionals” together with office-related occupations, or clerical work, and low-end retail sales. In 2004, only 6.3 percent of men worked in office and administrative support, in contrast to 23 percent of women. Sixteen percent of men worked in service-related occupations compared to 20 percent of women.

Occupational segregation is either horizontal, with clear race or gender notions attached to the job, or vertical, where promotional opportunities are blocked by gender and/or race, leaving the top positions to the top gender or race group. Scholars refer to a “glass ceiling” to describe workplace constraints that contribute to vertical occupational segregation by locking women into dead-end jobs such as secretary, while the positions available to white men are more often associated with promotional opportunities or what some call a “glass escalator.”

Occupations appear to take on value based in part on the social value attributed to the groups who dominate their ranks. However, scholars remain divided in their explanations for how social value and occupational segregation are correlated and whether allocation to different jobs along horizontal lines necessarily promotes inequality.

Some scholars argue that occupational segregation reflects differences among social actors, as a result of our socialization and orientation toward particular roles in society, or, as human capital theorists suggest, perhaps it reflects differences in training and ability as well. In other words, they link the outcome to differences in workers—differences in work ethic, training, availability, education, and so on. Others suggest that it is not our “human capital,” but who we know that affects our access to employment opportunities. Social networks, not just experience, training, and education, influence knowledge about job opportunities and promotions, as do employers’ gender and race notions of who is appropriate for the position.

Other scholars argue that culturally embedded race and gender notions result in discrimination by employers, coworkers, and/or customers and clients who shape workplace culture and practices to reflect these cultural notions. However, for some, occupational segregation is one of the practices that emerge in the complex of race-class-gender oppression that need not require overt, intentional discrimination by any of the social actors. In this sense, occupational segregation is both the product of practices that maintain divisions of race and gender privilege, inequality, and oppression and a means for reproducing these inequalities. It may result in part from socialization and discrimination, but it is also produced by a complex of social practices tied to cultural representations that reconstruct raced, classed, and gendered realities in dynamic ways, changing together as part of the taken-for-granted social organization of work in a highly differentiated globalizing capitalist economy.

SEGREGATION, RESIDENTIAL

Residential segregation most often refers to the separation of people into different neighborhoods based on their race and/or ethnicity, though neighborhood-level segregation can be computed using other characteristics of people, households, or neighborhoods, for example, social class, single-parent families, or home ownership. The association between the term residential segregation and race/ethnicity reflects the fact that segregation by race/ethnicity is far higher than segregation by other characteristics. Segregation is a social problem because where people live determines
other aspects of their lives: what schools their children attend, access to transportation, availability of municipal services, job opportunities, and so on.

Since residential segregation is based on neighborhoods, it is important to understand how neighborhood is defined. Neighborhoods are usually approximated by census tracts, non-overlapping areas that cover an entire city or metropolitan area and contain approximately 4,000 persons. With the exception of subdivisions to accommodate population growth, tracts have the advantage of changing relatively little over time, making comparisons across time easier. Researchers who argue tracts are too large to capture what most people mean by a neighborhood instead use block groups, areas of about 1,500 people, as proxies for a neighborhood, though these get redefined at each census. The larger the unit used to define the neighborhood, the lower segregation will be, because the probability of finding two different people, say a black and a white, increases as the total number of people examined increases.

In its simplest form, residential segregation is measured by the Index of Dissimilarity. This compares the population of each neighborhood to the overall racial composition of the city or metropolitan area in which it is located. Neighborhoods whose population more closely matches the overall racial composition contribute less to the index, those that do not contribute more. The index ranges from 0 to 100, where zero indicates no segregation and 100 indicates total segregation, with no groups sharing any neighborhoods at all. Values below 30 are considered low, those between 30 and 60 moderate, and above 60 high. The value of the index can be interpreted as the percentage of either group that would need to change their neighborhood so that each neighborhood would reflect the race/ethnic distribution of the city as a whole. The advantages of this index are that it is easy to compute and understand, takes the city’s overall racial composition into account and does not impose an artificial definition of integration, is unaffected by the relative sizes of the groups, and has a long history of use. The main disadvantage of the index is that it compares only two groups at a time, a feature that is becoming more problematic as U.S. society becomes increasingly diverse.

Using the Index of Dissimilarity as the measure allows description of patterns of segregation for different groups in the United States in recent decades. First, African Americans are almost always the most segregated group, followed by Hispanics, and then Asians. In 2000, on average, African American segregation from non-Hispanic whites was 65.2, Hispanic segregation was 51.6, and Asian segregation 42.2. Second, the segregation of African Americans has been declining in recent decades, but that of Hispanics and Asians has been increasing, in part because of continued immigration of those groups; new immigrants tend to live near others of their group, thus replacing those who have moved out. On average, while black–white segregation declined 4.6 points between 1980 and 1990, Hispanic–white segregation increased 4.9 points, and Asian–white increased 2.1 points. Third, segregation tends to be highest in older, formerly industrial cities, in the Northeast and Midwest, with large black populations. For example, in 2000 the segregation of African Americans from whites in Detroit was 84.7, compared to segregation of 45.7 for Hispanics and 45.9 for Asians. Conversely, it is lower in newer cities in the South and West whose populations are growing. For example, in 2000 the segregation of African Americans in Phoenix-Mesa was 43.7, compared to 52.5 for Hispanics and 28.1 for Asians. Metropolitan areas that attract more immigrants also tend to have somewhat lower black segregation than those that do not. Fourth, the largest declines in black segregation are in smaller metropolitan areas with small black populations. Between 1980 and 2000, African American segregation declined by nearly 20 points in Dallas and Phoenix-Mesa, while it declined by less than 5 in Detroit and Newark, and increased by 0.2 points in New York City. Thus, in the larger metropolitan areas where more than half of metropolitan blacks live, segregation declines have been modest.

Social scientists also increasingly realize that the simple description of residential segregation as a matter of even distribution across neighborhoods is inadequate to fully describe the phenomena. Issues such as how much your group’s percent of representation in different neighborhoods differs from your group’s percent of representation in the city’s overall population (uneven distribution), who shares your neighborhood with you (isolation), how the neighborhoods your group occupies are themselves distributed across space (clustering), whether you live close to the center city (centralization), and whether your neighborhoods are densely crowded (concentration) all refer to other important aspects of segregation. Each of these has a specific measure attached to it. Places that are highly segregated on four or all five of these measures are known as hypersegregated places. Until 2000, the only group in the United States that
lived in hypersegregated areas was African Americans. In 2000, Hispanics in New York and Los Angeles were also found to be hypersegregated. African Americans were hypersegregated in 29 places in 2000, including Chicago, Cleveland, Detroit, Milwaukee, Newark, and Philadelphia, where they had scores above 60 on all five measures.

While people choose different neighborhoods for a variety of reasons, residential segregation is not simply the aggregate result of individual choices, but the result of actions on the part of government, realtors, bankers, and insurance agents to influence where specific groups live. At the extreme, apartheid, there are laws dictating where specific groups can live. Historical research on segregation has shown that the process of limiting where African Americans could live in northern cities moved from individual acts of violence and deed restriction to restrictive covenants that applied to whole neighborhoods, to a brief attempt by some places to pass apartheid laws that the Supreme Court promptly declared illegal, to the practice of redlining of certain neighborhoods that was developed by the Home Owner’s Loan Corporation (HOLC) and carried out on an extensive scale under the Federal Housing Authority (FHA) with the cooperation of bankers and realtors. The final act of the civil rights legislation of the 1960s was the 1968 Fair Housing Act, which forbade discrimination in the sale or rental of housing. Studies have found that discrimination since then has become more subtle and is now often the purview of loan officers and insurance agents, as denial of mortgages and insurance results in the same loss of access as discrimination by a realtor.

The importance of segregation lies in its consequences: living in highly segregated neighborhoods limits the opportunities a person and his or her family have in a myriad of different ways. One important limitation is financial: houses in segregated neighborhoods tend to be worth less and appreciate far more slowly than comparable houses in white neighborhoods, directly contributing to the wealth differential between whites and blacks as well as restricting money available to pay for college or help with the down payment on a house for a child. Other consequences of segregation include job and transportation access, safety issues, exposure to crime and higher rates of poverty, and receipt of poorer municipal services. The effects on both adults and children of living in segregated neighborhoods have been extensively studied, and while there is some inconsistency among the findings, it is clear that there is spatial differentiation of neighborhoods and many behaviors, and that these are interrelated and vary systematically. Residential segregation by race/ethnicity, especially for African Americans, is not benign in its effects.

Self-Fulfilling Prophecy

Sociologist Robert Merton coined the term *self-fulfilling prophecy* in 1949 in *Social Theory and Social Structure* as “a false definition of the situation evoking a new behavior which makes the original false conception come true.” In other words, a person’s expectations about a situation eventually lead that person to behave in ways that confirm the expectations. Merton illustrated his concept with the example of the fictional bank of Cartwright Millingville. Although the bank is financially secure, its assets are invested in numerous enterprises. When a large number of depositors all show up at once wanting their money, a rumor spreads that the bank is in trouble. Within hours, so many panicked depositors withdraw their savings that the bank, unable to meet the sudden demand of all its customers, becomes insolvent and declares bankruptcy. Thus, the original false rumor leads to behavior that fulfills the prediction.
Psychologists Robert Rosenthal and Lenore Jacobson further reinforced Merton’s idea with the publication of Pygmalion in the Classroom in 1968. Their experiment showed that when teachers are influenced to have higher expectations for previously non–high achieving students, those expectations and the teachers’ subsequent behavior improve the academic performance of those students.

Self-fulfilling prophecies occur in a cyclical process. To begin, an observer internalizes a stereotype about a group. This stereotyped belief leads the observer to act accordingly toward that group. The subject group, upon receiving such differentiated treatment (either positive or negative), will often react accordingly to reinforce that expected stereotype, thus “proving” that stereotype and reinforcing it. This justification serves to encourage the differential treatment toward other group members as the cycle continues and the stereotype, prejudice, and discrimination remain constant.

Self-fulfilling prophecies can easily affect schoolchildren. If a schoolteacher internalizes stereotypes that whites are above average, Asians are the brightest, and other minority and immigrant children are below average, those beliefs will most likely shape how the teacher treats those students. Often, due to the internalization of such stereotypes, teachers will act in a prejudicial manner toward students without realizing what they are doing, since motivation for such actions comes from the subconscious level.

The result of self-fulfilling prophecies has been the unequal treatment of ethnic, racial, religious, and gender minority students throughout history. Groups stereotyped as below average students typically do not receive the same amount of positive interaction with their teachers as students believed to be above average. The effects of the self-fulfilling prophecy in the classroom often carry into students’ adulthood as they enter the workforce and face similar stereotypes and prejudices. The cycle continues, often contributing to the level of their productivity and success.

Self-fulfilling prophecies affect more than a person’s academic experience and career. Stereotypes regarding which groups are “more prone to break the law,” “better athletes,” and “more competent leaders” can affect which groups do become more criminal (or interrogated and/or arrested based on suspicion because of their group membership), good athletes (because of extra encouragement to develop their “inherent skills”), or elected officials (because of the perceived characteristics of their group).

Whether positive or negative, the cyclical process of self-fulfilling prophecies can affect one’s actions over an entire lifetime.

SENTENCING DISPARITIES

Individuals convicted of crimes are sentenced to a variety of punishments, including fines, treatment, supervision, and incarceration. Disparities, or differences, in these sentences correlate with both legal characteristics such as crime of conviction and prior record, and “extra-legal” characteristics such as race, employment status, sex, and age. Moreover, a thorough review of research reveals that race, employment status, and gender—especially child care responsibilities—all affect sentencing outcomes independent of legal variables. More particularly, even among offenders with the same legal characteristics, black offenders are punished more harshly than are white offenders, unemployed offenders are punished more harshly than employed offenders, and individuals who are not primary caregivers are punished more harshly than those who are. Compounding these disparities are others generated during other stages of criminal processing, such as arrest, pretrial processing, plea bargaining, release, and parole revocation.

History
Before emancipation, slave owners were legally free to punish their slaves for any offense without intervention
from the judiciary. This meant that punishment of blacks was generally inflicted on the body and that a conviction—or any legal process—was not necessary as a precursor to punishment. On the rare occasions when blacks were tried for their offenses—generally slaves whose alleged offenses affected the larger (white) community and free blacks—they were often subject to separate legal codes, especially in the South. The code that simply bore the state name was in fact only applicable to whites, and a separate code, often called “black codes,” was applicable to blacks. These codes mandated different punishments for the same offenses. Blacks were subject to some punishments that whites were not. For example, in Virginia, it was typical for slaves who ran away to be sentenced to castration or hobbling, while no such status and thus crime existed for whites and there was no crime for which whites could be sentenced to either of these punishments. In addition, prescribed punishments for many crimes were lighter for whites than for blacks. For example, Virginia decreed imprisonment for whites but death for blacks convicted of a variety of felonies, from buying or receiving a stolen horse to rape. In addition, blacks were tried in separate courts without juries, comprised of county justices and sometimes slave-owning assessors. One remnant of separate legal codes is that noncitizen individuals accused of criminal behavior are still subjected to a different set of laws than citizens accused of criminal behavior.

Contemporary Punishment

Today, most discussions about sentencing disparities focus on the apparent disjuncture between race-neutral law and racially disparate punishment outcomes. In other words, scholars investigate why, despite legal codes mandating that individuals with the same legal characteristics receive the same punishment, the effects of the race, class, and gender on individual outcomes remain. Early studies, from the 1920s to the 1970s, generally looked only at men convicted of felonies and tested for race and socioeconomic effects. These studies found that black men and unemployed men received more punitive criminal justice outcomes than white employed men. However, these studies used inadequate statistical methods and often contained methodological flaws, rarely controlling for legally relevant factors such as prior record or seriousness of offense. In the 1970s, many scholars reanalyzed the data from these earlier studies, this time controlling for legally relevant factors and using more sophisticated statistical techniques. These analyses showed that little if any discrimination existed. Further, when later studies added variables for prior record and offense seriousness, the effects of race and class often disappeared or lessened. As a result, many scholars rejected the “discrimination thesis,” arguing that what appeared to be effects of racial or class discrimination were actually the effects of legally relevant variables correlating with race and class, such as prior record.

Since then, several new developments helped to show where discrimination exists and why it was invisible in these earlier studies. First, scholars separated sentencing decisions into two parts: the decision to incarcerate and the sentence length. These studies find that while race or employment status rarely affects sentence length, both affect the decision to incarcerate. This probably occurs because judges have wider discretion when deciding whether or not to incarcerate an individual convicted of a crime, but sentencing ranges are often “recommended,” if not mandated, leaving judges little room to adjust sentences for a given offense. Second, researchers began to test for interactions. While the main effects for race and class variables were often modest, their interaction, often with gender and particularly in young, unemployed black males, was consistently strong and significant. Studies show that the effects of gender are not constant across different racial groups.

Third, studies looking at the effects of race on sentencing by offense category found that being black or Latino/a is more harmful for offenders charged with some offenses than for offenders charged with other offenses. This is often explained by one of two competing, but not necessarily incompatible, theories.

The liberation hypothesis argues that during the criminal processing of cases that are more serious, the seriousness of crime and the defendant’s prior criminal record strongly influence the outcome. In contrast, in less serious cases the features of the crime or the defendant’s criminal record less clearly affect the outcome, allowing criminal justice actors more discretion and thus increasing the likelihood of discrimination.

Another perspective, often called focal concerns, argues that judges rarely have complete information about cases or defendants and, as a result, they often try to reduce uncertainty by relying not only on the defendant’s present offense and prior criminal conduct but also on attributes linked to the defendant’s gender, race, social class, or other social positions.
Studies that separate their analyses by crime type find that racial disparity is greatest both among offenders convicted of less serious crimes and among offenders whose offenses are most likely to conjure racialized stereotypes. For example, black people are most disadvantaged, relative to white people with similar legal characteristics, when charged with or convicted of violent offenses. Latino/as are most disadvantaged, again relative to white people with similar legal characteristics, when charged with or convicted of drug offenses.

Finally, recent studies include variables that look at county-level demographics, such as economic inequality between black and white populations. These studies find that sentencing disparities are more substantial and consistent in some counties than in others and that this is linked to the demographics of those counties. For instance, race affects sentencing decisions most in counties where the percentages of blacks and economic inequality are both low.

**Employment**

Some evidence shows that individuals with lower socioeconomic status receive longer sentences than individuals of the same race, sex, and legal characteristics but with higher socioeconomic status. In this instance, employment status often serves as a proxy for class. Empirically, studies generally examine differences in sentencing outcomes between those employed and those unemployed at the time of arrest. Most studies find that unemployed individuals receive more punitive sentences than employed individuals. In fact, it would be surprising if this was not the case, since many states have codified employment status—along with other class-correlated characteristics such as residential stability—as a legal characteristic to be considered during criminal processing. That is, while criminal justice officials are not supposed to base their punishment decisions on race or sex, many states recommend that criminal justice officials consider employment status and residential stability when making their decisions. These characteristics receive consideration most directly during pretrial decisions, including the decision to deny bail, the setting of bail amount, and the decision to grant a nonfinancial release. However, since incarceration during pretrial increases the harshness of offenders’ post-trial sentences, it is no surprise that those unemployed at the time of arrest receive more punitive sentences than those employed at the time of arrest.

Sociologists also examine how changes in labor supply over time affect the level of punishment in a society. Some researchers argue that penal policy is used to regulate labor supply. If this is correct, then increases in unemployment rates should correlate with increases in imprisonment rates. Correspondingly, decreases in unemployment rates should correlate with decreases in imprisonment rates. Although some claim that the evidence is inconclusive, most longitudinal and many cross-sectional studies find significant associations between increases in labor surplus and incarceration rates. Moreover, unemployment appears to have the strongest effect on black incarceration rates, while the effect of unemployment on white male incarceration has diminished over time. Studies that do not control for race may thus be underestimating the unemployment–punishment link.

**Paternalism Versus “Caregiver Effect”**

Since the early 20th century, criminologists and other scholars have questioned the origins of gender disparities in the criminal justice system. While most scholars agree that gender differences in offenses explain some, perhaps most, of gender disparities in punishment outcomes, they nonetheless contend that decisions of criminal justice officials compound these “original” disparities. The most commonly espoused thesis states that “chivalry” or “paternalism” leads criminal justice officials to grant women more beneficial criminal justice outcomes than they do men.

However, many researchers criticize the “paternalism” hypothesis. One group argues that no actual difference exists between the criminal processing of men and women and that the apparent difference results from failure to control for legally relevant variables. A second camp argues that gender differences in processing result from racially disparate treatment that specifically targets black men. Here, scholars argue that the difference in the processing between black men and women—unlike that of white men and women, where little exists—is due to particularly harsh treatment of black men, not particularly lenient treatment of black women. Finally, a third camp of criminologists explore the impact of child care responsibilities on criminal processing and argue that criminal justice officials respond to child care responsibility, rather than gender per se, when making criminal justice decisions. These scholars find that both men and women defendants who are primary
caregivers to young children receive more beneficial
criminal justice outcomes than do defendants who are
not. Thus gender—specifically, childrearing—does affect criminal processing, but sex per se does not.

Research on gender disparities in criminal processing took a sharp turn beginning in the 1980s when
gender disparities in arrest rates, conviction rates, admission rates, and time served all increased dramat-
ically. Three dominant schools of thought on this phe-
nomenon emerged. The first attributed the increases in women’s rates of punishment to an apparent crime
wave by female offenders. A second camp argued that
increases in women’s rates of arrest and imprisonment
were due to a decline in chivalry on criminal process-
ing. A third camp argued that changes in sentencing
laws—in particular, the adoption of predetermined
sentencing policies—undermined criminal justice
officials’ ability to take gendered behaviors into con-
sideration when deciding punishment outcomes.
Moreover, some scholars argue that non-incarcerated
sentences are not necessarily less punitive than sen-
tences of incarceration since these forms of punish-
ment put women under intense surveillance while
they maintain their roles in families and homes.

Racialization of Criminal Codes

Defendants with the same legal characteristics do not
always receive the same criminal justice outcomes, and
these different outcomes correlate with extra-legal
characteristics such as race, gender, and class.
However, even if every defendant with the same legal
characteristics received the same sentence, only a small
decrease in racial disparities would occur because crim-
inality is race salient. White people, for example, are
disproportionately arrested for tax fraud, embezzle-
ment, insider trading, and many other types of white-
collar crime. Further, although these crimes cost more
money per capita than all street crime combined, sen-
tences for these crimes are, on average, less than sen-
tences for even nonviolent street crime. Black people
are disproportionately arrested for street crime—
vviolent and nonviolent. Thus, in addition to sentencing
inequalities that arise during criminal processing, some
inequalities are built into criminal codes. Even though
some people arrested for white-collar crime are black
and some people arrested for street crime are white, the
laws do not classify on the basis of race and so are dis-
tinct from the separate codes for blacks and whites that
were in place before emancipation.

Serial Murder

Serial killing is defined as four or more homicides in
separate events, in which there is a psychological
“cool-down” period for the perpetrator, which may be
weeks, months, or years. It is commonly distinguished
from mass killing and spree killing, in which there is
no “cool-down” period. Unlike mass and spree killers,
who are usually killed by police or take their own
lives at the scene of their crimes, most serial killers
are taken into custody, tried, and convicted.

The historical record includes many cases of mass,
spee, and serial killing since at least 1500. Some
speculate that earlier legends such as those of Count
Dracula and “Vlad the Impaler” from Romania and
Transylvania in the 1600s may be interpreted as early
serial killings. The accounts of “Jack the Ripper,” who
killed four London prostitutes in 1888, are often cred-
ited as the beginnings of contemporary urban legends

Traci Schlesinger
concerning serial killers. During the 20th century, serial killers stimulated a popular culture industry including movies (171 with serial killers during the 1990s), books (more than 300 books published since 1980), trading cards, comic books (by Boneyard Press), retro and costume clothing, and fan clubs. The 1991 Oscar-winning film *Silence of the Lambs* and its sequel arguably account for some of the contemporary craze, as does a socially constructed media image that is factually incorrect.

In reality, serial killing is rare, accounting for less than 1 percent of all homicides in the United States, the undisputed world leader in this area. Research shows that today most serial killers are white males, but about 20 percent are African Americans or blacks and about 17 percent are females. About 1 in 5 serial killings involves a team of two people who work together.

While respected Federal Bureau of Investigation profilers are insistent that there is no known “profile” associated with such a statistically rare phenomenon, clinical and in-depth case studies of surviving serial killers have revealed a credible set of generalizations about their behavior. The animus of the pattern begins very early in an individual’s life, and some kind of profound child maltreatment is common, which some observers have called “child abuse plus.” Problematic behaviors and acting out usually begin before adolescence, and this is commonly known to parents (if they exist) and others. More than 75 percent of known serial killers have prior juvenile and/or criminal records. The sexually motivated serial killers usually have patterns of adolescent sex abuse of some kind, usually beginning at low levels and escalating to more serious forms over time. Substance abuse is common, as is with many other criminal behaviors in U.S. culture. Early uses of pornography are as common for serial killers as with all other adult males. A very distinctive part of the serial killing etiology found in most cases is an elaborate serial killing fantasy, which commonly evolves over many years.

Victims of serial killers tend to be individuals from stigmatized or marginalized groups, and the police response is often inconsistent because of the competition between law enforcement agencies. Serial killing is just one of many ingredients in the social construction of the U.S. culture of fear that has evolved over several decades.

**SERVICE ECONOMY**

The term *service economy* refers to those industries and occupations within the formal economy that provide various services. It is a broad, general term covering industries as diverse as insurance, transportation, and food, and occupations as diverse as lawyers, investment bankers, and bartenders. Rather than producing a material object for subsequent market sale, as manufacturing did during the industrial era, the contemporary service sector sells a less tangible service. For example, when parents put their children in day care, they are paying solely for the service of watching children. Today, the United States has a service economy; the provision of services is the main driver of the economy, rather than the industrial or agricultural production of earlier eras, although the latter two still play major economic roles. However, the recent shift to a mostly service economy has caused significant economic, social, and cultural change in U.S. society.

The service economy has numerous “sectors,” or agglomerations defined by the types of services provided. Some examples are the fire, insurance, and real estate (commonly referred to as FIRE) service sector, the information sector, the legal services sector, the protective service sector (such as security and law enforcement), and the food and beverage service sector. Scholars often examine occupations within, rather than across, these sectors. However, comparisons across sectors do reveal much about the nature of the service economy as a whole. Complicating analysis, though, is the difficulty sometimes in categorizing an occupation as strictly a service occupation, since many occupations feature some manner of service and workers within the service economy generally deal with other people on a much higher level than those within an industrial economy. The key distinction is that today much of the U.S. economy is geared toward the provision of services of various sorts, resulting in the creation of new service occupations and a proliferation of existing ones.
The Rise of the Service Economy

Although the provision of services in some form has always been a part of the U.S. economy, only in recent decades did the service sector come to dominate economic growth. Several factors caused the overall decline in U.S. manufacturing and "blue-collar" jobs: increased levels of automation making workers obsolete for many tasks; increases in exporting labor overseas and the subsequent increases in foreign production; and overall international competition within the global market. Along with this decline were several economic and social changes in the past century that led to the proliferation of service jobs and rise of the service economy. One such shift was the increase in the number of households outsourcing needs such as food, child care, and home care as a result of increasing dual-income families and less weekday free time. More individuals thus rely on others to service them in various aspects of their lives than ever before.

Today, service is a commodity in itself that is bought and sold. A company’s level of service carries considerable weight and often is the sole basis of competition for customers. As a result, businesses and individual entrepreneurs continually devise new services and/or new strategies for providing old services. The result is new social relations under a new economy with complex consequences.

Problems in the Service Economy

A major problem with the service economy is the bifurcation of employment. Despite the creation of a significant number of jobs and significant expansion of preexisting service jobs such as those in the FIRE and food and beverage sectors, most of these new service jobs are generally low-paying positions with little, if any, opportunity for upward mobility. These are jobs in sectors such as fast food, frequently filled by people with less educational achievement or opportunity than those in the higher-status service professions. The service economy, then, has a tendency to divide workers within it along class and educational lines, which often translates into issues concerning race, ethnicity, and gender. It creates a two-tiered system in which some get well-paid, high-status jobs, while others get low-paying, low-status, unstable employment. Those in the latter category are often ethnic and racial minorities. Sometimes this division of labor along various lines is visible within a single workplace. For example, restaurants often feature ethnic minorities (often immigrants) in the backstage, low-paying, and low-status roles of dishwashers and line cooks and whites as front-stage waiters and waitresses, dealing with customers and earning more money.

Another important problem with the service economy is the conditions that the service jobs produce, as the service economy tends to turn many everyday forms of social interaction into economic exchanges. Numerous scholars apply Karl Marx’s classic concept of alienation to the conditions of the service economy. Although Marx was referring to industrial capitalism when he discussed how workers under capitalism are alienated from themselves, the work process, and what they produce due to material conditions and the relations of production, many scholars argue that service workers in diverse occupations are also alienated in these ways due to conditions of the service economy. One issue that these scholars point to is the existence of the managerial system, which limits autonomy that workers have over their work. Like factory workers, service workers often perform rote tasks that are easily rationalized, routinized, controllable, and calculable. Unlike factory workers, however, most service sector employees are not unionized or, more accurately, are not members of their industry’s unions. This is a result of the transient nature of such jobs and the fact that many feature office conditions far removed from those of factories.

Similarly, many scholars also examine the concept of emotional work, or service work that requires employees to deal with customers and clients on a face-to-face basis or over the phone. In these occupations, workers use their abilities to control their own emotions as well as those of their customers or clients. These workers put on an emotional display that may or may not express their true feelings. Although emotional service workers sometimes have autonomy over how they display themselves to others, they are often exploited for their emotional abilities by management, owners, corporations, protocols, or some combination of these actors in order to provide a distinct service. In this way, service workers for whom emotional expression is an important part of their jobs are alienated (a) from themselves, in that they are not expressing themselves in a way they normally would; (b) from what they do, in that they are not performing tasks in a manner that they normally would; and (c) from what they produce, in that their emotional expression during their occupational performance is
not their own. Workers, then, in effect, become the commodity.

On the other hand, scholars also see the service economy as a liberating shift from the industrial era. These scholars show how the pendulum of service work and emotional labor also swings in the other direction to create more autonomy for workers to be themselves and to be creative. This is certainly true for many professions, such as waiting tables, in which workers use their emotional appeal to procure tips. Again, however, it must be kept in mind that this is often determined by position within the service economy, meaning not all occupations have the luxury of autonomy. As mentioned earlier, contemporary U.S. households are frequently dual-income and individuals frequently experience an intensification of time in their daily lives, leaving them with little time of their own for themselves. A large, stable service economy helps to free up time so that individuals can pursue leisure activities. Scholars also point to the increasing amount of occupational flexibility that comes with this economic shift. No longer tied down to a single company, region, or even industry, workers are freer to explore many options in the service economy.

Overall, the rise of the service economy has had a profound impact on U.S. society. As the service economy and service industries expand, as more and more areas of everyday life become outsourced to private business actors, and as public social interaction rests on economic exchanges based on the provision of a service, U.S. society will continue to experience such effects in ever-changing and dynamic ways.

SEX EDUCATION

Progressive, comprehensive sex education encompasses the myriad issues related to human sexuality, including birth control, disease prevention, sexual orientation, gender roles, relationships, and intimacy. Such programs provide age appropriate information throughout primary and secondary education and support student exploration and development of emotions, attitudes, values, and identity as well as interpersonal communication and decision-making skills.

Sex education developed in the early 1900s, most prominently out of crusades against gonorrhea and syphilis and spurred by a sense that the youth of the day were morally and physically endangered by loosening mores. Then as now, sex education faced the tension between its potentially immunizing effects against the dangers of sexuality and the possibility that such education would itself dangerously arouse those being educated. While most educators presented sex negatively, focusing on danger and fear, a few—such as Mary Ware Dennett—rejected this stance and emphasized the joy and beauty of sexuality.

The years following World War II brought a resurgence of Victorian prudery and new devotion to a sanitized ideal of the nuclear family. While the production of penicillin reduced fears of sexually transmitted disease (STD) infection, the Kinsey reports on sexual behavior gave evidence to some of society’s slide into moral depravity. Though few, if any, of the study’s participants had received formal sex education, detractors vilified such programs. In the 1950s, sex education largely yielded to family life education, which focused on dating etiquette and home economics more than anything sexual. Reacting to this reconstituted void in education, the Sexuality Information and Education Council of the United States (SIECUS) emerged in 1964. SIECUS remains the only national organization dedicated solely to sex education and, with a membership that reads like a who’s who of expert and professional organizations related to the field, it has become the clearinghouse for research and policy in the area.
Overwhelming public support exists for comprehensive sex education programs. The percentage of public approval varies with the contentiousness of the particular topic in question, the age of the students, and the specific population surveyed, but it ranges no lower than 60 percent and reaches near unanimity for junior and senior high school programs. The current U.S. debate centers on “abstinence-only” programs narrowly restricted to the biological basics that teach that the only acceptable sexual activity is within the context of heterosexual marriage, emphasize the dangers of any deviation from this norm, and exclude all information on birth control or STD prevention. While several laws specifically prohibit federal prescription of sex education curriculum, conservative Christian influence has enabled exclusive funding of abstinence programs since 1981. Renewed and expanded in the 1990s, this funding topped $100 million at the turn of the new millennium and exceeded $241 million in 2007.

In assessing sex education, mounting evidence reveals that comprehensive curricula both delay onset of sexual activity and increase the likelihood of the use of safer sex techniques. In contrast, few studies indicate that abstinence-only programs affect rates or timing of sexual activity, and some indicate that they decrease the use of safer sex techniques. A comparison of U.S. statistics with those from Western Europe, where comprehensive sex education dominates, supports the utility of the European programs. However, sex education is far broader than classroom activities, and the more positive, healthier attitude toward sex and sexuality found in Western Europe might be an even more important factor.

Sexism

Sexism is a system of oppression that privileges men and discriminates against women. Sexism requires prejudice plus power. Like racism, sexism is not about isolated incidents but about patterns. The institutions of government, law, religion, education, and the media—as well as language and social mores—long perpetuated sexism, keeping females inferior and subordinate. Even though a female can discriminate against a male and do him harm to the point of taking his life simply because he is a male, such discrimination is different from systemic oppression. The societal problem is sexism, not males, and the movement to end sexism, sex exploitation, and oppression is feminism.

History

Today discussions about the women’s movement typically speak in terms of waves. The First Wave grew out of the anti-slavery movement and began as an organized movement with the Seneca Falls Convention in 1848 and ended with the ratification of the Nineteenth Amendment to the U.S. Constitution granting women the right to vote in 1920. The Second Wave grew out of women working in the civil rights and anti–Vietnam War movements and started in the 1960s, following the publication of Betty Friedan’s The Feminine Mystique in 1963 and the founding of the National Organization for Women (NOW) in 1966. In 1968, the term sexism first appeared, giving expression to a previously unnamed reality in women’s lives. The Third Wave began in the 1980s and continues still.

Patriarchy

Female or male status and roles are social constructions usually based on the ideology of patriarchy. Patriarchy grants males privilege and gives men power based on their gender identity. Males as a group obviously benefit the most from patriarchy. Females may benefit by attaching themselves to and identifying with males. Patriarchy thus is male-centered, male-dominated, and male-identified, and it functions by oppressing women.

Sexism often manifests itself in the workplace and in politics. For instance, it is not uncommon to hear judgmental comments about the appearance or personality of a female leader to an extent seldom heard
about a male. Strong female leaders cannot escape criticism about their “lack of femininity” or “over-assertiveness” when they take strong positions on an issue.

**Stereotypes**

Gender stereotypes about females and males keep sexist thinking alive. Females who have the ability to incubate embryos, give birth to human beings, and feed infants and toddlers with their breasts are stereotyped as members of the “weaker” sex. Males who excel in upper body strength are stereotyped as members of the “stronger” sex. In addition to being stereotyped as “weaker,” females are stereotyped as seductive and eager to please males. Racially tagged stereotypes portray black females as animalistic and hypersexual; Asian females as exotic and focused on catering to male desires; white females as bimbos and dumb blondes; Native American females as beguiling princesses or “squaws”; and Latinas as “hot mommas.”

**Sex-Role Socialization**

The socialization process traditionally teaches females to be subordinate, passive, compliant, nurturing, emotionally expressive, vulnerable, cooperative, and accommodating. Males learn to be dominant, aggressive, tough, emotionally in control, logical, and assertive. Some researchers refer to the socialization of females and males as a component of sexual terrorism (a system whereby males frighten and by frightening dominate and control females). Such “voluntary compliance” essentially socializes females to be victims and males to be terrorists in the name of masculinity.

**Media**

Although some people argue that sexism ended in the 20th century, evidence of sexism abounds. Children experience sexist socialization in virtually every social institution. In the media, for example, a content analysis of children’s television and print cartoons reveals that there are many more male characters than females. Spongebob, Barney, Big Bird, Snoopy, Garfield, Donald Duck, Mickey Mouse, Spiderman, and Superman are some examples. Some male characters do have female counterparts, such as Minnie Mouse, Daisy Duck, and Smurfette, but they are typically less important and very stereotypic, performing domestic duties and acting cutey. Lucy and Peppermint Patty from the Peanuts comic strip are arguably strong female characters. Others have attempted to bring in strong female cartoon characters such as the Power Puff Girls, but most of the newer female characters are presented as “sexy” females.

Video games present males as very violent and females as very sexual. An early female character named Samus from Metroid, a Nintendo game, was a strong character, but her female identity only became known at the end of the game. The depiction of most females in video games shows them with large breasts and as both hungry sex fiends and helpless victims of male conquest. The many male characters compete and kill with impunity.

Advertisements reinforce stereotypes, with females often depicted performing domestic tasks and doing service work. In contrast, males play and watch sports, drive cars, and occupy management positions. Advertisements also contribute to female subordination by undermining female self-esteem by encouraging females to be critical of their bodies, to fear gaining weight and showing signs of age. Advertisers offer products that aid dieting, maintain youth, and make females attractive to males by smelling right and looking seductive. Since the average American sees thousands of advertisements each day, these gendered messages are very effective.

Saturating television, music videos, music, magazines, and film are countless stereotypic gender messages. Repeated images of women in domestic roles and catering to the sexual desires of males reinforce traditional sex roles. On most television programs males have the major roles, and they are the most successful hosts of prime time talk shows. It feels “right” to see males in the power roles. Music videos are particularly rife with images of females offering males sexual pleasure. Some popular music such as rap and heavy metal contain overt messages encouraging violence against women and homophobia. Magazines marketed to women feature articles telling women how to please their men. Magazines marketed to men show images of highly sexualized females. Most popular movies feature images of aggressive males and sexy young females.

These media images are extraordinarily powerful. They effectively reinforce and reflect patriarchal values.
**Weapons of Sexism**

The so-called weapons of sexism include violence against women, homophobia, and economics. Males can exercise their aggressive masculinity by committing violence against females to keep them subordinate. Feminists charge that the global proliferation of pornography and the pandemic of battering, rape, sex trafficking, and sexual harassment are evidence of patriarchy as an oppressive worldwide system.

Economics is another weapon of sexism. Keeping females less well off economically than males, even though they often have the responsibility of supporting their children or older relatives, ensures female subordination. Unlike in the past, women today are more likely to be financially responsible for children. Women’s responsibility for children in a society that does not provide day care and other social services tends to leave them poor. U.S. females working full time earn about $0.78 for every dollar earned by a male. Since the Reagan era, poverty has increased among women, a trend known as the feminization of poverty.

**The Intersection of Sexism With Other Identities**

Sexism is perhaps best understood in the context of other systems of oppression, such as racism, heterosexism, and classism. People hold multiple identities by sex, gender, sexuality, race, ethnicity, class, and other simultaneous social identities. The term *intersection* helps pinpoint these multiple identities. Since there are hierarchies of identities, a person can simultaneously be dominating and dominated. For example, a white rich female has two dominant (race and class) and one subordinate (sex) identities.

No hierarchy of oppressions exists, however. Sexism is the practice of male domination that all people experience as dominants or subordinates. It is problematic that domination and subordination are used to organize society. Another model of societal organization that could move society beyond sexism is partnership, the organizing principle of societies prior to the advent of patriarchy. In partnership societies, deities were conceptualized as female or as females with male consorts; in art, violent masculinity and warfare were not idealized; wealth was rather equitably shared; and there was equal partnership between women and men. Although some scholars argue that this model might be more of a fantasy than a reality, it can aid in envisioning a society free of sexism.

**SEXISM, ADVERTISING**

Americans see thousands of advertisements for products and services every week, and many of those commercial messages contain representations of women that are unflattering, demeaning, and offensive to many. Over the years, parents, teachers, religious organizations, feminists, media critics, and public interest groups have all voiced concerns over commercial messages that debase women. The images and narratives used to sell products frequently reinforce gender stereotypes, emphasize body-image anxiety, and objectify and hypersexualize the female body, even in advertisements directed toward the very female consumers they are targeting.
Emphasizing The Look

Because the design of so many of the products of the fashion, cosmetic, and beauty industries creates a “fashionable look” as a selling point, women are constantly bombarded with advertising messages that tell them to change or improve their appearance. The high-fashion models whose images sell everything from clothes to makeup, lingerie to perfume, become the cultural standards of perfection. Ads often promise or imply that through the use of the product, consumers can be more like the thin, flawless models in the ads. As consumer culture inevitably compels women to compare themselves to the hyper-thin, air-brushed icons of beauty, it is no wonder that many women, especially vulnerable teenagers, report high levels of anxiety about their appearance and body image.

Unrealistic standards of thinness and perfection rob young women of a sense of confidence in themselves, but the unique emphasis on appearance as a cultural measure of women’s worth presents a significant problem for women as well. In the past, patriarchal Victorian society defined feminine worth primarily by appearance. Women were to be seen and seldom heard. Under patriarchy, social value resides in a woman’s ability to present herself as a pleasing sight, one able to satisfy the male gaze. Cultural critics observe that consumer society also tends to measure a woman by her appearance and ability to achieve the look, not on her merits or success in the larger public and economic spheres. Feminists argue that recognizing a woman’s social value requires going beyond appearance. Only then will society recognize a woman’s social contribution and achieve gender equality.

Selling Sex

Using sex to make a sale remains a favored marketing strategy for many products, and ads that sell sex along with products are standard features in the world of advertising. Men and women are often targeted with different messages, and ads for men frequently present women in sexually available and vulnerable positions, especially in cigarette and alcohol advertising. Scantily clad models in alluring and sexualized poses draw the interest of male consumers and in doing so objectify women as little more than commercially designed male fantasies.

Images of sexually alluring models are also featured in ads targeted to women. These women present cultural ideals of feminine sexuality, for they are able to attract the opposite sex. Becoming the object of desire by emulating the image, wearing the product, or using the perfume promises to confer a degree of personal power to women, the power of attraction.

Images that use female sexuality to stimulate male desire and objectify women leave both sexes without representations able to affirm one another’s full humanity, evoke mutual respect, or recognize shared emotional needs. In addition, sex is often associated with power, and images of objectified sexuality, together with vulnerability, reinforce cultural attitudes that condone force and even violence against women.

Violence

Whether selling makeup, sneakers, or high fashion, many advertisements depict women as victims of violence or feature the threat of violence toward them. Since many advertisements are primarily visual, these messages are often implicit, or implied by the photograph, not directly stated in the advertising copy. An ad for perfume featuring a nude woman pictured from behind, her hands bound across her back with an expensive bracelet, is an image of implied violence. The woman is constrained and helpless, and her nudity amplifies her vulnerable state. Through the camera’s perspective, the viewer becomes a voyeur, catching her from behind. She does not look back at the viewer and, because her face is hidden, she expresses no emotion and cannot make her presence felt. Such visual qualities present women as objects, and in this case, a sexualized object, bound and vulnerable. Many other, more explicit images depict women who appear to be dead lying on floors. Others are being slapped or threatened, drugged or placed in submissive poses. Images of violence and the threat of violence against women exist across the visual landscape of consumer culture, and such imaging reveals, at least in part, how women are defined and imagined in our culture. The visual geography of advertising also reflects what types of behaviors toward women are acceptable in our society.

Marketing Women’s Liberation

As women have struggled for equality over the years, many advertising campaigns have picked up on the themes of liberation and independence. Possibly the best example of marketing the idea of women’s
liberation can be found in the long-running campaigns of Virginia Slims cigarettes. But critics charge that slogans like “You've come a long way Baby,” appeal to women’s desires for equality and independence, while selling them a harmful product that leads, ironically, to dependence on nicotine. Even as advertisements represent the hopes and desires of female consumers, purchasing a product rarely fulfills such aspirations.

Cultural critics and social scientists writing from many different perspectives argue that commercial images of women are important forms of social communication that contain influential messages affecting public attitudes about the place of women in society. Advertising images play on gender stereotypes, and as they do, they reinforce harmful gender biases. Calling for an equality of imagery is one step along the way to social and economic practices that treat women as full and equal partners with social standing in our society.

**SEXISM, MUSIC**

Many people view sexism, defined as an ideology and practices that promote women’s inferiority to men, as a significant problem in contemporary music. While some think of the latest offensive lyrics by some popular music artists as symptomatic of this issue, others believe that the sexism in music harms society by its effects on behavior, particularly that of children. However, both conceptions underestimate the scope of the problem.

Sexism exists in various forms of music, not just popular music, suggesting that almost everyone has listened to sexist music at some point, regardless of one’s musical preferences. Moreover, sexism not only affects the content of the songs heard on the radio, but also the gender mix of artists selected for airplay. Sexism shapes popular conception of musical mastery, for instance, by prompting individuals to believe that women cannot master particular instruments or musical styles because of their gender, thereby minimizing women’s contributions to music. Thus, only an examination of how sexism shapes the content, effect, and production of music allows for a full assessment of its impact on society. Another focus should be on how audiences and artists resist the sexism in music.

The sexism in music has its origins in the patriarchy, or male domination, of society, perpetuated by sexist ideology and practice. For example, men may protect their control of the production of music by limiting women’s participation in production. Further, sexism even exists in the music that women perform. The male dominance of music extends to women often performing songs written by men, songs that reflect sexist ideas about what women want and feel, with emphasis on a romantic ideal of love that encourages women’s passivity and dependency on men. The sexist practice of discounting women’s contribution to music also promotes male dominance by ensuring that men are the ones that the audience views as exhibiting exemplary talent.

Given these factors, it is not surprising that researchers find sexism most commonly in music genres that display the most marked male domination, such as heavy metal and gangsta rap. Sexism, however, is perhaps most obvious in music videos, which often have little relationship to the content of the songs they supposedly enhance. Videos of even the most innocuous songs often portray women as the objects of men’s fantasy, not as individuals with agency. As a visual medium, videos can amplify the physical differences between genders that underlie sexist beliefs about women’s inferiority to men as well as powerfully strengthen the image of women as sexual objects.

Effect studies examining whether music influences behavior do not show that listening to sexist music causes people to be more sexist. Instead, research shows that music does not create sexist attitudes in
people who do not already have them; rather, sexist music helps reinforce these attitudes.

Another body of research finds sexism in the social organization of how music is produced. Sexist ideas about women’s difference from men have contributed to gender segregation that limits the kinds of music women are perceived as being able to perform with legitimacy. For instance, one study shows that some women tend to specialize in playing the bass in rock bands due to the belief that their bodies and temperament are better suited to that instrument. Historically, women were less likely to perform Beethoven’s works for similar reasons.

While the problem may seem intractable, individuals still find ways to resist the sexism in music. For instance, the Riot Grrls movement of the 1990s saw female rock artists starting their own bands, upsetting gender norms by wearing boots with dresses, and exhibiting an aggressive style of playing and singing that was typically associated with male rockers. These women deliberately challenged the allocated sexist role of the lead rock singer valued more for her beauty than her talent. More recently, women have highlighted affirming messages about black women’s beauty hiding within the sexism of many rap music videos. Other research reports male and female alternative rock fans self-consciously seeking to distance themselves from the sexism in rock, with male fans admiring female artists’ musicianship rather than their appearance. Such examples of resistance and challenges to sexism in music appear to be the vanguard of growing feminist actions to create lasting changes in music.

**Sex Trafficking**

Sex trafficking refers to the trafficking of women and children for sexual exploitation in forced marriages and forced prostitution. Generally, the trafficking flows from poorer countries to countries where the average person’s living standard is relatively higher. Women are typically tricked and recruited with promises of well-paid legitimate work elsewhere and delivered to the employers through agents and brokers. Upon arrival, they quickly discover that the work they are expected to do is very different from what they had been told. Traffickers deceive, intimidate, threaten, and/or use physical force to control these women and children. It is extremely difficult and dangerous to escape the abusive situation they find themselves in.

Debt bondage is often used to maintain control of women. This entails women being made to work without wages until they have fully reimbursed their employers. This debt typically exceeds their travel costs and routinely increases with arbitrary fines and deceptive accounting. In some cases, it can never be fully repaid. Some indebted women are sold by employers; others are eventually released when their debt is paid, but this can take years. Women and children face constant surveillance, threats of retaliation, confiscation of passports and other documentation, and are often handicapped by their inability to speak the local language, unfamiliarity with the local surroundings, and fear of arrest and mistreatment by police.

The United Nations estimates that 600,000 to 800,000 men, women, and children annually are trafficked across international borders. Approximately 80 percent are women and girls, and up to 50 percent are minors. The UN Children’s Fund (UNICEF) reports that in West and Central Africa, up to 200,000 children are trafficked annually. Estimates by the International Labor Organization indicate that 200,000 to 250,000 women and children are trafficked each year in Southeast Asia alone and more than a million children are affected globally every year.

Many countries facilitate trafficking by issuing false documents to brokers and agents, ignoring immigration violations, and gleaning bribes from employers. Police are often bribed with access to the women in the brothels. Even in the cases where some trafficked women are freed by police raids, women
are often mistreated by the authorities and do not have access to services or redress. When confronted with evidence of trafficking and forced labor, officials tend to focus on immigration violations and anti-prostitution laws rather than on the human rights violations committed against trafficked victims. Women are thus punished as illegal migrants and prostitutes, while the traffickers routinely either escape entirely or face only minor penalties.

**Controversies Over Sex Trafficking**

Sex trafficking is a locus of debate between feminists and human rights activists. Some feminists advocate an abolitionist model, arguing that prostitution is tantamount to sexual slavery of women. For instance, the Coalition Against Trafficking in Women (CATW) contends that sex trafficking violates the sexual rights of female victims. Groups such as the Global Alliance Against Trafficking in Women (GAATW) and the Network of Sex Work Projects (NSWP) observe that trafficking is forced migrant labor that violates women's human rights. They contend that sex trafficking is exploitative and immoral because it involves commercial sex.

Other feminists feel that intensive anti-trafficking campaigns deprive sex workers of their rights and that many Western feminists use victim discourse to project a patronizing attitude toward non-Western women. To focus on forced prostitution ignores the larger context within which force is used. This also provides a pretext for morally inspired campaigns against non-procreative sex. These feminists argue that prostitution is a result of global inequities of capital and labor, where women are robbed of viable options, forcing them into sweatshop labor or lucrative sex work. They argue that the moralistic campaigns against sex trafficking are intended to eradicate all forms of sex work and construe sex workers as sexual victims. This allows campaigners to disregard the issues of economic deprivation, poor nutrition, and low income that can all be considered violence against women.

Some researchers offer examples of women and children who, while reported by news media to be “successfully rescued” from brothels, have in fact escaped the shelters and returned to work in brothels on their own volition. They have refused to be “rescued” from the “captivity” of prostitution into the “freedom” of low-pay employment. Indeed, sex workers’ rights movements vehemently challenge the victim script in the trafficking discourse.

**Anti-Trafficking Campaigns**

Since the terrorist attacks of September 11, 2001, the Bush administration has embarked on an anti-trafficking cause, distributing more than $100 million to fight trafficking, including major grants to Evangelical groups. The State Department generates an annual Trafficking in Persons Report, which tracks U.S. and foreign reductions in trafficking. Countries are ranked by how much importing and exporting of trafficking victims is believed to occur within their borders. A three-tier classification is used to categorize each country: Tier 3 denotes countries with the poorest track records, Tier 2 refers to countries with borderline records, and Tier 1 is reserved for countries that are in line with the U.S. recommendations.

Some researchers criticize the Bush administration for placing certain countries on Tier 3 status only to fit its own larger foreign policy goals. Many also point out that the United States, as the major donor nation, forces other countries to crack down on brothels and prostitutes and formulate additional criminal laws against not only sex trafficking but against prostitution in general.

U.S. reports and policy documents brand sex trafficking with three characteristics. These include the brothel as prison, the female as victim, and rescuers as heroes. Some U.S. human rights organizations stretch beyond child exploitation and urge legislation criminalizing non-procreative sex and sex work in an attempt to save women. By emphasizing prostitution as a moral issue and emphasizing protection of women, critics claim such actions negate women’s autonomy and the empowerment that comes through their sex work by providing income and labor. Thus these organizations criticize the Bush administration’s seemingly inconsistent attempt to combat worldwide sex trafficking while at the same time refusing to support women’s reproductive rights. For instance, condom use is not promoted as an effective contraceptive or disease-preventing tool. Critics argue that the Bush administration’s endeavors to fight prostitution under the pretext of preventing sexual slavery are, in effect, endeavors to police non-procreative sex on a global level.

_Tiantian Zheng_
Sexual harassment in the workplace has existed since men and women started working. Yet the term sexual harassment and the problem of sexual harassment were not legally and publicly recognized until the 1970s in the United States and later in other countries. Historical accounts of sexual harassment in shipyards, factories, and department stores demonstrate that women and men experienced various forms of unwanted sexual behaviors at work, but there was no name for it nor any possibility of legal recourse. When the 1964 Civil Rights Act was passed by the U.S. Congress, including protections for sex discrimination in Title VII, the door was opened for the creation of sexual harassment as a legal wrong. In the 1970s, sexual harassment complaints started to appear in the legal arena. Combined with the momentum of the women’s movement, support from prominent feminist legal scholars, and media attention, sexual harassment became defined as a social and legal problem by the 1980s.

National surveys of sexual harassment estimate that approximately 20–50 percent of women will experience sexual harassment at work in their lifetimes. Behind these statistics is an enduring conundrum: many women and men who report experiencing unwanted sexual behaviors at work say “No” when asked if they experienced sexual harassment. Surveys show that people may experience behaviors that are legitimate forms of sexual harassment, but they may not label these behaviors as such. These statistics highlight some of the important issues around sexual harassment. First, what is sexual harassment? Second, why do so many people who experience sexual behaviors at work not define these experiences as sexual harassment?

Defining Sexual Harassment

Emerging from the groundbreaking work of legal scholar Catherine MacKinnon, sexual harassment in the United States is viewed as a form of sex discrimination. Legally, two types of behavior comprise sexual harassment: quid pro quo harassment and hostile environment harassment. Quid pro quo harassment involves sexual threats or bribery that are made a condition of employment or used as the basis for employment decisions. Established by the 1980 Equal Employment Opportunity Commission and the 1986 U.S. Supreme Court decision in Meritor v. Vinson, hostile environment harassment captures those behaviors, such as sexual jokes, comments, and touching, that interfere with an individual’s ability to do her or his job or create an “intimidating, hostile or offensive working environment.” This includes forms of gender harassment, such as gender-based hazing and put-downs. To be considered hostile environment harassment, it must be established that there was a single serious incident or a pattern of usually less severe behaviors occurring over time. Since the 1993 U.S. Supreme Court decision in Harris v. Forklift, the law considers whether a “reasonable person” would find the behaviors unwelcome as well as the “subjective” experience of the person experiencing the behaviors. Some lower court decisions acknowledge that sexual harassment is a gendered phenomenon, with women more likely to experience harassment and to be adversely affected by it. These courts have adopted a “reasonable woman” standard when evaluating whether harassment occurred.

On the surface, the legal definition of sexual harassment appears straightforward, with its focus on men using their power over women to satisfy their sexual desires. Yet, this focus has limited what can be claimed as sexual harassment. Critics identify several shortcomings in the current legal framework of sexual harassment. First, the legal definition of sexual harassment overemphasizes (heterosexual) sexual acts and sexual desire at the expense of gender-based harassment. Research shows that most sexual harassment that occurs is hostile environment harassment that involves the denigration of women (and men).
This means that at its core, sexual harassment is often not about sexual desire but about letting women (and men) know they are not welcome in certain workplaces and that they are not respected members of the work group. There is some concern that the current legal definition of sexual harassment may end up only ridding the workplace of such “nonthreatening” sexual behaviors as flirting and joking while overlooking how gendered hostility can exclude workers from the most desirable jobs in a workplace and lead to sex segregation and inequality at work.

Second, the founders of sexual harassment law in the United States considered the sexual harassment of men to be a rare event. Yet does this mean that men cannot experience sexual harassment? Research that takes this question seriously shows that men do experience some forms of sexual harassment and identify some behaviors as harassment that are not identified by women. These behaviors include those perpetuated by women, such as verbal comments that negatively stereotype men (e.g., “Men are pigs”). Men also report being labeled as “unmasculine” or “not man enough” (e.g., being called “fag” or “pussy”) when they do not participate with their male colleagues in jokes about women or other male-bonding activities. Due to the privileging of heterosexual masculinity, men are likely to be harassed when they step outside the traditional male role or are seen as less masculine compared to their peers. Sexual harassment of men, just like much of the sexual harassment of women, is not about sexual desire. Rather it most often occurs when a group (or individual) asserts power over those who violate traditional gender roles. In 1998, the U.S. Supreme Court in the Oncale case ruled for the first time that same-sex harassment between men can be sex discrimination.

Because of the limits to the legal definition, some social scientists prefer to define harassment more broadly. Psychologist Louise Fitzgerald and colleagues have developed a three-tiered measure of sexual harassment, the Sexual Experiences Questionnaire: sexual harassment consists of gender harassment, unwanted sexual attention, and sexual coercion. Measures such as these are based on “behaviorally based” survey items that attempt to capture the range of harassment experiences of women (and men). These survey items are useful for understanding the predictors and consequences of sexual harassment.

Some critics argue that survey measures do not adequately capture the subjective and ambiguous nature of what behaviors individuals define as harassment. This is also reflected in media and lay discussions of sexual harassment. From the 1991 Anita Hill–Clarence Thomas controversy to everyday discussions around the water cooler, debate has ensued as to when a joke is just a joke and when it is sexual harassment. Research demonstrates women and men sometimes have difficulty defining workplace sexual attention as sexual harassment. The concept of a “boundary line” is useful for understanding when sexual behaviors are harassing and when they are pleasurable or at least tolerable. For example, for some women, experiencing sexualized behaviors is institutionalized or considered part of the job, such as being required to wear a sexy outfit while working as a waitress in a restaurant. In workplaces such as these, women may view the sexual behaviors they experience as “disgusting” but inevitable since the behaviors are a normalized part of their job. Hence women may not define these behaviors as sexual harassment. Workers who experience more than one type of harassment and discrimination also may have trouble labeling their experiences as sexual harassment. Women of color who experience racial harassment alongside their sexual harassment may not see their experiences as fitting within the legal definition of sexual harassment. Sexual discrimination law in general is criticized for forcing women (and men) of color to choose which wrong they will pursue: race based or gender based. The sexual harassment law appears blind to the issue of how race intersects with men’s and women’s experiences.

**Understanding Who Is at Risk for Harassment**

Various theoretical perspectives exist for understanding why sexual harassment happens and who is at risk for being sexually harassed. Most perspectives have an underlying agreement that power, whether it be from such sources as gender or position in the organization, is at the core of most sexual harassment. At this point, though, there is no unifying theoretical perspective for explaining sexual harassment. Some of the approaches overemphasize certain types of sexual harassment while excluding others. The primary explanation for why sexual harassment occurs is based in the power derived from culturally legitimated power and status differences between men and women. This type of explanation fits with the “dominance” model that
emphasizes sexual harassment’s origins in patriarchal society. This model predicts that women are most likely to experience sexual harassment because of the economic, physical, and other forms of power men hold in workplaces and society. Within this model, there is little room for explaining same-sex harassment.

A second approach points to a sociobiological source for sexual harassment. Women are the most likely targets because men harass women out of the “natural” outcome of their biological sex drive. This approach is not supported by recent evidence that most sexual harassment is not based in sexual desire. Rather it is based in hostility toward women or men. Similar to the power perspective, an emphasis on sociobiological factors also ignores same-sex harassment.

Sexual harassment is also perceived to be an outgrowth of the gender socialization process and is a mechanism by which men assert power and dominance over women both at work and in society. Within this perspective, some research demonstrates that numerically skewed sex ratios in work situations, such as female-dominated and male-dominated work groups, play a prominent role in explanations of sexual harassment. Some approaches focus on the gender roles associated with female- and male-dominated work situations, while others discuss the issue in terms of numerical dominance of males over females in certain workplaces. With much of the focus on male-to-female harassment, male-dominated workplaces pose the biggest threat of harassment, since men both numerically and normatively dominate. More nuanced approaches draw on theories of masculinity to explain sexual harassment. For example, recent research implicates heterosexual norms of masculinity in the way that male coworkers ignore the harm of watching or “checking out” their female coworkers.

Organizational culture and context is also theorized to explain the occurrence of sexual harassment. Research demonstrates that if an organization has a culture whereby management does not tolerate harassment, workers are less likely to experience unwanted sexual behaviors. Examinations of sexualized workplaces move beyond this work to emphasize how organizational culture contributes to how sexual behaviors are interpreted as harassing, tolerable, or pleasurable. By bridging both power and gender socialization approaches, this research demonstrates that the context of work matters for what it means to be sexually harassed. For example, female editors working for a male pornographic magazine experience a daily litany of sexual joking and pornographic material, yet they do not define these as sexual harassment. Only when jokes become directed at them personally are behaviors defined as harassment. Taking into account the context of where one works helps understand not only who is at risk of sexual harassment but who is likely to label their experiences as sexual harassment.

Sexual Harassment Beyond the United States

The U.S. legal definition has been the prime mover behind the development of sexual harassment as a legal construct and social problem in other countries. However, countries such as France and Austria, along with the European Union itself, have developed laws focusing only on the sexual abuse of power aspect that is now eschewed by feminist critics of the U.S. harassment law. The reasons for this are not simply that European lawmakers, feminists, and the public view U.S. law as a consequence of American “prudishness” about displays of sexuality in the workplace. For example, the harassment law in France emphasizes harassment as an abuse of hierarchical power, not as sexual harassment between coworkers. What is considered sexual harassment in the law and in society is bounded by the national and organizational context of workers.

SEXUALITY

Human sexuality is one of the few distinctive traits shared by all civilizations, although its cultural characteristics and nuances differ widely. Sexuality in its broadest sense is not easily definable, since it covers such a broad range of behaviors, interpretations, norms, and processes. Sexuality is a sociocultural and historical construct that involves more than the biological drive that enables the reproduction of the species. As a sensation process, human sexuality consists of the totality of socially, culturally, and politically embodied experiences and intimate behaviors (not necessarily sex acts) between human beings. These feelings are sustained and expressed through emotions, beliefs, values, and cultural norms that collectively regulate sexual behavior. The body, as a space, is a contested site of identity, where sexual norms are both exhibited and preserved, often through cultural constructions of masculinity, femininity, gender norms, and accompanying social roles.

Sigmund Freud is most credited with advancing the modern study of sexuality with the publication of his Three Essays on the Theory of Sexuality. These essays contributed to the notion of childhood sexuality and, perhaps more important, the development of sexuality in the unconscious. Recent research has explored the relation between lived experience, the lived body, and the institutional frameworks that prohibit and restrict this process. The private sphere, in which we may elect to exhibit sexuality, involves a space or capacity where a possibility develops to assume states of sexuality; however, these states are always inseparable from our bodies. Normative labels that accompany these states (behaviors), when attributed to particular sexualities, have resulted in the creation of previously nonexistent sexual “identities” understood through categorical distinctions like “homosexual” and “heterosexual”; social scientists recognize such categories as social constructions. Philosopher Michel Foucault best exemplifies this perspective in his seminal multivolume work on sexuality.

In The History of Sexuality Volume 1: An Introduction, Foucault analyzes broad historical shifts over the course of centuries in an effort to address the various ways to understand sexuality as a historical construct. Foucault suggests that political power is manifested in sexuality through discourse and discursive formations, all of which constrain sex through socially constructed taboos that are usually, but not always, consistent with a system of norms. According to Foucault, these norms serve to maintain arbitrary binaries between two nonexistences (e.g., homosexual/heterosexual). A recognizable shortcoming in The History of Sexuality concerns Foucault’s failure to systematically address the concept of a universal patriarchy and how a normative masculinity constrains subjective manifestations of sexuality. Emerging scholarship in philosophy, cultural studies, feminism, and gay and lesbian studies continues to offer new ideas and fresh insights into the realm of sexuality. It seems certain that this scholarship will direct our future understandings of the subject.

Sexualization of Mainstream Media

Sexualization of mainstream media refers to the way that sex has become more visible in contemporary Western mainstream media in recent years. Other interchangeable terms are *pornification*, *pornographication*, and *porno chic*, which more specifically describe a fascination in contemporary media with sexually explicit styles of representation and the use of pornographic content or style in popular cultural forms.

Sexualization takes a number of forms that can be categorized in the following way:

- The expansion of pornography and other sexually explicit media representations and their increased accessibility to a wider group of consumers, principally via the Internet.

- A corresponding increase in the visibility, accessibility, and acceptability of commercial sex products, services, and pursuits. In particular, sex toys for women are now available on the main streets in many places. Escort agencies, sex parties, sex tours, and lap dancing clubs are expanding, and older forms of sexual performance such as burlesque are being revived and mainstreamed. In some instances, this involves their repositioning as leisure pursuits for women. For example, pole dancing is now packaged as a form of exercise, and classes are available in burlesque dance and striptease, erotic writing and sexual techniques. Many sex shops actively court female consumers, often through the development of a “feminine aesthetic.”

- The integration of media and communication technologies with sexual practice. The increasing accessibility of video and digital technologies has, for example, made it possible for people to make and circulate their own pornography or to include recording and viewing within their sexual encounters. New communication technologies have also become part of people’s sex lives, often providing new types of sexual encounters such as phone sex, e-mail affairs, and cybersex. In these instances, sexual representation, communication, and practice are blurred.

- A growing public preoccupation with sexual values, practices, and identities, often in the form of sex scandals and moral panics around sex. Sex has become a staple ingredient in newspapers, magazines, films, and television programs, most notably in confessional talk shows and media coverage of celebrities.

Although a public fascination with sex and sexuality dates back to the 19th century, the more recent process of sexualization can be linked to contemporary concerns with image, lifestyle, and self-exposure. To this extent, sex is becoming a question of aesthetics rather than ethics and a means of public rather than private self-expression. While it retains many of its former cultural meanings, chiefly as an expression of desire and/or love between two people, it also takes on a new significance as a hedonistic practice, freed from reproduction, kinship, or close relationship—a form of recreation rather than relation. In this sense, contemporary sexuality is becoming a form of auto-sexuality, the purpose of which is self-pleasure and self-expression. Representations of and discussions about sexuality increasingly link to consumer culture, presided over by a range of cultural intermediaries who are joining, and in some cases replacing, the moral and medical experts who were previously the custodians of this kind of public expression. To some extent, the cultural, moral, and medical significance of sex combines in contemporary thinking, with sex emerging as a form of self-care and route to self-development.

Sexualization raises questions about the role of the media, technology, and popular culture in sexual practices, relationships, and ethics that are important for academics, researchers, educators, policymakers, and the general public. Often, the context of the use of the term indicates a perception of it as a social problem, most frequently the ways in which the sexualization of particular social groups works to endanger, oppress, or limit them in some way. The extent to which sexualization is a democratizing force is a matter of dispute.
Some see it as part of a broader process in which ordinary people gain access to the means of reproducing sexual discourse and in which sex becomes a matter of more democratic public debate, in the process circulating more diverse and liberating ideas about sex and sexuality. Others argue that the only real significance of sexualization is an increasing commodification of sex and bodies, particularly those of girls and women, and that this involves little real equality or diversity. Despite different views, the sexualization of mainstream media and popular culture, coupled with the increasing difficulty of regulating these, requires that we rethink our inherited notions of sexual representation, regulation, and ethics.

**Sexually Transmitted Diseases**

Sexually transmitted diseases (STDs), also known as sexually transmitted infections (STIs), are infections spread primarily through sexual contact. More than 65 million people in the United States are currently infected with an incurable sexually transmitted disease such as genital herpes, and each year an additional 19 million people develop new cases of one or more of the 25 diseases categorized as STDs. More than half of all these new infections will affect young people ages 15–22.

**A New Paradigm for Assessing STD Risk**

Most personal health STD prevention programs focus largely on individual behavior as the basis for risk reduction. Many of these programs emphasize safer sex or abstinence from sexual intercourse as their preferred preventive approach. Public health STD prevention programs typically emphasize community health interventions such as free and confidential testing and treatment centers, needle exchange programs, and sociomarketing campaigns to promote condom distribution and family planning services. While both approaches have merit, each falls short of offering a comprehensive analysis of STD risks.

A more effective way to view STD risk is to conceptualize it as pyramidal in nature. A pyramid of risk model describes the interaction between personal and community risks and has four levels of risk factors: demographic, sexual/medical history, sexual lifestyle, and sexual behavior. Each level builds upon and is interpreted on the basis of risks associated with the previous one.

**Level 1 Risks: Demographic Variables**

Seven major demographic variables form the base of the pyramid and contribute to STD risk: age, gender, sexual orientation, injectable drug use (IDU), geography, socioeconomic status (SES), and race/ethnicity.

There are more cases of STDs distributed throughout the 15- to 25-year-old age group than in any other. Because more cases exist in this age group, the risk of acquiring an infection is greater for someone in this group or who has sex with persons from this age category. Sexually active teenagers have the highest rates of infection of most STDs. For example, teenage girls have the highest risk of becoming infected with gonorrhea. Rates for females in the 15- to 19-year-old age groups are 610.9 cases per 100,000 people. This is more than 5 times the national rate of 113.5 per 100,000. Young women in this age group are approximately 20 times more likely to be infected with gonorrhea than females 30 years of age and older. Young men have a similarly high risk compared to older men.
The risk of acquiring an STD varies by gender. Gender risks are related to the genetic, anatomical, and physiological differences between men and women. Women face a greater risk than men for both acquiring a sexually transmitted disease and developing complications for several reasons. Heterosexual women are receptive sexually—vaginally, orally, and anally. This greatly increases their risks for initial infection by exposing a greater surface area of mucosal tissue. Once infected with most STDs, heterosexual women tend to be asymptomatic more often than heterosexual men. Most heterosexual men notice initial symptoms of infection, whereas about half of women are asymptomatic. Because of the asymptomatic nature of most STDs in women, more women than men do not seek treatment during the initial stages of infection. This delayed access to treatment results in progression of the disease and a greater likelihood of developing complications. About 15 percent of women develop complications associated with gonorrhea or chlamydia, compared to less than 1 percent of men.

STD risks vary by sexual orientation. Gay and bisexual men, like heterosexual women, are receptive sexually and tend to have asymptomatic infections. In addition, certain diseases, such as HIV and hepatitis B, exist in endemic levels in the gay community and are incurable. Heterosexual men are at lower risk than heterosexual women and gay men because they are not receptive sexually, and female-to-male transmission of STDs is less efficient than male-to-female and male-to-male. Additionally, vaginal fluids are less likely to transmit infection than is contaminated semen. Lesbian women have the lowest rates of STD infection. Gay women tend to have fewer sexual partners over the course of their lifetimes, and they do not engage in vaginal or anal intercourse involving ejaculation.

STD risk is strongly associated with the number of injector drug users (IDUs) in a community. Injector drug use impairs users’ ability to make good decisions regarding sexual behavior and often involves needle sharing between users. This facilitates the transmission of blood-borne infections such as HIV and hepatitis B. A vicious cycle of drug abuse, exchanging sex for money or other resources, unsafe sex, and infection with a variety of STDs has occurred since the mid-1980s and has led to the resurgence of syphilis in urban America.

STDs are not distributed evenly across America. They are disproportionately higher in urban areas than in rural or suburban locations. STDs seem to be much more common in pockets of urban populations called “core groups.” Infected core groups are a major contributing factor for higher STD rates in urban communities despite individual behavior. For example, the risk of transmission of STDs among core group members and their sex partners is 300 to 600 times greater than among the U.S. population in general.

**Level 2 Risks: Sexual and Medical History**

A person’s sexual and medical history greatly influences the partner’s present level of risk for acquiring STDs. The number of different sexual partners a person has had over the course of a lifetime correlates to that person’s current STD risk. In general, the greater the number of lifetime sexual partners a person has had, the greater the risk that individual poses for a current sex partner. One’s contraceptive history also influences the present STD risk. Barrier contraceptive users have the lowest rates of infection. They are followed by other contraceptive users and nonusers, who have the highest risk. Persons with a history of IDU have an increased incidence of infection with blood-borne diseases, particularly HIV and hepatitis B. Last, persons who have been infected with STDs in the past are more likely to become infected again than those who have never been infected.

**Level 3 Risks: Sexual Relationships**

There are two dimensions of relationship risk: familiarity risk and exclusivity risk. STD risks decrease as sexual relationships move away from multiple, anonymous, sexual encounters toward monogamous (with uninfected partner) partnerships. Familiarity risk is synonymous with anonymity risk. Studies show that the less familiar individuals are with their sex partners (the greater the anonymity), the greater the risk. Anonymity influences one’s ability to make informed choices about the STD risks posed by potential sex partners. Exclusivity is associated with monogamy and must be examined in both partners to measure it accurately. If one partner is monogamous but the other is not, the benefits of exclusivity are lost. Exclusivity only works when both partners are uninfected. Exclusivity can actually increase STD if one partner is infected. The highest-risk sexual lifestyle is one that is nonexclusive and anonymous.
Level 4 Risks: Sexual Behavior

In general, behaviors that incorporate unprotected penile insertion and ejaculation entail the most risk. The lowest risk behaviors are nonpenetrative and do not include ejaculation and the exchange of bodily fluids. Penetration of un lubricated tissue, such as that in the rectum, allows direct access of infectious agents to the bloodstream. Theoretically, STD risk is always greater for the receptive partners of any sexual activity, since they receive the contents of the ejaculate.

Implications for Risk Reduction

The pyramid of risk model shows that STD risk is multifaceted in nature and combines a person’s current personal sexual behavior and lifestyle with past sexual history and demographic factors. Such a model demonstrates the futility of focusing prevention activities exclusively on current personal behavior while ignoring historical and community risks. Though individual personal behavior is crucial to the success of prevention activities, other factors affect personal risk despite the consistent and correct use of safer sex procedures. As mentioned previously, in certain core areas, individuals are 300–600 times more likely to become infected with an STD than their contemporaries living elsewhere. In such areas, engaging in any sexual activity carries a higher risk of becoming infected than engaging in more risky personal behavior in areas with less community risk. To be effective, prevention programs must take all four levels of risk factors into account when planning interventions.

SEXUAL ORIENTATION

Sexual orientation is the expression of sexuality enveloped by one’s self-identification, including romantic, emotional, and/or sexual attraction. Sexual orientation can be problematic for those not conforming to mainstream societal norms.

Heterosexuals are people who are sexually and romantically attracted to people of the opposite sex. Because heterosexuals are the dominant group in society, those whose sexual orientation differ are sometimes overlooked, under-represented, or misunderstood. People who are attracted to their same sex are known as gay and lesbian. The term gay refers mostly to men who are sexually and romantically attracted to other men, and the term lesbian refers to women who are sexually and romantically attracted to other women. Sometimes the term gay serves as an umbrella word for all people whose sexual attraction includes attraction to people of their same sex. Historically, the word homosexual described people who had same-sex attraction. Because of its pathological history and the clinical implication of the word, many people have stopped using homosexual to explain a person’s sexual orientation.

Bisexual people are people whose romantic, emotional, and/or sexual attraction is to both sexes. Many misconceptions exist about the bisexual orientation among the gay and lesbian population as well as the heterosexual population. Bisexuals are sometimes unfairly labeled as people who cannot “make up their minds” or as people who have sex with multiple partners simultaneously. Gays, lesbians, and bisexuals all face possible stereotyping because their sexual orientation differs from the dominant culture. Additionally, people who are gay, lesbian, and bisexual (or perceived to be) often face prejudice and discrimination based on those stereotypes and society’s misrepresentation of this group as “undesirable, deviant, and unnatural.”
Sexual orientation also includes a person’s sexual behavior, but the two are not always congruous. For example, some black and Latino men who have sex with men do not identify as gay, homosexual, or bisexual. Instead they are considered to be on the “down low.” Many of these men are married with children and lead lives that most would consider heterosexual. It is important to note that sexual behavior does not define one’s sexual orientation but is only one aspect of identity.

Asexual people are people who do not experience sexual attraction. Experts continue to debate whether or not asexuality is a sexual disorder or orientation. Most asexuals have the capability to be aroused, but the arousal is not in response to sexual attraction. In fact, asexuals find sexual behavior unappealing.

Sexual preference, a term that some believe to be congruent with sexual orientation, is favored by those who believe that individuals choose their sexuality. The “nature versus nurture” debate raises the question as to whether or not one is born gay. To say that a person chooses to be gay implies that she or he can change her or his mind and be “fixed” by therapy. Numerous programs in the United States operate on the premise that they can “make” a gay person heterosexual with the help of religion, normative gender role play, and psychotherapy.

SHOPLIFTING

Shoplifting, also termed retail theft, is a crime involving theft of goods or merchandise from a store. It also consists of altering or removing price labels, and in some jurisdictions, causing undercharging at the register to deprive the retailer the full value of the merchandise. Commonly included in penal code categories of theft offenses (usually termed theft or larceny), its listing joins other theft crimes, such as pick pocketing, purse snatching, theft from coin machines, and theft from motor vehicles. Depending on the dollar value of merchandise appropriated, the type of merchandise, and/or the criminal history of the offender, shoplifting offenses can result in disorderly person charges resolved with a payment of a fine, or misdemeanors, or even felonies carrying long terms of imprisonment. Shoplifting can be a felony in one state and a misdemeanor in another, even when the dollar value of the merchandise is the same. For example, Pennsylvania makes shoplifting a felony when merchandise valued exceeds $2,000, but shoplifting is a felony in New Mexico when merchandise value exceeds $250.

Shoplifting is one of the most common U.S. crimes, with more than 1.5 million shoplifting offenses occurring each year. However, most shoplifting goes undetected. Survey research reveals shoplifting is much more extensive, estimating that between 10 percent and 40 percent of all consumers shoplift. Economic losses from shoplifting affect consumers through increased prices to offset retail losses, well into tens of billions of dollars annually.

People shoplift for psychological, sociological, economic, and even biological reasons, including poor self-esteem, depression and anxiety, impulsivity, vengeance, and personality disorders. Other factors include resentment toward merchants, low self-control, drug abuse, antisocial attitudes and behaviors, economic stress, divorce or separation, and thrill seeking. Kleptomania, a psychiatric disorder, afflicts only a fraction (about 10 percent) of all shoplifters. Its essential feature is the recurrent failure to resist impulses to steal objects not needed for personal use or their monetary value. The kleptomaniac often discards or gives away merchandise rather than using or consuming it. For kleptomaniacs, shoplifting is impulsive and irrational. The kleptomaniac experiences an increasing sense of tension immediately before the act and then pleasure, gratification, or relief of tension during and after the theft. Theft is not committed because of anger, resentment, or vengeance, and not in response to a delusion or hallucination. Rarely is kleptomania used as a diagnosis for shoplifting.

Most shoplifters (about 90 percent) lead conventional lives and engage in shoplifting when opportunities present themselves, for thrill seeking, and in
situations of economic distress. Such individuals are nonprofessional or amateur shoplifters, unlike the remaining 10 percent of professional shoplifters who create an occupation or career of shoplifting for financial gain and are usually involved in other criminal behaviors. They may take “orders” and then carefully plan the shoplifting events (the place, time, and target) or steal marketable items in large quantities and return or resell the merchandise for profit. Some professionals are sole competitors while others are engaged in organized group shoplifting.

SINGLE MOTHERS

U.S. Census Bureau data indicate that the percentage of children living in single-mother families increased from 11 percent in 1970 to 23 percent by 2005. Although the percentage of single-father families also grew, rising from 1 percent in 1970 to 6 percent by 2003, the vast majority of single-parent households involve single mothers. Large race differences are evident: 50 percent of African American children live with a single mother, compared to 35 percent of Hispanic children, 16 percent of white children, and 10 percent of Asian children. Demographers project that half of all children will spend part of their childhood living with a single mother.

Single-mother family structure, however, does not necessarily mean that children live alone with their mother. Moreover, increasing diversity occurs in single-mother family living experiences. Grandparents play a significant role in many single-mother families; about 10 percent of children living with their single mother were the grandchild of the household head. Some single mothers also cohabit with a male partner, a trend that has grown in recent years, with about 11 percent of children in single-mother families living with their mother and her unmarried partner. In some cases, this unmarried partner is the child’s biological father, and such family arrangements of unmarried parents and their children are often referred to as “fragile families.”

Much concern exists regarding the consequences for children growing up in a single-mother family. Poverty rates differ dramatically by family structure, with nearly 6 out of 10 children in single-mother families living near or below poverty: about 45 percent of children living with a divorced mother and 69 percent of children living with a never-married mother. Consistent research findings indicate that children growing up in a single-mother family have, on average, poorer social, economic, and psychological outcomes compared to children growing up with two biological parents. Economic differences between single- and two-parent families explain about half of these differences.

When evaluating the consequences of growing up in a single-parent family, two important issues should be kept in mind. First, while we do have strong evidence of a correlation between family structure and child well-being, the direction of these effects is unclear. That is, the extent to which this relationship is causal (single-parent family structure causes poor outcomes) or due to selection (the findings reflect unmeasured factors that affect both the likelihood of growing up in a single-parent family and the outcomes associated with it) is unclear. Therefore, the causal ordering of effects requires careful attention. Studies that do not take these preexisting differences into account will overstate the effects of growing up in a single-mother family. Second, and more important, even though children growing up in single-mother families tend to experience poorer outcomes, the percentage of children actually experiencing these negative outcomes is far from overwhelming. One study, for example, compared depression rates among children growing up in one- and two-parent families, finding that 18 percent of children growing up in single-parent homes were clinically depressed compared to 14 percent growing up in two-parent families.
These findings suggest that the majority of children growing up with a single mother will not experience depression. However, in relative terms, the risk of experiencing depression was higher (.18 versus .14) in single-mother families, suggesting that living with a single mother increases the risk of mental health problems. The importance of this second point is that while single-parent family structure increases the risk for a variety of outcomes, not all children growing up in single-mother families will experience problems.

Single-mother families have increasingly moved into the policy spotlight. The 1990s represented a decade of substantial changes in government assistance programs used by single mothers and their children. Concern that welfare programs provided adverse incentives both to work and to maintain a two-parent family led Congress to implement a series of changes culminating in the Personal Responsibility and Work Opportunity Reconciliation Act of 1996, commonly referred to as “welfare reform.” Because single-mother families made up the vast majority of welfare recipients, they were a specific target of these reforms. Welfare reform aimed to move single mothers from welfare to work, and a stated goal of the 1996 bill was to encourage the formation and maintenance of two-parent families. Major changes in cash public assistance include a lifetime limit on how long a family can receive assistance (the federal guidelines state no more than 5 years) and work requirements. Other major policy changes largely impacting single-mother families include sharp expansions to the Earned Income Tax Credit (EITC). Available to working, low-earning parents, this work support program can raise the after-tax incomes of families by as much as 40 percent, and the EITC is now the largest anti-poverty program for the non-elderly. Welfare reform and a strong economy during the 1990s combined to increase the labor force participation rates of single mothers, but the poverty rate of working, single-mother families failed to decline between 1995 and 1999. Although welfare reform has dramatically reduced the number of families receiving assistance, debate over the long-term consequences of these policy changes continues, as does evaluation of the social and economic well-being of single mothers and their children.

The term situation ethics, coined by Joseph Fletcher in 1966, is sometimes referred to as “situational ethics” or as “situationism.” Fletcher and others argued that moral and legal absolutes are inflexible and do not allow for rational, thinking humans to make choices and decisions based on the specifics and characteristics of social events. In contrast, situation ethics refers to a definition of right and wrong rooted in the uniqueness and variability of social situations rather than according to absolute principle. Situation ethics thus emphasizes context.

Fletcher believed that people must have the freedom to define situations according to the unique and special circumstances that may occur in any human encounter. Central to this process is the idea that situational elements alter cases, which in turn alter the principles guiding behavior. For example, an absolute view would be that honesty is a moral principle and should be followed in all situations. Situation ethics would lead one to think that some situations are improved with dishonesty or that dishonesty is the better choice for some human interaction situations, usually with the argument that the truth would hurt someone needlessly. An absolute legal point of view would be that breaking the law is always wrong, and violators should be punished. Situation ethics would lead one to think that unique situations redefine law-violating behavior. For example, breaking a law to prevent a terrorist attack would invoke a higher, more important cause.

Opponents of situation ethics argue that it is moral relativism, with the result that no one set of ethics or
principles is any better than another. They argue that people need a firm set of moral principles to live by. Some critics argue that situation ethics philosophy is a version of the idea that the end justifies the means. Because situation ethics does emphasize contextual appropriateness, it leads to the notion that an action indeed may be considered acceptable if the end is defined as fitting or appropriate. However, Fletcher did not believe his concept of situation ethics was moral relativism. As an Episcopal priest, he argued that all behavior must be guided by the altruistic form of selfless love (agape), and that situational decisions should be made ultimately with agape in mind, opposed to specific principles or specific laws.

In social science today, the term situation ethics has generally lost its connection to the philosophical idea of agape. Currently, it most often refers to situational definitions of right and wrong and that rules for behavior should not be rigid in social life but vary according to the circumstances involved. Situation ethics allows, for example, a social actor to say, “I think cheating is wrong overall, but in this case, it was okay for me to cheat because I had a special situation.”

Skills Mismatch

Skills mismatch refers to a labor market condition in which a significant proportion of the labor force is either over- or underqualified relative to the skill levels of jobs offered by employers. Job seekers and workers affected cannot obtain jobs that match their skill level at the level of pay and terms of employment that previous labor market conditions, educators, or their own conceptions of the labor market had led them to expect.

In the case of an overeducated workforce or skills glut, a larger than usual group of better-educated workers will (a) take jobs traditionally held by less-educated workers, (b) accept long periods of unemployment while searching or hoping for a job closer to their education level, or (c) accept such a job under worse terms of employment than traditionally considered normative (e.g., lower pay, part-time or temporary basis). Even though the total number of mismatched workers may remain stable over time, individuals may move into and out of this group, as some people usually succeed in eventually finding jobs that better match their skill level and new graduates enter the labor market.

In the case of undereducation or skills shortage, less-skilled workers bear the burdens of underemployment, underemployment, or declining terms of employment, while higher-skill jobs may remain vacant for long periods because higher-skilled workers are relatively scarce. This skills mismatch can lead to simultaneously high unemployment among the less skilled and persistent vacancies in high-skill jobs or to the absorption of unemployed less-skilled workers only after their wages decline sufficiently to induce employers to hire them.

Skills mismatches are medium- or long-term conditions because of the time lag required for the educational composition of the workforce to readjust to the changing demand for skill. Mismatch situations are different from frictional unemployment, which results from imperfect information in the labor market that delays well-matched job seekers and employers from finding one another in the short term. Skills mismatches also differ from cyclical unemployment, which reflects declines in the overall demand for labor during general business downturns.

Skills Mismatch as a Social Problem

In the 1970s, observers believed that U.S. workers were overeducated relative to the number of jobs that could use their high levels of education. This partly reflected the rapid rise in college attendance during the 1960s, some of which was a temporary effect of college student deferments for the military draft during the Vietnam War. The rapid increase in the supply of college graduates depressed the size of their earnings advantage relative to high school graduates. In addition, various social science theories, such as signaling theory, credentialism, class reproduction theory, and deskilling theory argued that educational attainment tended to rise faster than the technical demands of jobs, because of either inflated hiring standards or reductions in the skill content of jobs. Analysts expressed concern that job challenges were...
not keeping up with rising education levels, contributing to declining job satisfaction.

With the exception of cultural capital theory, scholarly and policy thinking shifted in the opposite direction in the 1980s and 1990s, sometimes dramatically. More people believed that occupational, industrial, and technological shifts were transforming the United States into a postindustrial or information economy, resulting in a large group of undereducated workers. Poverty researchers argued that these structural changes limited opportunities for upward mobility among the urban underclass by widening the gap between the growing cognitive demands of available jobs and the relatively low skills of poor minority job seekers. The geographic redistribution of jobs to areas outside of central cities and the barriers to residential mobility among the poor further inhibited the ability of less-educated workers to find jobs that matched their qualifications. Most labor economists argued that the sharp rebound in the college–high school wage differential in the 1980s was evidence that the unprecedented rise in earnings inequality during this period was due to the growth in skill demand outrunning the growth in supply. Deepening concern with the state of U.S. education, which began with the economic competitiveness crisis in the early 1980s and continues today, also rests on the belief that the labor force does not have the skills required for the new economy. Economists, policymakers, and, increasingly, other social scientists share the view that inadequate skills and education are the main causes of rising earnings inequality and other labor market problems.

Problems With the Skills Mismatch Hypothesis

Despite its status as conventional wisdom, the view that the United States suffers from a skills shortage or mismatch has not gone unchallenged. Critics note that with the exception of a few occupations, such as nursing or fast-changing computer-related fields, the exact skills that are in short supply are rarely specified. Also rarely specified is whether skills mismatch is a highly general problem or restricted to narrower groups, such as the most disadvantaged. Employer complaints sometimes seem to be more about workers’ low effort and motivation rather than their cognitive skills, particularly when referring to young workers, who are generally more computer-literate than are more experienced workers. Scores on nationally standardized tests for high school students and college applicants have been stable or rising since the early 1980s, with some significant gains for minorities, and a growing percentage of young people graduate from college. Several studies of trends in occupation-based measures of skill requirements have found growth but not the dramatic acceleration in the cognitive demands of jobs over time that would explain the growth in inequality since the late 1970s. In fact, inequality growth moderated since the end of the 1980s despite continuing rapid advances in computer technology. In addition, since the mid-1990s, the labor market absorbed large numbers of low-skilled former welfare recipients at prevailing wage rates that exceeded the minimum wage and continued to draw greater numbers of even lower-skilled immigrants from abroad, suggesting that the number of low-skill jobs is not shrinking as rapidly as often claimed.

However, opportunities for less-skilled workers are concentrated increasingly in the lower-wage service sector rather than manufacturing. Critics of skills mismatch theories believe that this and other structural changes in labor markets, such as declining unionization, outsourcing, employer pay policies, and declining real minimum wage, are more important explanations of inequality growth than the failure of individuals’ human capital to keep pace with technological change.

SLAVERY

African slavery is arguably the thesis for almost every aspect of black life in the Western world. Beginning in the 16th century, slaves became a major commodity for international commerce, with large numbers of blacks forced to migrate throughout the world via the African slave trade. Kept in a system of involuntary servitude lasting into the mid-19th century, blacks found that slavery provided the foundation for institutional life in the United States up through the present. In fact, scholars continue to debate the historical significance, extent, scope, and political and economic implications of slavery.

Today the African diaspora extends to every continent, resulting in black representation within nearly every ethnic group in the world. That diversity includes Hispanic, Native American, European, Caribbean, and/or numerous African ethnicities. Race, though, tends to serve as a symbol for black social life and identity. Blacks have been associated with the dark, untamed, and mysterious continent: Africa. Like Africa and African history, culture, and life, blacks are less understood.

Originally determining the status of blacks in the United States were forced migration and enslavement, generating a legacy of racism still existent today. As also true for Native Americans, few similarities exist to allow comparison between the status of blacks and the status of Asian or white ethnic groups. Blacks were the only group forced to struggle from the status of existing as property to quasi-citizenship. The stigma of slavery contributed to the disenfranchisement, exclusion, and hostility experienced by blacks, often forcing them to develop economically and socially under life-threatening conditions.

The slave plantation was a unique institution and a labor-intensive agricultural enterprise, with black slaves as the primary source of labor. Plantation life involved an extreme regimentation under the constant supervision of whites. Institutionalized into the role of subservient worker, blacks had virtually no hope of the freedoms afforded their masters. W. E. B. Du Bois, in The Suppression of the African Slave Trade of 1897, criticized any attempt to minimize the inhumane nature of slavery. Similarly, many have not fully appreciated the economic impact of black slave labor on the U.S. economy. What would the economic position of the United States have been in a fledgling capitalist society without slave labor? It may well not have become the economic force it did.

Slavery is indicative of man’s inhumanity to man, joining the ranks of the Jewish Holocaust, the genocide of Native Americans, the internment of Japanese Americans, and the forced repatriation of Hispanic Americans. The abolition movement and later the civil rights movement relied heavily upon moral arguments in opposition to the institution of slavery. Legal arguments in opposition to slavery tended to dehumanize the issue, while moral arguments tended to appeal to the conscience of whites. These moral arguments provided a basis for the involvement of the white religious community in the abolition movement.

Gunnar Myrdal, in An American Dilemma of 1944, suggested that the treatment of blacks was “America’s greatest failure,” as well as its “incomparably great opportunity for the future.” In hindsight, slavery was a contradiction to the ideals embodied in the Declaration of Independence and today remains a dark blot in the history of the United States. The remnants of slavery remain in the consciousness of Americans and the world. Despite all the civil rights legislation, there has been only limited resolution to put permanently to rest the consequences of slavery. Myrdal’s challenge with respect to the future is still unrealized.

Black Americans are in a perpetual identity crisis rooted in slavery. Who are black Americans? Blacks tend to wrestle with the conflict of being black on the one hand and American on the other. Scholars have also wrestled with this dilemma. W. E. B. Du Bois posed that blacks were “transplanted Africans.” For Du Bois, numerous aspects of African culture survived the institution of slavery, therefore providing a basis for black American identity. Du Bois assumed that Africa rather than America is the thesis of black life. In contrast, E. Franklin Frazier argued that blacks are a product of America. Slavery for Frazier stripped blacks of African culture. Today, native-born blacks have little in common with African language, culture, and life, as shown in the cultural divide between native-born and African-born blacks. The Afrocentric movement of the 1960s attempted to reconnect blacks with their African roots. However, much of black life links more closely with European culture than the continent of Africa.
As the thesis of black life in America, slavery has had a profound influence upon black institutional life. Characterizing the U.S. black experience has largely been racial segregation and stratification. Forced to live in two worlds—one black, the other white—blacks created their own parallel social institutions: black family structures, churches, schools, businesses, and community-based organizations. These institutions mirror the larger society in which they are embedded. Black life has been largely stratified due to its disadvantaged status in a capitalist economy.

Remedies to address the consequences of black slavery have been highly controversial and thus largely unsuccessful. The failure of these remedies has been due to the political concessions of white liberal and white conservative politics. Conservatives tend to oppose remedies that address atrocities against racial and ethnic minorities. On the other hand, white liberals tend to be openly supportive of remedies such as reparations. Proponents argue that reparations are a legal remedy for egregious acts inflicted upon citizens by government, but polls consistently show most Americans are against reparations. Until all blacks experience the same level of acceptance and life opportunities as all other groups, the shameful legacy of slavery remains a part of U.S. society.

smoking, or sniffing its powder) on church property, under threat of excommunication. Smoking bans today are public policies, including legal prohibitions and occupational health and safety regulations that restrict smoking in public places. Their aim is to protect workers, citizens, and children from chronic and acute diseases caused by secondhand smoke.

The Public Health Cigarette Smoking Act, passed in 1970, banned radio and television advertising of cigarettes and mandated a stronger health warning on cigarette packages: “Warning: The Surgeon General Has Determined That Cigarette Smoking Is Dangerous to Your Health.” In 1972, the U.S. Surgeon General warned against secondhand smoke, but smoking bans in federal buildings and on airlines were not enacted until the late 1980s.

The California legislature in 1994 banned smoking in the workplace and then extended this prohibition in 1998 to all facilities, including bars. Soon thereafter, other states or cities—including the nation’s largest city, New York—enacted similar smoking bans. Since then, an increased number of states and countries have been banning smoking in various indoor public sites and workplaces, including bars, restaurants, and social clubs. A total of 35 U.S. states have some form of smoking ban on the books, and the countries of Bhutan, Canada, France, Ireland, Italy, Malta, New Zealand, Norway, Scotland, Sweden, and the United Kingdom are among the countries that have or will have laws enacted and effective by 2008.

Undoubtedly, the laws banning smoking resulted from sustained campaigns by several health and medical organizations. One of these, the Coalition on Smoking or Health, formed in 1982, was a three-way partnership of the American Cancer Society, the American Lung Association, and the American Heart Association to promote national legislation through coordinated lobbying activities on smoking prevention. To focus more sharply on smoking behavior research and interventions, the National Cancer Institute reorganized those efforts by creating its Smoking, Tobacco and Cancer Program. Shortly thereafter, in 1986, the Centers for Disease Control and Prevention (CDC) Report claimed that conclusive evidence existed on the dangers of secondhand smoke, especially on the children of smokers. The public has come to accept the evidence; smokers’ behaviors continue to change as smokers have become increasingly stigmatized when more citizens demand smoke-free environments.

Research Findings

Agencies, both public and private, have funded research with definitive conclusions as to the ill effects of tobacco use, including lung cancer, heart and circulatory disease, infertility, sexual dysfunction in men, pregnancy and newborn complications, respiratory disease, and dental problems. Given this enormous research effort during the past 30 years, few individuals doubt that cigarettes, chewing tobacco, cigars, and pipe tobacco contain harmful chemicals. For example, the Mayo Clinic in 2006 claimed that men who don’t quit smoking lose 13.2 years of life, while smoking women lose even more—an average of 14.5 years.

Recent studies show increases in women smoking in general, although educated women and women over age 65 were more likely to quit. Other studies point to differences among men and women with regard to the motivational behavior patterns associated with smoking. For example, women are more likely to have such smoking styles as deeper breathing, higher amounts of rapid inhalation per cigarette, and the use of cigarettes to reduce boredom, stress, and depression. Both women and younger smokers see smoking as improving their self-images, seeing smoking as “cool” or “chic,” perhaps reflective of advertising portraying the smoker as an attractive image.

By 1995, smoking became known as a “pediatric disease,” given the alarming increase of smoking among high school teenagers and by the growing scientific evidence that children of parents who smoke had higher risks of respiratory and coronary disease, including lung cancer. A CDC report claimed that the earlier young people begin smoking, the more likely they are to continue as adults. Moreover, social scientists had long associated tobacco use with other adolescent problems, such as alcohol and drug abuse. Consequently, federal legislation was enacted in 1997 banning the sales of cigarettes to minors, with severe penalties against abusers.

A Harvard Medical School study of more than 10,000 students enrolled at 119 nationally representative U.S. colleges in 2001 identified 51 percent as “social smokers.” Other studies focusing on age and gender reported that both girls and boys experienced pressure to drink and smoke at a young age. A 2001 National Institutes of Health study among 4,200 middle school teens found that peer pressure, particularly among one’s five closest friends (more so for girls than boys), influenced smoking and drinking patterns. In contrast, parents who were more engaged in their
children’s lives—conversing, listening to their problems, attending their after-school events—were more likely to have children who did not drink or smoke.

Sidestream smoke contains more than 4,000 chemicals, including 69 known carcinogens. In 2005, the CDC found that 3,000 people died every year in the United States from lung cancer and another 46,000 from heart disease, all caused by secondhand smoke. Another study concluded that lifelong nonsmokers with partners who smoke in the home have a 20–30 percent greater risk of lung cancer, and those exposed to cigarette smoke in the workplace have an increased risk of 16–19 percent. Involuntary exposure to secondhand smoke remains a serious public health hazard that can be prevented by making homes, workplaces, and public places completely smoke-free.

In spite of the progress made thus far, why do so many adults still smoke? Influencing factors might include the inability of the more seriously nicotine-dependent smokers to quit and also a reduction of federal funding for preventive programs. In contrast, tobacco industry advertising exceeds $15 billion annually. More than 100 million Americans ages 3 or older are exposed to secondhand smoke, and about 20 percent of today’s high school seniors smoke cigarettes regularly.

Social Bond Theory

Social bond theory (sometimes called “social control theory”) diverges from some theories of deviant behavior that try to explain why people deviate, as it focuses on explaining why people conform to the extent that they do. The theory assumes that without social control in effect, people would deviate from societal norms. The general principle permeating varieties of social bond theories is that bonds to conventional society can mitigate the power of negative influences. Largely credited to Travis Hirschi, the theory asserts that the social bonds to societal institutions, such as schools, teams, clubs, family, and/or religious organizations, exert some control over impulses. Stemming from Émile Durkheim’s early thesis about the importance of social connections, Hirschi argued that the stronger a person’s bonds or affiliations, the greater his or her “stake in conformity” would be. Investment in the opinions of significant others would prevent negative behaviors.

Social bond theory surmised that delinquent associations (best exemplified by Edwin H. Sutherland’s “differential association theory”) would not sway a juvenile into delinquency if the proper bonds to society were sufficiently strong. By implication, the best way to prevent delinquency would be to seek out aspects of conventional institutions to which juveniles could attach. Delinquency prevention programs, often in the form of team sports, are based on this premise.

Earlier incarnations of bond theory focused on the effect of personal controls, such as self-esteem, on the likelihood of being pulled into delinquent behavior. Later versions try to explicate the mechanisms by which attachments to society work to prevent delinquency. Hirschi and Michael Gottfredson refined the theory to explain the conditions in which youth would create bonds as well as explain why some youth do not. They attribute the lack of bonds to “impulsive personalities” among some youth; low self-control among impulsive individuals would lead to weakened attachments.

Social bond theory is still being tested and refined, although empirical support exists for the basic premise of the theory inasmuch as delinquent youth tend to have uneasy relationships with family members. Investment in school tends to mitigate delinquent influences as well. However, discussion continues about the ways in which social bonds work. For example, social bonds to conventional institutions, such as schools, may prevent delinquency variably, depending upon age of the child. In addition, engagement in delinquent behavior itself may diminish attachments. Attachment to law-breaking parents may not inhibit delinquency in the same ways that researchers expect. In addition, researchers have not fully addressed the interaction between the various elements of social bonds, such as how familial attachment works in the
face of weak school attachment or vice versa. In general, the complex webs of attachments that individuals experience in the social world make parsing out the relative influence of various bonds difficult but provide researchers plenty to refine for the foreseeable future.

SOCIAL CAPITAL

Social capital refers to the advantage embedded in relationships that enables individuals to achieve certain desired ends through networks and unites societies through trust and shared norms and values. Unlike other forms of capital—physical (material goods, possessions), financial (investments, money) and human (skills, education)—social capital can only be acquired and enhanced through relations with others, specifically in families, social groups, and formal institutions including churches, professional associations, schools, or the state.

Although the conceptual core of the term social capital dates back to the writings of Aristotle, Jean-Jacques Rousseau, Adam Smith, and Alexis de Tocqueville, its use in today’s meaning begins in the early 20th century in Judson Hanifan’s analysis of rural school communities, where he defined social capital as goodwill, fellowship, and mutual sympathy among a group of individuals and families.

Two key contemporary scholars instrumental in defining the concept are James Coleman and Pierre Bourdieu. Coleman defines social capital as a consolidation of structural resources to pursue goals of an individual or institutions. Coleman argues that social capital can also accrue unintentionally or as a by-product of other economic and political activities. As such, social capital manifests itself in (a) reciprocal relations as social obligations and expectations, (b) norms and effective sanctions, (c) authority relations within groups, and (d) social organizations. For Bourdieu, social capital is one of the key elements in the reproduction of power relations in modern societies. Because social capital is rarely shared across the boundaries of social class defined by cultural habits and economic resources, individuals or groups cannot easily change their social standing.

Moving away from Coleman and Bourdieu’s emphasis on the structural dimension of social relations, Robert Putnam redefines social capital as a generalized civic good built upon the engagement in common activities. Following Putnam, social capital is often used interchangeably with the concepts of “civil society,” “civic participation,” “civic health,” and “social trust.”

Critics argue that this latter definition of social capital does not take into account the exclusionary nature of social group interactions. In response to this criticism, two types of social capital—bonding and bridging—were proposed. Bonding social capital refers to strong ties within homogeneous social groups, while bridging social capital is the sharing of resources by members of external social networks. An example of bonding social capital is a street gang, while a bowling club generates bridging social capital. Bridging social capital is particularly important because it increases generalized social trust and, by so doing, enables the functioning of formal institutions and economic relations.

Throughout the 20th century, the term social capital occasionally surfaced in the works of sociologists, economists, and political scientists, and in organizational behavior scholarship. Since the published work of Bourdieu, Coleman, and Putnam in the early 1990s, the use of the term social capital in scholarship as well as in political debates has been growing exponentially.

**Social Change**

Social change can occur throughout an entire society or within parts of a society like groups, communities, or regions. It can have a variety of causes, including the efforts of individuals and groups to address social problems.

For analytic purposes, social change may be considered as any fundamental alteration in (a) the structure of existing relationships of a society or parts of a society, (b) the processes or common practices used in everyday life, (c) population composition (for instance, the size of a society or ethnic groups within a community), and (d) the basic values, ideas, and ways of thinking that prevail in a society or its parts. In actuality, when significant alteration takes place in one of these aspects, it is accompanied by change in one or more other aspects. For example, structural changes in U.S. race relationships during the 20th century were accompanied by alterations in discriminatory practices and in the idea of race itself. In Japan during the late 19th century, as new ideas and policies affecting national unification and relationships with world powers emerged, alterations in occupations and urbanization of the Japanese population also took place.

**Types of Social Change**

Social change may be categorized into three types: radical, reformist, and transient change. Radical (or foundational) change is made up of extensive transformations in the basic character or nature of a society, community, or group. Successful revolutions, for instance, sometimes bring widespread and profound transformations of many social institutions. The Russian Revolution of 1917 and the Chinese Revolution of 1949 brought such transformations in government, religion, education, and economic life. Later in the 20th century, in many societies the affordability of personal computers and sophisticated software contributed to profound alterations in modes of communication, entertainment, storage of information, research procedures, types of occupations available, and the curriculums of schools and universities. Sometimes, radical or foundational change occurs when people seek resolutions of what they consider important social problems. The elimination of the apartheid system in South Africa during the early 1990s encompassed foundational change resulting from initiatives to eliminate existing problems. In other cases, radical changes may follow as unanticipated consequences of natural events or new governmental programs.

Reformist social changes are modifications to a society, community, or group that are less extensive and less transformative. Reformist social change typically results from focused efforts to address specific social issues or problems. For example, individuals and groups in the women’s movement that gained momentum in the United States during the 1960s found the situation of women unsatisfactory and through efforts achieved some reforms in gender relationships, the types of education and occupations available to women, and beliefs about women’s abilities and rights. Persons seeking social justice goals frequently pursue social reforms. The efforts on behalf of better housing and health care for poor people in U.S. cities early in the 20th century by individuals like Jane Addams, Mary Kingsbury Simkovitch, and Lillian Wald were concerned with bringing about reforms, and these produced lasting changes.

Currently, individuals may become “change agents” who are trained and sponsored by private or governmental organizations to create reforms in groups or communities. In the United States, for example, agencies like the Peace Corps and the Agency for International Development have provided field representatives with training for introducing changes in education and farming practices in developing societies. In other cases, nongovernmental organizations (NGOs) may place trained “community organizers” in localities to build or strengthen public support for social reforms. When many people become concerned with addressing complex social problems, individuals and groups committed to radical foundational changes and those seeking reforms may share some goals and cooperate in some actions. However, because the types and extent of changes
sought by each are different, cooperation is necessarily limited.

Unlike radical and reformist change, transient social change is change that may be expected to occur periodically and refers to variations that have a minor or temporary effect on the character of a society or its components. For instance, in societies where new production procedures are welcomed, the nature of work may be understood as changeable and people may expect retraining cycles during their careers. Societies can also experience variations as fashion changes and fads, which are passing enthusiasms that have little lasting effect on social arrangements and actions.

Sources and Causes of Change

The emergence of significant changes within a society is a complex process. In identifying sources behind a past change, or that might produce a future reform, it helps to be aware that multiple causes are usually involved. For example, social movements (collections of groups and individuals combining to produce change) have been behind many reforms. But understanding causes involved in these reform changes may require examination of specific variables within social movements—for instance, how movements coalesced, produced leaders, identified specific objectives, organized resources, and responded to resistance. Understanding may also require examination of conditions inside or outside a society that allow change to occur. Analysis of change often calls for identification of primary and secondary causes; it may also call for determining that factor or variable that operates as the immediate precipitant of change.

There are many possible sources of social change. As suggested earlier, new technologies (tools and procedures) may contribute to change. Historians and social scientists have written about the social effects of technologies including (to name a few) the printing press, steam engines, trains, assembly lines, light bulbs, movies, forestry techniques, automobiles, televisions, and programmable chips. Change can also result from new policies introduced by national governments (for instance, the immigration policy changes developed in the United States during the 1960s) or by actions of foreign governments or groups that threaten or actually invade a society. Environmental variables have also been important in bringing about social change; prolonged droughts, floods, hurricanes, earthquakes, and volcanic eruptions have contributed to social transformations in societies around the world. By the last decades of the 20th century, globalization (the establishment of elaborate transnational networks for finance, production, and marketing) became a powerful source of change in many societies.

Understanding Social Change

Social change has long received attention in a diversity of fields. Aristotle, writing in the fourth century BCE, inquired into the best form of social organization in which humans might live (the city-state, he concluded) and how this best form develops from changes in simpler forms of association. During the 19th and 20th centuries, social conditions in many societies inspired novelists, dramatists, and other writers to bring questions of change before the public. In various societies, such individuals (Charles Dickens, Jane Austen, Harriet Beecher Stowe, Mark Twain, George Bernard Shaw, Jacob Riis, Marcel Proust, Franz Kafka, Upton Sinclair, Alan Paton, Yukio Mishima, Michael Harrington, Gabriel Garcia Marquez, Chinua Achebe, and Edna O’Brien) made issues of social change explicit or implicit parts of their work.

However, it was early 19th-century philosophers and social scientists like Henri de Saint-Simon and Auguste Comte who, influenced by major upheavals during their lifetimes and ideas of their Enlightenment predecessors, are credited with beginning modern efforts to understand social change. They saw change as progress and assumed that developmental dynamics governed change in all societies. Later in the 1800s, many social scientists and philosophers such as Karl Marx, Herbert Spencer, William Graham Sumner, and Lester Frank Ward made the phenomenon of social change a focus of attention and followed the same developmental assumption. By the opening of the 20th century, Spencer and his American followers had pushed Social Darwinism (including the ideas of societal evolution and the superiority of “more civilized” societies) into prominence, while anthropologist Franz Boaz and others were beginning to produce studies and articles countering evolutionary notions. Around the same time, the ideas of Marx about class conflict as the key source of change gained in influence; a few years later, the analysis of sociologist Max Weber concerning the causal importance of beliefs and values began gaining scholarly recognition. Around midcentury many social scientists were influenced by sociologists Talcott Parsons, Lewis Coser, and
other “structural functionalists” who explained social change as resulting from strains or inconsistencies within social systems. Soon after, other sociologists like Ralf Dahrendorf, William Domhoff, and Pierre Bourdieu brought attention back to the importance of conflict and power differences as sources of change. By the later years of the century, the assumption that social change was governed by developmental dynamics had been largely discarded, and the focus was on describing and understanding change in specific societies and situations.

Social Conflict

The ubiquitous nature of social conflict often leads to an intuitive understanding that human beings are inherently conflictive by nature. Typifying this view was Sigmund Freud. Although he noted the importance of social processes in its unfolding, Freud thought that the fundamental causes of social conflict existed in a priori drives. Human beings, according to him, are not “gentle creatures” who always prefer to be at peace with one another. Rather they are endowed with a death instinct, the instinctual capacity to be aggressive at best or self-destructive at worst. Sociological understanding, on the other hand, transcending a person-centered approach that gives undue emphasis to intrapsychic dynamics, assumes that the sources of social conflict reside in social relations.

The structure of these social relations render as inevitable the eventuation of conflict that ultimately leads to a major social change or alternatively, if the social mechanisms for properly managing it are available, the reproduction of the existing social order. In extreme cases, social conflict could be reduced to a benign level. By and large, human beings are not characteristically aggressive or amicable, for social structure has the capacity to enable or constrain members and groups of society to go either way.

Sources and Functions of Social Conflict

Although social scientists agree on the social nature of conflict, they differ on its source. Karl Marx was among the first modern social scientists who examined its causes, and according to him, social inequality, accompanied by social institutions that reinforce disproportionate distribution of resources, is the fountainhead of all conflicts. To the extent that processes reproducing social stratification are intact, social conflict remains steady and pervasive. However, conflicts between contending classes open only at critical historical moments. Insofar as superordinate groups do not exhaust their rulership role, social conflicts remain hidden until a legitimization crisis ensues. Such a crisis arises when a subordinate class turns itself from a “class-in-itself” into a “class-for-itself”; that is, a class aware of its interests that works toward attaining the historical mission of constructing an alternative social order.

Although not fully subscribing to Marx’s view, Max Weber, like his predecessor, was deeply interested in the social causes of conflict. Going beyond Marx’s economic theory of conflict, Weber added the dimensions of political and cultural factors to an understanding of social conflict, thereby suggesting a tripartite view of social stratification. From his perspective, social conflict arises when there is “status consistency.” Whereas status inconsistency refers to a condition wherein groups fare differentially in the multiple areas of social organization, thereby forestalling the feelings of powerlessness, status consistency is a condition in which certain groups have disproportionate power, wealth, and prestige simultaneously. Conflict reaches a critical stage when some members—denied access to the cultural, political, and economic capitals of their societies—become indignant at the existing system of social arrangements.
However, Weber did not, like Marx, assume that acute conflicts ultimately lead to a perfect social order. Societies are full of historical accidents that detract a linear development of society from unfolding.

By synthesizing these arguments, Ralf Dahrendorf provided an alternative approach that addressed the contemporary sources of social conflict. In his dialectical conflict perspective, Dahrendorf assumed that the grounds for conflict reside in what he called “imperatively coordinated associations” (ICAs), organizations within which two antithetical roles with an unequal power differential exist.

In the ICAs, power is legitimated when it is viewed as an authority relation; that is, when the ruling are endowed with a “normative right” to exercise their domination over the ruled. This authority relationship does not remain permanent, because power and authority are scarce resources that rival groups seek. Whereas the ruling groups are interested in maintaining the social order, the ruled seek to alter the existing power and authority relations. The normative right of the ruling is challenged when the ruled, due to the availability of technical, political, and social conditions, transform themselves from a quasi group into a conflict group, a group aware of its interests and committed to the redistribution of power and authority. The tug of war between the contending groups ultimately leads to successful social changes as a result of which the institutionalization of alternative ICAs becomes possible. This in turn sets the stage for another organizational setup prone to conflict and change.

In addition to examining the sources of social conflict, sociologists have addressed the social functions of social conflict as well. Georg Simmel and Lewis Coser are among the most important thinkers who dealt with this issue in some depth. Simmel was the first sociologist to insist that we should not perceive conflict as a source of discordance that causes social disruption alone. Rather, conflict can have an important impact on society, such as creating social solidarity among members of a group. In a conflict situation, wherein individuals see a clear distinction between themselves and “others,” cohesion among individuals who share the same perception is reinforced. Conflict also acts as a stabilizing mechanism by causing the centralization of authority and the management of disputes and deviance. Extending the insights of Simmel, Coser notes that, in addition to fostering collective identity among groups, in open societies the social functions of conflict lie in creating the condition for the emergence of safety valve institutions that allow the release of tensions. Most important, open societies, by permitting the expression of rival claims and through the constant adjustment of an existing system of social organization, are able to avoid catastrophic results that harm society. Moreover, through the process of revitalization of existing norms or by creating alternative ones, these societies deal with the demands of new social conditions.

**Types of Social Conflict**

Social conflict assumes various forms, ranging from micro- to macro-processes. The minutest type of micro-conflict takes place at an individual level, with role conflict (caused by the coexistence of multiple roles corresponding to different statuses) and role strain (caused by the contradictory expectations of the same status) among the most important ones. However, much sociological analysis has focused on middle-range as well as macro-conflicts that emerge as a result of the place groups occupy in the existing system of class, race, and gender relations. The system of social stratification related to these relations leads to collective reactions that focus on issues of economic justice and human, political, and cultural rights. The three social categories, however, do not operate disjointedly. Rather the social realm is an interlocking system in which the simultaneous functioning of all three takes place. In addition to this intersectional approach, a growing recent interest lies in the study of global conflict caused by processes that have far-ranging implications for economic, cultural, and geopolitical relations between nation-states.

There are diametrically opposite views on the nature of global conflict, with the perspectives of Immanuel Wallerstein and Samuel Huntington among the most notable ones. According to Huntington, the end of the cold war brought the movement of international conflict out of a Western context. The contending powers are now the West and “the Rest,” and the new fault lines are rival civilizations and not ideologies or economic paradigms. The “clash of civilizations” is the latest phase of conflict in the history of modernity, preceded by conflicts that took place between princes, nation-states, and adherents of different ideologies. Despite its cultural emphasis, critics note that the fundamental problem in Huntington’s argument lies in its mistaken assumption of civilizations as though they are compartmentalized cultural
monads. On the other hand, Wallerstein provided a more nuanced approach to the understanding of global conflict through his world-systems analysis, an analysis that benefits from a historico-eclectic approach yet centered on conflict theory. Wallerstein views the world-system as a modern historical construct that evolved into three major politico-economic zones: core, periphery, and semi-periphery. Core nations have the advantage over the other two because of their economic and military might. Peripheral nations rank the lowest in the world economy. Often they are appendages to the core because of their least-developed economies that put them at an ill-fated position in the world market transactions. The semi-periphery—mostly acting as a go-between among the two zones—are on a higher plane than peripheral nations, although lower in rank than core nations. Global conflict, accordingly, is nothing but a manifestation of the dynamics of opposing interests and capabilities and balance of power of the three zones. Core nations certainly have more power than others in maintaining their hegemonic status.

Further Readings

Social constructionist theory is a paradigm based upon uncovering the methods by which individuals and groups participate in the creation of their perceived reality. The approach involves examining how social phenomena are created, institutionalized, and made into an agreed-upon tradition. Social construction is understood as an ongoing process, as reality is constantly being (re)produced through the interactions of people and their knowledge of that reality.

Social constructionist theory is most notably a critique of two significant assumptions in Western classic philosophy. First, the tradition of the individual knower (the rational, self-directing, and knowledgeable agent of action) is questioned. The notion of the individual knower is foundational to Cartesian dualistic thinking, most noted in the phrase *cogito ergo sum* (“I think therefore I am”). Social constructionist theory challenges this individualist tradition and invites an appreciation of knowledge as a communal agreement. Second, this communal view of knowledge represents a major challenge to the view of an essential “Truth,” “Real,” “Good,” or the possibility that one way of viewing the world is more or less objective or accurate in its depiction of reality than another.

Social constructionist theory’s implications for the study of social problems are that supposed problems are simply a construction relative to the structure of a specific social context. For instance, some believe social problems are straightforward factual issues concerning what is right or wrong or in need of address via a moral framework; however, social constructionist theorists suggest that social problems are never self-evident. For instance, C. Wright Mills once defined politics as the public construction of private troubles. The sociologist Herbert Blumer stated that social problems have no existence in some objective, a priori state but are instead produced in the process of collective definition of recognition: legitimation, mobilization, formulation of proposed responses, and implementation. Despite various strands of thought, social constructionist theories examine the meaning-making of both problems and solutions as fluid, changing, contextual, and often disputed.

Social constructionism varies in its strength: from weaker versions in which there is still some underlying objective factual elements to reality, to stronger renditions in which everything is socially constructed. Further, radical social constructionists are concerned with how social processes influence the very things thought of as most objective: science and technology. For instance, radical social constructionist theory claims that the meaning of science and technology, including facts about its proper working, are themselves social constructs. This strand of social constructionist theory has given rise to the development of postmodernism—the concept that stresses the ongoing building of worldviews that comprise the imagined worlds of human social existence and activity, gradually reified by habit into institutions, given
legitimacy by mythology, maintained by socialization, and subjectively internalized in one’s identity.

SOCIAL CONTROL

Social control refers to all the practices that contribute to social order. More specifically, it refers to all the ways in which a society establishes and enforces its cultural standards or group expectations.

The norms of a culture—that is, the “shoulds” and “should nots” that govern our behaviors—are the central ingredients of social control. Ideally, appropriate norms are instilled in us via socialization. Norms vary in type. Folkways govern our most routine interactions—expectations concerning the foods we eat, the clothes we wear, and so on. Mores instruct us in the areas of morality—the expectations regarding proper sexual conduct or regarding the sanctity of life. Many norms (folkways and mores) become formally stated as laws and are backed by the power of the state—laws prohibiting public nudity or laws prohibiting acts of violence. Society regards and responds to violations of the normative order as deviance, and its major social institutions—education, religion, business, the military, and others—work conjointly to encourage conformity and discourage deviance.

The enforcement of norms occurs via the use of positive and negative sanctions as well as formal and informal sanctions. Positive sanctions reward our conformity to norms (e.g., praising a child for saying “Please” or “Thank you” or giving an employee a raise for good job performance). Negative sanctions punish deviation from norms (e.g., scolding a child for using profanities or issuing a ticket to a speeder). A formal sanction is one carried out by officially designated agents of social control—the police, courts, prisons, and so on. Anyone in society can exercise an informal sanction, since no special training or credentials are required. Historically, social control has largely displayed a punitive face. In recent decades, however, an increase in therapeutic social control—reliance on medical experts to “treat” rather than punish deviant behavior—has evolved. Since the terrorist attacks of September 11, 2001, use of electronic surveillance as a tool for social control increased significantly.

While a tendency exists for people to equate social control with its “formal” manifestation—such as with the work of police, courts, prisons, or hospitals—formal social control is not the primary tool for maintaining order in society; informal sanctioning is far more prevalent in our lives. Indeed, effective socialization guarantees the power of informal social control. Properly socialized individuals come to care about what others think of them and thus are good candidates for the influence of informal social control. The smiles, compliments, gestures, signs, frowns, and harsh words we exchange throughout the course of a day all are part of the informal social control we exercise.

Despite its ubiquitous nature, social control varies across social space. Access to and use of the law, for instance, is often the luxury of the powerful and wealthy. Social subordinates have at times been legally prohibited from invoking the law against superiors. The poor lack the resources needed for economic awards and sanctions—that is, giving raises to deserving workers or withholding wages from the undeserving. Yet the socially disadvantaged do not suspend their normative expectations of others; they too seek ways to bring offenders back into line. For example, they can engage in a variety of sanctioning tactics such as rebellion (open violence against social superiors), covert retaliation (secret payback by subordinates), noncooperation (refusal to perform for superiors), appeals for support (asking third parties to
intervene as allies), flight (avoiding further contact with superiors), and distress (employing illness or injury as a way to sanction an offending superior). Some of these tactics, particularly rebellion and non-cooperation, may well provoke legal or violent responses from social superiors. Other tactics like covert retaliation, flight, and distress are more veiled (and thus safer) efforts to get others to fall into the normative line.

Ideally, the intent of social control is to create and maintain social order. Ironically, however, social control can often produce the opposite results. Escalation may result when the very process of exercising social control triggers further normative violation: for example, police efforts at crowd control might trigger further unruly crowd behavior. Non-enforcement produces further deviance when offenders see the lack of sanctions as a license to continue their deviant behavior. Covert facilitation occurs when efforts by legal authorities structure interactions or social opportunities in ways that favor the commission of a crime—for example, setting up sting operations. In each case, social control efforts contribute to the violations of norms, not to social order.

The irony of social control is also apparent with regard to the issue of terrorism. While the post–9/11 world seeks increasing control of terrorism, this seemingly straightforward policy is not without its problems. Arguably terrorism is itself a type of social control; it is “self-help” behavior that responds to and sanctions the perceived offenses of others. Taped statements by Osama bin Laden, for instance, assert that the 9/11 attacks were part of a holy war against the United States. If it is correct to view terrorism as a form of social control, the social control responses made to terrorism will likely exacerbate the conflict. Terrorists will regard repercussions as unjustified attacks and will feel justified in continuing to use terrorist tactics to redress any and all efforts at social control. Terrorism will beget social control that will beget terrorism, and the cycle will continue.

Clearly, social control is a fundamental of social existence—we can’t have group life without it. It plays a role in both the production of conformity and the production of deviance.

Social Disorganization

Social disorganization theory refers specifically to the failure of a neighborhood’s social institutions to develop cohesion, exert social control, and diminish crime. A departure from individual explanations of crime, social disorganization theorists examine how the structural characteristics of neighborhoods—residential stability, housing quality, economic opportunity, income levels, and social institutions—affect how residents realize common values and wield social control. In general, socially disorganized neighborhoods are characterized by high residential turnover, poverty, overcrowded living conditions, racial and ethnic heterogeneity, and social isolation. Together, these conditions hinder strong social ties and trust among neighborhood residents, making it difficult to develop the informal social control that maintains conventional values and reduces crime.

In socially disorganized neighborhoods, residents often move, choosing not to invest in their communities and strengthen neighborhood institutions that preserve traditional values (e.g., churches, voluntary associations, youth clubs). Poverty also makes it difficult to address social problems; little funding exists to support social institutions, and most residents focus on daily survival. As a result, these neighborhoods never develop the social resources to deal with crime. Here, an alternative value system emerges, one supporting crime and competing with the conventional values of most residents. Isolated from mainstream
institutions and individuals, some adolescents become confused as to what constitutes appropriate behavior. Once criminality surfaces, it can sometimes flourish, especially when successful criminals earn respect through displaying material status symbols and violence. Thus, in socially disorganized neighborhoods, deviance and crime result not solely from the individual, but more from the breakdown of neighborhood social institutions that maintain conventional values and social control.

Social disorganization theory originates in the sociological studies of the early 20th-century Chicago School. During this period, Chicago was a growing city, with a booming manufacturing industry and a large influx of immigrants. However, crime and poverty accompanied this growth—social problems that sociologists from the University of Chicago would focus on for subsequent decades. To understand such problems, W. I. Thomas and Florian Znaniecki documented the hardships of Polish immigrants as they adjusted to Chicago in the early 1900s. Thomas and Znaniecki contended that new urban conditions (a dramatic change from rural and isolated living) disrupted immigrants’ traditional family and community social control. Thus, Polish crime rates in Chicago rose to much higher levels than rates found in Poland.

Robert E. Park and Ernest Burgess were also interested in the relationship between people and place; they developed a social ecological approach to studying neighborhoods. In a spatial analysis, Park and Burgess divided Chicago into five concentric zones, finding that zones varied in physical and social characteristics, such as housing quality, income, and crime. The inner zones—characterized by new immigrants, poverty, overcrowding, and deteriorating housing—had the highest rates of crime. The outer zones—characterized by successively higher-income groups, single-family housing, and spacious environments—had lower rates of crime. Park and Burgess concluded that, because of the constant influx of immigrants and outflow of established residents, inner-zone residents cannot exercise sufficient social control over the neighborhood.

The two Chicago sociologists credited with developing the first comprehensive theory of social disorganization were Clifford R. Shaw and Henry D. McKay. Borrowing from Park and Burgess, Shaw and McKay analyzed Chicago’s concentric zones, collecting more than 56,000 juvenile court records that covered three periods between 1900 and 1933. They found that, despite ethnic succession (the replacement of one ethnic group by another), inner-zone crime rates remained high. And when an ethnic group, en masse, left inner-zone neighborhoods for outer ones, their crime rates diminished substantially. For Shaw and McKay, this meant that ethnicity, or the cultural characteristics of groups, had less impact on crime than the neighborhood structure.

In analyzing inner-zone neighborhoods, Shaw and McKay consistently found high rates of poverty, residential instability, family dissolution, and overcrowding. The researchers argued that these factors created a collapse in informal social control, leading to high rates of crime. For instance, in these neighborhoods, stabilizing family traditions weakened because of immigrant encounters with American ideas and the new powerlessness of immigrant parents relying on their children to navigate the new language and environment. Racial and ethnic differences also hindered neighborhood organization by creating distrust among residents and making communication difficult. Furthermore, many residents sought better living conditions and moved to more stable neighborhoods. This continuous exodus of long-term residents hampered the growth of strong social institutions, leaving a disorderly neighborhood for new immigrants to inherit. Under these conditions, argued Shaw and McKay, informal social control is absent, allowing criminality to thrive and compete with conventional values. For some youth (certainly not all), criminal enterprises and gangs become viable, almost legitimate, alternatives to the legal world. Once criminal traditions solidify, they become difficult to undo. Thus, unconventional values become permanent fixtures of the neighborhoods rather than values of the people themselves.

To reduce crime, Shaw and McKay advocated the replication of social institutions found in organized, low-crime communities. Organized communities exert informal social control through institutions that protected and perpetuated conventional values and isolated children from criminal influences. They were mostly voluntary organizations, such as parent–teacher associations and social clubs and neighborhood clubs for children. In the early 1930s, Shaw put theory into practice, founding the Chicago Area Project, which still exists today. This project focuses on reducing delinquency through local organizations and activities: recreational centers for children; neighborhood associations; working relations among neighborhood residents, police, and school authorities;
adult–child mentor programs; and the improved physical appearance of neighborhoods. In short, Shaw and McKay’s mission was explaining and reducing crime from a neighborhood perspective, from examining neighborhood structures and improving neighborhood organization, a decisive departure from individual-based explanations and reforms of crime.

Subsequent research during the 1980s and 1990s built upon social disorganization theory, providing theoretical improvements and methodological sophistication. In terms of race and crime, sociologists Robert J. Sampson and William J. Wilson emphasized how macro factors (economic shifts and discriminatory housing practices) interacted with community-level factors (local poverty, residential turnover, family disruption) to produce weak social institutions in urban areas. This outcome reduces the neighborhoods’ social control over crime and eventually leads to a destructive culture. Sampson and Wilson’s main focus was on how poor minorities experience “social isolation,” a segregation that keeps inner-city residents poor and disadvantaged. Poor minorities are isolated not only from work, but also from mainstream institutions that teach youths the benefits of conventional roles and values. Sampson and Wilson concluded that the black–white difference in violence results from racial segregation, a crucial separation that limits minorities’ options in work and social values and confines minorities within a space of destructive cultural adaptations.

In a multiple-level study of Chicago neighborhoods during the mid-1990s (using statistical analysis, surveys, interviews, and field observations), other researchers also found that although some inner-city neighborhoods appeared socially disorganized because of poverty and high crime rates, residents still displayed strong social ties. Such findings suggest that strong social ties alone cannot informally control crime. What matters is the neighborhood’s level of “collective efficacy,” a community’s sense of needing to respond to neighborhood transgressions.

More recent community-level research, however, runs counter to social disorganization theory. Although social disorganization theory posits that increased immigration, especially a poor and low-skilled wave, disrupts social control, new research suggests that neighborhoods with large immigrant concentrations and high poverty establish high social cohesion and low rates of violent crime. This latest finding led the researchers to conclude that the 1990s crime drop, among many factors, partly resulted from the decade’s large influx of immigrants to urban areas. However, violent crimes increase among second-generation immigrants and then even more among the third generation.

Throughout its development, social disorganization theory has also had other critiques. One criticism addresses how social disorganization assumes that crime and delinquency occur less in affluent communities, where offenders can escape notice or are dealt with informally. Another critique is that neighborhoods with high rates of poverty can exhibit strong social bonds between residents and maintain social order. Last, social disorganization cannot explain the low crime rates of some ethnic groups residing in poor urban areas, who, as some research suggests, maintain strong ties within the family and community.

**SOCIAL DISTANCE**

Social distance is a term that refers to the degree of social acceptance individuals give to members of other racial or ethnic groups. Sociologist Emory Bogardus (1882–1973) devised a simple measurement tool to assess the closeness (or distance) individuals find personally acceptable. Choices included acceptance by
marriage into one’s family, personal friendship, neighbor, coworker, speaking acquaintance, only as visitors to the country, or the extreme of barring even entry to the country. In national studies beginning in 1926 and spanning 50 years, researchers obtained responses from college students ages 18 to 35 about their preferences among 30 groups. Generally, the findings reflected a similarity-attraction bond, with Northern and Western Europeans in the top tier, followed by Southern, Central, and Eastern Europeans in the middle tier, and racial minorities in the third tier.

In 2001, sociologist Vincent N. Parrillo revised the Bogardus measurement scale to reflect demographic changes in the United States. He removed less currently visible minorities (Armenians, Czechs, Finns, Norwegians, Scots, Swedes, and Turks) as well as a two-generation representation of Japanese and Mexicans (keeping those groups but deleting Japanese Americans and Mexican Americans). The nine replacement groups were Africans, Arabs, Cubans, Dominicans, Haitians, Jamaicans, Muslims, Puerto Ricans, and Vietnamese. His national study, the largest social distance study conducted thus far (with more than 126,000 responses), otherwise replicated the previous studies in sampling and methodology.

Parrillo and Christopher Donoghue reported both expected and surprising findings. As Bogardus had predicted, the overall mean score for all groups continued to decrease, as it had in all previous studies, and so did the spread in social distance between the highest and lowest groups, indicating increased acceptance of diverse groups. Also, homogenized, non-ethnic white Americans were closest in social distance, as in all previous studies. Not surprisingly, given that the study was conducted just 2 months after the September 11, 2001, terrorist attacks on the United States, Muslims and Arabs ranked at the bottom. However, their social distance scores were actually lower than for 17 groups in the previous 1977 study by Owen, Eisner, and McFaul, suggesting Americans were less inclined to assign group blame to all for the actions of a few. Among the surprising findings were Italians ranking ahead of Canadians and British in the 2001 study and African Americans ranking in the top 10 for the first time. In both instances, their strong acceptance by Hispanic respondents, whose numbers were far less in previous studies, was a major factor.

Parrillo and Donoghue suggested that the dramatic decrease in social distance may bear witness to a “unity syndrome”—a coalescing of racial and ethnic groups against a common enemy in the immediate aftermath of the terrorist attacks on U.S. soil. Since any social distance study only captures social acceptance of groups at a given moment in time, future studies will determine how tolerant Americans remain in their ever-growing multiracial, multicultural society.

Social Exclusion

In recent years the term social exclusion has gained much popularity in political dialogues on social policy issues in developed countries outside the United States. In the late 20th century, the European Union adopted “social cohesion and social inclusion” as its theme; and “social exclusion” became part of the UN standard vocabulary to address the broad range of issues related to global inequality and injustice.

In Britain, Tony Blair’s Labour government created a special interdepartmental branch of government, the Social Exclusion Unit (SEU), in 1997. The SEU identified various social and economic problems associated with specific underprivileged population groups and proposed a series of policies to tackle these problems. As a result, this term became the main currency of public debate in addressing social policy issues ranging from unemployment to homelessness, from child poverty to health care.

Concerns about inclusion and exclusion have deep psychological and sociological roots. Psychologists view inclusion as a natural need, because the sense of belonging and membership is critical to one’s physical and mental well-being. Since exclusion always exists in tandem with inclusion, the psychological impact of inclusion lies as much in the fact of being included as the fact of not being excluded.
Sociological scholars also recognize this innate, natural need of human beings. For instance, Max Weber identified exclusion as a form of “social closure” preserving the privilege of one group against competition from other groups. Also, Georg Simmel provided a vivid depiction of the outlook of the “excluded” in his portrayal of strangers in a society, those who are physically close yet socially distant.

Modern usage of this term traces back to Rene Lenoir’s 1974 book One in Ten French People, where he invoked the term social exclusion to describe the social and economic divide in then-contemporary French society. Specifically, the “excluded” were administratively excluded by the state, the victims who fall through the social welfare safety net. He thought such exclusion was a threat to French national unity, since social cohesion is considered the essence of the society.

One view of social exclusion focuses on the lack of monetary resources and the material deprivation of individuals. Causes of poverty, joblessness, and economic hardship, as well as their resulting pathologies, receive primary attention. Some critics allege that often social exclusion is actually a euphemism to avoid the sensitivity of the “P” word for political convenience. For example, the initial adoption of the term in the United Kingdom was to highlight the failure of the Conservative Party to recognize the existence of poverty.

**Lack of Participation and Access**

Increasingly, application of the social exclusion concept goes beyond this conventional emphasis on deprivation to include also a lack of access and healthy participation in the community and society.

First, social exclusion represents the expansion of scope from the materialistic to the nonmaterialistic, such as access to information, services, and participatory activities in social and communal life. Such access and participation play nontrivial roles in shaping life experiences and could alleviate or exacerbate the impacts of materialistic deprivation.

Second, social exclusion increases the dimensionality of the existing concept. Going beyond the traditional focus of income and employment, social exclusion incorporates more aspects, such as welfare, housing, education and training, health care, public service and assistance, and so on.

Third, social exclusion also represents a shift from static state to dynamic process that involves multiple players engaging in constant conflicts, negotiations, and competitions at multiple levels. It highlights the relational features of deprivation and calls for specific examination of the relationship and interaction between the excluders and the excluded.

Fourth, social exclusion implies change of focus on levels of resources responsible for deprivation. Besides individual factors, social exclusion draws attention to broad impacts of the community environment on social and economic progress. This perspective shift from individual to community has profound implications for understanding the causal dynamics and mechanisms of various social problems.

Some scholars use the concept of social exclusion to illuminate a special feature of capability deprivation: the need to participate in community activities. They argue that social exclusion includes incapacity to participate in social and communal life. Restoration of this basic human right is the collective responsibility of the state and society. Any infringement of this right, as often occurred to certain vulnerable groups, diminishes their capacity for fully and effectively participating in their communities, which then contributes to other observable social problems.

**Challenges to Research**

Both the complexity and dynamic process of social exclusion pose significant challenges to data collection and analysis. Its multidimensional nature dictates multidimensional measurements to adequately represent multiple indicators at multiple levels. To go beyond any isolated concrete indicators, the measurements must also reflect its broadened perspective from micro to macro.

Further, the dynamic nature of the problem requires measurements that can capture the interactions of the excluders and the excluded in the process. This kind of analysis demands collection of large scale, in-depth, comprehensive, multilevel, and longitudinal data. Some critics argue that existing data—the readily available statistics collected in conventional methods for conventional purposes—may not be suitable for investigating social exclusion.

The relative lack of attention to this concept in the United States is intriguing, and social observers attribute various historical, political, and philosophical reasons to account for this. The most common explanation is that Americans tend to emphasize personal responsibility and oppose government assistance or intervention for the progress and development
of individual well-being. Since the concept of social exclusion carries with it a sense of innate rights and inherent obligations of state to individuals, some Americans find this concept difficult to accept.

Moreover, confusion and criticism exist regarding the meaning of social exclusion. Critics question its validity as a separate entity and useful concept with measurable properties to assist in studying and understanding such related issues as group relationships, social problems, inequality, unfairness, and social justice. Some characterize use of this term as overreaching, as an umbrella term more rhetorical than substantive.

Social Institutions

Social institutions are organized patterns of beliefs and behavior that are centered on basic social needs. Examples of social institutions include the family, religion, the economy, education, health care, and government. Social institutions can be viewed as the locus of social problems as well as important players in addressing social problems.

All societies have social institutions; they may be thought of as cultural universals that were first described by the anthropologist George Murdock as general practices found in every culture, such as sports, food preparation, and funeral ceremonies. However, social institutions are more complex, dealing with broad areas of people’s behavior, and they have much greater social impact than a single cultural universal.

Social institutions such as the government or the economy are such regular, ongoing elements of society that they are often regarded as “permanent” and that a situation is “just the way things are.” However, taking a longer sociohistorical perspective will identify major changes in a social institution such as the family, reminding us, for example, that remarriage after a spouse dies, much less the notion of divorce, was not always socially acceptable or even legal. Students of social problems often try to rethink how social institutions can be organized to develop solutions to social problems and do not accept their current organization as static.

Functionalist View

One way to study social institutions is to examine how they fulfill essential functions using the functionalist (or structural-functionalist) perspective. To survive, any society or relatively permanent group must accomplish five major tasks, or functional prerequisites:

1. *Replacing personnel.* Any group or society must replace personnel when they die, leave, or become incapacitated. This function is accomplished through such means as immigration, annexation of neighboring groups, acquisition of slaves, or sexual reproduction.

2. *Teaching new recruits.* No group or society can survive if many of its members reject the established behavior and responsibilities. Thus, finding or producing new members is not sufficient. The group or society must encourage recruits to learn and accept its values and customs. Such learning can take place formally in schools (where learning is a manifest function) or informally, through interaction and negotiation in peer groups (where instruction is a latent function).

3. *Producing and distributing goods and services.* Any relatively permanent group or society must provide and distribute desired goods and services to its members. Each society establishes a set of rules for the allocation of financial and other resources. These rules must satisfy the needs of most members to some extent, or the society will risk the possibility of discontent and ultimately disorder.

4. *Preserving order.* Societies must defend themselves from threats from both without and within.
Contemporary issues, as well as controversies, of immigration, surveillance, terrorism, military buildup, private security, prisons, gated communities, disarmament, and treaties concerning nuclear weapons are all manifestations of the need to maintain order.

5. Providing and maintaining a sense of purpose. People must feel motivated to continue as members of a group or society in order to fulfill the first four requirements. Many aspects of a society can assist people in developing and maintaining a sense of purpose. For some people, religious values or personal moral codes are paramount; for others, patriotism or tribal identities are especially meaningful.

This list of functional prerequisites does not specify how a society and its corresponding social institutions should perform each task. For example, one society may protect itself from external attack by amassing a frightening arsenal of weaponry, while another may make a determined effort to remain neutral in world politics and to promote cooperative relationships with its neighbors. No matter what the strategy, any society or relatively permanent group must attempt to satisfy all these functional prerequisites for survival. If a society fails on even one condition, it runs the risk of extinction.

**Conflict View**

Conflict theorists do not concur with the functionalist approach to social institutions. Although theorists of both perspectives agree that institutions are organized to meet basic social needs, conflict theorists object to the implication that the outcome is necessarily efficient and socially desirable.

From a conflict perspective, the present organization of social institutions is no accident. Major institutions, such as education, help to maintain the privileges of the most powerful individuals and groups in a society, while contributing to the powerlessness of others. To give one example, public schools in the United States are financed largely through property taxes, an arrangement that allows people from more affluent areas to provide their children with better-equipped schools and better-paid teachers than people from low-income areas. As a result, children from prosperous communities are better prepared to compete academically than children from impoverished communities. The structure of the nation’s educational system permits and even promotes such unequal treatment.

Social institutions operate in a social environment with a great deal of inequality by social class, race, gender, and age. From the perspective of conflict theorists, social institutions perpetuate inequality across society and from one generation to the next.

**Feminist Perspective**

Related to the conflict perspective as an approach to social institutions is the feminist perspective, which considers how the relative role of women has been ignored. Generally, this approach observes that social institutions establish the “rules of the game” that typically advantage men. Historically in most societies, men organized institutions and outlined the norms. Institutions are symbolically interpreted from the standpoint of men as reflected in men being “head of the family” or a male divinity figure serving as the focus of religious worshipers who are guided and directed largely by men.

Another aspect of women’s subordinate status is that, more than any other group; they are confined to certain occupations. Some sex-typed jobs for women, such as nursing and teaching, pay well above the minimum wage and carry moderate prestige. Nevertheless, they are far lower in pay and prestige than such stereotyped male positions as physician, college president, or university professor. When they do enter nontraditional positions, women as a group receive lower wages or salary.

Male dominance of high-paying occupations such as corporate executive and financial manager is well documented. Women dominate in other occupations, but they tend to be lower-paying, such as secretaries, seamstresses, health care workers, and domestic workers. Trends show the proportions of women increasing slightly in the professions, indicating that some women have advanced into better-paying positions, but these gains have not significantly changed the overall picture.

How pervasive is segregation by gender in the workforce? To what degree are women and men concentrated in different occupations? U.S. Bureau of Labor Statistics researchers have compiled a segregation index to estimate the percentage of women who would have to change their jobs to make the distribution of men and women in each occupation mirror the relative percentage of each sex in the adult working
population. This study showed that 54 percent of women and men workers would need to switch jobs to create a labor force without sex segregation. Despite a steady decline in such segregation, the decrease was not as great in the 1990s as in earlier decades.

**Interactionist View**

Social institutions affect our everyday behavior, whether we are driving down the street or waiting in a long shopping line.

Interactionist (or symbolic interactionist) theorists emphasize that our social behavior is conditioned by the roles and statuses we accept, the groups we belong to, and the institutions within which we function. For example, the social roles associated with being a judge occur within the larger context of the criminal justice system. The status of “judge” stands in relation to other statuses, such as attorney, plaintiff, defendant, and witness, as well as to the social institution of government. Although courts and jails have great symbolic importance, the judicial system derives its continued significance from the roles people carry out in their social interactions. As we approach social problems related to criminal justice, the relationships among and the social network of all these roles need to be considered.

No one perspective of social institutions is correct by itself, but taken together the four approaches help us understand social institutions and their relationship to social problems.

**SOCIALISM**

Socialism, one of the leading ideologies of the 20th century, is a theory of social organization in which the means of production are collectively owned and managed, with goods collectively distributed. It also refers to a practice, whether a political movement or a type of governance, aspiring to implement such a theory.

Socialism in its modern form originated in the 19th century and is usually linked to Marxism. Although Karl Marx is one of the best-known theorists of socialism, he is not the originator. The term usually is considered to originate in the *London Co-operative Magazine* of 1826, where it referred to followers of Robert Owen, Marx’s predecessor. Owen’s followers adopted this name in 1841. By the 1840s though, socialism also referred to the schools of Henri de Saint-Simon and Charles Fourier in France.

Socialist ideals precede the 19th century. They can be found in Plato’s *Republic* and in such Renaissance works as Sir Thomas More’s *Utopia* of 1516 and Tommaso Campanella’s *The City of the Sun* of 1623. They also relate to French Revolution notions of liberty, equality, and solidarity. Socialism also shares ideals of communalism, brotherhood, and altruism with Christianity.

Socialism was a reaction to the economic and social changes associated with the industrial revolution, beginning as a humanistic and economic critique of capitalism. Socialists sought to overcome poverty, inequality, and social conflict and to reach happiness, harmony, and justice. The major tenets of socialism generally include cooperation, public ownership, and equality as opposed to competition, individual profit seeking, private property, and social stratification, which are common to capitalism. Historically, socialist agendas differed, with some socialists disapproving
the abolition of private property (Saint-Simon) and others offering various visions of public ownership and ways to reach equality and progress.

Predecessors of socialism like Owen and Fourier saw it emerging in small socialist communities in agrarian settings or in advanced industrial ones, with a social order based on fellowship, harmony, and altruism. Marx called them “utopian socialists” and emphasized the need to understand the historical laws of society and economics. According to Marx’s “scientific socialism,” economic forces determine historical evolution, including social and political relations, ideology as well as culture. Marx argued that socialism will emerge out of the class struggle, the struggle between the bourgeoisie and the working class (the proletariat), when inequality and exploitation will deepen in advanced capitalism. The class struggle would create a revolutionary class consciousness and would lead to proletarian revolution and the founding of a classless society. The final stage of history will be communism, characterized by absence of alienation, producers’ control of the means of production, free and creative work, and goods for everyone’s needs. The Communist Manifesto of 1848, written by Marx and Friedrich Engels, marked the beginning of Marxism. Marx’s thoughts on capital, alienation, class, value, and commodification continue to be important contributions to social theory.

Many varieties of post-Marxian socialism evolved in the 19th and early 20th centuries, such as gradualism or social democracy (Eduard Bernstein, the Fabian Society), Christian socialism (Frederick Denison Maurice and Charles Kingsley), and guild socialism in England (George Douglas Howard Cole) or syndicalism in France (Georges Sorel), the latter two associated with workers’ control through trade unions. Eduard Bernstein, the gradualist and social democrat, was the principal revisionist of Marxism. Bernstein noted that Marx’s predictions about the deterioration of capitalism did not take place. According to Bernstein, reforms, and popular support of the middle classes and the proletariat rather than revolution were to lead to socialism in Germany. In England, revisionist socialism was led by the Fabian Society, which like Bernstein, promoted socialism through gradual and democratic reforms.

In the 19th century a number of socialist communities were founded, including William Lane’s New Australia in Paraguay, Etienne Cabe’s Icaria in Illinois, Charles Fourier’s Brook Farm in Massachusetts, and Robert Owen’s New Harmony in Indiana. In the end all the communities failed because of, among other reasons, lack of financial support, agricultural skills, and commitment. After the Bolshevik Revolution in 1917, the Soviet Union became the first socialist country. Unlike Marx, Vladimir Ilyich Ulyanov or Lenin, the leader of the Bolsheviks, did not believe that the proletariat would develop class consciousness to stage the revolution. In his What Is to Be Done? (1902), Lenin suggested forming a vanguard party of intellectuals to lead the socialist revolution. Unlike Marxists, who thought that advanced industrial capitalism was a precondition for socialism, Lenin envisioned a proletarian revolution in Russia, a precapitalist country. Bolsheviks and later communists made Marxism an ideology of Soviet state power.

Until World War II, socialism was predominantly a European phenomenon. After the war it spread to Asia, Latin America, Africa, and the Near East, in countries that modeled themselves after the Soviet example. These socialist countries could be identified by their public ownership of the means of production, one-party rule, centralized state economy, and unified ideology. Since the birth of socialism, the United States has been the only advanced industrial nation that lacked a durable, mass-based socialist or labor party.

Exploitation, inequality, and conflict did not disappear with socialism. In the Soviet Union, forced industrialization and collectivization transformed traditional ways of life and traditional values. In the major haven of socialism in the 20th century, the Soviet Union, territorial expansion, political oppression, economic exploitation, and mass killings were often carried out in the name of socialism.

Although many often assume socialism to be the ideology of the working class, it is not synonymous with workers, some of whom never supported the socialist cause. Socialist leaders, in fact, attracted various strata of people, sometimes forcing bourgeois values like temperance and birth control on workers. Although promoting humanistic values, socialism has been expressed in various forms of governance, such as totalitarianism, fascism, and parliamentary democracy, which enforced or undermined these values in different ways.

The collapse of the Eastern European and Soviet Union communist states in 1989 led many socialists throughout the world to revise their conceptualization of socialism, a process still unfolding.

**Socialized Medicine**

The term *socialized medicine* refers to a publicly administered national health care system, also referred to as a “universal health care system.” Versions of socialized medicine systems can range from programs in which the government runs hospitals and health organizations to programs in which there is a single-payer national universal health care plan.

Supporters of universal health care emphasize that single-payer systems save money when compared to multipayer systems in which health care is funded by private and public contributions. Germany and France use the latter. Denmark, Sweden, and Canada are some of the countries that employ single-payer financing of health care.

Health care systems can also be classified according to whether they provide universal coverage, provide portable and comprehensive benefits, have geographically accessible care, offer affordable coverage, are financially efficient, and provide reasonable levels of choice for consumers.

In the United States, the populist view associates these programs with communist-run countries, but most industrialized countries have some form of socialized medicine. The matter is important to the United States now more than ever, due to the high percentage of Americans without health insurance (44.8 million in 2007). The cost of health care and insurance premiums has risen dramatically in recent years, resulting in a high number of employers dropping health insurance benefits for their employees. The rising costs of health care insurance result from higher costs of prescriptions, doctors’ fees, and hospitalization and administrative expenses.

The United States is the only industrialized country without a system of socialized medicine. The only health care programs subsidized by the U.S. government are Medicaid and Medicare, instituted in 1965. Medicare covers Americans over age 65 and some permanently disabled persons, while Medicaid covers a small portion of persons who are poor and aged, blind, disabled, pregnant, or the parent of a dependent child. These two programs are the closest to a socialized health care system plan within the United States.

Great Britain provides its citizens with a National Health Service (NHS), through which the government directly pays all health care costs for all citizens. Implemented in 1948, it was subsequently used as a socialized medicine model by other industrialized countries. Under national terms and conditions of service, doctors, nurses, and other specialists work as salaried employees at hospitals or health care facilities. Funding for the publicly owned hospital and community services comes from central taxation. Before the implementation of NHS, more than half of Great Britain’s population—mainly women, children, and the elderly—had no health coverage.

To keep costs down, the NHS has relied on national and regional planning and shifted services to the private sector, severely undermining the fundamental bases of universal health care in Great Britain. The government shifted some costs and risks to patients and discouraged central taxation as the funding base of the NHS. Even with the erosion of the NHS in the past decades, compared to the United States, access to care is much greater and costs of care are far less.

Canada offers universal coverage through a National Health Insurance (NHI) program run by the government as a single payer. Canadian hospitals receive both an annual operating budget and a capital expenditure budget from the government. Hospital doctors are salaried; other doctors who own their practices submit their bills directly to the health insurance system, using a fee schedule negotiated annually between the provincial governments and medical associations.

Canada has one of the world’s most successful health care systems. Canadians have greater access to
care than U.S. citizens, and Canadian doctors report higher levels of satisfaction than do U.S. doctors. Harvard Medical School researchers reported in 2006 that not only are Canadians healthier than Americans, but that the latter have more unmet health needs due to greater difficulty in getting care, despite the United States spending nearly twice as much per capita for health care. U.S. residents had higher rates of nearly every serious chronic disease, including arthritis, chronic lung disease, and diabetes. Canadians were 19 percent less likely to have an unmet health need, partly due to the fact that twice as many Americans went without a needed medicine due to its cost (9.9 percent versus 5.1 percent). Also, Canadians were 7 percent more likely to have a regular doctor.

Health care in Germany is organized through an entrepreneurial system, with primary health care provided by private practitioners paid on a fee-for-service basis by insurance companies. The system relies on social insurance groups: cities, occupations, or industries that provide insurance for their residents or members. These groups are known as “sickness funds.” Premiums are based on community ratings (group rate premiums) and are paid jointly by employers and their workers. On the other hand, insurance companies in the United States use actuarial risk rating, which means that they insure low-risk individuals and/or high-risk individuals only if they pay high premiums.

Germany has been more successful than any other industrialized nation in limiting increases in health care spending. Nevertheless, costs continue to rise and affect patient services. One problem is that Germany’s complex insurance system results in higher administrative costs compared to the Canadian and British health care systems.

In the United States, the most recent heated discussions about health care occurred in the early 1990s, when President William Clinton proposed the Health Care Security Act (HCSA). Because the HCSA proposal represented a liberal approach to health care reform, conservatives attacked it and the public expressed concern about its costs and implementation through the federal bureaucracy. As a result, the bill never made it to the floor of Congress.

It now seems more likely that reforms to the U.S. health care system will occur at the state level. For example, the Massachusetts legislature passed a new state health insurance law in 2006. This plan offers combined subsidized and low-cost insurance plans, expands Medicaid coverage, offers incentives for businesses to cover workers, and requires some form of coverage for everyone. The bill offered mechanisms for all citizens to have access to health care, mandating coverage for all by July 1, 2007.

Private businesses with more than 10 workers must provide insurance or incur a penalty per employee per year. People able to purchase private insurance must do so on their own; if they do not, they pay a fine when they file their state income taxes. The state government subsidizes private insurance plans, thereby allowing more of the working poor to buy insurance. Also, the law increases the number of children who are eligible for free coverage. Meanwhile, the federal government continued to provide Massachusetts with its annual Medicaid money for the first 2 years under the new law. Experts predict that the Massachusetts universal health care plan could serve as a model for the rest of the United States to achieve an equal system of health insurance coverage, thus approximating the systems of socialized medicines that other industrialized countries offer to their citizens.

Social Mobility

In a stratified society, social mobility refers to the increase or decrease of the class or status of individuals or groups. This movement requires an open class system or social structure that provides opportunities for changing one’s relative position in the society. In the United States, the system of advancement is perceived as a meritocracy, in which abilities or achievements determine mobility.

Social mobility may be measured in changes in income or occupational prestige. Movement between classes may be measured within one person’s life course (intrageneral mobility) or may be measured across generations (intergenerational mobility). Thus, a parent working hard in a blue-collar factory job may save enough money to send a son or daughter to law school, or individuals may begin as the children of working-class parents and through their own excellence in academics may be accepted to that same school. In both cases, the meritocratic system would allow for upward intergenerational and intragenerational mobility. However, the reality is that there are numerous factors associated with one’s chances of social mobility. Birth status (ascribed status) plays a significant role. Limitations such as parental socioeconomics, opportunities for educational attainment within the society, race/ethnicity, sex, and urban or rural residence have great influence on the individual’s prospects for mobility. Moreover, analysts attribute most social mobility in the United States to structural economic and social changes rather than to personal effort.

Absolute Versus Relative Mobility

A common measurement of social mobility is tracking the income or occupation of individual families over time and evaluating the degree of mobility in absolute or relative terms. Absolute mobility refers to the inflation-adjusted change in a family’s income over time, often measured as it crosses over a fixed standard such as the poverty line. Relative income mobility is typically measured in movement between quintiles (a distribution that has been divided into fifths). Most families experience some relative mobility, moving up or down one or more quintiles in mean income. Yet, the proportion of families to remain in the same quintile increased from about 35 percent in the 1970s to about 40 percent in 1990s. This indicates an increasingly less mobile class structure.

Opportunity and Structural Mobility

The degree of mobility is related to the rate of growth in an economy and the amount of opportunity the economy holds for individuals to move from one type of employment to another. Changing U.S. economic structures in the 20th century account for most of the documented social mobility. With increasing productivity resulting from technological improvements, living standards may improve from one generation to the next, though the class structure itself changes little. However, the growth of the economy resulted from the structural transition from agrarian to industrial, then to technology-based economies. This allowed for a great deal of upward intergenerational mobility, especially during the postwar period (1950s–1970s), as the occupational structure of the country changed. Yet, the changes in the relative class status from one generation to the next were modest. Few moved more than a few positions (up or down) within the class structure.

The United States has also become more “open” and “fair,” affording opportunities to broader segments of the society and establishing legal rights and policies aimed at promoting a more meritocratic system. When compared to earlier time periods, ethnic minorities, immigrants, women, and the disabled have more opportunities for class mobility today. Nevertheless, these groups still face structural impediments and discrimination that limit significant upward mobility.

Postsecondary Education

Access to college education has also been a significant factor in promoting social mobility in the 20th century. Median incomes of those with a four-year degree are more than twice those of individuals with only a high school diploma. Attempts have been made to increase access to postsecondary education to lower-income families and thereby encourage intergenerational mobility. However, opportunities for college education are still greater for those from families
with higher socioeconomic status, especially in the elite colleges and universities.

Immigration and Social Mobility

In the past 40 years, the proportion of immigrants in the United States has increased to about 13 percent of the total population. The majority of migrants enter the United States today with lower levels of “human capital” than current U.S. citizens, placing them at a disadvantage in competing for fewer and fewer higher-prestige, higher-income jobs. For intergenerational mobility to occur, the children of migrants must overcome barriers to assimilation, their low ascribed status, and fewer opportunities in the economy. In particular, mass migration has created ethnic enclaves with their own independent economies that act to limit opportunities for upward mobility.

Stalled Growth

The rate of upward social mobility in the United States was steady until the late 1970s, then declined afterward as economic growth slowed or even stalled (principally in the late 1990s). This stalled growth led to a decline in the proportion of middle-income and high-skill workers in favor of a growth in the service sector, resulting in a decrease in the opportunities for upward mobility. In inflation-adjusted terms, men born after 1960 are earning less than their fathers’ generation did at the same age. An increase in economic inequality during this period can be linked to a widening gap between wages of skilled and unskilled labor.

SOCIAL MOVEMENTS

Even though discussions of contemporary social problems rarely take up the topics of social movements, protest campaigns, strikes, riots, insurgencies, and other forms of collective action, in fact, a close relationship exists between these phenomena and social problems. Often precipitating riots, for example, is police violence, which is commonly identified as a high-priority social problem in poor urban communities. Also, given the statistic of several million U.S. homeless, one does not have to look far to find social movement organizations bringing the claims of the homeless to the public forum and offering solutions. Numerous environmental problems come to the public’s attention and get on the political agenda through the protest and lobbying campaigns of environmental movement organizations.

Yet the social problem–social movement relationship is neither straightforward (a view that might propose that social problems automatically give rise to social movements) nor simplistic (that is to say, that social movements articulate practicable solutions to social problems). Social movements are complex phenomena made up of numerous and often very different social actors that propose variant—and sometimes conflicting—solutions to perceived injustices. Some social problems link more closely to social movements than others, and some widely recognized social problems would not have come into public consciousness at all if not for the efforts of social movement activism. For example, drunk driving legislation passed in many states largely through the efforts of Mothers Against Drunk Driving (MADD), a particularly effective social movement organization. On the other hand, social problems do not always have social movements associated with them. For example, no groundswell of citizen protest against smoking tobacco or the corporations that produce tobacco products evolved, despite the huge social costs of tobacco-related illness. Rather, policy
change has come slowly and mostly through institutional channels rather than popular mobilization.

Although formal organizations (such as MADD) often play important—sometimes central—roles in social movements, they are not social movements per se. A social movement is a much broader phenomenon that typically encompasses many groups and organizations. Much like a social problem, a movement is a complex and diverse social phenomenon that includes various perspectives, strategies, and foci. For example, the environmental movement embraces numerous ways of thinking about environmental problems. Within the movement, constituent organizations and individuals focus on different facets of environmental claims, solutions, and activist strategies: degradation of rainforests versus alternative fuels, direct action versus lifestyle choices, Greenpeace versus the Sierra Club or World Wildlife Federation. The definitive characteristic of a social movement is that numerous and variegated actors—individuals, groups, and formal organizations—engage in collective actions over time to bring about social change. This recognition of a need for social change lies at the heart of the social problem–social movement relationship. To put this observation somewhat differently: Why change an aspect of society if there is not a problem?

Implicit in the idea that social movements represent efforts to bring about social change (or prevent it—although this is less common in practice) are three basic themes. First, social movements are organized attempts to solve social problems. This view must consider whether the assessments of the aggrieved population adequately provide solutions to social problems they face. It must also factor in the intermediate political and media-related processes by which a population’s claims are negotiated and practically translated into policy decisions, thereby introducing other actors into the equation, such as politicians, interest groups, countermovements, and media gatekeepers. Second, social movements affect social problems by defining them in certain ways. This topic is related to the first, because how a movement defines a problem—or frames it—has much to do with how successful the movement will be in achieving its goals. Third, sometimes the state labels social movements as social problems and makes them the focus of repression or eradication. Although in the West, movements and protests are standard fare in the political process, elsewhere they pose challenges to the state—the most powerful and most salient arbiter of what is a social problem and what is not.

Social Movements Propose Solutions to Social Problems

Claim making is a process that is central to both social movement analysis and the analysis of social problems, but the relationship within the movement of the claims that it makes and the policy solutions that may result is neither straightforward nor obvious. About 50 years ago, when the study of social movements became institutionalized in the social sciences, scholars working in the collective behavior tradition claimed that social strain and widespread grievances—racial injustice, low wages, rapid price increases, for example—were the causes of social movements. A serious social problem experienced by enough people, under the right conditions, would generate enough popular discontent that a social movement proposing a solution would arise. In this view, the linkage of social movements and social problems was strong, and researchers focused on imbalances or strain in social structure as places where panics, riots, protests, and social movements were likely to occur. This viewpoint often saw social movements as collective responses to social problems and vehicles of proposed solutions. Social movements and protest campaigns were relatively uncommon, uninstitutionalized responses to social breakdown. Thus while some claims might be made through political channels and party politics, only a particular genre of social problems lent itself to social movement mobilization: grievances of those who did not have access to institutional channels, namely, marginalized and unintegrated members of society.

As a social movement research agenda progressed, it became clear that much more was involved in social movement development than individuals collectively acting upon the seriousness or scope of a social problem. In addition to the claims that mobilize core participants, the ability to bring the claim to the public forum in a way that draws a wider circle of supporters is critical for social movement success. Much like a social problem marketplace, where numerous claims compete for limited public attention, social movement scholars recognized that while society supports a wide array of aggrieved groups, each with their own set of claims and proposed solutions, only some groups can be successful. Research showed that the key
The difference between success and failure was the level of resources that the movement could bring to bear: The greater a movement’s resources, the more likely that its claims and solutions would find a place in the public forum. To put it another way, neither the seriousness of the movement’s claim nor the practicality of its solution determined the course for a movement’s development and the success of its agenda. Rather, its material resources (money, buildings, equipment), organizational resources (networks, official contacts, efficiency and commitment of participants), and cultural resources (reputation, media portrayal, slogans, and strategies) were critical elements of successful mobilization.

Insofar as social movements propose solutions to social problems, then, the success of solutions depends on intentional, goal-directed, planning and implementation of strategized courses of action by organizations, networks, and their leaders. These activities have the immediate objective of mobilizing broader organizational and material resources for the sake of collectively promoting a group’s solutions within the public forum. Moreover, within a social movement, different groups have different proposals and different resource levels. These groups cooperate, compete, negotiate, sometimes defect or withdraw, and compete for media attention. Just as within the social problems marketplace, numerous groups within a social movement competitively promote their agenda. Each group’s relative resource levels in part determine which emphases, foci, agendas, and solutions will be heard.

In addition to resources, social movement groups must contend with institutional actors in business, government, and—increasingly—at the transnational level. In democratic states, these are the key players by which all policy change is mediated. Also, in democratic states there are established channels for grievance articulation—political parties and interest group politics—and whether solutions to social problems come from social movements or from institutional political actors depends partly on the structure of political opportunities that are relevant for a given issue or problem. In the Jim Crow South, claims against the injustices of racial segregation could not be addressed via institutional political channels. Leaders of the civil rights movement were forced to take the path of protest and movement mobilization to win concessions, with many of their actions aiming at the federal level, where small political openings existed in the Kennedy and Johnson administrations.

The shape and accessibility of political institutions and the accessibility of political channels are key determinants of (a) who will be proposing solutions to social problems; (b) what social problems will enter the public forum; and (c) how those solutions to social problems will be codified into law, namely, how far will the final political solution deviate from the social movement’s original proposals. The solutions that social movements offer to social problems and the policy responses, if any, that result from movement mobilization are the result of complex, negotiated interaction among many different institutional and noninstitutional actors.

**Social Movements Define Social Problems**

Social movement researchers recognize that how a social movement defines its claims is a key element in understanding its success or failure. Also, because social movements are often key players in public policy debates, how a social problem is defined, or—in the lexicon of social movement analysis—how it is framed, in part determines the shape and substance of the social problems marketplace and, eventually, the policies that result. Finally, among the various groups and organizations that comprise a social movement, the ones that show special talent for framing claims in ways that strike a resonant chord among the populace are more likely to have their particular slant on the problem aired publicly and therefore will have greater influence on policymakers.

The framing of a social problem functions much the same way as a frame around a picture: attention gets focused on certain elements and away from others. For example, the problem of across-the-board low wages among hotel service workers might be portrayed as worker exploitation by greedy hotel chains or as ethnic discrimination or as gender discrimination or as denial of union-organizing rights. All these are components of the larger problem and different groups—AFL-CIO, Latino/a community organizations, university anti-sweatshop groups, the Catholic Church—may emphasize one or another, depending upon their particular perspective (or, one might say, according to their own frame of interpretation). However, a particular mix of issues and foci may be able to attract greater public sympathy and increase the likelihood of wage increases. For example, one might frame the protests in terms of legal, first-generation
immigrants struggling to support families and pursuing the American Dream rather than class exploitation. For want of a better term, the analyst might trace how this “American Dream” frame (a) privileges certain constituent social movement groups over others; (b) gives them media access to promote their claims and—as a scarce commodity—closes media access to other groups; and (c) opens doors of access to officials and politicians who might be in positions to do something about the problem. Strategic framing does not define away the social problem or even cloak it as something else, although this may seem to be what occurs. Rather, strategic framing can take advantage of cultural and political predispositions of the public to increase the likelihood that the problem gets attention, both by the public and by those in power. There is, however, a delicate balance to be struck: a social problem can be eviscerated by a frame that seeks too broad an appeal. If a social movement’s demands are watered down so much that the achieved concessions satisfy no one, the movement may not be able to count on the support of its members.

While social movements define social problems, and while there even may be internal contention—“frame disputes”—among social movement groups and organizations about the shape of a frame, other key players in the social problem marketplace typically offer up countervailing frames. The state is always in a powerful position to have its countervailing frames made public, and businesses, business associations, and interest groups often are players in the battle over framing social problems. But especially relevant to how social movements affect social problems is the role of countermovements—mirror images of social movements that actively oppose change-oriented claims and solutions.

Some analysts suggest that countervailing frames fall into four categories: denial, disagreement over causes, debate over possible solutions, and discrediting claims and solutions by questioning the character of the claims makers. Because collective identity is a key element in movement unity and purpose, movement participants will likely not accept the attacks, but these can have adverse effects on how the larger public responds to the movement’s claims.

Movement–countermovement debates over framing social problems do not end here. Several researchers have pointed out that social movements spend significant time and resources responding to their opponents’ counterframes. The picture that emerges is a dark dance among key players in any social problems arena that goes beyond charges and countercharges typical of political contention in the party system. Rather, the keen observer will find that nuanced, strategized, and sometimes highly professional media campaigns come into play, as can be seen in the recursive framing and counterframing of the abortion debate over the past 30 years: abortion as a medical issue counterframed as taking a human life, which is reframed as a rights issue and a matter of choice, and then reframed again as “It’s not a choice, it’s a life.” This sequence is but a gloss of the on-the-ground framing battles, not to mention how these rhetorical duels are played out via various media—television, public forums, print media, church meetings, flyers, documentaries, Web sites, and so on—such that high resource levels (e.g., Planned Parenthood versus the Catholic Church) and media expertise are important determinants of who wins. Although not as highly paid (and sometimes volunteering their skills), “spin doctors” are as much elements of social movement contention as they are in political contention and elections.

Social Movements as Social Problems

Media strategies aside, political elites are the main players in the processes that define social problems. Depending on the nature of the state, those in power can classify a social movement as a serious challenge to political authority—at one end of the spectrum—or a benign, taken-for-granted participant in the give and take of open democratic political contention—at the other end. The consequences of how political elites define a movement are much more serious than those of a framing debate. Indeed, the level of repression that a movement receives is probably the best measure of how political elites problematize a social movement. It is fair to say that, depending on the movement, the state can mete out repression that ranges all along the spectrum. Repression can be brutal or soft, situational or institutional, and occur prior to mobilization—as part of intelligence gathering and covert action—or occur in real time—when protesters are in the streets. The degree of state repression may reflect a combination of all these dimensions and depend on the openness of the state, the level of the challenge (local or national), and its intensity or scope (revolutionary or policy specific).

Two general factors interact to determine in part whether a social movement gets repressed. First, the
openness of the political process is directly related to whether the challenges from social movements are defined as legitimate. Open political systems, as in the liberal democracies in the West, allow space in the public forum for social movements. Second, the degree to which the movement threatens political authority is an important determinant of the repression it receives. In open political systems, a local movement that mobilizes against the construction of a huge superstore would most likely be seen as a legitimate expression of local interests. In closed, authoritarian systems, a similar movement might be repressed. For example, in the Baltic republics of the former USSR, local neighborhoods sometimes mobilized to oppose the siting of large factories or mines. Central economic planners in Moscow conceived these projects and mandated the immigration of a large, foreign labor force whose influx would change the ethnic and linguistic composition of the region. Opposition to these plans was seen as a challenge to the communist state’s authority, and movement leaders were often arrested, marches prohibited, and media access denied.

Another dimension that determines repression is the size of the movement. Poland’s Solidarity movement posed a clear and direct challenge to the dominance of the Communist Party and key tenets of its ideology, yet Solidarity’s scope and popular support mitigated against its full repression—at least for a time. Conversely, in Western democracies, it is not uncommon that small political organizations espousing radical ideas and confrontational tactics are repressed, often through infiltration, agent provocateurs, and illegal “Dirty Harry” operations. Political elites in both democratic and authoritarian states have wide latitude in determining whether a social movement gets defined as more or less problematic, but as a general principle, a movement that challenges the political authority of the ruling elite or the legitimacy of the state is labeled a social problem. In authoritarian Burma, the democracy movement is labeled as a tool of Western neocolonialism and is repressed. Most likely, this occurs to a wider spectrum of movements in closed political systems. Yet in open systems too, movements are labeled problematic: in the United States and United Kingdom, Islamic charities—players in global Islamic radicalism—that channel money to Hezbollah, al Qaeda, or Hamas—are labeled terrorist threats, closed down, and assets seized. But even in this latter example, if violence is eschewed, Western democracies often give legal guarantees of free speech and association. Although these may offer protection against more draconian forms of repression, they are not guarantees against subtle (sometimes secretive) preventative state interventions, such as surveillance and limiting access to the public forum.

**SOCIAL NETWORKS**

A social network is a style of organization of social relationships characterized by highly mobile, interconnected links between individuals or groups. Such connections may take many forms, from business relationships based on status to relationships between friends. Social networks exist in flux as new nodal
connections are formed and those rarely used become weaker. No formal division exists between one network and another, nor does a network possess a center. Networks provide resources that may be emotional, material, informational, or financial in nature. A network can be utilized to obtain a job, get information, spread news, organize protest movements, or make romantic connections. One’s positioning in the system of social networks, therefore, has a large effect on the span of an individual’s power in a contemporary informational society.

Initial conceptions of social networks appear in the works of such early theorists of modernity as Émile Durkheim and Georg Simmel, who noticed increased instrumental interpersonal encounters at the turn of the 20th century. In the 1930s, social network analysis evolved as a means of quantifying and mapping emerging social networks, becoming a subfield of work on social ties in the social sciences. Decades later, the meaning and importance of the social network grew and changed dramatically when social scientists identified a qualitative and significant difference in the ordering of social connections in the postmodern era. This change occurred with the revolution in information technology, including the widespread use of the Internet, cell phone communications, and the “time–space compression” of the new global economy. As the speed and connection of social interactions increased worldwide, social relations increasingly took the form of the network.

Unlike traditional ties to local communities, networks exist not in terms of physical space alone, but they can continue uninterrupted between cyberspace and actual space. Because of the increased speed, mobility, and anonymity such a system provides, networked groups have an advantage in collective political activity. In the era of globalization, social networks are important in shaping the actions of transnational activists, who use this technology for communication and organizing across national boundaries. Networked telecommunications via cell phone and text message, for example, help protesters communicate information during political demonstrations, such as warning each other about the location of police. Likewise, terrorist groups rely on elaborate social networks to help spread messages below the level of government radar.

Networks also become increasingly important in a technological society because they provide access to remote and highly specified information from human, living sources often more trusted than official information sources. For example, an individual might ask friends if they know anyone who has ever lived in Portland when considering a move. This same individual might also check Internet chat rooms for Portland residents to find out what living in Portland is like. The social network can thus provide a level of information that other official sources, in this case, a guidebook to Portland or population statistics, cannot provide.

Social scientists, theorists, and activists are divided on the meaning and value of social networks. Some argue that social networks represent an increased superficiality in human relationships, that bonds between people have become more temporary, increasingly utilitarian, and less emotionally meaningful in contemporary society. To others, social networks represent a dangerous move away from the close, informal ties of civil society, instead creating more mobile bonds in which individuals weigh the potential benefits against the costs of each networked social relation.

Despite these serious concerns, the flexibility and potentiality inherent in a nodal model offer much to celebrate. Activists especially find social networks invaluable for communication purposes. Those studying cybernetics celebrate the immersion of the human in a web of the technical and biological networks of the information society, arguing that this technology produces and allows for an increasingly fluid sense of self.

**Social Promotions**

Social promotion refers to the practice within schools of allowing students to progress to the next grade level with their peers regardless of whether or not they have mastered the academic skills and content of the current grade level. A student may be socially
promoted even if not ready for the next grade due to complex social and psychological factors that make retention in the same grade equally undesirable.

No U.S. data exists on how many children are socially promoted each year. In fact, most teachers are reluctant to admit they ever participate in the practice. But the problem of social promotions was perceived to have reached such scandalous proportions by the 1980s that the problem was included in the famous “A Nation at Risk” report, and the Clinton administration banned the practice outright. In 2001, the No Child Left Behind (NCLB) Act added a new focus on testing and accountability. Although NCLB’s annual basic skills tests are designed to help educators learn how best to improve students’ mastery of the curriculum, they also serve as a safeguard against social promotion.

Unfortunately, while new retention policies effectively raised student test scores, it is not clear that students most in need of help have benefited. Elementary-age children believe that retention is a punishment; they feel stigmatized by being left behind by their peers. Studies indicate that the trauma of this stigma damages a child’s social and emotional development, as retained children typically demonstrate more behavior problems and lower peer acceptance. These difficulties may persist into high school, since some studies reveal a correlation between retention and high school dropout rate. Most important, when retained students relearn the same material through the same teaching methods, they do not catch up with their peers. On the contrary, they fall further behind because they face the same struggles again, while their peers move on to new material.

That said, social promotion is not a solution to this problem. Letting students move ahead when they cannot do the work frustrates them and contributes to their failure later in life, since success in any grade depends on skills learned in past grades. Social promotion sends a message to students that they do not have to work hard to achieve academic goals. This, in turn, decreases the individual student’s motivation to achieve.

Society also pays an economic price for social promotion practices. Nationwide assessments consistently show that the majority of public school students cannot meet basic standards. Many employers and colleges spend time and money on remedial instruction. The combination of low self-esteem and dropping out of high school can lead to crime and violence in young adults.

With this debate in mind, policies to end social promotion need to be accompanied by concrete action plans for helping struggling learners. Retention alone does not solve the problem. Strategies for ending social promotion include high-quality universal early childhood education, early identification of students at risk for learning difficulties, and a focus on high-quality curriculum and instruction as well as interventions to help low-performing schools.

SOCIAL REVOLUTIONS

Social revolutions are the most extreme forms of collective actions. Where most social movements limit themselves to changes in the social system, social revolutions seek changes of it. Because they contest economic, political, cultural, and social orders with an involvement of a large number of people hitherto excluded from the domains of “public transcripts,” social revolutions are distinct from political revolutions and coups. Political revolutions are upheavals that result in the reorganization of political society without eventuating changes in the social structure. Coups are political strokes (often involving the military) in which an incumbent government is stripped of its political power by way of meta-constitutional means. Hence, since they involve changes in the restructuring of both political and civil society, we have had very few instances of social revolutions. Some scholars identify the most classical social revolutions, often labeled as the “Great Revolutions” of the modern era,
as the French Revolution of 1789, the Russian Revolution of 1917, and the Chinese Revolution of 1921–49. Other scholars argue that the American Revolution of 1776 also belongs on this list. Recently the world has witnessed different social revolutions in developing nations (Cuba, 1959; Ethiopia, 1974; Iran, 1979; Nicaragua, 1979) and the former socialist countries (1989) where state socialism and command economy came to an end.

Causes of Social Revolutions

Social revolutions and social problems are closely knit to one another. All the same, even the most critical social problems do not ipso facto lead to social revolutions. As Alexis de Tocqueville aptly noted, relative, and not absolute, deprivation—occasioned as a result of a gap between groups’ experiences for an improved future and the means of attaining perceived expectations—fosters revolutions. More important, only a constellation of political and cultural opportunities, resource mobilization, organizational dynamics, and ideational processes have led to social revolution. Karl Marx was among the first modern social scientists to think of the cause of social revolutions along this line, although some political philosophers before him, such as John Locke, provided the ideological justification for political revolutions. According to Marx, social revolutions emerge when there is an intense dialectical tension between the productive forces and the production relations of a given society that ultimately manifests itself in the heightened tension between the contending classes.

Unlike Marx, who considered the state as a concentrated reflection of the mode of production that hardly sustains its self-dependence, Theda Skocpol, in her analysis of the Great Revolutions, viewed the state as an administrative apparatus with an independent logic of its own. This simple but important view of the state allowed Skocpol to provide what some call the most revolutionary view of social revolutions. On the basis of her structuralist approach, she noted that revolutions are caused by state breakdown; that is, the state’s inability to manage the affairs of society induced by fiscal crisis or international pressures. Moreover, according to Skocpol, the state needs to be considered in an international world-historical context. From this geopolitical perspective, state breakdown comes in part as a result of the competition of multiple states working within the constriction of imbalanced world development. States less hampered by internal forces in their access to the resources requisite to resist the challenges posed by other states are less vulnerable than those states that have overextended themselves and encounter pressure from the dominant classes. Skocpol, accordingly, contends that social revolutions take place when the state is weakened by its inability to deal with extranational load effectively, when the dominant classes are capable of exerting their influence on the state that desperately seeks to maintain the compass of its authority, and when the lower classes are capable of mobilizing themselves and act accordingly. Only the combination of these three factors leads to social revolution.

Without abrogating the fundamentals of the Skocpolian thesis, Jack Goldstone spelled out his own version of the state-centered approach. Goldstone contends that in her analysis of the Great Revolutions, Skocpol overemphasized the role of war in undermining the smooth operation of states, although on numerous occasions wars have occurred without begetting state breakdown. Goldstone, accordingly, suggests an alternative perspective in which political crisis commingles with demographic dynamics. He contends that population growth can cause price inflation, fiscal crisis, lower wages, and elite competition, thereby leading to state breakdown, especially when the state lacks appropriate resources and has weak financial structures to deal with these pressures.

Serious criticisms against the Skocpolian approach have emerged from scholars who believe that Skocpol’s approach is overly structuralist because it undermines the role of culture and ideational processes in the genesis and development of social revolutions. Even Goldstone acknowledges the relevance of ideology and culture in the latter parts of a social revolution, because revolutions, in his view, are not single events but long processes with multiple phases. Ideologies may not be effective during the phase of state breakdown, but they do play an important role during the phase of reorganization of social and political structures. Other analysts have gone much further in acknowledging the role of ideas and culture. For example, some note that the Enlightenment was crucial during the French Revolution in laying down the ideological basis for the abolition of monarchical rule and the reconstruction of a new social order. Most agree that revolutions are social constructs that surface on the social-political landscape.
as a result of the “choices” made by the individuals involved in them.

SOCIOECONOMIC STATUS

Socioeconomic status (SES) reflects one’s position in the social structure. Research clearly demonstrates that SES associates with individual behavioral, social, and psychological characteristics. Links between SES and individual mental and physical health outcomes often involve individual psychosocial and behavioral characteristics, including antisocial and health risk behaviors; marital, parental, and social relationships; and psychological resources. Health research findings show that decreases in SES associate with increases in health problems in a monotonic manner, producing an “SES–Health Gradient.” Research also suggests that the influence of SES on individual characteristics and health outcomes is not only contemporaneous, but also persistent and cumulative over the life course. However, SES influences vary depending on the outcomes and life stages under consideration.

Several theoretical perspectives suggest ways to operationally define SES. For example, Marx’s view sees SES as determined by social classes based on class production relations (e.g., the working class and the bourgeois). Alternatively, a Weberian perspective views SES as based on social stratification or employment relations. Accordingly, researchers typically define SES using markers that involve employment, income, and education and often employ these conventional markers either separately or jointly as indices of SES.

The validity and utility of any SES measure depends on whether the measure is predictive in relation to the outcomes of interest. Recent theoretical and empirical developments in this area suggest that operational definitions of SES should take into account both economic factors and other social and individual factors that influence individual functioning in the social system. For example, James S. Coleman defines one’s SES as access to different types of capital. According to Coleman, SES is a function of material capital (e.g., income and property), human capital (e.g., skills and knowledge), and social capital (e.g., social status, social support, and power). Because of these important developments, recent research often uses composite measures or latent constructs of SES to combine multiple measures of SES dimensions.

SES is not limited to an individual characteristic. Rather, one can define and measure SES at different levels, including individual, family, and community. Research suggests that SES at multiple levels uniquely influences individual outcomes. For example, community research shows that community SES influences resident net health of individual or family SES. In addition, findings generally indicate intergenerational transmission of SES from parents to children in many societies. However, other limitations on social mobility to cross SES categories may exist. Empirical research has yet to explain completely the influence of race/ethnicity on individual outcomes of interest, suggesting the need to consider other potential markers of SES.

The term sociopath refers to an individual who exhibits behaviors that are outside of society’s norms and expectations. Sociopaths, as well as psychopaths, fall under the psychiatric umbrella diagnosis of persons with “antisocial personality disorder,” although many in the mental health profession feel that sociopaths and psychopaths are distinct personalities and should not be grouped under the same diagnostic category. The two primary organizations responsible for diagnosing mental health problems—the American Psychiatric Association and the World Health Organization—define sociopaths differently, which illustrates the complexity and difficulty that diagnos- ticians have with this personality type.

The American Psychiatric Association refers to sociopaths as persons having a pervasive pattern of disregard for and violation of the rights of others, occurring since the age of 15, and who possess three or more of the following criteria: (1) failure to conform to social norms with respect to lawful behaviors as indicated by repeatedly performing acts that are grounds for arrest; (2) deceitfulness, as indicated by repeated lying, use of aliases, or conning others for personal profit or pleasure; (3) impulsivity or failure to plan ahead; (4) irritability and aggressiveness, as indicated by repeated physical fights or assaults; (5) reckless disregard for safety of self or others; (6) consistent irresponsibility, as indicated by repeated failure to sustain steady work or honor financial obligations; and (7) lack of remorse, as indicated by being indifferent to or rationalizing having hurt, mistreated, or stolen from another.

The World Health Organization’s most recent version of the International Statistical Classification of Diseases and Related Health Problems, or ICD-10, refers to sociopaths as having “dissocial personality disorder,” which is characterized by (1) disregard for social obligations, (2) callous unconcern for the feelings of others, (3) gross disparity between behavior and the prevailing social norms, (4) behavior that is not readily modifiable by adverse experience, including punishment, (5) low tolerance to frustration and low threshold for discharge of aggression, including violence, and (6) tendency to blame others or offer rationalizations for behavior.

This disorder is diagnosed much more frequently in males than in females and is often associated with criminality and alcohol and drug use. And while sociopaths may be difficult to diagnose, many exhibit three warning signs, known as the MacDonald Triad: bedwetting, pyromania, and cruelty to animals. However, critics note that these behaviors are only a repetitive finding in sociopaths and that some children who exhibit them grow up to be healthy, normal adults. Because there is a limited amount of insight into the symptoms for sociopathy, persons rarely seek treatment for it, and when they do, their treatment options are limited.

Special Interest Groups

A special interest group is a group that, in pursuit of its goals, lobbies for government assistance or against government interference. The U.S. founding fathers created separation of powers, checks and balances, and federalism in order to keep such groups from gaining too much power or influence. However, concerns about the disproportionate influence of interest groups, as well as the unbalanced influence among those groups, remain despite the passage of various laws governing lobbying and the participation of special interest groups in campaigns.

Three primary theories address the role of interest groups in the United States. The pluralist theory holds
that enough interest groups should participate in the political process so that everyone’s interests get represented, whether or not individuals participate. The elitist theory challenges the pluralist view, arguing not all groups are represented and the ones that are not represented equally. It argues further that public policy is primarily influenced by a small elite group rather than by a wide array of interest groups or the general population. Although examples of elite success exist, other successful examples that elitists thought would not succeed have also occurred. Hyperpluralism, the third theory, notes the large number of interest groups in U.S. politics and says those who are against something have a better chance of success, because the government’s structure makes change more difficult than maintaining the status quo.

**Types of Interest Groups**

Groups can be categorized in several ways, including by membership, organizational structure, and goals. Membership categories include groups run by members, groups with corporate or other types of entities as members, groups with pocketbook members, and groups without members that are run by their staffs. Pocketbook members are people who pay dues but do little else in the group, although they may occasionally write letters or call Congress if asked by the group. Some groups have a formal organizational structure while other groups are less formal, and some are not really structured at all. In terms of goals, private interest groups (i.e., businesses) primarily seek benefits that can be limited to their members. Public interest groups (i.e., civil rights) advocate for benefits that cannot be limited to their own members.

**What Interest Groups Do**

Interest groups seek to influence government policy and to obtain government benefits by lobbying the legislative and executive branches of government and sometimes by participating in election campaigns. After passage of a law, the lobbyists pressure the bureaucracy charged with creation and implementation of its regulations and/or the courts charged with interpreting the law.

Lobbying can be direct or indirect. Direct lobbying includes any activity intended to influence, which involves personal contact with government officials or their staff. Activities include meeting with, calling, faxing, or writing government officials and staff as well as giving testimony or speaking at public meetings, submitting position papers, engaging in relevant lawsuits, and writing amicus curiae (friend of the court) briefs—statements written by nonparticipants in a case that supports the legal argument made by one of the participants.

Indirect lobbying seeks to influence government officials through a third party such as the media or a group’s members. Staging events that obtain press coverage (i.e., press conferences and protests) and writing letters to the editor are two common methods of using the media. Also, groups ask their members to engage in various direct lobbying activities (rather than the organization doing so itself), perhaps by e-mailing or calling their congresspersons.

Interest groups participate in the campaign process by donating money to candidates and/or instructing their members to donate money to or volunteer for a particular candidate. They also engage in independent campaigns using their money and members to assist in getting out a message to their members and/or the public to vote for a candidate or party. Organizations may engage in all, some, or none of these activities.

**Likelihood of Success**

How successful a particular interest group is depends on its resources, which include knowledge, membership, money, and reputation, all of which can be maximized through coalitions. The first of these resources—knowledge—falls into four types: knowledge about the group’s issue(s); knowledge about how the political process works and the people whom you are trying to influence; knowledge relating to effective organization building, leading, and maintaining; and general knowledge, particularly in the areas of writing and speaking in standard English.

The second resource—membership—involves five important characteristics: number, geographic dispersion, cohesiveness, intensity, and market share. All things being equal, larger groups have an advantage over smaller ones. A group with a large number of members in a small geographic area would have significant influence in that area but less broad influence in a larger area. On the other hand, a group such as the American Association of Retired Persons (AARP), which has more than 50,000 members in a significant number of congressional districts, is able to have a much broader impact nationally, since all representatives have constituents who are part of the group.
A small cohesive group will do better than a large divided group. A group unable to decide what it wants makes it easier for politicians not to respond. It also makes it harder for the group to act. Sometimes multiple groups represent the same group(s) of people. When all of these groups are unified, they are more successful than when there is division among the groups.

Intensity is a benefit because when members feel intensely about their group’s cause(s), they are going to be willing to work harder, donate money, and vote accordingly. Intensity is one of the reasons the religious right is playing a significant role in U.S. politics.

A group’s market share—the percentage of eligible people who join the group—may also affect its success. This is most significant for organizations such as the American Bar Association and the American Medical Association, where the total number of people eligible to join the organizations is known. An organization has an easier time representing a specific group of people the higher its market share.

Money is a significant resource because it can be used to purchase many of the other resources as well as to pay for communications and make campaign donations. It is also the resource that is at the center of much of the controversy over the influence of interest groups in a democracy. The concern is that small groups with significant financial resources can influence policy in ways that disadvantage the majority.

Reputation, the final resource, has two elements. First, politicians do not want to be associated with unpopular groups. Second, the groups who have a history of giving good information are more likely to be trusted and believed than the groups who do not.

Three aspects of goals affect success rates. Groups seeking to block change do better because the government is structured to make change more difficult to achieve than maintaining the status quo. Groups with narrow or technical interests also do better than those with broader or less technical goals because they are less likely to stir up substantial opposition. This is in part because narrow goals are less likely to be noticed or, if noticed, inspire opposition from a significant number of groups or individuals. Technical goals are hard to understand and thus tend to receive less opposition.

Also, if a group has no organized competition, it has a better chance of success. When there is a mismatch in the resources groups have, the group with the superior resources has an advantage. These realities raise concerns for both democratic theorists and citizens. The primary concern is that policy decisions favor groups because of their resources, not because of the merit of their positions or because their positions represent the majority. When groups are evenly matched, the outcome is either compromise or stalemate. Sometimes the result in the former case is incoherent and/or piecemeal policy. In the latter case the status quo wins.

**Impact of Interest Groups**

Interest groups provide information, new ideas, an opportunity to pool individual resources, and the ability to rely on others to participate in one’s place. The recent explosion of interest groups driven by technology, changes in campaign finance laws, and the weakening of political parties has increased people’s concerns about their overall influence. The mismatch in group resources and the focus of groups on their own interests leave many concerned that the public is not represented, thereby possibly overriding the majority will. Research suggests the influence of interest groups is greater for issues on which there is no intense public sentiment. Interest groups also have more influence on less visible votes such as those taken in congressional committees as opposed to the floor of Congress.

**Split Labor Market**

The term *split labor market* comes from Edna Bonacich’s landmark study of how the differential price of labor for competing ethnic or racial groups plays a role in the creation of ethnic antagonism and
conflict. Within a capitalist market economy, the combination of key factors such as employers’ imperative to maintain a cheap labor supply and competing ethnic groups who draw from diverse and limited resources, in turn, results in a multilayered labor market, ethnic antagonism, and sometimes violence between these groups. This important 1972 study moves beyond explanatory models of ethnic antagonism that focus exclusively on religious and linguistic differences, skin color, and cultural learning and examines instead how conflicts are produced by interactions between groups. Split labor market theory reveals how ethnic and racial social conflict is shaped by economic competition, unequal distribution of resources, and class strife and, therefore, fits within a neo-Marxist theoretical paradigm. This theory has been widely applied in historical and comparative sociological analyses that examine ethnic and racial conflicts in relation to the labor market and class stratification and, in particular, in studies of new contact situations with immigrant or migrant laborers as well as racial antagonism during the American postwar period.

Specifically, Bonacich outlines how a split labor market contains differences in the price of labor—that is, the sum cost of wages, recruitment, benefits, and worker strife—for the same occupation of at least two groups of workers. This difference, therefore, is not the result of a direct discriminatory response to a particular racial or ethnic group. Rather, this stratification emerges as an effect of long-term processes and/or social conditions that create inequalities in resource distribution between these groups. Group differences in resources (e.g., economic, political, general knowledge) and motives (e.g., workers’ desire to obtain temporary versus permanent work, investment in labor disputes, and willingness to participate in unions) lead to a preliminary gap in the cost of labor. Ethnic groups new to the labor force may, for instance, be willing to accept low-paying or undesirable jobs and be less likely to engage in labor strikes. For the higher-paid labor group, the split labor market provokes fears of being displaced by the new ethnic group and/or accepting lower wages. The lower-paid labor group does not intentionally undermine the higher-paid laborers, but is more effectively exploited by employers because of their relative lack of resources with respect to the higher-paid group. In turn, growing hostilities between these groups produce further antagonism and violence and occasionally result in outcomes driven by the higher-paid group such as ethnic exclusion and the creation of caste systems. While ethnic exclusion policies draw divisions around ethnic members and severely limit their ability to participate in society (e.g., immigration caps), caste systems depend on the labor of ethnic members yet simultaneously exploit the group and debilitate their overall employment (e.g., South African apartheid). Other studies have investigated how employers play an active role in creating ethnic or racial divisions and examined alternative historical outcomes to the split labor market.

STALKING

Stalking first became recognized as a crime in the United States in the late 1980s. After the highly publicized stalking and murder of television actress Rebecca Schafer in 1989, as well as several other stalking murders and attempts, stalking moved onto the public’s radar. Legislation criminalizing stalking followed these tragic, and potentially foreseeable, events. California was the first state to adopt legislation defining stalking as a criminal offense in 1990. Other states followed in short order. Since 1994, all 50 states have similar classifications.

The National Center for Victims of Crime estimates that 1 out of 12 women and 1 out of 45 men will be stalking victims during their lifetimes. Thus, during any given year, nearly 1,000,000 women and 400,000 men experience an episode of stalking.

Despite the staggering prevalence of stalking, it remained relatively unnoticed until only recently, and even then, policymakers have had difficulty with its definition. Undoubtedly, some of these difficulties stem from the orientation of the criminal justice system: that one is innocent until proven guilty and one cannot be arrested without some type of justification.
Prior to stalking legislation, a victim might have reported her stalker to the police only to be told that they could not do anything because "he (she) hasn’t done anything wrong (yet)." Now, while specifics vary across states, most statutes include definitions that convey that (a) the behavior is a course of conduct that is unwanted and harassing, causing substantial emotional distress and serving no legitimate purpose; and (b) the offender must pose a credible threat to the safety of the victim, her family, or friends. Most recently, lawmakers added cyberstalking to the growing ways in which stalkers threaten and frighten their victims.

The Problem of Definition

Interpreting the definitions and behaviors of stalking is problematic. For one, how many acts does it take to determine that certain behaviors create a "pattern" or "course" of conduct? Further, the terms credible and threat are complicated. For example, how serious does one have to be to be considered credible or reasonable? Presumably standards for reasonable fear could be different for males and for females; if so, which standard should we use, or should they be different? Further, must threats be verbal? Could threats be written? Do they have to be clear and direct, or can they be implied?

Similarly, typical or usual (and completely understandable) victims’ responses often jeopardize their cases as well as their positions and significance as "victims" in the eyes of the criminal justice system. To illustrate, many victims engage in what are called "acquiescent strategies"; that is, assenting to their stalkers to some small extent so that "he would stay cool." Law enforcement personnel may see the victim as being unsure of what she wants or leading the stalker on. Another example is that many stalkers engage in "courtship"-like behaviors (e.g., leaving a rose on the windshield of the victim’s car, professing love, begging the victim to return). While the victim is aware of the true meaning and threatening nature of these "romantic" displays, others, such as criminal justice personnel, may see these seemingly insignificant behaviors as no cause for worrying or being concerned. Such issues regarding the definition of stalking may negatively impact victims’ experiences with the criminal justice system as well as the ability of criminal justice personnel to adequately protect the victim. As such, many victims of stalking do not report their harassment to the police or do so only minimally.

Stalking Offenders

Most scholars typify stalkers into three categories: simple obsessional, love obsessional, and erotomania. The simple obsessional is the type who stalks his or her ex-spouse, lover, or former boss. The love obsessional is typically a male who stalks a stranger (possibly a celebrity) and professes inappropriate romantic notions. Finally, the erotomaniac is typically a female who stalks a man she believes loves her. She reinterprets his responses to her in order to support her delusions. Other typologies of stalkers include the intimate stalkers, who want to (re)establish a permanent romantic union; the rejected stalkers, who pursue their victims in order to reverse or avenge a rejection (e.g., divorce, separation, termination); and predatory stalkers, who spy on their prey so they can plan an attack—usually sexual—on the victim.

Stalkers use a wide variety of strategies. Depending on the type of stalker, she or he may use courtship behaviors like professing love or begging the victim to return. The offender may use surveillance techniques like following the victim, driving by the victim’s home or place of work, spying on the victim, tapping phones, or otherwise listening in on the victim’s conversations. Most stalkers utilize threats, either direct or implied, against victims. These may include threatening to kill the victim; breaking in or vandalizing the victim’s car, home, or property; entering the victim’s home without permission; verbally abusing the victim; threatening to harm the victim; threatening the victim with a weapon; or threatening suicide if the victim does not comply. Stalking often escalates into violent behaviors such as physical assault, preventing the victim from leaving some place, sexually assaulting the victim, or murder. Other types of typical behaviors by stalkers are showing up at the victim’s home or work, repeatedly telephoning, contacting the victim’s family, and leaving written messages.

Stalking Victims

Women are primarily the targets, and their stalkers are usually ex-partners who cannot accept the conclusion of the relationship. Typically, the stalking behaviors start soon after the conclusion of the relationship, one often characterized by abuse. The Federal Bureau of Investigation estimates that about one third of female homicide victims were previously stalked by their killers.
Stalking victims are unique from many other types of crime victims. They experience an ongoing crime rather than one with a definite beginning and end. Many experience great confusion, because stalking often incorporates romantic gestures intermixed with threatening overtones, and the victim may once have even loved the stalker. Nonetheless, stalking is a crime that produces extreme stress, fear, and hysteria. The stalker may appear to be everywhere; she hides but he finds her. He may be whispering sweet nothings to her, but he may be ranting abuse as well. Victims try to get help, but often it is not particularly effective, and all the while he or she continues to experience stalking. Victims may experience denial and self-guilt, shock and confusion, irritability, fear, anxiety, phobias, panic attacks, anger, depression, flashbacks, difficulties with concentration, post-traumatic stress disorder, health problems, sleep disturbances, or alcohol or drug use or abuse.

STANDARDIZED TESTING

A common misconception equates the term standardized test only with those tests that use multiple-choice items and machine-readable (“bubble”) answer sheets. To the contrary, if any aspect of a test—format, procedures, or administration—is standardized across test takers, it can be considered a standardized test. Thus, tests with written, oral, or otherwise “constructed” instructions or responses can be standardized. Physical tests, such as those conducted by engineers, can be standardized, of course, but most focus on the measurement of latent (i.e., non-observable) mental traits.

Both surveys and tests measure mental traits. Surveys typically measure attitudes or opinion, whereas tests typically measure proficiencies or aptitudes. Like surveys, however, tests are composed of items (e.g., questions, prompts).

Educators and psychologists are the most frequent users of standardized mental tests. Educators measure academic achievement (i.e., mastery of knowledge or skills), diagnose learning problems or aptitudes, and select candidates for higher academic programs. Psychologists measure beliefs, attitudes, and preferences; diagnose psychological problems or strengths; and select candidates for employment.

Good standardized tests tend to be reliable—producing consistent results across time, conditions, and test takers, when the characteristics of the test takers are held equal—and valid—measuring those traits that they are intended to measure. When used for selection (e.g., university admission, employment), an effective test has strong predictive validity—a high correlation between test scores and future performance—or allocative efficiency—a high correlation between test scores and the performance of a group as a whole when the separate individuals are organized in a particular structure of relationships.

When tests have consequences, or stakes, they can induce beneficial washback effects. A plethora of research studies demonstrates that students and candidates study more and take their studies more seriously (and, thus, learn more) when facing tests with stakes. Moreover, when test takers wish to perform well, and their teachers wish to help them, they tend to focus their preparation on mastering that knowledge or those skills they judge will be covered by the test. This has the indirect, but usually beneficial, effect of increasing efficiency by aligning educational or training program curricula with known standards, benchmarks, and goals.

Education Tests

In most of the world, systemwide education tests are based on common standards and curricula. Teachers align their instruction, and students their study, to them. Most of these tests have consequences and,
typically, are placed at the entry and/or exit points of levels of education. Most countries require both upper secondary exit and university entrance examinations as well as either lower secondary exit or upper secondary entrance exams.

In the United States, however, where education governance is more fragmented, common standards and curricula have been difficult to implement and enforce. In the place of standards-based (criterion-referenced tests) tests, many U.S. states and school districts purchased norm-referenced tests from commercial test publishers. The “norms” were constructed through field tests with national samples of students on a generalized curriculum of the publishers’ own construction. In the absence of standards-based testing, aptitude tests were often used to make consequential decisions, such as assigning students to special programs, retaining them in grades, awarding them scholarships, or admitting them to selective schools or universities.

The courts, however, have since declared it unfair to impose negative consequences, such as retention in grade or diploma denial, on students who fail tests based on pseudo-curricula rather than the one to which they actually were exposed. This principle has since been written into the Standards for Educational and Psychological Testing, which have become the de facto regulations governing legal uses of standardized tests in the United States. As a result, virtually all grade promotion and graduation examinations are now standards based, not norm referenced, and achievement, not aptitude, tests.

Test Development

Standardized tests evolve through a demanding and time-consuming process based on either classical test theory or item response theory. In classical test theory, every test is custom designed and relevant to a particular population. First, one develops a test content framework, or outline, and then validates it with reviews by experts or current job holders. Next, one drafts test items and field tests them with a representative sample of the test-taking population, which can be difficult to do without exposing that population to the test content.

Test development according to item response theory (IRT) requires large populations of test takers to produce reliable test statistics, but these statistics are not then dependent on any particular choice of respondent samples. Moreover, respondent scores are independent of any particular choice of test items.

Computer-adaptive testing (CAT) owes its existence and its increasing popularity to IRT. With CAT, test takers are presented an item at a level of difficulty determined by their performance on the previous item. Correct responses yield more difficult subsequent items. Those responding to all items correctly can finish the examination early by circumventing the need to respond to the less difficult items.

Standpoint theory is a feminist epistemology with roots in Marxist ideology. Feminist scholars use the term *standpoint* in varied ways, making it difficult to think about standpoint theory as a unified project. A central premise of all feminist standpoint epistemologies is the idea that all knowledge claims are historically and socially situated. While dominant modes of scientific inquiry posit a disembodied knower, feminist standpoint theories treat all knowledge as bounded by the cultural position, historical place, and biography of the knower. Standpoint theorists propose a redesign in the generation and evaluation of knowledge claims.

Standpoint epistemologies begin in a critique of the standards of objectivity and claims of universality that dominate in the natural and social sciences. For standpoint theorists, claims of objectivity conceal the androcentric underpinnings of science and obscure the ways that men established the authority of scientific knowledge to serve their own interests. Standpoint theory challenges not only the idea that knowledge emerges from a position of nowhere—what standpoint theorist Donna Haraway has called “the god trick”—but also the idea that an essential truth in the order of things can be recovered. Against the claim of an absolute truth, standpoint theorists see only the possibility for partial and multiple truths that always begin with a situated and embodied knower. Taken together, the recovery of differing standpoints provides a more complete and less distorted representation of social reality.

Standpoint theories recognize the production of ideas as a central dimension of women’s oppression. Standpoint epistemologies have problematized women’s exclusion and alienation from and misrepresentation and objectification within the production of knowledge. Standpoint theorists, building from Hegelian and Marxist ideas, propose that marginal groups, because they are positioned outside the nexus of power, offer a unique and legitimate perspective on the social world.

Feminist standpoint theorists also see an implicit link between knowledge and emancipation. A central aim of standpoint theories is to recover women’s experiences and the subjugated knowledge of other oppressed groups, seeing this as critical to ending systems of oppression and developing a transformative consciousness for historically subordinated groups. Emphasizing the link between knowledge and empowerment, feminist standpoint theorist Patricia Hill Collins, for example, seeks to make black women agents of knowledge about their own lives.

Early articulations of standpoint theories were often critiqued for being either too relativistic or for essentializing the category of woman as knower. Feminist standpoint theorists have countered the claims of essentialism by arguing against a universal feminist subject of knowledge, seeing women as differently positioned in society and therefore able to offer a set of diverse perspectives. Feminist standpoint theorists have countered the charge of relativism, seeing feminist standpoint epistemologies first, as a complement to other modes of empirical inquiry, and second, by refusing to concede that all standpoints are equally valid.

State Crime

State crime is any action that violates international public law and/or a state’s own domestic law when committed by individual actors acting on behalf of, or in the name of, the state, even when such acts are motivated by their personal economical, political, and ideological interests. Crimes of the state have been one of the foremost social problems of the past 100 years, with wide-reaching costs and little in the way of potential controls.

During the course of the 20th century, the state crimes of Turkey, Nazi Germany, Stalinist Russia, Pol Pot and the Khmer Rouge, and Maoist China were especially large-scale, dramatic examples. Crimes of the state involving weapons of mass destruction, genocides, and crimes against humanity have been all too frequent (e.g., Bosnia, Croatia, Darfur, Democratic Republic of Uganda, the Democratic Republic of Congo, Rwanda, and Yugoslavia). Other charges of state crime occurring around the world involve Egypt, Israel, the United States, China, United Kingdom, Russia, Chechnya, and North Vietnam.

In the late 20th century, new major initiatives sought to bring perpetrators of crimes of the state to trial, including International Criminal Tribunals focusing on genocides in Bosnia and Rwanda, and the establishment of the Rome Statute of the International Criminal Court. As legal attention to such events increased, so has the scholarly community’s attention toward description and analysis of these phenomena.

Costs of State Crime

Committing the most harmful of crimes (physical and economic) are entities and individuals acting on the behalf of, or in the name of, the state. Such acts have cost citizenries and the international society incalculable losses. Additionally, genocides, war crimes, and crimes against humanity have claimed millions of lives over the past century. Further, they produce an immeasurable amount of pain and suffering for the survivors. Crimes of the state also can lead to the destruction of infrastructures, resulting in additional devastating atrocities (e.g., the 2002 sinking of the Senegalese ferry Le Joola, with a loss of more than 1,000 lives).

State crimes can also result in environmental destruction, with devastating effects on generations of citizens (e.g., the 1986 disaster at Chernobyl). More important, state-committed crimes rip asunder the social trust between a state and its citizenry (e.g., Watergate) as well as trust between states (e.g., invasion and occupation of sovereign states, including most recently Iraq). When states violate such trust, domestically or internationally, they threaten the security of the global order, peace, and legitimacy of an international community. To maintain peaceful, productive, and respectful global interactions, nations must agree to, and abide by, the rule of international law that guides states’ behaviors.

State Crime and Criminology

An outgrowth of Edwin Sutherland’s 1939 call to expand the purview of criminology to crimes of the powerful, the subfield of state crime specifically traces its origins to William Chambliss’s 1988 American Society of Criminology presidential address on state-organized crime. Exploring crimes such as piracy and smuggling, Chambliss showed how states can be crucial in the organization and support of activities that violate their own laws and international laws when doing so fulfills their broader political and economic objectives. Criminologists, particularly critical criminologists, quickly adopted the concept, broadening and enriching the field. Their early work focused not only on crimes tacitly supported or organized by a sovereign polity, but on actions committed by nation-states themselves. As this field evolved, it broadened the definition of state crime to include all actions committed by states that violated domestic, international, or human rights laws, as well as incidents of states or state agencies failing to take actions when obligated to do so.

Critics suggest that reliance on governmental or quasi-governmental agencies for the labeling of actions as crimes removes scholastic independence and mires the field within political struggles in national or international arenas. Others advocate a social harm-based definition. This position points out that laws are created by states within political processes, and therefore law is a non-objective definitional criterion. Rather, behaviors engaged in by a state or its agents that generate demonstrable social harm on a nation’s citizens or the citizens of another nation are actually state crimes. Those who advocate this position claim that through the use of a nonlegal (and thereby nonpolitical) definition, independent scholars can...
define and explore the phenomena in a more objective fashion. Critics of the social harm definition suggest that socially injurious actions, the main definitional criterion, are vague and open to individualistic political interpretation, even if they avoid the political constructions of states.

Other cognate areas of state crime include political crimes, political white-collar crimes, environmental crimes, finance crimes, and the recently added crimes of globalization. Crimes of globalization recognize the intertwining of states and international finance institutions (e.g., World Bank and the International Monetary Fund) that can result in forms of state crime.

**International Controls of State Crime**

The capacity of international law as a control for state crime can be both a potential deterrent and a guide for state behaviors. However, due to the problematic ways of international law enforcement (or non-enforcement), it does not hold the same deterrent power over states as domestic laws may have over the citizenry. Nonetheless, law can be a post hoc control to address states’ and/or individual state actors’ criminality. There are five main venues for such controls: states’ domestic prosecution, the United Nations, international criminal tribunals, the International Court of Justice, and the International Criminal Court.

The United Nations exists as a mediating agency through which states can air their concerns and grievances before an international audience. Designed as a diplomatic clearinghouse, it has the ultimate goal of enhancing international peace and stability via dispute resolution. The International Court of Justice is essentially a global civil court where disputing parties seek either arbitration or a trial hearing. They can submit themselves to binding and nonbinding agreements when various treaties have been violated. The International Criminal Court is a permanent criminal court designed to investigate, prosecute, and punish genocide, war crimes, and crimes against humanity. It is a complementary court empowered to act when a given state is unable or unwilling to do so itself.

**STATUS OFFENSES**

Status offenses refer to conduct considered illegal only when committed by a minor. These acts of “non-criminal misbehavior” include running away, curfew violation, truancy, underage drinking or smoking, and ungovernability. Understanding status offenses as a contemporary social problem requires us to contextualize them within a historical perspective. Changing conceptions of gender, race/ethnicity, social class, family, and urbanization play a fundamental role in shaping their construction.

**History of Status Offenses**

During the colonial era, the family served as the model for morality and social order. In this period, the family—particularly the father—had ultimate legal autonomy to maintain discipline of children. Domestic matters such as childrearing remained in the private domain, and families viewed government attempts to intervene with suspicion. This authority met its first systematic challenge in the early 19th century, however, with the identification of poverty as a particularly pressing social ill. A centralized system of public...
and private institutions evolved to address poverty, and reformers worried about its nearly inevitable result—crime and vice.

As poverty, immigration, urbanization, and delinquency became inextricably linked in reformers’ consciousness, the children of the “dangerous classes” became the targets for institutional reform. Following the writings of Thomas Malthus, reformers worked to alleviate poverty and delinquency by inculcating the children of immigrant families with the virtues of hard work, self-control, and individualism. The first House of Refuge was instituted in New York City in 1825, soon followed by Boston in 1826 and Philadelphia in 1828. The education provided by these institutions, and at reformatories opened in the latter half of the 19th century, emphasized the acquisition of skills for agricultural and industrial work for boys and preparation for domestic servant positions for girls. In addition to instilling middle-class values and preparing youth for a working-class existence, this work was a chief source of revenue.

The first juvenile court, established in 1899, created a dual system of justice for juveniles and adults. While the primary response for adult offending was punishment, the juvenile court saw its role as intervention and rehabilitation. Viewing youthful offenders as innately pure and especially amenable to change, reformers worked to intervene before they encountered the “slippery slope” of criminality. The legal concept of parens patriae allowed the juvenile court far-reaching authority to intervene in the “best interests” of the child and his or her community. Almost any behavior, particularly those associated with poor ethnic immigrants (e.g., loitering and general idleness, begging, frequenting pool rooms), could suggest the need for intervention. Juvenile judges viewed their power to remove children from the home and commit them to institutions for moral education as both a means to support families that were unable to control their children and a way to address the failure of some parents to properly raise their children. Because these facilities were rehabilitative, not punitive, in nature, reformers failed to view the similar treatment for status offenders and delinquent law violators as problematic.

This practice continued, unchallenged until the 1960s, when youth workers began to advocate for the separation of status and delinquent juvenile offenders. Charging that status offender laws were essentially “omnibus” regulations whose vagueness allowed the court too much discretion, these advocates argued that placing status offenders in detention and reform facilities was not only unfair but ineffective. Moreover, they expressed concern about the stigma resulting from involvement in the juvenile justice system and the potential for harmful peer associations with delinquent offenders. As a result of their efforts, the Juvenile Justice and Delinquency Prevention Act (JJDPA) of 1974 made it illegal to house status offenders in secure detention. For the next 5 years, approximately 65,000 young people were held in custody for status offenses. Then, the proportion of status offenders in secure facilities declined dramatically, but the practice has not been completely eliminated.

**Status Offenses Today**

Since some states treat status offenders as dependency cases (often termed “in need of supervision”) and others are addressed through the juvenile justice system, current counts of status offenders are difficult to ascertain. Of the more than 2 million juvenile court cases processed annually, 16 percent are status offenses. One-fifth of status offenses are handled formally, led by charges for underage drinking (28 percent) and truancy (24 percent).

In 2003, juvenile facilities held just under 5,000 status offenders, an average of 5 percent of the total number of juveniles in custody. Status offenders are more likely to be held in private than in public facilities, in contrast to their delinquent counterparts. These private facilities are generally staff-secure (instead of locked) and involve longer stays in custody. More than one quarter (27 percent) of status offenders in detention facilities and 42 percent in residential placement are there as a result of ungovernability. Just over half (52 percent) of status offenders in custody are racial/ethnic minorities, an increase from 41 percent in 1991.

Status offender laws disproportionately affect girls. Nearly one quarter of the girls housed in detention centers are there as a result of status offenses, compared to only 4 percent of boys. Most of these are runaways who have fled their homes as a result of sexual or physical abuse (60 percent of youth petitioned for running away are girls). Until better alternatives for females are widely available, however, secure detention facilities will continue to fill this service gap in the system.

Evidence suggests that the mental health system has become an alternative means of addressing the
problem of status offenders. Private facilities have increased their advertising for parents encountering difficulties with their children’s substance abuse or other problem behavior. However, while the status offenders in the past were most likely referred by parents and schools, police are now responsible for half of the status offense referrals made to the juvenile court. As more major cities pass curfew ordinances and establish truancy courts, there will undoubtedly be continued shifts in the way status offenses are viewed and treated.

**STEREOTYPING**

Stereotypes are oversimplified generalizations used to describe a person or group. They can exist in virtually unlimited categories. Age, gender, race/ethnicity, religion, hair color, height, weight, residential locale, and occupation are but a few of the possibilities.

Stereotypes act as a means to simplify unfamiliar situations. In initial contact with an unknown person or group, one typically engages in *categoric knowing*; that is, classification on the basis of limited information obtained by visual and/or verbal clues. These quick judgments may well contain some elements of truth, since they rest on perceived characteristics. The problem is that, once assigned, these stereotyped characteristics virtually take on a life of their own, becoming difficult to eradicate. Moreover, when stereotypes get applied to an entire group, such perceptions ignore the wide range of individual differences within that group.

Another problem with stereotypes is that they affect others’ reactions to the one stereotyped. For example, if an individual is labeled as “trouble,” then others may either avoid her or him and/or prejudge that person. Similarly, members of a group labeled as “lazy” may well encounter difficulties in finding jobs.

Stereotypes often form as a response to a particular stimulus. Historically, common factors that initiated common stereotypes were economic and social competition, misunderstood cultural attributes, wartime panic, and fear of one’s own group losing power as others gain power. Unsurprisingly, therefore, stereotypes are typically negative in nature, regardless of the group they are describing. The rare exception usually occurs regarding stereotypes of those who hold societal power.

One may argue that stereotypes have an almost instinctive role. When people must assess danger, their decision for flight, fight, or remaining calm must rely on some type of external factor. Usually individuals rely on the stereotypes of an individual’s group to deduce whether or not the person is a risk. For instance, if a person were confronted by two strangers—one dressed in ragged, dirty clothes and the second nicely dressed—appearance will dictate the response. Despite the many variances of possibilities as to who these individuals actually are and what they are truly doing, typical stereotypes would lead one to believe the former is potentially dangerous and the latter is someone who is not a threat.

Since stereotypes vary from society to society (sometimes even within one society), one must question their true validity. For example, race is a biological reality, but it is also a socially contrived concept based on physical attributes. Thus, still influenced by its legacy of slavery, the United States has a more
rigid racial classification system and greater problems with racism than does Brazil. Similarly, the social construction of gender leads to different stereotypes, perceptions, and social interaction patterns from one society to another. Although male and female are biological concepts, what is considered masculine or feminine varies greatly among societies.

Although stereotypes may be useful at times, they are not always beneficial and are frequently degrading. The problem with the quick assumptions one makes based on stereotypes is that they are often derived from prejudicial beliefs and have little or no merit. Therefore, as these stereotypes are perpetuated, so is the prejudice (i.e., negative feeling) toward that particular group.

The existence of stereotypes affects academia. If stereotypes exist that a certain race, ethnic group, and/or gender academically performs either well or poorly, then students are more likely to be treated with bias and either favored or disfavored based on their membership, or lack thereof, in the stereotyped group. Even if the perceived unintelligent student was actually smarter than the perceived intelligent student, the biased treatment from the teacher could lead to a self-fulfilling prophecy in which the former student performs poorly and the latter student performs well. If this phenomenon continues to occur throughout the students’ academic careers, the stereotypes will continue to perpetuate self-fulfilling prophecies and contribute to the cyclical process of keeping minorities without power in society. For example, poor performance in school leads to the likelihood of low-paying jobs. In turn, this will keep these individuals in low-income neighborhoods that are likely to have poor educational systems more likely to give their children a below-average-quality education. Therefore, stereotypes can play a key role in continuing the cycle of poverty.

Further affecting minorities are criminality stereotypes, an all-too-often label they receive. This results in racial profiling, when minorities of a particular racial or ethnic group are more likely to be questioned by police and hence more likely to be charged with a crime. This can be particularly troublesome in court: if the defendant is of a minority group typically stereotyped as “criminal” and the jury is familiar with that stereotype, the issue of how likely that minority person would receive a fair trial arises. Stereotyping can help us understand why crimes committed by the lower class and minorities are seen as more wicked and immoral than white-collar crimes, which are typically committed by the upper class of society.

Even positive stereotypes can have negative consequences for a particular group. Consider Asian students stereotyped as excelling in math and science. If an Asian student does not do well in these subjects, that individual could feel inadequate and have emotional distress, perhaps even severe depression.

Additionally, if only members of a group are stereotyped and perceived to be good at a particular task (such as playing a sport or taking a science test), then others may not perform at their true level because they believe they will not do as well. Also, when members of a particular group are obviously or subtly made aware that their group generally performs poorly on a task, they are much more likely to perform more poorly on that task. This effect has obvious consequences in the classroom as well as on the athletic field and workplace.

The media portrays and reinforces stereotypes. One latent function of the media is to both teach and reinforce cultural norms and values. Therefore, the stereotypical depictions of gender and/or minority roles vary through time and reflect present-day societal norms. Conflict theorists argue, however, that the upper class or elite of society rule the media and are more apt to project the norms, values, and stereotypes that keep them in power. Since the owners of media are often white males, they are more likely to favor programs that portray and stereotype white males powerfully. This transmission of stereotypes through media leads to their legitimization and continuation in a society.

Another drawback with stereotypes is that they are often long lasting. Once a person has learned a stereotype about a particular group, it is difficult to erase or forget that belief. Even when meeting individuals of that group who do not fit the stereotype, one often dismisses those individuals as “exceptions to the rule.” Therefore, if a member of the minority group (stereotyped as criminal) stops a crime from occurring, one may view that person as “one of the few good minorities.” Additionally, if a member of the majority commits a crime, one may view that person as being deviant and acting out of character.

One does have the ability, however, to overcome learned stereotypes and to judge others on a more individual basis. The ability of a person to do so relies on three factors. First, as the amount of personal information known about another increases, the stereotype loses relevance. Second, a person’s cognitive ability affects how likely one will rely on stereotypes; a person without the time or mental clarity to correctly
assess another will be more likely to make quick judgments based on stereotypes. The third factor that enables someone to overcome a stereotype is motivation; if someone were to be rewarded (financially or otherwise) for making an accurate judgment about someone, this could encourage a more accurate impression rather than a reliance on stereotypes. Ironically, research shows that the more people try not to use stereotypes, the less they are able to not use them; even if they can suppress using stereotypes for the short term, afterward the stereotypes often rebound more strongly than before, resulting in greater prejudice.

Although stereotypes simplify situations for people and allow them to make quick judgments based on limited information, they can also have serious negative consequences for all members of society. Due to the tendency for stereotypes to disproportionately affect minorities negatively, it is important for one to use stereotypes with caution and to make an effort to judge people based on individual characteristics and less on stereotypes of the group to which they belong.

STIGMA

A stigma is any social marker that refers to a deviation from the norm. It can be a trait that the general population deems unacceptable or undesirable or a mark of disapproval based on undesirable beliefs, ideas, behaviors, or even personal characteristics. Individual societies determine what is acceptable or “normal.” Anything that deviates from the acceptable is stigmatized. What may be a stigma in one society or community at a particular moment in time may be an acceptable attribute in another. The stigmatized are sometimes thought of as deviant, since their stigmas may have caused them to deviate from what are considered to be societal norms.

Stigmas are often based on race, ethnicity, culture, social and economic status, gender, sexual orientation, religion, and even educational attainment. For example, racial/ethnic minorities, people from non-Western cultures, the poor and/or working class, women, non-heterosexuals, non-Protestant Christians, and people with less than a college education (as that often signifies class) are more likely to be stigmatized in U.S. society. Physical appearance often leads to assumptions made about people. Stigmas can even be based on physical features such as skin, eye, and hair color; hair texture; body size and type; and height. Often people with darker skin and eyes, dark hair that is not straight, the overweight (or sometimes even the underweight), and people who are short or too tall can all be stigmatized, and so can people with perceived physical and mental disabilities. Most important, understandings and perceptions of stigma are socially constructed. Stigmatizing attributes change depending on time and/or location. For example, 200 years ago in the Western part of the world, a tanned, white, muscular male was considered undesirable because his tan and muscular frame alluded to the fact that he was probably part of the working class, possibly a farmer or someone who worked with his hands.

Markers of identity and/or physical attributes are stigmatized along with behaviors, beliefs, and even political affiliations. For example, criminal or deviant behavior and even some illness or sicknesses can be stigmatized. People with belief systems different from that of the dominant group can face ridicule and stigma, as experienced by communist sympathizers during the 1950s in the United States.

Probably the most well-known work on stigmas in the social sciences is Erving Goffman’s Stigma: Notes on the Management of Spoiled Identity. Published originally in 1963, Stigma examines the experiences of both the individual and the society when a person is considered to not be “normal” for some reason or another. According to Goffman, there are three types of stigma. The first type of stigma is physical in nature; this includes deformities such as missing limbs or obvious physical disability. The second type of stigma is based on ideas or beliefs. Examples of this form of stigma include everything from homosexuality to political beliefs. The final type of stigma, as described by Goffman, involves issues around family and lineage. Such stigmas are concerned with religion,
caste, and race—things passed on from one generation to the next.

Goffman argues that forming stigmas about an individual can be somewhat beneficial to those who apply the stigma to different groups, because it serves to psychologically protect them from the idea that they could easily become inflicted with the stigmatizing characteristics. Goffman maintains that we look for a way to blame the individual, and this serves as a justification for ways in which people without the stigma treat her or him.

An example of this occurred during the early 1980s and still exists today with HIV/AIDS. AIDS, a disease that occurs when the HIV virus weakens the immune system, leaving the body prone to infection, was highly stigmatized when it was first discovered. AIDS symptoms were originally noticed among gay men, which led to the identification of the gay-related immune deficiency syndrome or GRIDs. GRIDs later became AIDS, or acquired immune deficiency syndrome, when heterosexuals became infected. However, it soon became apparent that heroin addicts, sex workers, and other more deviant populations were also becoming infected due to increased at-risk behaviors that involved the sharing of bodily fluids. With the exception of hemophiliacs and babies born to AIDS-infected mothers, AIDS was associated with people on the fringes of society, and as such, AIDS became a stigmatized illness. Since a number of people did not consider themselves at risk for HIV infection because they were not homosexuals or drug addicts, rates of HIV infection increased among non-intravenous-using drug addicts.

The relationship between the stigmatized and society becomes important in examining what a stigma may mean. Frequently, stigmas contribute to discrimination and prejudice. Societal reactions to stigmas have an incredibly negative impact on the stigmatized individual. Stigmas tend to be influenced by the perceived threat the individual may pose to others. This devalued attribute leads to a number of stressors for the targeted individual. The prejudice and discrimination that people experience as a result of their stigma increases their levels of stress and can affect everything from where they live to where they attend school and work. This can also negatively impact the self-perception of the stigmatized individual. They may devalue themselves or perceive themselves as worthless or less than attractive, and this can be especially problematic in the teenage years, when self-perception relies heavily on acceptance by others.

Though social scientists focus on the impact that stigma has on the individual, they are most often concerned with the impact the stigma has on society. Stigmas are frequently based on stereotyped beliefs individuals have about people associated with a particular stigmatized attribute. The discrimination that people experience as a result of their stigma has many large-scale societal implications. Racism and racist social policies, such as those in the South after the Civil War—for example, Jim Crow and the notion of “separate but equal”—forced a legal separation between blacks (and other people of color) and whites. Today, people of color still experience employment and housing discrimination, even harassment.

Strain Theory
Strain theory states that the experience of strains or stressors increases the likelihood of crime. Strains refer to events and conditions that are disliked by individuals. Examples include the inability to achieve valued goals, such as economic success; breakup with a romantic partner; and verbal and physical abuse. Individuals sometimes turn to crime in an effort to cope with their strains. For example, they sell illicit drugs or engage in prostitution in an effort to achieve their economic goals. Strain theory describes those types of strains most likely to lead to crime, the reasons why strains lead to crime, and the factors that influence the effect of strains on crime.

The initial versions of strain theory, such as that of Robert Merton, focused on that type of strain involving
the inability to achieve economic success. Merton argued that all people in the United States are encouraged to pursue the goal of economic success, but many people—particularly lower-class people—are unable to achieve this goal through legal channels. More recent versions of strain theory examine other types of strains, with Robert Agnew’s version of strain theory being the most general.

Agnew focuses on three major types of strains: (1) the inability to achieve positively valued goals, including economic, autonomy, and masculinity goals; (2) the loss of valued possessions and relationships, such as the death of a close friend; and (3) the experience of noxious events and conditions, such as being bullied at school. Agnew argues that strains are especially likely to result in crime if, among other factors, they are serious and seen as unjust. For example, individuals are more likely to respond with crime if they are subject to an unprovoked punch by another versus an accidental bump while walking down the street.

Research suggests that several strains increase the likelihood of crime, including the inability to achieve goals; parental rejection; harsh or erratic parental discipline; childhood abuse and neglect; partner abuse; negative school experiences, such as low grades; chronic unemployment; work in low-paying, dead-end jobs with unpleasant working conditions; homelessness; peer abuse; criminal victimization; and experiences with prejudice and discrimination.

The experience of strains increases the likelihood of crime for several reasons. Strains contribute to a range of negative emotions, such as anger, frustration, and depression. These emotions create pressure for corrective action, and crime is one possible response. Crime may allow people to reduce or escape from their strains. For example, individuals may engage in theft to achieve their economic goals or they may run away to escape abuse by their parents. Crime may allow people to seek revenge against the source of their strains or other targets. For example, individuals may assault the peers who insult or bully them. And crime may allow individuals to alleviate their negative emotions. For example, individuals may use illicit drugs in an effort to make themselves feel better.

Strains may also lead to crime because they reduce the individual’s ties to conventional others and institutions. Individuals who are mistreated by their parents, for example, may come to dislike their parents. And individuals who receive low grades in school may come to care little about school. People with weak ties to conventional others and institutions have less to lose by engaging in crime. Further, strains may increase crime by fostering beliefs favorable to crime. Individuals who are regularly bullied by others, for example, may come to believe that violence is justified if one is provoked. Finally, strains may increase crime by causing individuals to associate with other criminals, who encourage and reinforce crime. Individuals who cannot achieve their economic goals through legal channels, for example, may join criminal gangs in an effort to make money through illegal channels—such as selling drugs.

Most individuals who experience strains, however, do not turn to crime. Rather, they cope in a legal manner. For example, they negotiate with the people who mistreat them or they exercise to relieve their stress. Strain theory devotes much attention to those factors that influence the likelihood that people will respond to strains with crime. A criminal response is said to be more likely among people with poor coping skills and resources. This includes people with low IQs, low self-control, poor social and problem-solving skills, and limited financial resources. A criminal response is said to be more likely among people who are low in social support; that is, people who cannot turn to others, such as family members and friends, for help in coping. Crime is said to be more likely among people who have little to lose by engaging in crime, such as people who lack close ties to family members and do not have good jobs. And crime is said to be more likely among people who are disposed to crime, such as people who have criminal friends and believe that crime is sometimes justified. Research provides some support for these predictions, although more research is needed on those factors that increase the likelihood of a criminal response to strains.

Strain theory has not only been used to explain why some individuals are more likely to engage in crime than others, but also why some groups have higher crime rates than others. For example, males are said to have higher crime rates than females because they are more likely to experience strains conducive to crime, such as criminal victimization, and they are more likely to cope with strains through crime, partly because they are lower in self-control and are more likely to have criminal friends. Strain theory, in sum, constitutes one of the leading explanations of crime.

Stratification, Age

Stratification is the process of dividing members of a society into strata, or social groups; when this is done by age, it is termed age stratification. The various age strata form age cohorts that encompass those born within a particular time period. One of the largest and most well-known age cohorts in contemporary society is the baby boomers, those born after World War II between 1946 and 1964. These cohorts age together across the life course and share common history, experiences, norms, and role transitions while changing from “young” to “middle-aged” and “old” statuses.

In addition to the relationship of the members within a stratum, and unlike stratification by social class, groups of different age strata interact in society. For example, those in the young group may interact with those in the middle-aged and old groups in a family setting or by participation in the workplace. While the similarities of members within a stratum are thought to provide cohesion within that stratum, age stratification theories suggest that interstrata conflicts also exist.

Conflicts may arise between strata, typically structured around competing group interests such as young versus old. One example of how these conflicts play out in society would be institutional battles over the allocation of economic resources, such as spending on Social Security programs for older persons versus federal aid to families with young children. Terms like the generation gap and age war imply competition and accentuate differences between the strata. The idea that older persons place an excessive burden both upon their families and upon the health care system also implies conflict, pitting the interests of younger groups against those of older persons.

Some suggest lessening conflicts by forming positive connections among the strata through common interests. Some theorists argue that the role of intergenerational exchange—the exchange of time and resources among groups of different generations—promotes solidarity. The exchange buffers the negative views of old groups by young groups through positive social interaction. Some argue that although models of intergenerational conflict are promoted, the degree of conflict between young and old groups is overstated. Theories of the intergenerational exchange, the merits of the strata working together, and conflicts among the strata find frequent debate in empirical and theoretical work. This debate on the nature of the relationship among the strata will continue in the United States as the 65-years-and-older segment of the population continues to grow into an increasingly larger segment of society.

Stratification, Gender

Gender stratification is the stratification of individuals based on biological sex and the socially derived gender roles attached to sex. Stratification based on gender has existed in human society from the beginning of recorded history, if not before. In the United States, such stratification has traditionally existed in the institutions of education, work, and family, with men in the privileged position. Although great changes have occurred since the women’s rights movement, men and women still remain stratified from each other in these three domains.

Education, one of the main conduits to upward mobility and increased status in the United States,
experienced change in recent decades, with girls increasingly reporting liking traditionally male subjects in school such as math and science. Girls have also surpassed boys in obtaining higher grades in both elementary and secondary school. At the collegiate level, women have made great inroads, now comprising over half the population of undergraduates. Additionally, the Census Bureau reports that women graduate from college at higher rates than men. However, despite these substantial inroads in the educational domain, women do not experience the same benefits as men in occupational upward mobility.

According to recent Census data, the female-to-male earnings ratio among full-time, year-round employees has increased since 1960, from roughly 61 percent to 77 percent. Such differences persist regardless of education. The gender gap in wages tends to be the largest for women in the highest-paying jobs, which often require the most education. In addition to obtaining less for the same work, women often face other barriers to upward mobility. Research indicates that women in high-status jobs often face a “glass ceiling” beyond which they can no longer advance in a company, an invisible barrier that their male counterparts do not encounter.

Gender stratification in the work domain often reinforces traditional distinctions between men and women within the family. Although biological justifications for women as homemakers and men as breadwinners are often employed to ensure women’s dependence on men, the desire to maintain a decent lifestyle has helped create many dual-earner families. Indeed, at least 58 percent of women have full-time, year-round employment. Such numbers might influence traditional gender stratification in the home, since many women now have an independent source of income. However, many women must take on a “second shift,” in which they perform their traditional tasks in the home in addition to working a full day in the paid workforce, a trend that reinforces traditional gender stratification in the family.

As society evolves, women will likely continue expanding their presence in the educational and work domains. However, unless cultural change in the status of men and women additionally occurs, gender has the potential to remain a stratifying characteristic in the United States.

Stratification, Race

Race stratification, which exists worldwide, is the ranking of individuals in groups based on perceived innate differences and the socially derived beliefs attached to these differences. In the United States, individuals of European extraction generally enjoy greater privileges and outcomes in comparison to many minority groups that enjoy fewer rewards on average. Although race stratification has become less prominent in the United States over the past century, large racial differences still exist in a variety of areas.

The United States is a racially diverse society, encompassing African Americans, various Asian American and Hispanic groups, American Indians, and Anglo Americans. Life outcomes vary both between these groups and within them. For the most part, Asian Americans have similar, or more positive, life outcomes to whites, and as such have been dubbed the “model minority.” In contrast, African Americans, many Hispanic groups, and American Indians often face greater levels of discrimination, have lower educational achievement, and attain lower levels of wealth than their white and Asian American counterparts. It must be stressed that between-group observations are general trends based on socially constructed categories. Additionally, systematic variation often occurs within particular minority subgroups (i.e., Japanese
and Vietnamese Americans, or Cuban and Puerto Rican Americans).

Racial stratification can be clearly observed in the segregation of different groups. Although racial segregation in housing or education is no longer sanctioned by law, de facto segregation still remains in these two areas. This is especially prevalent among African American and Hispanic American groups, who often live in racially homogenous locations that also tend to have lower average income levels. This informal segregation is highly problematic because individuals living in lower-income areas often attend schools of lower quality, face discrimination in housing (i.e., less access to home loans), which leads to lower wealth accumulation and lower overall quality of life.

These differences become more tangible when examining problems such as the persisting “education gap” in test scores between different racial groups. In standardized test scores at all education levels, African Americans consistently perform most poorly, followed closely by Hispanic and American Indian youth. Asian groups, on the other hand, often perform as highly as, or higher than, their white counterparts. Some authors claim that the education gap is at least in part due to resource differentials derived from de facto segregation. Others argue that structural disparities and continuing discrimination are factors that have led African American and Hispanic students to avoid “acting white,” which is often correlated in their minds with having high educational achievement.

In addition to education, race stratification is also embedded within the institution of work, where median income levels vary by race. In 2006, non-Hispanic white households earned $52,423. In comparison, African American households earned $31,969 (61 percent of non-Hispanic whites) and Hispanic households earned $37,781 (72 percent of non-Hispanic whites). Further reflecting the educational trends previously discussed, Asian American households earned $64,238 (123 percent of non-Hispanic whites). Both educational and work disparities perpetuate systemic differences among racial groups in the United States by limiting earning potential. In a country in which wealth and education lead to upward mobility, minority groups who live in segregated areas and have differing educational achievement face higher hurdles, which serve to perpetuate stratification.

Fifty years after the civil rights movement, groups in the United States continue to challenge existing racial stratification. However, without alteration of structural features and cultural beliefs affecting race, it will likely remain a stratifying characteristic in the foreseeable future.

Stratification, Social

Social stratification is a structured ranking of categories of people who receive unequal amounts of wealth, power, and status from generation to generation. It is a cultural universal found in almost every society from the past to present. However, the basis upon which stratification rests may vary through time and from one society to another. In order to be accepted by all members of society, including those of low rank, every system of stratification must have a legitimizing ideology. This legitimizing ideology typically justifies inequality through claims to transcendent ideas, usually from religion. Examples of major systems of stratification include caste, slavery, estate or feudal, and social class.

While the British monarchy is a remnant of a European caste system, the oldest worldwide example that most closely approximates the type based on ideas is that of India. India’s caste system has four primary divisions (varnas), each one with multiple subcastes (jatis). About 160 million people considered “untouchables” and known as Dalits (or as harijans)—“children
of god,” Gandhi’s term) are at the bottom of this caste system, which has been rigid (although this is breaking down now), with little if any mobility between castes. Ascribed at birth, caste position determines virtually all aspects of life, including, for example, the type of work one is allowed to perform, marriage partners, rights, and obligations. Here, caste has determined social status that then determined one’s wealth, in contrast to a class system in which wealth largely determines social status. Finally, this extreme system of inequality has persisted partly because the internalization of the system’s legitimizing ideology rests on the Hindu religion.

Slavery is another ancient system of stratification still found in various forms in some parts of the world. The distinguishing characteristic of slave systems is that a person can legally own another human being as property. Individuals have usually become slaves in one of three ways: ascription by birth, military conquest or capture, or debt. In ancient societies, slavery was mostly ascribed or the result of military conquest. Slaves could obtain their freedom by purchasing it from their owner. Slaves also held a variety of social positions, including some with high prestige or authority. In the United States, slavery was based on capture (among Native Americans) or ascription (children of African slaves were themselves slaves). Although possible, most slaves would rarely have opportunities to obtain their freedom legally. In the latter case, a legitimizing ideology—this time racism—justified this practice of white superiority.

The estate or feudal system is characteristic of agrarian societies. The best approximation to the ideal type occurred in medieval Europe, where feudalism existed through ownership of land by militaristic nobility that provided protection to the peasants or serfs in exchange for their labor to cultivate the land. Around the 12th century, this system evolved into the estate system, comprised of nobles, priests, soldiers, craftsmen, and commoners. As the system matured, it became increasingly rigid, with class positions defined by ascription. Originally based on tradition and custom, during the estate period the legitimizing ideology became increasingly based in law, as religious leaders argued that the nobility represented “God’s” will to govern in his name. Under this system of stratification, social inequality was high.

Social class is historically the newest form of stratification, one essentially derived from capitalist industrialization. Under a class system, ascribed status is still a major determinant of one’s social position, but it is possible to experience social mobility and change position based on merit and effort. Income and wealth primarily define social class, while the system’s legitimizing ideology is the belief that equal opportunity exists for all. Karl Marx viewed class stratification as determined exclusively by ownership of the means of production that generate wealth. However, other theorists such as Max Weber argued that class position is determined not exclusively by wealth but also by status and power. For example, Weber argued that a high rank in one category such as wealth did not necessarily imply high rank in status or power, although normally that was the case. Rather, some people could experience status inconsistency, such as a college professor who may enjoy high social status but a lower level of wealth.

The Davis and Moore Hypothesis

Kingsley Davis and Wilbert Moore exemplify the functionalist sociological approach to stratification. They argued that every society requires the performance of important jobs that require certain levels of skill, training, and innate ability. To induce those capable of performing these jobs to undertake the necessary training, they must receive higher rewards, thereby justifying social inequality. Although their argument sounds rational, it does not explain why the salaries of some highly valued jobs, such as clergy and teachers, have low rewards. It also fails to explain why the salaries of movie and rock stars far exceed those of people considered more valuable, such as doctors or accountants. Finally, their argument does not address why some jobs are valued more than others in the first place.

Conflict Theory

According to conflict theorists, stratification is the result of the capitalist system that exploits those with little to no power. They argue that those who have wealth and power shape laws in a manner that protects their own class interests. For example, stealing a loaf of bread is the punishable offense of theft, even if the thief is a poor hungry child. In his essay, “Labor Theory of Value,” Marx argued that the capitalist class (bourgeoisie) exploits the working class (proletarians) through its ownership of the means of production, such as factories. This allows the capitalist class to offer workers wages below their fair value. Capitalist
business owners keep the difference between what they pay workers and the full value of their work, thus making the owners wealthy. In addition, Marx argued that the capitalist system of work leads to workers experiencing alienation from their products, society, and even themselves.

Marx believed that the only way to end exploitation would be through a social revolution by the working class. He also believed that the absence of a workers’ revolution was because of their false class consciousness. Working people are unaware of their class exploitation because they have accepted capitalism’s legitimizing ideology produced by the upper class to secure everyone’s conformity to the system.

The Classless Society

The only society with no stratification would be a communist one, as advocated by Marxists. Historically, such a society existed in prehistoric times with human groups that were hunters and gatherers and where little distinction existed between members as they enjoyed basic equality with one another in primitive communal societies.

Nineteenth-century utopian idealists and hippies in the 1960s also experimented with classless communes, many of them short lived. No large-scale, modern communist society has ever existed: the former Soviet Union, China, Cuba, and North Korea do not fit the true definition of communism. Instead these societies are better described as socialist dictatorships that base stratification on Communist Party affiliation rather than wealth. Authentic communism may never occur on a large scale, given the necessary idealistic preconditions to make such a society possible. Perhaps this is why theoretical communist societies are also called utopian, which means to some “admirable but impractical in real life.”

Stressors

More than 50 years ago Hans Selye, a Canadian endocrinologist, defined stress as “the nonspecific response of the body to any demand.” In laboratory experiments, Selye exposed rats to a variety of noxious chemicals and extreme environmental conditions that he labeled “demands.” The environmental demands included freezing temperatures, constant light, deafening noise, and nonstop exercise via motor-driven treadmills and constant swimming to avoid drowning. Selye found that when these demands threw the rats’ normal operating systems (respiration, circulation, digestion, and temperature regulation) too far out of their normal range of functioning, they adjusted by initiating a complex pattern of physiological changes that he called the “stress response.” Not only did the rats initiate this life-saving response, but the response was the same regardless of the type of demand that triggered it. Selye called this phenomenon the “nonspecific response to any demand.” Besides rats, Selye replicated the response with mice, rabbits, dogs, cats, and other laboratory animals. The nonspecificity of the response to any demand was the key factor in the development of Selye’s stress theory.

What Are Stressors?

Researchers since Selye often refer to demands as stressors. Stressors are the people, things, and situations that create unusual or excessive demands on people, leaving them feeling threatened and unable to cope. Most people suffer from social stressors associated with work, school, relationships, family life, and
world events rather than extreme environmental demands like those created by Selye in the laboratory.

Thomas Holmes and Richard Rahe, pioneers in the study of life events and their link to stress, identified a relationship between stressful occurrences and susceptibility to illness. They examined the past medical records of their subjects and discovered that the development of serious illnesses often followed major life changes. They used the term *life events* to refer to these life-changing experiences. Some of these events were positive (*eustress*)—marriage, the birth of a child, a new job—while others were negative (*distress*)—the death of a loved one, the loss of a job.

Holmes and Rahe found that exposure to these positive and negative life events throws the body’s systems out of balance, triggering the stress response. Like Selye, they believed that the stress response was the body’s way of readjusting to stressors. Additionally, they believed that the body had a finite amount of energy available to make these readjustments to adapt to stressors. Exposure to too many life events in a short a period of time increased one’s risk for the development of disease.

**The Role of Perception in Stressors**

In the 1970s and 1980s, researchers in the field of cognitive psychology took issue with the notion of the comparability of eustress and distress. They also questioned the belief that the life events identified by Holmes and Rahe were universal stressors for everyone under all circumstances.

Richard Lazarus, a pioneer in this research, found that people responded to life events differently, depending on how they perceived them and on their ability to cope with them. Lazarus and his colleague Susan Folkman established that some subjects perceived life events such as divorce as very stressful, while others didn’t view them as stressful at all. Such events are stressful only if people appraise them as threatening and feel unable to cope with them. Until that determination, life events and other demands are potential stressors.

Threat implies a state of anticipating a confrontation with a harmful condition. Whether the stressor is real or imagined is immaterial. One’s *perception* of the threat associated with the potential stressor determines whether or not it becomes an actual stressor that triggers a stress response. One’s perceived ability to cope with the potential stressor plays a key role in determining how threatening it is. If one feels that he or she can cope with a potential stressor, regardless of how threatening it might actually be, it is not very likely to turn into an actual stressor.

Another key element of the stress appraisal process is that it is always influenced by space and time. One may evaluate the same potential stressor differently the next time exposure occurs. Not only will the context be different (different time and different circumstances), but so will be the person (a little older and wiser, maybe more rested, perhaps traveling home from a wonderful vacation).

**A New Way of Looking at Stressors**

A key aspect of viewing stress as a transaction is the process of appraising the threat posed by potential stressors. Viewing stressors as potential stressors instead of actual stressors reduces their ability to trigger a stress response. This subtle language shift reaffirms the principle that demands are not inherently or universally stressful for everyone under all circumstances. Potential stressors must be transformed by individuals into actual stressors. Essentially, they are neutral until perceived as threatening and beyond one’s ability to cope with them.

This is a quantum leap from the outdated belief that certain demands (divorce, marriage, loss of job, starting a new job) are inherently stressful for everyone, under all circumstances. The major implication of viewing demands as potential stressors instead of actual stressors is empowerment. Understanding stressors as having the potential to cause stress leads to the realization that stress is no longer something that just happens and is beyond one’s control. Stressors become more than just “bills” or “traffic” or “the government.” They transform into demands that people can play an active role in understanding and managing. This empowerment means that the progression from potential stressor to stress response need not happen automatically. Coping with stress thus begins with viewing demands as potential stressors and understanding that the leap from potential stressor to stress response is not automatic.

**Subculture of Violence Hypothesis**

The subculture of violence hypothesis refers to a theoretical perspective that argues that violence is a result of a system of accepted norms and beliefs that condone violence in interpersonal relationships. This perspective claims that societal groups statistically associated with high rates of violence hold these norms and beliefs. Traditionally, these groups have been minorities (particularly African Americans), the poor, and those who reside in the South.

Marvin Wolfgang and Franco Ferracuti first articulated this perspective in their 1967 book, *The Subculture of Violence*. They connected the statistical association between poverty and numbers of African Americans and violence with a subcultural normative system that is reflected in psychological traits, resulting in an individual’s greater likelihood of using violence. Transmitted through cultural learning, this pro-violence normative system appears most prominent among younger men. Although others later applied the subculture of violence thesis to lethal and nonlethal forms of violence, this original research addressed homicide specifically.

In a highly influential analysis, Raymond Gastil and Sheldon Hackney observed an association between violence and southern states. In addition to claiming the existence of a normative acceptance of violence there, they delineated several historical features that shaped this cultural orientation toward violence, arguing that the South showed a greater propensity toward violence even prior to the Civil War. Evidence for this conclusion included the persistence of the duel for settling interpersonal matters, the greater numbers of guns owned, and the notion of defending honor with violence. Further arguments included the institutions of slavery and lynching—both pre- and post-Civil War—as indicators of an acceptance of violence.

Empirical support for the subculture of violence hypothesis has been mixed. Most research does not find the South more violent. In fact, in recent decades the West has become the most violent region. Poverty continues to be a consistent factor in violence, though the reasons for this association generally lack specificity. Similar findings exist for the impact of race, although here a clear confounding effect of poverty on the race and violence relationship does exist.

Criticism of the subculture of violence thesis occurs on several grounds. First, little strong empirical support for the theory exists from a macroanalytical perspective, due largely to imprecise measures of subcultures of violence using demographic groups as a proxy for a set of subcultural values. It is difficult to state what actually causes the observed associations between poverty, minority groups, and/or the South and violence. Other explanations such as social disorganization and frustrations because of disadvantage and discrimination are also possible connections. However, there is an indication that institutional legitimation of violence—separate from race, socioeconomic status (SES), or geographic location—does impact violence. Directly examining manifestations of a legitimization of violence offers much stronger support for the connection between institutionalized cultural values accepting violence and the rates of violence. These measures, however, reflect a belief system that is not bound to race, SES, or geographic location. Second, the thesis rests on the premise that the observed associations between violence and minority groups, the poor, and the South have a cultural base. In other words, these demographic groups comprise groups with a shared set of identifiable beliefs and norms that include violence. This led to the presumption that (a) individuals within these groups are more violent, and (b) group membership means an adoption of those violent beliefs. This, however, implies a greater homogeneity among those who belong to a subcultural group than most likely exists. Furthermore, when race and violent beliefs are directly examined through survey data, the research finds that whites, not African Americans, are more likely to espouse beliefs in the use of violence in
defensive situations, with no difference in the acceptance of violence as an instrumental strategy to solve problems. Research examining offenders such as batterers and rapists, for example, indicates that a strong relationship exists between an individual’s acceptance of violence and the willingness to use violence. Therefore, violent belief systems may, in fact, help us understand violence, but evidence is lacking that these belief systems occur in greater numbers in the groups identified as violent subcultures.

Currently, researchers continue to test specific tenets of the subculture of violence thesis to further elucidate the mechanisms through which violent beliefs may link to particular subcultural groups and how those beliefs translate into acts of violence. In addition to examining minority groups, the South, and the poor, researchers also examine whites (especially white power and white hate groups) to explore the connections between subculture and violence. The strongest contribution of the subculture of violence perspective has been in its application to direct measures of acceptance of violence, both institutional and attitudinal, that are promising in their contribution to our understanding of the causes of violence.

**SUBCULTURES**

In the social sciences, the term *subculture* most often refers to a group in conflict with or segmented from its dominant society. For anthropologists, who define *culture* as a complex system of beliefs and behaviors that characterize a particular group of people, subculture refers to parts of the whole. Most anthropologists have emphasized the continuity of culture: as having a single ethos, as “coherent wholes,” or as patterns of behavior that characterize a people. Subculture, as a concept within the social sciences, is more often used as a term to discuss large modern societies in which there is cultural variation among people. Scholars thus discuss subcultures in the context of looking at groups of people in opposition with or rebellion against a larger societal norm.

Subculture also denotes a social group that is distinct and distinguished from a larger cultural identity. Definitions of a subculture can be along lines of nationality, class, ethnicity, ancestry, generation, background, stereotype, or underclass, to name only a few of the many possibilities. A subculture can also be a group that may be stigmatized or a minority relative to the dominant culture. Additionally, a subculture can be a counterculture, a social identity that exists in response or reaction to a dominant culture. Such a countercultural response operates as rebellion against the cultural norms of mainstream society.

Sociologists such as Max Weber believe that a subculture is an outcome of society’s inequality and a consequence of economic exploitation and social stratification. Seeing social divisions as the outcome of modern life and as part of the structure of society led to discussions of subcultures as the outcome of such societal tensions as youth frustration, minority identity, artistic temperament, and socioeconomic struggle. In the realm of socioeconomic struggles, the anthropologist Oscar Lewis analyzed the impoverished classes as belonging to a “culture of poverty.” He thought that poverty perpetuated itself in subsequent generations (a view rejected by many social scientists) and that people in poor communities had similar characteristics. The characteristics of the culture of poverty were marginality, dependence, helplessness, a sense of not belonging, powerlessness, inferiority, unworthiness, lack of history, and a lack of class consciousness.

While subcultures may grow from such socioeconomic divisions, they may also arise from group
cohesion. An example of such a subculture of cohesion can be found in ethnic identity, one based on ancestry or kinship. People in distinct ethnic groups see themselves as having a certain amount of shared history (real or imagined).

Ultimately, whether created through the operations of division or cohesion, self-imposed or defined by others, subcultures are fundamentally defined as subsets of the dominant society.

Suicide

Suicide is a health, family, institutional, political, and social issue of tremendous significance, and the field of suicide prevention is a significant priority for both public and mental health. Federal initiatives, consumer advocacy, clinical efforts, and empirical work have significantly advanced the field. While great strides have been made in the area of suicide prevention over the past two decades, the morbidity and mortality related to suicide remains significant. The short- and long-term impact of the death of one person by suicide is far reaching.

Epidemiology: Suicide Morbidity and Mortality

Suicide rates can be examined from many perspectives—internationally, nationally, regionally, temporally, racially, by gender or age cohorts. More than 30,000 suicides occur every year in the United States and more than 80 suicides each day, or approximately 1 suicide every 16.7 minutes. In 2004, suicide was the 11th leading cause of death, while homicide was 15th. The rates are highest in persons over 80, and suicide is the third leading cause of death for youth ages 15–25 years. The rates are increasing for youth ages 10–14 years. Males and Caucasians are more likely to die by suicide than are females and other races. Firearms are the major method (50 percent) for completed suicide (hanging is second). In fact, each year there are more firearm suicides than firearm homicides. And sadly, U.S. soldiers involved in the Iraqi Freedom conflict are dying by suicide in increasing numbers, beyond average rates for military persons.

The Surgeon General’s Report on ethnicity, race, and mental health underscored the significance of suicide in the major racial and ethnicity groups, including Asian, black, Caucasian, and Hispanic persons. The suicide rate for Native Americans is the highest next to whites, and suicide was the second leading cause of death for American Indians/Alaskan Natives in 1999–2004. Suicide is the eighth leading cause of death for Asian Americans/Pacific Islanders, in particular the elderly. The highest rates for blacks are among young males ages 20–24.

Somewhere between 8 and 25 suicide attempts occur for every death by suicide. The ratio of attempts to suicide deaths in adolescents is approximately 1 to 100–200. Females have the highest rate of suicide attempts, and the ratio of attempts by females versus males is 3:1. Approximately 650,000 persons receive treatment following an attempt each year. The most common method for attempts is overdose. The rates of attempts increase in the elderly. The risk for attempting suicide in blacks is highest among 15- to 24-year-olds. The Centers for Disease Control and Prevention 2005 Youth Risk Behavior Surveillance System surveyed high school students and determined the rates of suicidal behavior were highest in Hispanic youth, particularly Hispanic females.

Risk and Protective Factors Framework

The risk and protective factors framework helps explain, assess, and intervene with suicidal behavior. Risk or protective factors are characteristics or conditions that, when present, increase or decrease respectively the likelihood that persons will develop suicidal behavior. Risk and protective factors include individual, familial, psychological, or environmental domains.
Examples of common suicide risk factors include the following: individual factors, such as gender, genetic vulnerability, chronic physical illness, and poor coping skills; family factors, such as severe marital discord, psychiatric disorders, suicide of a family member, and abuse and neglect; psychiatric factors, such as depression, substance use or abuse, and limited access to mental health services; and environmental factors, such as violence, poverty, racism, lack of social support, and access to highly lethal means of suicide. Protective factors include resilience, family ties, cultural and religious beliefs that discourage suicide and support self-preservation, culturally sensitive programs that strengthen family ties, tribal spiritual orientation, and specialized mental health and addictions treatment.

The majority (90 percent) of persons who die by suicide have a psychiatric illness (most often depression); however, one particular risk factor increases the probability but is not necessarily the cause of suicidal behavior. It is the accumulation and interaction of risk and protective factors that contribute to mental health problems (like suicide) or illness and mental health, rather than a single risk or protective factor. Resilience, or the capacity to bounce back from adversity, has received considerable attention in mental health promotion. Resilience stems from the interaction of an individual situation with protective factors from the environment. In the clinical application of the risk and protective factors model, the modifiability of a risk or protective factor is a prerequisite for the development of interventions targeting such factors.

Nomenclature for Self-Injurious Thoughts and Behaviors

There is much confusion and misuse of words related to suicidology. A newly revised nomenclature seeks to increase the ability of clinicians, epidemiologists, policymakers, and researchers to communicate more clearly and study similar types of suicidal behavior. The essential components of this nomenclature include suicide-related communications, suicide-related behavior, and suicide-related ideations. Suicide-related communications is defined in this nomenclature as any interpersonal act of imparting, conveying, or transmitting suicidal thoughts, wishes, desires, or intent (explicit or implicit), including threats or plans. Suicide-related behavior is a self-inflicted, potentially injurious behavior for which there is evidence that the person wished to use the appearance of intending to kill himself or herself in order to attain some other end or the person intended at some undetermined or some known degree to kill himself or herself. These behaviors include self-harm, self-inflicted unintentional death, undetermined suicide-related behaviors, self-inflicted death with undetermined intent, suicide attempt, and suicide. A suicide attempt is self-inflicted, potentially injurious behavior with a nonfatal outcome for which there is evidence (explicit or implicit) of intent to die. A suicide attempt may result in no injury, injuries, or in death, defined as suicide.

Clinical Suicidology

Suicidology refers broadly to the study, prevention, and intervention of suicide. Suicide assessment measures include screening tools, risk assessment instruments, and assessment of clinical characteristics of suicidal persons. Reviews of suicide assessment tools for adults and youth are available from the National Institute of Mental Health. No single best instrument yet exists; the gold standard for assessment is the clinical interview.

The American Psychiatric Association recommends the following components of suicide assessment: identify specific psychiatric signs and symptoms; assess past suicidal behaviors, including intent of self-injurious acts; review past treatment history and treatment relationships; identify family history of suicide, mental illness, and dysfunction; appreciate psychological strengths and vulnerabilities of the individual patient; and specifically inquire about suicidal thoughts, plans, and behaviors (suicidal ideation, suicide plan, suicidal intent, lethality of plan, and means). Recently an American Association of Suicidology study of imminent (current or immediate) risk for suicide revealed empirical evidence for the following warning signs: ideation, substance abuse, purpose, anxiety, a feeling of being trapped, withdrawal, anger, recklessness, and mood changes. The acronym for these warning signs is IS PATH WARM. Clinical researchers also developed various structures for suicide risk assessment and intervention and underscored the need for systematic and repeated assessments. Risk level is typically rated as mild or nonexistent, moderate, or severe, with interventions based on the severity of risk. Moderate or severe risk is considered a psychiatric emergency.

An Institute of Medicine report on reducing suicide summarized many evidential aspects of clinical interventions, including psychoactive medications, electroconvulsive therapy, psychotherapies, inpatient
care, after-discharge risk, treatment adherence, and follow-up care. Suicide risk is the most common precipitant for hospitalization. The Joint Commission on the Accreditation of Health Care Organizations (JCAHO) has also acknowledged that suicide is the most frequent sentinel event in health care facilities, as approximately 5–6 percent of suicides occur during hospitalization. About 1,500 inpatient suicides occur each year, most often during the first week of hospitalization. As a result, the 2007 National Patient Safety Goals for Hospitals and Behavioral Health include the safety of persons at risk for suicide. Furthermore, the American Association for Suicidology published “Recommendations for Inpatient and Residential Patients Known to Be at Elevated Risk for Suicide,” while forensic experts in suicidology have proposed clinical and legal standards of care for suicide prevention.

Research in Suicidology

Following the 1992 recommendation of the Centers for Disease Control and Prevention for strategies for youth suicide prevention, a strong push followed for evidence-based practice in suicide prevention. A series of reviews of youth programs, primarily by Canadian groups, focused mostly on school-based programs. One such review emphasized the effectiveness of cognitive-behavioral therapy (CBT) for suicide prevention, most particularly CBT with a problem-solving component. A significant increase in biological research took place, such as postmortem brain autopsies of persons who die by suicide. Only two psychopharmacological agents, Lithium and Clozaril, have thus far demonstrated a direct reduction of suicide symptoms. However, research does show that increased suicide risk relates both to failure to medicate certain psychiatric illnesses and to client adherence issues.

One of the leading science reports in suicidology is the Institute of Medicine report on reducing suicide. Another resource is the Best Practices Registry (BPR) for suicide prevention, a collaboration between the Suicide Prevention Resource Center (SPRC) and the American Foundation for Suicide Prevention (AFSP), funded by the Substance Abuse and Mental Health Services Administration (SAMHSA). The purpose of the BPR is to identify, review, and disseminate information about best practices that address specific objectives of the National Strategy for Suicide Prevention.

The National Institute of Mental Health has a Suicide Prevention Consortium that oversees the suicide research portfolio, including studies that underscore such findings as 70 percent of elderly suicides saw a primary care provider in the month before they died. Other significant studies have included a surveillance study of adolescent attempters seen in emergency departments in Oregon, psychological autopsy studies of teen suicide, and the community evaluation of the Air Force plan. Several journals are also devoted to suicidology.

Policy and Suicidology

In the early 1990s, a shift to the public health for suicide prevention from the mental health approach occurred, sparked by the 1984 Task Force on Youth Suicide. A series of national meetings and policy reports reflected this shift in attitudes, science, and funding priorities. Then, in 1999, Surgeon General David Satcher issued the Call to Action to Prevent Suicide, a blueprint for addressing suicide that succeeded through awareness, intervention, and methodology based on the recommendations of the national Reno Conference that same year. After public hearings, a federal steering group drafted the National Strategy for Suicide Prevention.

The national strategy now informs funding priorities, research, and state and local plans. Every state has a suicide prevention task force, developed by regional health departments to implement the national strategy. Most states have a suicide prevention plan that may or may not have funding appropriated for the activities in the respective plans.

Society and Suicidology

The Suicide Prevention Resource Center has outlined the history of suicide prevention. Significant events included the Los Angeles Suicide Prevention Center, opened in 1958 and funded by the U.S. Public Health Service. Edwin Shneidman was the director of that center and is often referred to as the “father of suicidology.” His prominence rests on numerous contributions to the field, particularly his elucidation of the phenomenon of psychache, the unbearable pain experienced by suicidal persons.

The consumer movement in suicide prevention has had a major influence on shifting the federal priorities. Perhaps the consumer exemplar is the Suicide Prevention Action Network (SPAN USA), founded in
1996 in Marietta, Georgia, by Jerry and Elsie Weyrauch (parent survivors) with the goal of preventing suicide through public education, community action, and advocacy. Survivors are family members, significant others, or acquaintances who have experienced the loss of a loved one as the result of suicide. The Weyrauchs and SPAN USA efforts have had a dramatic impact on policy advances, such as the passage of Senate Resolution #84 and House Resolution # 212 for suicide prevention during the 105th Congress. Public acknowledgment by well-known persons of either their own suicide experience or survivorship has also done much to increase awareness and decrease stigma.

Another significant part of societal impact is education. Several professional organizations focus on suicide prevention. The primary organizations in suicidology are the American Association of Suicidology (AAS), American Foundation for Suicide Prevention (AFSP), the International Association of Suicide Prevention (IASP), and the Suicide Prevention Resource Center (SPRC). An exemplar in training is the SPRC and AAS training, “Assessing and Managing Suicide Risk.” This competency-based training has been delivered to mental health professionals across the nation.

With increased suicide rates among minority groups, cultural competency has become a vital design and implementation criterion for suicide prevention activities. Suicidal youth or those at risk for suicide often require emergency room treatment. An ideal program demonstrating cultural competence is the emergency department adherence program for Hispanic adolescents. Included on the SPRC Best Practice Registry, it incorporates an orientation video for families, an on-call bilingual crisis therapist or crisis manager, and an interdisciplinary training program for emergency department personnel.

Another cultural adaptation demonstrated that when staff in a rural emergency department provided education in means restriction (decreasing access to lethal means of suicide) for parents of youth at risk for suicide, parents were more likely to lock up medications and firearms.

A famous pioneer in suicide prevention, Robert Litman, warned those in suicidology that the field is risky and dangerous and one must anticipate casualties. Although we will never be able to save every person from suicide, if consumers, professionals, researchers, and policymakers continue to build partnerships, we can make a difference, one life at a time. Every life saved is significant.

Surveillance technologies and practices have become increasingly developed and diffuse. In a generic sense, surveillance refers to the process of observing behavior. In contemporary usage, surveillance refers to the use of electronic devices to expand the reach and depth of traditional sensory observation and knowledge. For example, a video camera may serve as the extension of the eye, and a listening device may serve as an extension of the ear. Similarly, data-mining methods may deepen the boundaries of what is knowable, allowing information to be detected well beyond what is normally accessible. Characteristics of emergent surveillance technologies contributing to their increased use are their often unobtrusive and cost-effective nature.

The dominant academic metaphor for understanding surveillance in contemporary society is known as the "panopticon," derived from 18th-century utilitarian philosopher Jeremy Bentham's (1748–1832) architectural design for a prison that allowed for continual supervision of inmates. Given the design of the panopticon, prisoners were aware that they might be observed at any time, causing them to control their own behavior. This self-control stemmed from the perception that one might be under observation, which was reinforced by the periodic supervision of prisoners by hidden guards. Although Bentham designed the panopticon as a prison house, he also suggested its use in orphanages and poor houses. While contemporary persons do not literally live in a panopticon, scholars of surveillance argue that they nonetheless live and behave as if they are potentially under observation in an electronic web of surveillance technologies. In this sense, many scholars argue that the contemporary surveillance society is analogous to a broad-reaching panopticon of social control.

Varieties of Surveillance

In the past, surveillance concentrated on individuals determined to be suspicious. Increasingly, scholars argue that a "new surveillance" is developing, one that focuses on categories of suspicious persons. Under the new surveillance, individuals may be disproportionately subjected to observation based on group membership. For example, all members of groups with higher rates of criminal offense, such as urban minority males in the United States, or who are perceived as possible perpetrators of serious offenses, such as Arab Muslims, may disproportionately fall under police surveillance. In a criminal justice context, this process may lead to a self-fulfilling prophecy in which groups who are more heavily surveilled will in fact be determined to have a higher rate of offense. Such an outcome may rest more in the detection of criminal behavior than in true underlying differences in rates of offense.

Similarly, under the new logic of surveillance, private organizations such as corporations may collect information about members of market segments in the advancement of profitability. This means that those members of less desirable market segments, such as the poor, will not be proportionally targeted for marketing surveillance. Ironically, while the poor are more likely to be the subject of surveillance by the criminal justice system, they are more likely to be ignored by corporate surveillance. Both tendencies may lead to the further disempowerment of the poor in relationship to public and private institutions.

Problems Associated with Surveillance

Surveillance occupies an interesting position in relation to social problems in general, in that it is often interpreted as both a problem in itself and a solution to numerous other problems. Although surveillance practices may relate to numerous social arenas, they are particularly relevant for legal and criminal justice dimensions. Technologies of surveillance are developing rapidly, and the future impact on legal landscapes is yet to be determined. In common law systems such as the United States and Canada, the development of legal precedent to deal with emergent problems tends to be case driven. Therefore, the development of legal positions related to emergent technologies of surveillance is likely to lag behind the emergent
technologies themselves. There is likely to be a continued tendency for legal stances related to surveillance practices to develop only when they arise as legal problems for the courts. Given the widespread and increasing use of surveillance, this presents a future crisis for the judicial system. In particular, the relationship of surveillance practices to rights of personal privacy and personal information may increasingly arise as a legal conundrum.

Similarly, the increased use of surveillance may cause problems for the criminal justice system. Although there may exist some optimism about the use of surveillance technologies to detect and deter criminal behaviors, the increased ability to detect criminal behaviors in suspect groups may lead to higher rates of arrest of group members. In turn, this may lead to a higher rate of conviction and incarceration, which may put a strain on the criminal justice system’s ability to process and house offenders. While many scholars already point out a racial bias present in the criminal justice system, the increased use of surveillance technologies to monitor suspect groups may ultimately exacerbate this bias, with suspect groups more heavily policed. In practice, the criminal justice system has yet to deal with the practical and juridical complications caused by the new surveillance in its violation of the presumption of innocence. That is, developments in surveillance may complicate the right of an accused to enjoy the legal position of innocence until proven guilty in court. A related issue is that the extensive use of surveillance practices by criminal justice agencies may complicate long-standing debates related to Fourth Amendment issues of search and seizure. While the Fourth Amendment protects individuals from search without probable cause of suspicion, the criminal justice system has yet to resolve the constitutionality of putting all individuals within a subpopulation under surveillance.

SUSTAINABLE DEVELOPMENT

The concept of sustainable development first emerged on the international stage in 1972, when the United Nations sponsored the Stockholm Conference on the Human Environment. This conference was, in part, an outgrowth of the global environmental movement. It was the first global conference to focus on the growing impact of humanity on the environment and the need to protect and preserve biospheric integrity to produce sustained improvement in living conditions for all. Although the term was not stated explicitly, the Stockholm Declaration laid the foundation for global environmental governance and brought the concept of sustainable development to the international lexicon.

The term sustainable development was popularized in 1987, when the World Commission on Environment and Development, also known as the Brundtland Commission, released the report Our Common Future. This report provides the most frequently cited definition of sustainable development. It defines the term as “development that meets the needs of the present, without compromising the ability of future generations to meet their own needs.” This definition contains three core elements: (1) it recognizes that human beings affect and are affected by the environment; (2) it acknowledges that human interactions with the environment must be sustainable in the long term; and (3) it implicitly accepts the interconnections among the environment, social development, and economic development.

More broadly, this definition highlights two fundamental themes inherent in the concept of sustainable development. First, sustainable development emphasizes the integration of social, economic, and environmental policy. As action in one policy area affects other policy areas, sustainable development requires a holistic approach to economic, environmental, and social policy development and implementation. For example, environmental policies must protect natural resources and ecological systems yet still promote economic and social development. Social policies should address issues such as health and education, so that the economy and environment remain fit. Economic policies should address social issues such as poverty.
and inequality and promote trade and industry that encourages social and environmental health.

Second, sustainable development requires intergovernmental and intersectoral cooperation that traverses traditional geopolitical boundaries. The full range of environmental, economic, social, and other issues that impact sustainable development cannot be addressed by a single organization but rather depend upon the engagement of numerous organizations at all levels of government and in all sectors of society working in concert with each other. Thus, to achieve sustainable development, international, national, subnational, and regional governments must work in partnership, as well as with private and nongovernmental organizations.

In 1992, the UN Conference on Environment and Development (UNCED), also known as the Rio Earth Summit, renewed the world’s interest in sustainable development. Although the conference had several notable achievements, it is perhaps best known for the creation of Agenda 21 and the Rio Declaration on Environment and Development.

Agenda 21 emphasizes the need to foster cooperation, coordination, and collaboration among the numerous agencies and actors involved in sustainable development and to develop strategic links and integration among major sustainable development initiatives. To do so, it calls for the establishment of National Councils for Sustainable Development to operate as focal points or mechanisms to oversee the coordination and implementation of the Earth Summit agreements at the national level. Agenda 21 also calls for broad public participation in decision making and implementation as a prerequisite of sustainable development. It recognizes nine major groups of civil society from whom participation is needed: women, children and youth, indigenous people, nongovernmental organizations, local authorities, workers and trade unions, business and industry, scientific and technological communities, and farmers.

The Rio Declaration puts forth 27 general principles agreed upon through a series of difficult and significant compromises among industrialized and developing countries. Although the principles are general, many have become core elements in international law. For example, principle 2 recognizes a nation’s sovereign right to exploit its own resources in accordance with its own policies as long as it does not harm the environment elsewhere. Likewise, principle 3 recognizes the right to development, while principle 4 requires environmental protection as an integral part of development. To support this, principle 16 promotes the “polluter pays” principle and principle 15 endorses the “precautionary” principle. Each of these efforts is further supported by principle 27, which calls for nations to cooperate to develop further the international law in the field of sustainable development.

In 2002, the United Nations hosted the World Summit on Sustainable Development in Johannesburg, South Africa. Participants of this conference reaffirmed their commitment to the Stockholm and Rio Declarations and to full implementation of Agenda 21. The conference produced a political declaration, the Johannesburg Plan of Implementation, and a range of partnership initiatives.

Today, sustainable development is a major component of international law, affecting environmental, trade, renewable and nonrenewable resources, human rights, social, and other international agreements. Numerous areas fall within the scope of sustainable development, including but not limited to agriculture, atmosphere, biodiversity, climate change and ozone depletion, consumption and production patterns, debt service and restructuring, demographics, disaster reduction and management, education, energy, finance, forests, hazardous waste, health, human settlements, industry, land management, oceans and seas, poverty, sanitation, solid waste, technology, toxic chemicals and waste, trade, transportation, and water. With such breadth, sustainable development is intrinsically complex and complicated. Nevertheless, many leaders, scholars, scientists, activists, and everyday people see sustainable development not only as a sound public policy but also as an important concept necessary for humanity’s survival.

Sweatshop

Once thought a nasty relic of history, sweatshops have reemerged in both advanced industrial and newly industrial economies. Sweatshops are production sites where workers are subjected to multiple violations of their respective nation’s labor laws regulating occupational safety and health, wages and work hours, child labor laws—the institutionalized reforms won in hard-fought struggles waged in the 19th and early 20th centuries by labor and consumers unions. The struggle continues even today. Sweatshops occur because they are easily hidden from public view and because they are loosely tied to larger, name-brand manufacturers. While apparel manufacturing is often associated with sweatshops, the “sweating” model also operates in other light manufacturing industries such as toys, small appliances, and even service industries.

Sweatshops arise in industries where little capital investment in physical plant and equipment is required and where the production process can be subdivided and some functions contracted out. Segmenting jobs and reassigning pay for those jobs reduce labor costs because firms can keep their research and development jobs in house while farming out assembly work to contractors and their subcontractors. When prejudice and institutionalized discrimination create lower-cost labor pools like immigrants (especially undocumented), women, children, the disabled, and the elderly, the conditions are ripe for the “sweating system.” Piecework and extra-high production quotas force workers’ earnings below the society’s established wage and hour laws, and worksites are small, cramped, dangerous—and out of sight of government regulators.

Consumer pressure for low-priced consumer goods also contributes to the reemergence of sweatshops, because the locus of control over the production process has moved from the manufacturers to mega-retailers such as Wal-Mart. Instead of retail products and prices determined by the costs of manufacturing, the process is reversed: the retail price sets the manufacturing costs. Since retail corporations often control access to raw materials or components used in the manufacturing process, the only area of flexibility for manufacturers is control of labor costs. The pressure to squeeze more labor out of workers to meet production demands means ever-increasing use of the sweating system of contracting and subcontracting in both developing and developed economies.

Finally, as retailing spills over into services, sweatshops even appear in service-related industries. Workers in call centers for banking, billing, and reservations increasingly work to quotas, and face outsourcing of jobs (probably off-shore), and the “business model” increasingly infiltrates the formerly “safe” professional industries of medicine and health care, law and legal services, and lower and higher education.

Synthetic Drugs

See Club Drugs
Taylorism is a set of ideas regarding factory management developed by Frederick Winslow Taylor (1856–1915) in the late 19th and early 20th centuries in the United States under the name of “scientific management.” The core of Taylorism is a system of task management in which managers and engineers are responsible for planning and task optimization, primarily through motion and time study, while workers are responsible for carrying out discrete tasks as directed.

The so-called scientific management movement, which began in earnest in the late 19th century, drew on some earlier ideas, most famously those of Charles Babbage (1791–1871) and W. S. Jevons (1835–1882). Babbage emphasized how the division of labor within the factory contributes to operational efficiency by subdividing work into distinct tasks that could be completed by specialists. Both Babbage and Jevons advocated the systematic analysis of work, including collection and use of data obtained by observing work processes.

Toward the end of the 19th century, managers began to encounter new problems as the size of factories grew due to increasing consolidation of operations under newly formed joint-stock companies. Managers and engineers began to focus on problems of “shop management,” such as plant layout, production processes, and incentive and wage systems. During this time Taylor began to develop his ideas, first at the Midvale Steel Company in Pennsylvania from 1878 through the 1880s, and later when it became the Bethlehem Steel Company. Taylor sought to remedy a number of problems he saw with traditional management, which left workers to complete the work as they pleased—using “rules of thumb”—and encouraged “systematic soldiering,” or the restriction of output by workers.

In Taylor’s *The Principles of Scientific Management* of 1911, he outlined and illustrated four main principles of scientific management: (1) the development of “scientific knowledge” or standard procedures to replace rules of thumb; (2) the systematic selection of and training of workers for the correct jobs or tasks; (3) inducing them to work to standard through “watchfulness” and a “large daily bonus”; and (4) “an almost equal division of the work and responsibility between the workman and the management.” The last point is part of Taylor’s emphasis on “harmonious cooperation” between labor and management, where managers take on all responsibilities for the planning of work and workers simply follow the prescribed routine.

Another important element of Taylorism is the ideas of Frank B. and Lillian Gilbreth (1868–1924 and 1878–1972) on motion study and industrial psychology. The Gilbreths focused on the best method to perform an operation and reduce fatigue by studying body motions, attempting to eliminate unnecessary ones and simplify necessary ones to discover the optimal sequence of motions.

The content of Taylorism has shifted over time, moving somewhat away from the ideas Taylor and the Gilbreths originally articulated. Taylor argued that other important elements of scientific management included extra pay for the extra hard work and rigid
standardization of the system, careful attention to not overextending workers, listening to workers’ ideas and compensating them for adopted improvements, a system of functional foremen, and study of worker motivation. Much of this has been lost in the subsequent development of Taylorism into a management system. Both Taylor and the Gilbreths were careful to warn against overwork. However, as the system was diffused and elaborated, Taylorism commonly came to be understood primarily as an emphasis on breaking down work into discrete tasks that can be analyzed for waste through motion and time study. In addition to sharply limiting worker autonomy, the system has often been experienced by workers—and denounced by unions—as a form of work speedup, leading to many problems in the workplace, such as increased worker stress, resentment, and dissatisfaction, often resulting in labor–management conflict, individual forms of resistance like work sabotage, and organized forms of resistance.

Taylorism is an important part of the model of traditional mass production often referred to as “Fordism,” which was developed in the United States and became the dominant form of production in most industrialized countries, particularly after World War II. As a model of work organization, Fordism refers to the supply-driven, mass production of standardized goods using semi-skilled workers. Taylorism is key to Fordism because it contributes to efficiency improvements via scale economies through the separation of conception from execution—often understood as a process of deskilling—as managers and engineers in the planning department are responsible for breaking down tasks into their simplest operations and determining standards, while workers are expected only to execute their tasks as directed.

Taylorist methods have been used widely in all manufacturing sectors in developed and developing countries and were also embraced by the Soviet Union under Lenin. However, the ideal of complete separation of conception and execution was not fully realized in most places. One reason for its imperfect realization was resistance by workers and unions. Perhaps more important, in order for many factories to operate smoothly on a daily basis, workers had to retain and exercise some amount of discretion to deal with problems in the planning process.

Though the Fordist model is increasingly being replaced by post-Fordist forms of production, such as the demand-driven model of lean production, the status of Taylorist methods in the post-Fordist labor process is debated among scholars. Taylorist methods are widely used in service industries today, as exemplified by the extreme task division and standardization in the fast-food industry as pioneered by McDonald’s. Another example of Taylorist standardization in services is scripted talk required in a wide range of industries in which workers must interact with customers, from restaurants to retail stores to call centers. In the manufacturing sector, however, some argue that post-Fordist models like lean production have initiated a reintegration of conception and execution, hence overturning the Taylorist model. However, as many observers have noted, although lean production methods explicitly aim to induce workers to contribute ideas for continuous process improvement, work remains highly regimented into discrete tasks, and a primary goal is to develop new and improved work standards through, among other things, detailed motion and time study. Thus, many see lean production methods as a form of neo-Taylorism that engages workers in setting and developing new standards.

Teenage Pregnancy and Parenting

In 1976, the National Center for Health Statistics (NCHS) reported that the rate of pregnancy for 15- to 19-year-olds was 101.4 per 1,000 adolescents. This rate peaked in 1990, at 116.8 pregnancies per 1,000 adolescents. This means that, in 1990, 11.7 percent of U.S. teenagers were pregnant, compared to 7.6 percent in 2002. Overall, about three-quarters of a million teens become pregnant over a one-year period,
and approximately 8 in 10 of these pregnancies are unintended. Between 5 and 6 out of 10 of these pregnancies end in birth, while about 3 in 10 end in abortion, and the rest end in spontaneous miscarriage.

Pregnancy rates have historically been higher among racial and ethnic minority teens than among white teens. For example, in 1990, the pregnancy rate for non-Hispanic white teens was 86.8 per 1,000 adolescents. In contrast, it was more than 2.5 times as high for non-Hispanic blacks (at 232.7) and nearly twice as high for Hispanics (at 167.4). Since 1990, rates have fallen for all groups; however, the rate for non-Hispanic blacks is still more than 2.5 times higher than for whites (138.9 vs. 49.0); and the rate for Hispanics, which has not declined as quickly, is similarly high (135.2).

U.S. teen pregnancy rates have historically been higher than those for other developed countries. For example, research conducted by the Alan Guttmacher Institute shows that, in the mid-1990s, Denmark, Finland, and Sweden had teen pregnancy rates in the range of 20–25 per 1,000 adolescents. Also, Canada and England and Wales had rates in the range of 45 per 1,000 adolescents. Part of the reason for higher pregnancy rates in the United States is thought to be lower levels of contraceptive use among teenagers in the United States, perhaps due to cultural norms and greater restrictions on access.

Teen birth rates followed a pattern similar to that of pregnancy rates. However, after falling 34 percent between 1991 and 2005, in 2006 birth rates for this age group rose by 3 percent. Trends by race and Hispanic origin varied somewhat: 5 percent for non-Hispanic black teens, 2 percent for Hispanic teens, 3 percent for non-Hispanic white teenagers, and 4 percent for Native American teens, with no change for Asian teens. Race/ethnic differences in the probability of having a first birth by age 20 are also significant; in 2006, 22 percent of non-Hispanic white teens had their first birth under age 20, compared to 50 percent of non-Hispanic black teens and 65 percent of Hispanics.

Even when the rate of teen births declined, the proportion of all teen births that occurred to unmarried teens increased significantly. For example, according to NCHS statistics, in 1960 the percentage of teen births that were nonmarital was 14.8; this increased to 40.3 percent in 1976 and to 84.4 percent by 2006. This trend is due to a drop in the likelihood that young women marry during their teens (in connection with a pregnancy or not), as well as a drop in the birth rate for married teenagers. Also, although a high proportion of teen births are nonmarital, teens do not account for the majority of all births to unmarried women. In 2000, 72 percent of nonmarital births occurred to women ages 20 and older.

Finally, similar to pregnancy rates, research conducted by the Alan Guttmacher Institute shows that the U.S. teen birth rate is high compared to those of other developed countries. In the mid-1990s, Japan, Sweden, and Switzerland had rates of under 10 per 1,000 adolescents, while Canada and England and Wales had rates of 24.2 and 28.5, respectively. In contrast, the rate for the United States was 54.4.

**Consequences of Teen Motherhood**

To what extent should we be concerned about the relatively high rates of teen childbearing in the United States? Early research on the consequences of teen childbearing suggested that adolescents who gave birth were less likely to graduate from high school, more likely to have low earnings as an adult, and less likely to marry than women who delayed childbearing. However, these studies did not fully account for the fact that young women who bore children early were more likely to be disadvantaged to begin with than those who did not. As a result, it was not clear whether poor outcomes in adulthood among teen mothers stemmed from prior disadvantages, or whether they were, at least in part, a result of the childbearing itself.

More recent research shows that when the disadvantaged backgrounds of adolescent mothers are more fully accounted for, the negative effects of early childbearing are substantially smaller and in some cases erased. Thus, poor outcomes in adulthood appear to be more the result of the social and economic disadvantages of teen mothers than the result of the early childbearing. Put another way, the new research implies that delaying childbearing among these young women would not result in increased educational attainment or adult earnings or a higher likelihood of marrying. However, researchers have not yet fully investigated whether family income levels moderate the long-term impacts of teen births.

What about the children of teen mothers? Some have speculated that teen mothers may lack parenting skills and provide less than adequate home environments for their children, resulting in lower cognitive skills and more behavioral problems for their children when compared to those of older mothers. Indeed,
early research showed that, on average, children of teen mothers score lower on measures of cognitive and socioemotional development, and are at higher risk of poor school achievement, than the children of older mothers. However, later research, which more thoroughly controlled for the background disadvantages of teen mothers, showed that these background factors explained the lower cognitive and socioemotional scores, at least among children through the pre- and early teen years. Fewer studies have been conducted on the outcomes of older children of teen mothers. While some research shows that children of teen mothers may be less likely to graduate from high school, or more likely to be incarcerated, it is not yet clear whether these differences remain when fully accounting for the background characteristics of teen mothers.

Overall, the accumulation of research evidence suggests that teen childbearing does not have the substantial, deleterious consequences for mothers and their children that it was once thought to have. In addition, rates of teen pregnancy and births have fallen significantly in the past three decades. Despite this, many continue to view teen motherhood as a significant social problem. Forty years ago, concerns about teen pregnancy first arose in concert with concern over the increasing proportion of children born out of wedlock, particularly among poor African Americans. Since that time, rates of out-of-wedlock childbearing have increased for all groups, and it is likely that religious and moral opposition to nonmarital childbearing—as well as entrenched beliefs regarding the primacy of the two-parent household for the well-being of children—will continue to fuel public concern about, and efforts to reduce, teen (now largely nonmarital) childbearing. In addition, as some sociologists argue, the continued preoccupation of Americans with teenage pregnancy and parenting might also be explained by American adults’ attitudes toward, and discomfort with, teenage and premarital sexual activity and contraceptive use.

Temperance Movement

Temperance, most notably associated with alcohol use, refers to moderation or restraint in one’s consumption of alcohol. Temperance movements are social movements that attempt to convince others, either through morality or law, to refrain from drinking alcohol or at least moderate their alcohol consumption. These movements, some of which are still active today, have a long history. The thought of moderation regarding alcohol consumption was evident in the earliest American colonies; these ideas eventually resulted in the creation of the Eighteenth Amendment and Prohibition.

Colonists generally practiced moderate drinking throughout the 18th century. However, by the beginning of the 19th century, people began to recognize an increase in the use of alcohol. Founded in 1826, the American Temperance Society began gathering
pledges calling for abstinence from alcohol. By the mid-1830s there were more than 8,000 local temperance societies in the United States, establishing temperance reform as a national movement. These organizations viewed the ever-growing immigrant-laden cities as the epicenters for moral weakening and wickedness, attributing alcohol use as the foundation for their purportedly deviant lifestyle. As a result, temperance groups and the movement itself continued to grow in popularity through organized church efforts, pamphleteering, and lectures, all of which attracted a wide range of supporters.

A major part of the temperance movement was the national Prohibition movement, also referred to as “the noble experiment.” The prohibitionists directing this movement believed that alcohol was a dangerous drug that disrupted the moral order within the family and community and destroyed lives. As a result, they believed that it was the responsibility of the government to prohibit the sale of alcohol. Between 1880 and 1890, the National Prohibition Party, the Women’s Christian Temperance Union (WCTU), and the Anti-Saloon League of America put pressure on their local politicians to amend the Constitution.

In January 1919, the Eighteenth Amendment was ratified, banning the sale and manufacture of alcohol with the sole exception of industrial use, marking the beginning of the Prohibition era. The means for its enforcement followed with passage of the Volstead Act. The law marked a triumph for the moral order, although enforcement was spotty at best and it sparked considerable public opposition. In 1933, the ratification of the Twenty-First Amendment repealed Prohibition, after which the temperance movement began to fade.

Since the movement’s heyday, Alcoholics Anonymous (AA) has been the best-known contemporary temperance effort. Although this organization promotes total abstinence from alcohol, it primarily focuses on alcoholism as a disease and has no interest in the government shutting down the liquor industry. Other modern organizations that reflect some elements of the temperance movement are Mothers Against Drunk Driving (MADD) and Students Against Drunk Driving (SADD). These organizations have had a great impact on drinking and driving laws in the United States, such as increasing penalties, lowering the amount of alcohol required to be considered drunk, and raising the legal drinking age.

TEMPORARY ASSISTANCE FOR NEEDY FAMILIES

Temporary Assistance for Needy Families (TANF) is the means-tested income support program that replaced Aid to Families with Dependent Children (AFDC) in 1996. Unlike AFDC, TANF is behavior rather than benefits oriented, has multiple goals and targets and a dynamic, longitudinal, and complex focus with an emphasis on outcomes.

TANF replaced the entitlement for low-income children and their caretakers with block grants to states for income support, services, or job training. It established a five-year federal lifetime cap on receipt of benefits. Although states retained their authority to determine eligibility requirements and benefit levels, they must meet work participation requirements or lose part of their block grants. States must deny benefits to families in which a member is a fugitive felon, probation or parole violator, or has been convicted of a drug felony; operate programs to reduce out-of-wedlock births; encourage the formation of two-parent families; set aside at least 10 percent of their grants for “faith-based” organizations; and restrict services to immigrants. Considerable variations among states persist in benefit levels and earnings disregards (the amount of wages that public assistance recipients could earn without having that amount deducted from their public assistance—e.g., AFDC grant) and in the strictness of sanctions, time limits, and overall work incentives. States also differ significantly in the nature and extent of support services.

TANF’s effects have been decidedly mixed. Supporters point to dramatic declines in caseloads as evidence of success. Critics counter that caseloads...
began to decline before 1996 and continued to drop in the late 1990s. They argue that poverty rates have not declined since 1996 and that extreme poverty has increased, especially among African Americans. A family that receives a TANF grant and food stamps (the amount of which varies depending on the size of the family and the family’s income) will receive combined assistance whose total value ranges from 37 to 71 percent of the official poverty threshold established by the federal government. The reason for the wide variation is that different states provide vastly different amounts of aid to families who are eligible for TANF. Critics also assert there is no way to determine whether recipients left welfare for employment or are still employed.

By terminating entitlements and restricting benefits, TANF undermined the concept of assistance in the Social Security Act. It further devolved policy responsibility from the federal government to the states and, within states, to local governments and the private sector. In many states TANF’s implementation increased the burden on community-based nonprofit organizations without providing them with needed resources. Many small organizations, which primarily serve TANF recipients or persons of color, are at risk of closing.

TANF also had a serious impact on states’ budgets. During the late 1990s, states benefited from TANF’s funding formula, which linked block grants to 1994’s relatively high caseloads. When caseloads fell and tax revenues surged in the late 1990s, some states used surpluses to expand services. Since 2001, increasing caseloads have exacerbated states’ fiscal crises. In the future, it remains unclear how states will respond to more stringent work requirements and sanctions, caseload increases during future recessions, the impact of lifetime benefit caps on the growing proportion of African American and Latino recipients, and the deterioration of community support systems.

**TERRORISM**

Terrorism is a fluid and adaptable form of political behavior that defies precise definition. It typically involves the illegal use or threatened use of violence against individuals unable or unprepared to defend themselves in order to elicit fear and advance a political, ideological, or religious cause. Attacks can range from isolated events perpetrated by “home-grown” terrorists such as Theodore Kaczynski (the Unabomber, who engaged in nearly 2 decades of bombings from the late 1970s to early 1990s) and Timothy McVeigh and Terry Nichols (who bombed the Alfred P. Murrah Federal Building in Oklahoma City in 1995) to synchronized mass casualty events such as the September 11, 2001, attacks (9/11) or the Madrid train bombing in 2004. Weapons of terror can include chemical or biological agents (i.e., bioterrorism), radiological dispersive devices (RDDs), and nuclear devices (the so-called weapons of mass destruction, or WMDs). Sometimes terrorism can involve self-sacrifice (i.e., suicide terrorism) and martyrdom.

Catastrophic terrorism raises the specter of numerous casualties and open-ended religious or cultural battles, while other forms of terrorism have been linked to ethnic conflicts, environmental concerns, and criminal activities. Terrorism can impose very high costs, create massive disruptions, and create a generalized condition of fear that may have wide-ranging social, political, psychological, and economic consequences. Thus, terrorism can enable microactors to have macro-impact.

Analysts are divided on the utility of theorizing terrorism as a permanent feature of political life or as a distinctly modern phenomenon. Certainly, it is possible to identify in antiquity and throughout the Middle Ages individuals and groups that used violence to instill fear in order to advance political goals, such as the Zealots of Judea during the Roman Empire or the Assassins during the medieval period. But these examples do not allow for a clear criterion for deciding who is a terrorist and who is simply a combatant or agent of legitimate political power. Facilitating this distinction is the idea that the legitimate use of violence is limited to a government formed through a social contract, which is a modern concept associated with writers such as Thomas Hobbes.

Indeed, for well over 300 years after Hobbes wrote his state-defining study, *Leviathan* of 1651, the image of the world as an anarchic system, in which the
governments of sovereign states monopolize violence within a defined territory and then engage with other states in a competition to survive that frequently leads to war, was favored by the security community. After the enormous devastation of World War II, analysts and policymakers concluded that the great challenge was to find ways to prevent a third world war involving nuclear weapons while working under the condition of anarchy. A number of concepts were devised or adapted to investigate and explain the problems of the cold war world, such as the security dilemma (actions taken to enhance one state’s security may make other states feel less secure, leading to conflict or countermeasures that offset the initial actions), balancing (promoting regional or global stability by forming and reforming alliances to counter states and other alliances of states perceived as threatening), the spiral model (when actions taken by one state lead to countermeasures by another state, triggering further measures by the first state, and so on), and deterrence (when one actor attempts to influence the behavior of another actor by communicating that a given action will lead to a response that will inflict unacceptably high costs). Defense policy was constructed on a platform of realist theory animated by estimates about other states’ military expenditures, weapons development programs, alliances, and intelligence capabilities.

Late in the 20th century, real-world events began to erode this image. Global processes such as rapid technology diffusion greatly empowered nonstate actors, who often organized themselves into transnational networks. Problems that once paled alongside the threat of world war—such as global terrorism and transnational crime—evolved as serious national security concerns. Over the past several decades, major shifts in global power and technology ushered in a period in which individuals seeking to influence the global political and economic landscape moved beyond territorial boundaries to form transnational networks capable of impacting traditional power structures within and among nation-states. As part of this trend, global terrorism became a significant national security concern. Small groups now have the motivation and capacity to do great harm. Promoting elections and expanding free trade may not be enough, at least in the short term, to neutralize them.

Moreover, in some instances the threats posed by terrorists have been depicted as not only the most urgent threats facing the United States and many other countries, but also as virtually immune to traditional defense strategies. Reflecting this attitude, the 2002 National Security Strategy of the United States explicitly rejected the utility of the concept of deterrence in understanding or responding to terrorists. Reinforcing this alleged discontinuity with past approaches to security are claims about decisive shifts in the structure and character of network threats such as terrorism.

The contemporary terrorists epitomized by Al-Qaeda, some experts suggest, do not have the clear political agendas of their ancestors, and, most unsettling, they are not averse to causing mass casualties. In particular, weapons of mass destruction are not off limits for them. The 21st-century terrorist, many experts believe, is as likely to welcome the possibility of mass casualties and suffering as be constrained by it. Nonetheless, this is not a universal position, as other experts maintain that WMDs, while possible, are improbable (although, of course, devastating if successful).

Contemporary global terrorism is widely perceived as an explicitly malevolent threat currently focused on attacking the United States, its allies, and its interests on many international fronts. These terrorist activities threaten to bring the problem of weapons of mass destruction, disruption and effect into an entirely new and highly destructive arena. Global terrorist networks such as Al-Qaeda do not raise money from taxes or operate under the control of a government that can be defeated or bargained with. To raise funds, they often engage in criminal acts or ally with criminal organizations. They are bolstered by religious fervor that can accommodate many different agendas. They strategically align themselves with real grievances or strong perceptions of real grievances. They artfully manipulate mass media to promote sympathy, if not downright support, for their “courageous” struggle against a vast, wealthy enemy. They draw recruits from the angry, terrified, and disenfranchised—and from the well-educated, privileged youth of middle-class suburbs around the world. To both they offer a sense of meaning as well as a sense of identity from membership or affiliation with the terrorist group. They reach people by assuming the guise of a non-governmental organization (NGO) or by radicalizing the curriculum of an elementary school. They utilize both highly sophisticated technologies as well as crude but destructive weapons cobbled together from hardware stores and rental agencies. They frequently utilize the Internet to enlist recruits, communicate among themselves, and train in techniques.

While the catastrophic global terrorism associated with Islamic extremism is not the only form of terrorism
evident in the world today, because of its open-ended
agenda, its desire to acquire and use weapons of mass
destruction and effect, and its hostility toward the
United States and its allies, it is the most alarming
(and perhaps well-studied) contemporary form of ter-
rorism. Other extremists target more localized griev-
avances and have more limited aims.

Because terrorist activities appear fluid and shift-
ing as global responses to terrorism unfold, under-
standing the motivations and operations of terrorism
demands simultaneous investigation of the impact ter-
rorism has on individuals, communities, and whole
societies. In addition to targeting the physical well-
being of the populace, the ultimate goal of terrorism is
often to instill fear and create ongoing anxiety. On that
score, terrorism is often remarkably effective—and it
is assumed that terrorists monitor the consequences of
their actions and adjust accordingly.

Studies conducted in the United States following the
9/11 terrorist attacks demonstrated that fear and anxiety
were widespread—and not merely on the direct targets
of the actions. Indeed, widespread media and press cov-
erage of major terrorist attacks has expanded geograph-
ically the psychological impact of these events and
turned the psychological impact of localized attacks
into a global issue that can ripple beyond the immedi-
ately affected communities. For example, perhaps more
than 100,000 individuals directly witnessed the events
of September 11, but millions of others across the
world viewed the attacks and their aftermath via the
media. When framed within this context, these attacks
did far more than destroy buildings and kill thousands
of innocent people. They shattered a sense of security
and perceptions of invulnerability among residents of
the United States and the Western world. They inter-
rupted the rhythm and social fabric across the entire
United States, not simply in New York City,
Pennsylvania, and Washington, D.C.

The randomness, unpredictability, and uncontrol-
lable nature of ongoing terrorist attacks ensures max-
imum psychological impact. Individuals exposed to
terrorism (either directly or indirectly through the
media) often experience a number of emotions: shock
or emotional numbness in the immediate aftermath,
intense fear or anxiety about the future, and a sense of
sadness or depression about the losses incurred.
Stress-related symptoms (acute and post-traumatic
stress symptoms, such as repeated memories, thoughts
and mental pictures of the attacks, hyperarousal, and
avoidance of reminders) as well as somatic symptoms
(headaches, chest pains, nausea) are also quite com-
mon. Moreover, research has demonstrated that the
degree of individual response is not explained simply
by the degree of exposure to or loss from the trauma.

However, beyond post-traumatic stress symptoms,
positive personal and social consequences are also
possible in response to terrorism: a new appreciation
of the value of life, closer relationships with family
members, recognition of increased altruism, kindness,
and solidarity among others, and the perception of
political benefits, such as increased patriotism and an
increase in national security. In the absence of ongo-
ing attacks, psychological symptoms typically dimin-
ish over time, and most individuals and communities
are quite resilient and adaptable. Individuals and com-
nunities exposed to repeated and prolonged terrorist
attacks often develop mechanisms to cope with the
chronic stress.

It appears that global terrorist organizations moni-
tor closely media representations of their behavior, the
social responses to threats and attacks, and the coun-
termeasures that are implemented. This can lead to a
revision in attack strategies, development of new tac-
tics, and acquisition of new targets. The consequences,
in turn, depend on risk communication, preparedness,
and perceptions of who the terrorists are and why they
have selected a given target and attack plan.

Understanding the causes of terrorism can best be
facilitated by recognition that the causes and conse-
quences cannot be examined in isolation. They consti-
tute a dynamic system, and each part plays an integral
role in how the other is realized. Moreover, while much
of the impact of terrorist attacks is psychological, losses
of infrastructure (e.g., transportation, communications)
and resources (e.g., water, food, livestock) due to
weapons of mass destruction can have very real mater-
ial effects that significantly disrupt both individual- and
community-level functioning. In addition, responses to
the actual and perceived future threat may evoke polit-
ical responses that in the aggregate can influence demo-
cratic values, institutions, and practices. For example,
recent research suggests a strong association between
perceptions of an ongoing threat of terrorism and sup-
port for increased diplomatic, military, and domestic
action in response to the perceived threat, as well as a
willingness to sacrifice personal liberties in support of
anti-terrorist policies.

The future of terrorism is unknown, and terrorists’
plans are undoubtedly shaped by the actions taken
to defend against their success. A government’s or
public’s efforts to defend against one means of attack undoubtedly leads to a search by the terrorists for additional vulnerabilities. Unfortunately, little evidence suggests that terrorism is decreasing in frequency or intensity as a technique as long as terrorists perceive the success of their mission.

TERRORISM, COUNTERTERRORISM APPROACHES

Terrorism is a complex phenomenon with many dimensions that vary in intensity and scope across time periods and have varying degrees of impact and significance in different regions of the world. Counterterrorism approaches, in consequence, are likewise multifaceted in kind to offer appropriate responses to the threat and reality of terrorism on a local, national, and international level. Although political objectives lie at the heart of most terrorist violence, enactment of counterterrorism strategies not only occurs at the government levels of nation-states and their international unions but also extends to many other institutions and organizations.

International Law and Politics

Historically, counterterrorism strategies have at least two important precursors. First, in the middle of the 19th century, autocratic political regimes in Europe responded to political dissent of a more or less violent nature by organizing national and international police and surveillance practices. Among these efforts were police activities involving covert surveillance practices as well as cooperation activities, on a bilateral and multilateral scale, to exchange information on wanted political opponents of established autocratic regimes. Police institutions conducted these activities and, in the course of their activities, gradually gained professional expertise and autonomy to focus attention on more distinctly criminal rather than political enforcement objectives. Second, developments in the area of international law occurred to outlaw and institute appropriate practices against politically motivated violent activities. Most distinctly, in the late 19th and early 20th centuries, governments signed treaties that led to organized international efforts against anarchist
movements. Similarly, the first international treaty specifically dealing with terrorism was in 1937, when the League of Nations drafted a convention on the Prevention and Punishment of Terrorism. However, only one country, India, ratified the agreement, testifying to the ideological difficulties within and across nations to enact measures and foster collaboration on a matter as politically volatile as terrorism.

During the remaining decades of the 20th century, government policies and legislative actions against terrorism evolved slowly and in piecemeal fashion, typically focusing only on specific violent and criminal activities often associated with terrorism, such as hijackings and bombings, rather than on terrorism as such. For instance, the United Nations adopted a convention on the Prevention and Punishment of Crimes Against Internationally Protected Persons in 1973 and on the Taking of Hostages in 1979. Similar international treaties against terrorism were adopted by other international governing bodies, such as the Council of Europe and the Organization of American States, as well as at the bilateral level between nation-states. International treaties, however, could not lessen terrorism as an often contentious issue in the global field of international relations.

In the United States, legal and policy efforts against terrorism developed even more slowly than in the international arena, primarily because of a prevailing view that terrorism was a foreign problem. During the Reagan administration emerged the Act to Combat International Terrorism of 1984 and an Omnibus Anti-Terrorism Act in 1986. Yet, it was not until certain high-profile terrorist incidents, such as the bombing of the World Trade Center in 1993 and the Oklahoma City bombing of 1995, that the Clinton administration stepped up legislative efforts against terrorism, leading to the Antiterrorism and Effective Death Penalty Act of 1996.

The Centrality of September 11

Despite the gradual increase in legislative and political responses to terrorism during the late 20th century, the enormous impact of the terrorist attacks of September 11, 2001, on counterterrorism approaches was unpredictable, as counterterrorism efforts expanded considerably on both the national and international levels. The United States took the lead in passing the USA PATRIOT Act, allowing the detention and trial of terrorist suspects in military tribunals, and creating a new department, the Department of Homeland Security, specifically designed to respond to the terrorist threat. Furthermore, counterterrorism measures expanded to the military field when the United States and selected North Atlantic Treaty Organization (NATO) nations undertook military operations in October 2001 against the Taliban government in Afghanistan, which was offering support to Al-Qaeda members.

The military invasion in Iraq in March 2003 was politically incorporated in the so-called war on terror, thereby giving that expression more than mere metaphorical meaning. Although revelations about the decision to invade Iraq showed it less clearly related to the terrorist threat, ongoing conditions in Iraq as well as the internationally contentious struggles over the war’s relationship with terrorism have influenced the debate over the proper response to terrorism. Most remarkable is that many nations across the world and a variety of international governing bodies instituted new legislative and political policies similar to those implemented in the United States. For instance, new anti-terrorist laws expanding policing powers against terrorist suspects passed in many nations also considered under the threat of international terrorist groups. International governing bodies, such as the United Nations and the European Union, similarly adopted new measures to ensure international cooperation against terrorism. What these developments show is a trend toward the treatment of terrorism as an issue of national and global security.

Dimensions of Counterterrorism

In spite of the growing significance in counterterrorism of matters related to security, warfare, and military might, counterterrorist activities are comprised of a multitude of political, legal, military, economic, and cultural efforts, which are not always in complete harmony with one another. Most conspicuous at the level of formal state institutions are the extended counterterrorist powers granted to law enforcement institutions. Strikingly, police organizations conceive of terrorism as a distinctly criminal enforcement problem requiring response with technically sophisticated means of policing. Police counterterrorism responses, both within nations and at the international level, thus demonstrate the relative autonomy of police to determine the proper means and to specify the objectives of their counterterrorism activities.
The reorganization of police power under conditions of an intensified concern with terrorism may lead to structural adjustments that will have effects long after the more immediate repercussions of the terrorist threat have faded. Moreover, police institutions might pay relatively less attention to other enforcement tasks and thus exacerbate criminal conditions unrelated to terrorism. Furthermore, because police organizations are not alone in conducting counterterrorism activities, they increasingly confront the counterterrorism operations of other state institutions, such as rival police organizations (e.g., the Federal Bureau of Investigation in the Department of Justice, and Immigration and Customs Enforcement in the Department of Homeland Security), intelligence organizations, and military institutions. For example, police and intelligence efforts in counterterrorism do not always neatly harmonize, as policing activities focus on suspects in criminal cases, while intelligence work involves the routinized collection of information irrespective of a criminal incident. The new realignments of police, intelligence, and military brought about by the intensified focus on terrorism pose important problems of jurisdictional authority, the appropriate methods and means of interagency cooperation, and the relationship between civilian police and military power from a functional and organizational point of view.

Besides interagency cooperation within nations, moreover, the international nature of the current terrorist threat also places a premium on international counterterrorism cooperation. The centrality of international cooperation applies to various levels of counterterrorism, including treaties of international law, diplomatic efforts, police cooperation among nations and participation in international police organizations such as Interpol and Europol, coalitions in military operations, and the imposition of economic sanctions against nations that harbor or support terrorist groups. Interestingly, growing international cooperation in matters of terrorism has not yet fostered a truly global climate of counterterrorism inasmuch as national interests, concerned with the more locally confined implications of terrorism, remain paramount.

Again showing the multifarious nature of counterterrorism, international counterterrorism activities also include attempts to build public support against terrorist groups and practices and, relatedly, to foster the spread of democratic values across the globe. Presumably not unimportant in this respect are also the efforts taken in the academic research community to study the mechanisms, causes, and effects of terrorism and counterterrorism as well as the activities undertaken by civic groups to ensure a climate to obtain a sufficient degree of effectiveness in counterterrorism strategies without sacrificing civil liberties and human rights.

TERRORISM, DOMESTIC SPYING

Domestic spying is a cultural construct that is used, especially among civil libertarians and the media, to refer to internally directed surveillance programs initiated by a variety of formal agencies of social control and intelligence. In the current U.S. context, domestic spying primarily refers to the debate that erupted following several revelations about surveillance programs set up, without court approval or congressional oversight, to aid in the fight against terrorism. Although the debate on domestic spying is recent, internal surveillance programs have considerable historical antecedents.

Domestic Surveillance Programs
U.S. domestic surveillance programs date back to the 1930s, when President Franklin D. Roosevelt secretly ordered the Bureau of Investigation (renamed Federal
Bureau of Investigation [FBI] in 1935) to investigate the American Nazi movement. On September 6, 1939, 3 days after the British and French declaration of war on Nazi Germany, Roosevelt formally placed the FBI in charge of all surveillance activities relating to espionage, sabotage, subversive activities, and violations of U.S. neutrality laws. During World War II, the FBI was responsible for all domestic intelligence work and foreign intelligence in South America, while the Office of Strategic Services (OSS) was the leading intelligence agency for all other regions.

Domestic surveillance in the United States remained primarily in the hands of the FBI after the war. Most distinct amongst these efforts was the Bureau’s COINTELPRO or counterintelligence programs from the 1950s onward that acted against communist groups and a wide range of other organizations, including leftist groups, civil rights organizations, and the Ku Klux Klan. In the early 1970s, COINTELPRO was formally abolished, leading to passage of the Federal Intelligence Surveillance Act (FISA) in 1978, which permits electronic surveillance within the United States on foreign agents and international terrorists on the condition that a judge in a specialized FISA court issues a warrant.

Presently, several partly interacting and overlapping surveillance agencies handle domestic intelligence duties, including the FBI, the National Security Agency (NSA), the Central Intelligence Agency (CIA), the Office of the Director of National Intelligence, and various federal and local law enforcement agencies.

In the current context of counterterrorism, domestic spying debates erupted following several revelations reported in the popular media about domestic surveillance programs, conducted by the NSA, that were secretly authorized by the president following the terrorist attacks September 11, 2001. In addition to these NSA surveillance programs, debate also raged over the expanded opportunities afforded to the U.S. intelligence and law enforcement community under provisions of the USA PATRIOT Act, a federal bill passed in 2001 that broadened police powers against terrorism. In November 2005, the Washington Post disclosed a rapidly growing practice of domestic spying under the provisions of the PATRIOT Act by the FBI seeking information on the basis of so-called national security letters. Such letters enable the FBI to secretly review the private telephone and financial records of suspected foreign agents. However, the letters program also included U.S. citizens and residents who were not suspected of any wrongdoing.

Most important in the recent debate on domestic spying, The New York Times on December 16, 2005, reported on a secret domestic surveillance program conducted by the NSA. This so-called Terrorist Surveillance Program, initiated in early 2002 on the secret authorization of President George W. Bush, allows the NSA to intercept, without a court-approved warrant, communications that involve one overseas and one domestic party or at least one party suspected of holding ties to Al-Qaeda or an affiliated terrorist group.

The response to this revelation was intense. In January 2006, the American Civil Liberties Union (ACLU) and the Center for Constitutional Rights filed lawsuits, arguing that the NSA eavesdropping program violated Americans’ civil rights. That same month, the Electronic Frontier Foundation filed a class-action lawsuit against the telephone company AT&T, accusing it of providing the NSA with unfettered access to customer phone calls and Internet communications in violation of the Fourth Amendment as well as federal wiretap and communication laws. On a political level, two Senate Judiciary hearings held in February 2006 discussed the status of the NSA program. Another revelation about contemporary domestic surveillance programs came when the newspaper USA Today reported in May 2006 that the NSA had kept logs of billions of domestic calls, a program that began, without court approval, soon after 9/11.

The Domestic Spying Debate

The debate on domestic spying contains important considerations of both a legal and normative nature. From the legal viewpoint, the Bush administration insisted that it had the power to authorize the wiretapping program under both the U.S. Constitution and the congressional resolution of the Authorization of Military Force that authorized use of wartime powers against those responsible for the 9/11 terrorist attacks. The constitutional powers of the U.S. president as commander-in-chief would allow President Bush to pursue, without explicit congressional permission, any enemy operating inside the United States. Additionally, the wartime powers of the president would allow him to bypass the courts to spy on Americans without warrants, a presidential power that not even Congress can restrict, as the president not only has the authority but also the duty to protect the nation. The administration further argued that the congressional resolution on the Authorization of Military Force that passed shortly after 9/11 also granted the president the right to use all
"necessary and appropriate force," thereby effectively suspending the FISA requirements that are considered outdated and inappropriate in view of the contemporary war on terror. When President Bush in a televised address admitted that he had authorized domestic, warrantless monitoring of calls involving an overseas party, he defended his actions as crucial to national security.

Opponents argue that the president’s expansion of executive power violates constitutionally framed mandates for judicial and congressional oversight. Congress and the courts have a constitutional right and obligation to provide a check against extra-legal activities in the executive branch. The uncovered domestic spying programs, they claim, violate Fourth Amendment protections against illegal search and seizure. The Supreme Court has likewise held that most surveillance by government agencies must be based on a judicial finding of probable cause of criminal wrongdoing.

Other arguments against domestic spying invoke concerns over two specific federal acts. First, critics say the program violates provisions of the 1978 FISA Act that require warrants. The PATRIOT Act only allows for the collection of data for up to 72 hours before a warrant must be requested from the courts, and the Authorization of Military Force resolution does not give the president the power to bypass this law. Second, because only eight members of the House and Senate were briefed about relevant developments, the NSA program violates the National Security Act of 1947, which requires that intelligence oversight committees of Congress be kept informed of U.S. intelligence activities. Absent such congressional approval, prosecutions of captured terrorists may be jeopardized by defendants’ claims that the evidence against them was collected illegally. In August 2006, a U.S. District Court ruled the NSA surveillance program to be unconstitutional. At this writing, an appeal is still pending.

Underlying the legal debate on domestic spying are conflicting positions about its normativity. On the one hand, proponents suggest that special surveillance programs are necessary because of the severity and nature of the current terrorist threat and, moreover, that they have effectively prevented other terrorist attacks on U.S. soil. Under present-day circumstances, they claim, most Americans would agree that some of their rights have to be sacrificed in order to preserve national security. On the other hand, opponents argue measures implemented against terrorist groups should not curb civil rights, which are an essential part of a free and open society. Making exceptions on constitutional restrictions on presidential power in the area of counterterrorism might lead to wrongly justify other special provisions, such as on the use of torture and the indefinite detention of citizens. Modernizing the rules of counterterrorism surveillance in the United States could allow for the use of new means but only within proper limits that prevent innocent citizens from being investigated.

Given the continued anxieties over the terrorist threat and the likewise persistent concerns over civil rights, the debate on domestic spying is likely to stay in the public consciousness for some time in the foreseeable future.

THEFT

Theft is the act of taking property (physical or intellectual) from someone (including businesses and corporations) with the intent of keeping the item permanently. Various criminal codes throughout the United States subdivide theft into different areas, although the primary theme is identical: taking property, thus depriving the rightful owner of his or her goods. Within English common law, two precise
categories of theft existed: petit larceny and grand larceny. A thin line separated the two, with the deciding factor resting on the value of the goods stolen. Grand larceny is a felony, while petit larceny is a misdemeanor.

In common law, for theft (used interchangeably with larceny and stealing) to occur, specific circumstances had to be met: (a) the thief deliberately took the property into his or her possession, thus securing control of it; (b) the goods were “moved” from their rightful place; (c) a trespassing occurred when the merchandise was removed from the rightful owner’s possession; (d) the property was tangible; (e) the property belonged to someone else (one cannot steal land that lacks an owner); and (f) the intent to steal was evident.

Other areas of theft include using false pretenses—meaning that an individual makes false representations, either spoken or written, with the intent to cheat or defraud the victim. A similar crime, but generally more serious, is a confidence game or “con game,” where the falsehoods must be tangible; mere words are not enough. Embezzlement is often a definition of theft, but there are subtle differences. In embezzlement, the property is legally possessed or accessed by the embezzler, whereas in theft the goods are in another’s possession. Embezzlement commonly occurs in businesses, with an employee “borrowing” money from the employer but not repaying it before detection.

Robbery is a particularly violent form of theft, often viewed as a hybrid of assault and battery plus larceny, thus the title “aggravated larceny.” Burglary is the act of entering into any building or structure as a trespasser with the intent to steal something of value. Passing bad checks is considered theft in all states, with special statutes detailing checks in which the giver does not have an account in the bank in which the check was drawn, and “short” checks in which an account is held but contains insufficient funds; thus, when a check is made out, it “bounces.”

As the 21st century unfolds, the two most common forms of theft are identity theft and the theft of intellectual property. Identity theft is a crime that occurs whenever someone steals another’s personal, identifying data (charge cards, Social Security number, and so on) without consent, with the intent to commit fraud and/or other criminal acts. The theft of intellectual property occurs whenever an individual plagiarizes another’s work, whether it is music, words, ideas, or other work and uses it as his or her own without acknowledging the rightful owner. The ubiquity of Internet access has caused this problem to skyrocket, causing billions of dollars in lost revenue. Until better security measures are available, identity theft and the theft of intellectual property will remain common hazards in the information era.

THEORY

Theory has multiple meanings in regard to its context in both field and method. In everyday use, the word theory generally means an assumption or inference, to denote a status less than something that can be certifiably known as a fact. Following this, “theory” is often juxtaposed against “fact.” However, both are mutually exclusive or opposed: an action can be empirically verifiable, and the theory as to why the action has occurred either falsifiable or verifiable (e.g., an apple falls and the theory of gravity explains why).

As sociology developed out of a positivist scientific system in the tradition of Auguste Comte, it is based in a scientific, as opposed to a hermeneutic (interpretative), approach to theory. However, this is by no means exhaustive, as many traditions in sociology are explicitly based on the discovery and evaluation of meaning and qualitative enterprises. Scientifically, “theory” is often described as an anticipated and/or projected interaction within and between natural or social phenomena. That is, theory is a hypothesized explanation of empirical evidence. This means that theory generally (a) is consistent with, or falsifiable of, preexisting theory; (b) is sustained by pieces of evidence opposed to a solitary, unified body of thought; (c) makes forecasts
that could be used in the future to falsify the theory; (d) is hesitant and provisional; and (e) is the most parsimonious explanation (often known as “Ockham’s Razor”).

Following, there are several types of theory. First, metatheory (also referred to as “epistemology” or the philosophy of knowledge and/or science) specifies the nature and goals of science, sets standards by which it is evaluated, defines what methodology will be used to obtain data, and sets the research goals. Second, conceptual theory provides the perspective and language with which a science addresses reality. Third, explanatory theory orders the subject matter and proposes why phenomenon and variation occur. This type of theory is able to predict phenomena of a similar ilk and is capable of being tested.

Within general sociological purview, and within the subdiscipline of the study of social problems in specific, there are various forms of sociological theory, but these are often boiled down to three distinct approaches. First, functionalist theory is the oldest perspective and rests upon two endeavors: the first is the application of the traditional “scientific method” to the social world, and the second is the understanding of the individual and society as continually involved in a (dys)functional relationship. Notable functionalists are Émile Durkheim, Robert Merton, and Talcott Parsons. Second, conflict theory is predicated upon the work of Karl Marx, who stated that society is in constant conflict among groups vying to maximize their interests. The theory attempts to refute functionalist paradigms that leave little room for explaining the operations of power. Other notable conflict theorists are Georg Simmel, Lewis A. Coser, and Ralf Dahrendorf. Third, symbolic interactionism (its later derivation is known as “cultural sociology”) explains how individuals and groups interact, focusing on the creation of personal identity through interaction with others. Drawing from the sociology of Max Weber, symbolic interactionism examines how individuals create the symbolic structures that make life meaningful. Reality does not impose the names and definitions of things, but rather people must define things and give them meaning in order to make them socially real. Notable theorists in this tradition are Herbert Blumer, Erving Goffman, and George Herbert Mead.

THERAPEUTIC COMMUNITIES

Although the model of drug misuse treatment called the “therapeutic community” (TC) traces its American roots to Synanon, it has quite an ancient pedigree. At the dawn of the Christian era, Philo Judaeus wrote of com-munitae therapeutides, the art of which was to “heal the souls which are under the mastery of terribl e... incurable diseases of pleasures and appetites. . . .” Thus, it appears that the struggle with uncontrolled appetite was a challenge then, as it is now, and the ancients embraced similar principles to ensure spiritual health. These principles have been present in mutual help communities from early monastic splinter groups to the much later Methodist congregations that espoused a “return to first principles” and morphed into the early Oxford movement. They can be summarized as follows:

- Concern for the state of our soul and our physical survival
- Search for meaning: transcending truths
- Challenge and admonish with love
- Be invasive—accountable to the community
- Public disclosure of acts, fears, hopes, guilt
- Public expiation for wrongs done
- Banishment is possible—done with concern for survival
- Leadership by elders—by models

In the 17th and 18th centuries, religion-based mutual help societies emerged in Western Europe.
Responding to the widespread overuse of alcohol, they launched temperance efforts in Europe that spread to America. Many of these early attempts at “appetite control” included temporary residential support and pledges of abstinence. Key principles embraced by these mutual help groups, including disclosure (confession), admonition, commitment, and conversion of others, spread and, by the 1800s, influenced development of the Oxford Groups.

The term therapeutic community, however, does not reemerge until World War II. At Northfield Hospital in England, a facility dedicated to the treatment of traumatized United Kingdom troops, two psychiatric innovators, Maxwell Jones and Tom Maine, sought to reapportion authority and decision making between staff and patients. They called their effort a “therapeutic community,” and “patients” in their psychiatric units became the active decision makers, taking on increasing responsibility for ward management. Early discussions among these pioneers resulted in five basic assumptions: (1) two-way communication at all levels; (2) decision making at all levels; (3) shared leadership; (4) consensus in decision making; and (5) social learning by social interaction with emphasis on the here and now. This horizontal, open system of communication was itself assumed to result in healing, eliminating the need for individualized treatment plans. This notion would later become doctrine in U.S. drug treatment TCs.

But the drug treatment TC was not introduced by any of the nurses or psychiatrists who, inspired by Jones, sought to develop similar models. It emerged in Venice Beach, California, in 1959, when an Alcoholics Anonymous member, Charles Dederich, began an organization called Synanon, embodying the mutual help principles of AA and characterized by hierarchical structure, a semi-open communication system, small-group encounters focusing on behavior change, and encouraging members or residents to become leaders. This clear progenitor of what later became known as TCs enjoyed early success working with heroin users, but it is best known for its slow decline into a controversial cult.

The next major residential community to utilize similar techniques for drug treatment was Daytop Village, established in New York in 1963. While adopting the treatment strategies of Synanon, this organization rejected that group’s notion of becoming an alternative, utopian community, referring to itself originally as a “humanizing community.” In 1966, New York City’s mayor, John V. Lindsay, recruited Efren Ramirez, M.D., a San Juan psychiatrist, to coordinate the city’s narcotic treatment programs. Ramirez had already developed systems of community engagement, protracted client induction processes, and treatment approaches similar to those of Daytop Village. Daytop staff became a resource for Ramirez as he set out to expand the city’s response to a growing heroin epidemic. It was Ramirez, trained in the Jones model, who persuaded Daytop to use the term therapeutic community to describe itself.

Ramirez was soon joined by Mitchell S. Rosenthal, M.D., who had headed an alcohol and drug treatment unit at the U.S. Naval Hospital in Oakland, California, where he had introduced many structural and group characteristics of Synanon. Ultimately, Ramirez made Rosenthal his deputy commissioner for treatment. The convergence shaped by Ramirez became a major force for expanding the TC model in New York City. Daytop lent staff to each of the treatment leaders in Ramirez’s group. This rich mix led to the development of Odyssey House (Judy Densen Gerber), Phoenix House (Rosenthal) and the expansion of Samaritan (Richard Pruss). By the end of 1968, Daytop staff had also contributed to a second wave of TC development with Gateway in Chicago, Gaudenzia in Philadelphia, and the Village in Miami.

Further expansion followed: Marathon House in New England, Integrity in New Jersey, Walden House in San Francisco, the Mendocino Family, and Abraxas. Participation in marathon therapy as TC training in authenticity, expiation, and commitment inspired many visitors to the Intensive Training Institute, developed at Daytop’s Swan Lake facility, to emulate part, or all, of this early TC model.

Subsequently, TCs spread to Sweden, Germany, and Great Britain. By the mid-1970s, the World Federation, led by Msgr. W. B. O’Brien of Daytop, had started programs in Italy, the Netherlands, and Southeast Asia, which, in turn, influenced further expansion into Spain, Portugal, and Brazil.

During the 1960s, leading researchers, such as O. Hobart Mowrer and Abraham H. Maslow, applauded early TC initiatives and contributed ideas as well as methods. At the start of the 1970s, outcome and follow-up studies done at Phoenix House by George DeLeon and others provided an academic and research base to the movement, bringing increased credibility and recognition.
By the end of 1974, 15,000 persons were being treated in TCs. In 1976, a Therapeutic Communities of America (TCA) planning conference sponsored by the National Institute on Drug Abuse (NIDA) brought first, second, and third wave post-Synanon groups together. Discussions focused on such issues as size, fidelity, working with various different populations, and the discreet needs of women with children.

In the 1980s, training in drug abuse treatment methods, supported by the U.S. State Department, brought the TC to Southeast Asia, South Asia, and East Central Europe. TCs were developed in Slovakia, the Czech Republic, Hungary, Slovenia, and Poland. The TC approach is now found not only throughout the Americas, but also in such Muslim countries as Malaysia, Afghanistan, Pakistan, and Bangladesh and in Lebanon, Israel, China, South Africa, India, Thailand, Vietnam, and Cambodia.

Key enduring principles have survived, along with certain features of program structure, daily schedule, small-group work, and the development of social responsibility and compassion. In most programs, the role of the leader—regardless of the size of the unit, program, or system—still influences what principles are emphasized or downplayed, although many European programs and some American ones have adopted a far more egalitarian Jones-like approach.

Not so curiously, the older leadership bemoans many current practices, the dilution or drift from earlier models. Newer practitioners, educated more broadly and with less doctrinaire backgrounds, applaud the utilization of new science-driven practices. To remain relevant, the movement must applaud history, use the key enduring principles, and also embrace new practices. It is no longer a belief system with some techniques found wanting, or at worst destructive. It is and can proudly refer to itself as a model of value, proven in the treatment of addictive disorders, and capable of developing character and survival competencies for many, regardless of the culture in which it is found.

Think Tanks

Think tanks are independent, nonpartisan, non-university-based organizations that conduct policy research. More than 300 think tanks in the United States and thousands of others around the world focus on domestic and foreign policy issues such as the economy, environment, welfare, social security, education, health care, governance, military technology, and global trade. The primary purpose of think tanks is to educate the public and policymakers through research relating to current policy issues. As 501(c)(3) nonprofit, tax-exempt organizations, U.S. think tanks cannot endorse political candidates or legislation. In practice, however, many newer think tanks walk a fine line, operating more like advocacy organizations than research institutes. The increasing politicization of think tanks and the shift toward advocacy and marketing has been a focus of current research on think tanks.

U.S. think tanks are guided by their mission statements and are focused on national, regional, or state issues. Varying widely in size and scope, think tanks can be run by a staff of two to five people on a small budget or house dozens of researchers with a budget in the tens of millions. Single-issue think tanks dedicate their efforts to the study of one topic, such as the environment or tax policy. However, the majority of think tanks focus on multiple issues, with several divisions dedicated to specific research areas. The funding for think tanks comes primarily from philanthropic foundations and donations from corporations and individuals, while a far smaller number of think tanks accept government grants.

Political scientists generally differentiate think tanks based on the nature of their work. Several different “ideal types” of think tanks are academic, contract research, and advocacy. Often referred to as “universities without students,” academic think tanks are largely staffed by individuals holding doctorate degrees and
have their agenda set by their researchers and funding source. Examples of academic think tanks include the Brookings Institution, Public Policy Institute of California, and the Washington Institute for Near East Policy. Contract research think tanks are also staffed largely by Ph.D.s with their agenda set by the agency that contracts their work, in many instances federal or state government. Their work often involves the evaluation of existing policies and programs. Examples of contract think tanks include the RAND Corporation, Pacific Institute for Research and Evaluation, and the American Institutes for Research. Both academic and contract think tanks have a “muted ideology” and as such tend not to have a mission affiliated with a particular political perspective.

Advocacy think tanks, on the other hand, have staff with philosophical, political, or ideological leanings. Research positions are less likely to be filled by academics with Ph.D.s, and its directors set the think tank’s agenda. Examples of conservative think tanks include the Heritage Foundation, American Enterprise Institute, and Hudson Institute, which generally advocate for limited government, free markets, private enterprise, and individual responsibility. Examples of liberal or progressive think tanks include the Economic Policy Institute, Center for American Progress, and the Center for International Environmental Law, which generally advocate for economic and social justice, racial equity, reproductive rights, and increased environmental protections.

Lengthy research reports and books are more typical of the publications produced by academic and contract think tanks, while advocacy think tanks put more emphasis on producing policy briefs, summary reports, thought pieces, and newsletters. This more condensed style of policy research is typical of think tanks that are interested in marketing their publications to policymakers and the media. Think tanks additionally hold conferences, give briefings to legislative committee staff, and testify as policy experts.

The earliest think tanks, founded at the beginning of the 20th century, include the Russell Sage Foundation in 1907, Carnegie Endowment for International Peace in 1910, and Brookings Institute in 1916. These policy institutes, which would not be referred to as “think tanks” until decades later, were backed by Progressive Era reformers who believed that society could be improved through social scientific inquiry. Business interests often joined these “scientific reformers” in an attempt to direct government management away from corrupt politics and toward rationality and efficiency, while at the same time asserting their interests.

In the past several decades, a dramatic growth in the number of U.S. think tanks occurred, going from approximately 50 in 1970 to well over 300 by 2005. With this growth came a shift toward a “new guard”: think tanks more directly focused on affecting policy and more partisan in nature. Although this growth occurred among all types of think tanks, the most dramatic increase was among conservative think tanks. Scholars attribute this growth to the expansion of business in politics, the rise of neoconservatism, a new paradigm of neoclassical economics, and the political mobilization of fundamentalist Christians.

Research on think tanks largely focuses on defining these institutions, their activities, historical growth, relationships to foundations, increased politicization, and role in the policy-making process. A common measurement of the influence of think tanks is tracking their media citations, congressional testimony, visibility, credibility, marketing strategies, and access to policymakers. Other think tank research takes a more global dimension, focusing on the activities of these policy organizations internationally.

THREE STRIKES LAWS

Three strikes laws are statutes that mandate state courts to impose a mandatory extended period of incarceration to individuals convicted of a felony on the third offense. The name originates from baseball, following the model of the “Three strikes, you are out” theory. Its intent is to combat recidivism by mandating lengthy sentences to deter criminals from repeat offenses.

These laws prescribe that felons found guilty of a third serious crime should face an indeterminate term of life imprisonment. The first two “strikes” would accrue for serious felonies, while the third committed offense triggers a life sentence that could be applied for any felony, whether serious or general. Additionally, the law doubles sentences for a second strike, requiring extended sentences be served in prison (rather than in jail or on probation), and limits “good time” earned during prison to 20 percent of the sentence given rather than the 50 percent prescribed under previous law.

The practice of increasing the length of incarceration for repeat offenders dates back to the 19th century but was not a precedent for the subsequent three strikes laws. New York State, for example, had a Persistent Felony Offender law that sought to combat recidivism, but the sentences were set on a case-by-case basis, thus affording judges more discretion. Washington State first established the strict application of the three strikes law in 1993, when voters approved Initiative 593. One year later, California adopted the law, and by 2007, 26 states and the federal government had laws following the three strikes criteria, although the laws vary considerably in their application by state.

The greatest difference lies in the sentencing, by which California imposes a mandatory sentence for any third felony conviction, whereas other state laws prescribe that all three felony convictions must be for violent crimes in order for the mandatory sentence to be applied. Efforts to change the stricter third general-felony rule in California failed in 2004 when the voters rejected an amendment to the statute (offered as Proposition 66). The amendment would have required the third felony to be either violent and/or serious in order to result in a 25-years-to-life sentence.

Criticisms surround the law’s application, since some states label their laws differently and some offenders have been “victims” of the law for crimes such as shoplifting. In some states, possession of a small amount of cocaine or marijuana is treated as a felony, so three convictions for possession would carry longer imprisonment under the three strikes laws. Some minor white-collar crimes and burglaries also marginally qualify as felonies and thus invoke application of the three strikes laws.

Critics of the three strikes law, citing numerous instances of the punishment not fitting the crime, point to the notorious case of Kevin Weber, a homeless and unemployed man sentenced to 26 years to life for the crime of stealing four chocolate chip cookies from a restaurant (his previous strikes were burglary and assault with a deadly weapon). Other critics point to the fact that defendants may be charged and convicted with two “third strikes” for a single case, which many believe invokes double jeopardy. In some cases, both strikes may arise from a single criminal act which may subject a defendant to two sentences that run consecutively, resulting in a 50-years-to-life prison sentence.

Critics also believe that criminals may choose to commit more serious offenses since the punishment is the same albeit a serious or minor third offense. Cost-effectiveness is also a point of contention for critics, who point to the notion that imprisonment of older career criminals will exceed their criminal activity if and when released, thus incurring costs with no crime-reduction benefits.

Despite the debate, the U.S. Supreme Court held that such sentences do not violate the Eighth Amendment of the Constitution, which prohibits cruel and unusual punishment. In a landmark case Ewing v. California, 538 U.S. 11 2003, challenging the three strikes law, Justice Sandra Day O’Conner opined that the Supreme Court does not seek to super-legislate state policy choices and that it was enough for the justices that the State of California had a reasonable basis for believing that dramatically enhancing sentences for habitual felons advanced the goals of its criminal justice system.

Some amendments to the original law have passed after its enactment. In November 2000, about 61 percent of California voters supported an amendment to the statute (offered in Proposition 36) that scaled back punishment of those convicted for possession to mandate drug treatment instead of life in prison. In November 2004, California voters considered another reform (Proposition 66) to eliminate several crimes, such as residential burglary, from the three strikes rule, but narrowly rejected it. Proposition 66 would have released approximately 37,000 people from state prisons, which proved to be a major voters’ concern.
Research showed that as of June 2005, 60 percent of the state’s 7,700 third strike inmates had committed a nonviolent or less serious third strike.

Undaunted, critics offered other amendments to reduce the penalty imposed by the three strikes laws against nonviolent criminals. People v. Cluff, 2001 87 Cal.App.4th 991, and People v. Garcia, 1999 20 Cal.4th 490, 493–494, both dealt with courts’ discretion to remove strikes and offer sentences proportionate to the crimes at issue. In Garcia, the Supreme Court held that a trial court may exercise its discretion when applying the three strikes law and dismiss prior conviction allegations. This ruling does not force judges to dismiss prior strikes but instead affords them the opportunity to limit the damage potentially caused by the strict application of the three strikes law.

As with many laws, the three strikes law remains under challenge. Law enforcement officials believe that the law affords some flexibility and that judges have discretion in sentencing criminals. Some mitigation of extreme application of the three strikes sentences has occurred over the years and may continue.

Title IX

Title IX of the 1972 Education Amendments Act stipulates that “no person in the United States shall, on the basis of sex, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any education program or activity receiving federal financial assistance” (20 U.S.C. § 1681). Designed to eliminate discriminatory treatment at all levels of education and applying to both students and employees, Title IX paved the way for equal treatment of girls and women in career counseling, vocational training, admissions, athletics, extracurricular activities, and employment and promotion decisions. Title IX also assists in creating a climate of intolerance for sexual harassment and tracking on the basis of gender in educational programs. Though the letter of the law mandates gender equity in educational institutions and much progress has occurred since its initial passage, additional enforcement efforts still remain to achieve gender equity. Title IX has been most successful in responding to and further facilitating a shift in societal expectations for greater gender equity and providing individuals and groups with a limited number of remedies when educational institutions fall short of gender equality.

While Title IX mandates gender equity in all educational programs receiving federal funding, enforcement has been sketchy at best and in the 30-plus years since its passage, no institution has lost federal funding as a result of noncompliance. Persons hurt by institutions’ noncompliance have three options. They can file an in-house complaint with the employee designated as the official Title IX officer; lodge a complaint with the U.S. Department of Education’s Office for Civil Rights (OCR), the federal agency that oversees Title IX; or file a lawsuit. In-house complaints are the least effective and carry considerable risk of social ostracism and other forms of retaliation within the organization for the complainant. Complaints lodged with the OCR also usually result in limited remedies for the complainant, the program, and the larger educational institution. Instead of withholding federal funding, the OCR typically responds to meritorious complaints by admonishing institutions to remedy the discriminatory treatment. Successful lawsuits, however, have the potential both to admonish institutions to remedy discriminatory practices and inflict financial punishment for such discrimination. Since the 1992 U.S. Supreme Court ruling, Franklin v. Gwinnett, which held that plaintiffs successfully demonstrating intentional discrimination under Title IX were entitled to collect compensatory and punitive monetary damages, educational institutions now have significant financial incentive to comply with Title IX. Nevertheless, more recent Supreme Court rulings have the potential to scale back or erase these financial incentives.

Despite these limited enforcement efforts, Title IX has been successful in reducing or eliminating barriers
to higher education for girls and women, such as the previously widespread practices of withholding financial aid and scholarships from women, holding women to more stringent admissions requirements than men, and setting sex quotas on women’s, but not men’s, admissions. As a result of Title IX, women and men now face more equitable admissions and scholarship processes. Despite women’s slight majority over men in percentage of earned bachelor’s degrees, women still trail men in percentage of earned doctorates and professional degrees. Though women have made considerable inroads as teachers, faculty, and administrators, they are still under-represented in the highest levels of education (i.e., as principals, superintendents, deans, provosts, and presidents), signifying a persistent “glass ceiling” for women. Moreover, women’s representation in math and science still lags, due to both blatant and subtle discrimination in these traditionally male disciplines—disciplines that tend to offer greater financial rewards than traditionally female disciplines. The dismantling of affirmative action programs in many colleges and universities across the United States has also negatively affected women’s entrance into and advancement in male-dominated disciplines.

More than any other issue covered by Title IX, effecting gender equity in athletics has been the most contentious and litigious. Detractors claim that boys’ and men’s sports have been hurt by the increase in girls’ and women’s sports as limited but arguably more gender-equal funding is spread thinly across a larger number of teams. Detractors also allege that because interest in girls’ and women’s sports is limited, requiring equitable offerings, funding, and facilities for girls’ and women’s athletics is both difficult and unnecessary.

Yet since the passage of Title IX, women’s and girls’ participation rates in both high school and collegiate athletics have grown considerably faster than boys’ and men’s, an indication that interest in athletics is indeed high among girls and women. Still, women’s and girls’ overall participation rates lag behind boys’ and men’s and do not yet equal the rates of boys and men just prior to passage of Title IX. Though women now constitute a slight majority of all college students, funding for collegiate sports still disproportionately favors men, with men’s basketball and football receiving the lion’s share of funding. Scholarships to male athletes in both Division I and II athletics far exceed those to female athletes. Women still comprise a small minority of high school and collegiate athletic directors, and since 1972, the percentage of head coaches who are women has actually decreased substantially for both girls’ high school and women’s intercollegiate athletics teams, a trend not offset by gains in women coaching men’s sports. Moreover, with few exceptions, a persistent pay gap exists between men and women coaches at all levels. Like men, women benefit physically and emotionally from greater sports participation, and Title IX is often credited with facilitating a groundswell of support (as both players and fans) for the burgeoning number of women’s collegiate and professional sports teams.

Torture

The practice of torture is so ancient that its origins are lost in the distant past. However, recorded history shows that all major civilizations practiced it, either as a form of punishment or as a means of obtaining information. The ancient Egyptians, Assyrians, Greeks, Persians, Romans, and Chinese left records of it, and the Bible recounts many examples.

During the 15th and 16th centuries in Europe, the Holy Inquisition used torture to elicit confessions of heresy or other beliefs or actions contrary to the
Torture

dogma of the Catholic Church. During the 17th cen-
tury, suspected witches were subjected to tortures for
essentially the same purpose, with those found guilty
of heresy or of witchcraft burned alive.

Examination of ancient castles reveals areas
reserved as prisons and designed to be as unpleasant
as possible. Some spaces were simply deep pits below
the lower floor of a castle tower, where a prisoner was
literally dropped and then left until such time as some-
one cared to retrieve him. Such spaces are called
“oubliettes,” after the French word oublier, meaning
“to forget.” Sometimes formal detention facilities
were in basement areas with barred entrances. These
were usually too low for a person inside to stand
upright, and their location permitted frequent flooding
from ground water or the castle moat. In general, the
quarters reserved for housing prisoners were them-
selves a mode of torture.

Modern practices of torture have several possible
goals: extraction of information, incitement of fear
or terror, inflicting pain to punish, obtaining a con-
fession pursuant to a criminal investigation, or, in
rarer instances, application of pain for perverse sexual
pleasure.

Legal Barriers to Torture

Among Western nations, legal barriers to torture
became universal between 1750 and 1820, partly as a
result of the Enlightenment and partly in recognition
that torture was not an effective method of obtaining
confessions or information, since the victim would
say anything to make the torture stop. The Eighth
Amendment to the U.S. Constitution prohibits “cruel
and unusual punishment,” thereby outlawing torture.

International efforts to end torture by legislation
resulted in a number of conventions. Article 1 of the
UN Convention Against Torture defines torture as
“any act by which severe pain or suffering, whether
physical or mental, is intentionally inflicted on a per-
son . . . when such pain or suffering is inflicted by or at
the instigation of or with the consent or acquiescence
of a public official.” The European Convention for the
Protection of Human Rights and Fundamental Free-
doms and the European Convention for the Prevention
of Torture and Inhuman or Degrading Treatment or
Punishment also prohibit torture. The Geneva
Convention Relative to the Treatment of Prisoners of
War also specifically prohibits torture and mistreat-
ment of prisoners. This is but the latest in a series of
Geneva Conventions beginning in 1864, all of which
prohibited torture. Article 5 of the Universal Declara-
tion of Human Rights of the United Nations states,
“No one shall be subjected to torture or to cruel, inhu-
man or degrading treatment or punishment.”

Despite this apparent universality of legal bars to
torture, resistance to its abandonment was remarkably
stubborn, and local police routinely brutalized prison-
ers to elicit confessions well into the 20th century.
Many nations still allow their police to beat and tor-
ture prisoners, especially throughout Africa, Asia, and
Latin America.

Torture Methods

Generally, torture attempts to obtain compliance from
the victim by inflicting or threatening severe pain or
mutilation or through psychological methods, where
one is deprived of sleep, disoriented, isolated, and in
some instances subjected to sensory deprivation and
the application of drugs. Threats or displays of torture
of others may also be used.

Torture methods vary by culture and utilize avail-
able technology. The ancient Greeks wrote about the
use of a brazen bull in which victims were roasted to
death. The Romans practiced crucifixion and flagell-
tion (whipping with a special multistrand whip
weighted with lead at the ends). In the Middle Ages,
the state and/or the church used mechanical devices in
torture. The thumbscrew, rack, and iron maiden are a
few of the best known of these tools of torture.

Modern torture methods vary by country. For
instance, Latin American countries favor using la
capucha, placing a hood filled with noxious fumes
over the victim’s head, and submarino, suspending
upside down by the ankles and submerging in a barrel
of water until the victim nearly drowns. Many Arab
states practice jalanga, beating the soles of the feet
with a narrow hard object, inflicting excruciating pain
and leaving the victim unable to walk. Strapping may
be part of other torture methods, or a torture by itself,
and involves immobilizing the individual in unnatural
positions by means of ropes or other restraints.

In the United States, where the law prohibits tor-
ture, intelligence agencies practice forms of psycho-
logical torture and teach them to agents of other
nations. The CIA has run a training program for
decades at the School of the Americas at Fort Benning,
Georgia, teaching many interrogation tech-
niques, including those defined as forms of torture, as
illustrated by the acts committed at Abu Ghrabi prison
in Iraq.
Rape and sexual abuse are common methods of torture worldwide. Both men and women may be subjected to sexual abuse and mutilation to humiliate them and break down their will to resist questioning. Societal taboos about sexuality often work in favor of the torturer, so that the victim becomes a social outcast as well as a traumatized torture survivor. Soldiers, insurgents, guerilla fighters, and paramilitary forces routinely use severe beatings and rape to torture and terrorize the civilian population.

Implements of torture can be ordinary tools or utensils, or sophisticated techniques, including drugs, behavioral conditioning, and acupuncture. Electronic immobilization devices (stun guns), which emit high-voltage shocks, are other implements of torture.

Most arguments justifying the use of torture tend to be pragmatic, such as the “ticking bomb” scenario proposed by legal expert Alan Dershowitz. However, modern interrogation techniques are far more effective than torture in extracting factual information. When laws prevent security agencies from using torture within their home countries, they sometimes resort to involuntary removal of prisoners to countries where torture is still practiced.

The Torturers

Little sets torturers apart from other people. Some become torturers out of political or social conviction or a religious belief. Child soldiers engage in torture because they are themselves terrorized by their commanders, or because they are trying to impress their fellow troopers with their “toughness.” Some members of security forces regard it as routine job performance. Some torturers may be sociopaths, but in other instances the government trains people to perform torture and commit atrocities. In societies where torture is traditionally used, no shame or guilt attaches to its performance, and therefore police, security, and military personnel will act as torturers without compunction, even though the practice may be unlawful. In many instances, torture techniques may be developed and practiced with the assistance of health care professionals, in violation of ethical standards.

Results of Torture

The individual torture survivor suffers many consequences of the torture, some physical, some mental. These can be acute or chronic and come at great cost to the individual, the family, and society, with the possibility of long-term disabilities resulting from the torture and related maltreatment.

Psychological consequences of torture include post-traumatic stress disorder (PTSD), depression, anxiety, sleep disorders, phobic reactions, guilt feelings (especially survivor guilt), sexual dysfunction (especially in rape victims), and personality changes. Torture survivors often turn to substance abuse in an attempt to self-medicate their trauma. Family members may even develop PTSD vicariously or suffer ambiguous loss when individuals are abducted by security forces or militias.

Another consequence of torture to society is the loss of educated and skilled individuals. Wherever torture and atrocities were committed against the civilian population, the bulk of the middle class disappeared. These individuals were some of the first targets of rebel forces, and those not killed often fled the country entirely, their potential contribution to their nation lost forever.

Treatments for Torture Victims

Treatment of survivors of torture varies with the availability of facilities within the society, the willingness of victims to access treatment, and the training available to health care professionals. While the prevalent method of treatment worldwide has been psychodynamic, evidence shows that other methods are more effective and efficient. Cognitive-behavioral therapy, pharmacological treatment, eye movement desensitization and reprocessing (EMDR), and conjoint marital and family therapy have all successfully reduced symptoms and improved the long-term functioning of torture survivors. Especially needed is family therapy in cases where entire families were terrorized as a result of the torture or disappearance of a family member.

The Abolition of Torture

Several nongovernmental agencies attempt to combat torture worldwide through monitoring, publicity campaigns, public education, and humanitarian efforts. These include Amnesty International, the UN Office of the High Commissioner of Human Rights in Geneva, the International Red Cross, Physicians for Human Rights, and the International Rehabilitation Council for Torture Victims in Copenhagen, Denmark. These organizations also train professionals and paraprofessionals in how to deal with trauma and publicize the consequences of torture and trauma for
society. Recently, commissions of truth and reconciliation served a role in raising public awareness of torture and its use in armed conflicts within some societies.

TOTAL FERTILITY RATE

Total fertility rate (TFR) is among the most commonly used fertility measures. As a period measure, TFR usually examines fertility cross-sectionally. TFR represents the average number of children a woman would have, assuming that current age-specific fertility rates (ASFRs) remain constant throughout her childbearing years (ages 15–49) and she were to survive to the end of her reproductive cycle.

ASFR is calculated by dividing the number of children born to women in an age group by the number of women in that age group. The equation for ASFR is

\[ nFx = nBx/nWx \]

where \( F \) = fertility, \( B \) = births, \( W \) = women, \( x \) = age at the beginning of the interval, and \( n \) = number of years the age interval spans (usually 5-year intervals). TFR builds on ASFR by summing the rates for each age group and multiplying by the length of the age interval:

\[ TFR = n \times \sum_{x=0}^{n} nFx \]

Another way to measure TFR is through cohort reports of Children Ever Born (CEB). CEB tracks a cohort of women’s reproductive histories from the beginning of their childbearing years through completion, resulting in a measure representing the average of all children each woman actually bore. Usually data for ASFR, TFR, and CEB come from surveys or midyear population estimates combined with vital statistics on the number of births. When information about births is collected retrospectively, there is the danger of missing children who died shortly after childbirth.

TFR varies widely throughout the world today and has changed significantly over time. Levels range from well above replacement fertility (TFR = 2.1, an average of two children replacing one’s parents, plus a one-tenth factor allowing for under-age-15 child mortality) to below-replacement fertility. In the early 1970s, TFR for the world was 4.5; by 2005, it had fallen to 2.6. For the same periods, in Latin America and the Caribbean, TFR dropped from 5.1 to 2.5. In 2005, Asia, excluding China, had a TFR of 2.8 (it was above 5.0 in the 1970s), with Taiwan and South Korea having among the lowest TFRs in the world at 1.1. European fertility levels were already reaching replacement in the 1970s, but now have dropped significantly below replacement to 1.4. TFR in the United States has remained stable since the 1970s at 2.0. TFR in sub-Saharan Africa has gone from 6.8 to 5.4 during this period; but in 2005, it ranged from a high of 7.9 in Niger to a low of 1.8 in Mauritius. Regional and national TFRs often hide substantial ethnic and racial variation.

Historical changes in TFRs often relate to new contraceptive technologies, access to services, and policies. In China, for example, TFR was close to 6.0 in the early 1970s, prior to the “later-longer-fewer” family planning campaign and the more widely known one-child policy. In 2005, TFR was 1.6; many scholars speculate that this drastic, rapid fertility decline is having significant effects on China’s economy, marriage market, and care for the elderly. Changes in fertility across space and time have important
context-specific influences on social and demographic processes.

**Total Institution**

Erving Goffman defined total institutions in 1961 as places of residence and work where individuals lead together an enclosed, formally administered life cut off from the wider society for an appreciable period of time. Total institutions are a departure from basic modern social arrangements where members sleep, play, and work in different places and with different people, under different authorities and without a unified rational plan. Unlike traditional social institutions, total institutions are distinct in four ways: (1) all aspects of life are conducted under the control and regulation of a single authority; (2) individuals are in the company of similarly situated people; (3) individuals are under a rigid schedule; and (4) all activities are designed to satisfy the goals of the institution. Prisons and mental hospitals are the most frequently explored examples of total institutions, but the concept may also apply to military bases, boarding schools, religious institutions, and concentration camps.

Goffman’s concept of the total institution represents the evolution of his early work on the construction of identity and concept of self as a product of social interaction, shaped by the roles and relationships accorded an individual by the social order. His consideration of the concept of total institutions represented an extension of this early work, in that he went on to study the constraining aspects of this construction. He examined the effects of institutionalization on an individual’s construction of social, personal, and ego identities, such that it becomes difficult for individuals to forge definitions of self distinct from the definitions imposed on them by the structure, authority, and goals of the institution itself.

Goffman’s interest in the total institution reflects his interest in how institutions place enormous constraints on identity construction such that they strip an individual from any existing conceptions and impose a new self that is reflective of the institution. He refers to the stripping of identity as the mortification of self or “civil death” and suggests that it occurs through several stages. Individuals come to total institutions with a concept of self previously established through interaction with the social world. Upon entrance into the institution, the recruit is stripped of any social support and is subject to what Goffman called the “abase-ments, degradations, humiliations, and profanations of self.” Locked doors, high walls, and barbed wire provide physical and symbolic barriers to the outside world and isolate the inmate from the social interaction and support that previously allowed for the construction and maintenance of one’s identity. Further stripping identity are admission procedures and “programming” designed to shape an inmate into an object assimilated into the routine operations of the institution. The loss of personal clothes, control over one’s own appearance, and any trappings associated with the inmates’ “identity kits” further accomplishes what Goffman refers to as “role dispossession.”

Inmates must also share space and interact with others in a way that further abases and challenges the preexisting self-concept. Here Goffman speaks of contaminative exposure: in the social world, individuals have control over the physical space, circumstances, and social relationships that expose them to foreign and contaminating things. In a total institution, however, inmates lose control over any boundaries between themselves and such contamination; they must participate in indignities incompatible with their conception of self.

Once inmates are stripped of their former identity, the total institution attempts to rebuild a new identity by bestowing privilege, or access to desirable good and assets. These items, such as coffee, cigarettes, and control over television program selection, may be of little value outside the total institution. Goffman advises that the privilege system does as much to maintain role dispossession as it does to build the new self-concept.

Critics attack Goffman’s concept of the total institution on a number of counts. Most prominently, they characterize his conceptualization of the total institution as vague, which led to loose application of the
term, both in his own work and in that of others. Recent literature from sociology, criminology, and penology shows a less structured conceptualization of the total institution frequently used as shorthand to characterize an oppressive environment that, to varying degrees, isolates its inhabitants from the social world. Many current applications emphasize individuals’ responses to life in a total institution—the development of an “underlife” and coping mechanisms for retaining self-concept—rather than focusing on the concept of total institution itself.

TOTALITARIANISM

Totalitarianism in its simplest sense designates the all-embracing total state. In its narrowest application it refers exclusively to Nazi Germany and to the Stalinist period of the Soviet Union. As a concept, however, it emerged originally in connection with Mussolini’s Fascist Italy, and its frame of reference historically expanded to include the diverse range of communist regimes that evolved in the post–Second World War era. More recently, some commentators have sought to bring Islamic-inspired political extremism into the same orbit. Totalitarianism, arguably, represents a continuing problem for society insofar as the conditions for its emergence are modern: they are a combination of technological possibilities and radically future-oriented political aims. Its event also discloses uncomfortable questions about the character of human nature, the status of moral progress, and confidence in science as an unmitigated good for the improvement of human affairs.

The meaning of totalitarianism is usefully understood in contrast with authoritarianism. The latter term became, in the course of the 20th century, increasingly inadequate to cover the kinds of political regime standing in need of a more specific typology. Totalitarianism came to refer not only to absolute power, but to the attempt to mobilize entire populations in the service of an “ideology,” an end requiring the regulation of both public and private behavior and issuing ultimately in the use of terror and acts of mass murder. The contrast with authoritarianism also illuminates more recent attempts to refine the concept. The earliest literature on totalitarianism sought to enumerate the whole range of all its institutional features. This typically clustered together the combination of traits displayed by all polities plausibly described as totalitarian. Most prominently, these were the single-party system; the deployment of sophisticated methods of propaganda and surveillance; the state’s control of all public associations, including the churches; and the controlled economy. Such a model was, however, open to criticism. Where control, in practice, fell short of being complete, or where purported cases of totalitarianism failed to meet the definitional requirements in each and every detail, the scope of both its purchase and its utility became considerably reduced.

One tack taken in the light of this was, for some, to argue for a clearer conception in Max Weber’s sense of an ideal type, an abstraction to which no real-world polity actually corresponds. More lately, the original model has instead been revised according to a twofold contention. The first aspect of this is the limitation of the earlier understanding by an overemphasis on mechanisms of rule. The second is that it is in thrall to a false image of totalitarianism that still views it as the commitment, on the part of elites, to increase the power of the state as an end in itself. Rather, an increasing consensus affirms that it is the ideological...
dimension in which resides the real source of commonality between regimes with a valid claim to being both identified as totalitarian and conceptually distinct from authoritarianism. In part this is paradoxical. A long-standing grievance with the totalitarian thesis is that it is wrong-headed to bracket together (right-wing) fascist and (left-wing) communist systems. Nonetheless, the new consensus centrally highlights the historically unprecedented attempt to use the available apparatus of a modern state to fabricate a new form of society. On this view, whether the regime succeeds in mobilizing its citizens to actively participate in this effort, or whether it is obliged simply to impose it by force, does not disrupt this definitional core. In this sense, totalitarianism is a composite blend of diverse intellectual elements that may be identified, most minimally, as utopianism, scientism, and revolutionary violence. In practice, its legitimation draws on all of these diverse currents of thought, and equally each frames the project of transformation that it seeks to enact. The two things are in fact inextricably linked: the claim to legitimacy turns on the promise to bring into being the glorious new dawn.

Totalitarianism of both the right and left draws selectively on utopian ideas. From one direction it derives from a specific vision of the community imagined via a blueprint, proposed with the aim of exposing the degeneracy of contemporary society, and intimately linked with a belief in the need for a complete transformation of human nature. Communism, for instance, conceived class oppression as the root of all wrongs and accordingly sought to eliminate all class differences, while National Socialism saw the corruption of the present as being embedded in racial impurity and was thereby animated by the quest to achieve racial unity. In this connection, some commentators have observed a millenarian variant of utopianism at work, located in the aim of realizing a kind of earthly paradise.

In its second composite element, totalitarianism embraces the modern scientific worldview. The historical destiny that the projected utopia is predicated upon rests on (pseudo)scientific laws of social and political change that grant a privileged status, as determinants of progress, to class, race, or nation. Typically, the single totalitarian party poses as the interpreter of these historical forces that, conceived as inevitable, are in principle beyond human control. Yet, in “acting out" the struggle envisaged, totalitarian regimes vigorously set out to remake social and political reality in line with this conception, finally by murderously removing from the community the entire range of its socially and racially defined enemies. In so doing totalitarianism meets with a last strand, that of revolutionary violence. The earliest intimation of this possibly appeared in the Terror of the French Revolution and, while characteristically evident in totalitarianism in its initial phase on taking power, violence is also intrinsic to its dynamic and often perceived in almost religious terms as a cleansing source.

TOXIC WASTE

Every year, industrialized nations—via their industries, consumers, and cities—produce millions of tons of toxic waste. These hazards directly and indirectly contribute to high rates of human morbidity and mortality and to ecosystem damage on every continent and ocean system. Since the end of World War II, industrialized nations have generated increasing volumes of hazardous chemical wastes—a result of technological developments across all industry sectors. Reinforcing this trend is a culture of increasing acceptance of such risks in this late modern era.

Every living thing on the Earth has been exposed to some level of human-made toxic substances. Toxic chemicals and their residues pervade our environment and reside in all of our bodies. For example, the U.S. Centers for Disease Control and Prevention released a study in January 2003 in which they tested a sample of more than 9,000 individuals across the United
States and found pesticides in 100 percent of their bodies.

This is a relatively new phenomenon, as the production and use of hazardous substances increased exponentially in warfare, agriculture, electronics, and a range of industries in the past six decades. Since that time, the industrial and consumer economies have come to rely heavily upon products made of chlorinated hydrocarbons. The size of the industries associated with these substances (plastics, oil, pharmaceuticals, and pesticides and chemicals) grew in response to increased demand from related industrial sectors and increased consumer demand for related products. The associated by-products were thus intensely toxic and increasingly ubiquitous. Today's hazardous wastes are the perilous physical and cultural residues of industrial production with deep historical roots, as the rise of urbanism and industrialization in the West went hand in hand with pollution.

The Resource Conservation and Recovery Act (RCRA) is a federal U.S. law that defines as “hazardous” those materials that may present a significant threat to human health or the environment when treated, transported, disposed of, stored, or managed improperly. While this definition is technically correct, the emphasis on the idea that such wastes only present a danger when “improperly” handled is misleading, since the very existence of these materials is hazardous. Moreover, the designation of materials as hazardous suggests they lie at the extreme end of the production spectrum when, in fact, they are at the core of any industrial society. The numerous industries that generate hazardous wastes are at the center of industrialized nations, producing employment, revenue, and social benefits. Hazardous wastes are generated by nearly every industry, and those industries that themselves generate few hazardous wastes nonetheless use products from hazardous waste-generating industries. Societies in the global North are particularly implicated in this process because they tend to be the largest producers of such toxins.

There is a general absence of rigorous, longitudinal, and definitive data on the health and environmental risks of our chemical intensive lifestyle. Despite Rachel Carson’s own research and dire warnings in her classic book *Silent Spring*, we continue to produce and use even more chemicals today and have taken few steps to understand their potential effects before doing so. This is why many scientists, policy-makers, and environmental activists are calling for the adoption of the “Precautionary Principle”—the policy that if there is a reasonable indication that a chemical may be unsafe, then we should refrain from using it, even if there is not yet conclusive scientific evidence to that effect. This is a regulatory approach that shifts the burden of proof that chemicals are safe onto the producers rather than allowing them to essentially test these materials on an unwitting public. The current regulatory framework in the United States presumes chemicals are innocent until proven guilty and simply releases them into widespread use until there is reason to believe they are unsafe. The consequences have been disastrous. We have scarcely any toxicological data on the more than 80,000 chemicals in use today. The extent of toxin production and its associated risk in the United States is staggering. The United States produces nearly 6 trillion pounds of chemicals annually. Toxic materials exposure can cause genetic defects, reproductive disorders, cancers, neurological damage, and the destruction of immune systems.

The evidence of risk and disease associated with the production and use of toxic chemicals is mounting. In February 2004, scientists with the U.S. Environmental Protection Agency estimated that 1 in 6 pregnant women in the United States has enough mercury in her blood to pose a risk of brain damage to her developing child. This new estimate is double that of a previous calculation. Mercury is a heavy metal and, when ingested or spilled in the environment in tiny amounts, can wreak havoc on the nervous system of humans and other living beings. Effects include brain, lung, and kidney damage and death. Mercury is released into the environment primarily by power plants and waste incinerators polluting the air, and it is then deposited into oceans and other waterways, where humans and other animals ingest it and it bioaccumulates throughout the food chain.

Polybrominated diphenyl ethers (PBDEs) are a little known class of neurotoxic chemicals found in computers, televisions, cars, furniture, and other common products used by consumers every day. PBDEs are ubiquitous not only because they are contained in so many consumer products but because they also leak into the environment during production, use, and disposal. As a result, they are found in household dust, indoor and outdoor air, watersheds, and the body tissues of dozens of animal species around the world, including humans. Women's breast milk in the United States, Europe, and Canada has been found to have high levels of PBDEs, and most residents in the
United States are believed to carry this chemical in their bodies at unsafe levels.

European Union (EU) nations continue to pollute at an alarming volume as well. One in five persons employed in the EU is exposed to carcinogenic agents on the job. Cancer, asthma, and neuropsychiatric disorders are some of the illnesses associated with the 100,000 chemicals and biological agents marketed in the EU, according to the European Agency for Safety and Health at Work. Approximately two thirds of the 30,000 most commonly used chemicals in the EU have not been fully tested for their potential health effects on humans or the environment.

Nonetheless, European environmental organizations have successfully pressured states and industries to pass legislation that would mandate the risk evaluation of chemical substances, such as the REACH policy—the Registration Evaluation Authorization of Chemicals—and the requirement that electronics manufacturers produce their goods with fewer toxic substances and take back those products for recycling at the end of their consumer life—such as the Restriction on Hazardous Substances and the Waste from Electrical and Electronic Equipment Directive.

Unfortunately, affluence among nations is highly correlated with the production of toxic waste. In the early 1990s, the 24 richest and most heavily industrialized nations collectively produced 98 percent of all hazardous wastes. Today rich nations in general are not reducing the level of hazardous wastes produced. Industrialized nations produce 220 pounds of hazardous waste per person each year. This figure is expected to rise to 320 pounds by the year 2020.

Given the high level of toxicity of everyday life in industrialized nations of the global North, if states and corporations are not planning to reduce toxic inputs into production, then it makes sense to seek outlets for dumping some of the most hazardous substances elsewhere, to reduce exposure to these dangers. A logical approach, then, would be to export these wastes to global South communities.

**Toxic Waste Trade and Dumping**

Today, it is estimated that nearly 3 million tons of hazardous waste from the United States and other industrialized nations cross international borders each year. Much of this waste is being shipped from wealthy nations in Europe, the United States, and Japan to poor nations in Latin America, the Caribbean, South and Southeast Asia, and Africa. This is what scholars call “environmental inequality” and it is a global problem.

Four factors explain this shift of toxic burdens to the global South. First is the exponential increase in the production of hazardous waste and the emergence of more stringent environmental regulations in northern nations. These changes increased the costs of waste treatment and disposal in the global North, which are magnitudes greater than in most southern nations. Similarly, the typical legal apparatus found in industrialized nations is much more burdensome when compared to the lax regulatory regimes in many nations in the South, which allow for dumping at a fraction of the cost. This is due partly to a comparatively more influential environmental movement sector in industrialized nations, which contributed to building regulatory structures that provide a minimal level of oversight over polluting firms. The unintended consequence of this environmentalist success in the North is to provide an incentive for the worst polluters to seek disposal sites beyond national borders.

A second factor pushing hazardous waste beyond northern borders is the widespread need for fiscal relief among southern nations. This need—rooted in a long history of colonialism and contemporary loan/debt arrangements between southern and northern nations—often leads government officials in the South to accept financial compensation in exchange for permission to dump chemical wastes in their borders. Many observers have described these transactions as economically efficient, while others prefer the term *garbage imperialism*.

The third driving force behind the international export of hazardous materials is the seemingly inexorable power of economic globalization, which has a logic that dictates that industries must cut costs and increase profits or simply fail. Economic globalization allows and requires firms to access global consumer and commercial markets and labor forces, increase automation, and improve efficiencies in a 24-hour economy that is more interdependent than ever. The same logic applies to those industries that manage the hazardous wastes that market economies produce: they must access markets and buyers where the prices allow for increasing profits and reduced costs. This means those wastes will be traded and dumped in nations and regions where, as a result of unstable states and vulnerable economies, pricing will be more profitable to waste management firms and brokers.
The fourth reason for the global waste trade is a racist and classist culture and ideology within global North communities and institutions that view toxic dumping on poor communities of color as perfectly acceptable. This ideology is best exemplified in an infamous internal World Bank memo authored by Lawrence Summers, then chief economist and vice president of the World Bank, in which he argued that the World Bank should encourage the migration of polluting industries to poor nations because such a practice would be economically efficient.

In 1989, the world’s nations came together via the United Nations and created the Basel Convention to regulate the international trade in toxic wastes. A few years later, they reconvened to pass an amendment—called the Basel Ban—that bans the flow of hazardous waste from rich to poor nations.

**A Theoretical Perspective**

German social theorist Ulrich Beck offers a productive way to think about toxic wastes in the late modern era. He argues that we live in a risk society—a stage in human evolution marked by a fundamental transformation in the relationship between society and the environment where we witness an exponential increase in the production and use of hazardous chemical substances. These practices elevate the level of social and physical risk to scales never before imagined. Ecological risks are deeply embedded in society and are extremely harmful, yet frequently are difficult to measure.

Beck argues that the politics of the distribution of environmental degradation favor more powerful communities over others. Thus advanced capitalism creates wealth for some and imposes risks on others, at least in the short term. In the long run, the problem of widespread global ecological harm, however, ends up returning to impact its creators in a boomerang effect. That is, the risks of modernity eventually haunt those who originally produced them. This generalization of risks unlimited in time or space is experienced by all persons, all groups, across the divides of social class and ethnicity. One example is the spread of health problems that result from exposure to pesticide residues. The risk society thesis puts forward the position that modernity is a fundamentally anti-ecological endeavor.

If toxic waste is an ordinary by-product of industrialization, then this raises serious questions about the way we define and achieve progress within human societies. Toxic waste is therefore part of a much broader problem rooted in the proliferation of toxic jobs, toxic industries, and toxic communities that constitute the risk society.

**Traffic Congestion**

The social problem called traffic congestion results when the number of vehicles using the existing transportation facilities and systems serving a country, city, community, or other area (infrastructure) exceed that infrastructure’s carrying capacity. Characterizing traffic congestion are a decrease in the actual speed a vehicle may travel regardless of posted speed limit, increased travel time, and/or an increase in the amount of time it takes to enter an existing flow of traffic. The amount of traffic congestion depends on both recurring (regular rush hour traffic) and nonrecurring (congestion due to special road construction) variables.
According to the U.S. Department of Transportation Federal Highway Administration (FHWA), since 1982 traffic congestion has increased in all cities across the United States. In 2003, the Texas Transportation Institute studied 85 U.S. urban areas and found that traffic congestion caused an estimated 1.9 billion hours of delay and cost an estimated $63 billion in wasted time and fuel. Solutions to this overall increase in traffic congestion include building more roads and highways, using the existing infrastructure more efficiently, and a more controversial measure, the privatization of U.S. highways.

**Measures of Traffic Congestion**

The FHWA officially measures traffic congestion in terms of a *travel time index* and *delay*. The travel time index consists of the ratio of the time it takes to travel during peak infrastructure use to the time it takes to travel the same distance when traffic flows freely. For example, if a commuter must spend 35 minutes traveling from point A to point B during a holiday, but only spends 20 minutes traveling that same distance on a regular weekday, that travel time is calculated by dividing 20 by 35, and travel time is 1.75 in the travel time index. This measure accounts for both reoccurring (i.e., late afternoon commuter traffic) and incidental (i.e., traffic accidents) travel interruptions. The Texas Transportation Institute found that the Los Angeles-Long Beach-Santa Ana, California, urban area had a travel time index of 1.84, while the Corpus Christi, Texas, urban area had a travel time index of 1.04, indicating that the former urban area experienced more congestion than the latter.

The *delay* measure consists of annual hours of delay (hours of extra travel time due to congestion), annual delay per capita (hours of extra travel time divided by area population), and annual delay per road user (extra travel time hours divided by peak period road users). For example, the Texas Transportation Institute’s regular analysis of traffic congestion in the largest 85 urban areas demonstrated that American travelers lost 47 hours in annual hours of delay, up from 16 annual hours of delay in the 1982 traffic congestion survey.

In addition to the time travel index and delay, recently the FHWA began measuring *travel time reliability*, a measure of variation in travel time taking into account unpredictable congestion (i.e., a traffic light malfunctions, leaving cars backed up at an intersection until police arrive to direct traffic). Travel time reliability varies over time because conditions such as the weather and work zones vary over time. Traveling in an area with highly variable travel time causes travelers to leave extra time, or *buffer*, in their schedule for possible delays; even though at worst this may result in a traveler arriving early instead of on time, this is still time the traveler might have used more productively elsewhere.

Officials measure travel time reliability in terms of how travel time varies hour to hour or day to day. For example, a traveler might report that it takes 30 minutes to reach a destination with no traffic or construction, but with an active work zone on the road it takes 1 hour and 30 minutes. Travelers must consider this unpredictable event when planning their journey or risk arriving at their destination late.

**Underlying Causes**

Many variables, including season of the year, day of the week, and time of day may affect the number of vehicles attempting to use existing infrastructure. Additionally, the weather, work zones, slow-moving vehicles, poorly timed traffic signals, special events such as parades, emergencies such as evacuations, and traffic accidents (among others) may affect an infrastructure’s carrying capacity as well as the number of vehicles attempting to utilize the infrastructure. According to the FHWA, the most common cause of traffic congestion is a *bottleneck*, a point where either the roadway shrinks to fewer lanes or regular traffic demands cause traffic to stop (approximately 40 percent of all traffic congestion). Any infrastructure may experience traffic congestion at any time as demand increases. At times, traffic congestion may develop into a *traffic jam*, a condition in which a number of vehicles impede the movement of other vehicles to the extent that no vehicles are moving.

**Solutions**

The FHWA suggests that the country can decrease its traffic congestion by focusing on improving service on roads, increasing the price of road usage, increasing available infrastructure, improving efficiency of work zones, managing travel demand through interagency coordination, and providing travelers with accurate, up-to-date traffic information. Many of these same strategies also improve travel time reliability, thus reducing traffic congestion due to travelers leaving a time buffer in their schedule.
Improved service on existing roads can result from managing traffic more efficiently. Some Department of Transportation suggestions to improve road service and reduce congestion include updating traffic signal equipment and/or timing devices to improve traffic flow, improving the accessibility of major roadways from secondary roadways, and responding more proactively to adverse weather by reducing speed limits and posting weather advisories on roadside electronic signs. Other suggestions involve charging a higher toll price during periods of increased infrastructure use and improving work zone traffic efficiency through developing transportation management plans to guide work zone behavior, limiting the number of lanes closed for work zones, and timing lane closures for minimum traffic disruption (for example, overnight instead of daylight land closures).

As part of efforts to increase travel time reliability, engineers and urban planners suggest several practical strategies. First, they suggest constructing more or larger highways in order to increase overall infrastructure while simultaneously redesigning roadways and others areas with a history of bottlenecks. Additionally, they suggest improving the efficiency of the existing infrastructure and working on travel demand management, finding alternatives to commuting alone. An example of travel demand management is the use of high-occupancy vehicle lanes that channel carpooling (multiple occupancy) commuters into an area of the highway with less traffic, and encouraging more efficient use of existing infrastructure by offering an incentive that decreases the total number of vehicles using the highway.

**Privatization**

Globally, several industrialized nations allow private companies to own and/or build or operate highways, for example, Canada, India, and Italy. Privatizing U.S. highways is a controversial method of decreasing traffic congestion, with some arguing that government involvement in U.S. infrastructure is impractical, resulting in a high cost to the public as well as inefficient maintenance. Others suggest that the government should develop comprehensive infrastructure, for example, in the form of mass transit that takes into account not only efficient transportation but also the effects of infrastructure use on communities and urban areas.

The primary argument by proponents for privatizing U.S. highways is that privatization will improve overall highway efficiency and durability while decreasing overall infrastructure cost by promoting competition. Opponents focus on the risk that, rather than decreasing consumer cost, privatization will result in increased cost to the consumer through government overregulation over who can purchase highways, their maintenance, and measurements of the quality of their performance.

The Dulles Greenway, opened for travel in Virginia on September 29, 1995, is an example of an existing for-profit road operating in the United States. It consists of a 14-mile extension connecting the Washington Dulles International Airport with Leesburg, Virginia. The company that operates the road publicizes the reduction in travel time, claiming that, prior to the road’s construction, a trip from Leesburg to Dulles took 30 minutes, but once the highway opened, the same trip takes less than 15 minutes.

**Transgender and Transsexuality**

Transsexuality is a term used to describe individuals who desire to change their sex and/or gender presentation. Transsexuals may also self-identify as male-to-female (MTF), female-to-male (FTM), preoperative, postoperative, or nonoperative transsexuals. For example, the experience and visibility level of MTF
transsexuals may be dramatically different than FTM transsexuals, because they are transgressing different gender boundaries.

Since the late 1980s, transgender has come into common use as an umbrella term for individuals identifying as transvestites, transsexuals, gender queer, no gender, or multiple genders. Although some transsexuals identify as transgender, the two identities are not interchangeable; indeed, transgender-identified individuals tend to have a history within the lesbian, gay, and bisexual social and political communities. Social problems faced by transsexuals and transgenders may include difficulty with state recognition of sex or gender changes and discrimination in employment, insurance access, and housing, along with violence and suicide.

Most difficulties faced by transsexuals and transgenders are rooted in the legal and social ambiguity of changing gender or sex status, which varies by country and culture. For example, in the United States, many states either require expensive medical procedures in order to change legal documents or do not allow individuals to change the sex listed on their birth certificates or driver's licenses. Because many social interactions and structures are organized based on gender, transsexuals and transgenders may face discrimination if they are perceived as gender ambiguous or transgressive. This daily discrimination may include refusal in public accommodations, violence on the street, and hate speech. Some cultures have space for “third gender” or gender transformative roles, such as the berdache tradition in Native American culture or hijras in India, that may alleviate this discrimination. Other cultures may include roles for gender transformative individuals, such as prostitution, that may intensify this discrimination.

In the past two decades, transsexual and transgender activists have organized through support groups and the growing transsexual and transgender movement to advocate for social justice. After World War II, well-known transsexuals such as Christine Jorgenson, British actor Jan Morris, and American tennis player Renee Richards raised public visibility of issues facing transsexuals. Contemporary activists such as Pat Califia, Kate Bornstein, and Leslie Feinberg have continued this education and activism. Transgender activism within the lesbian, gay, bisexual, and transgender (LGBT) movement has led to the increase in local and statewide protections against discrimination for transsexuals and transgenders. Both transsexual and transgender activists have also been involved in various local and national activism around access to medical insurance and health care, street violence, police harassment, and shelter accommodations for homeless transgenders.

TRANSITION LIVING

Young adults with disabilities are less likely than their nondisabled peers to be employed full-time, enroll in postsecondary education, earn a bachelor’s degree, and engage in recreational activities such as going to the movies with their friends. Unlike their nondisabled peers, upon leaving school and entering the real world, young adults with disabilities tend to be more reliant on society and are less likely to engage in meaningful employment, postsecondary education, and independent living. In an effort to increase the ability of individuals with disabilities to become contributing members of society and to have a better quality of life, transition planning has become part of school programming. Coupled with the need for school programming to better prepare individuals with disabilities for postschool life is the need to provide appropriate education to a growing number of adolescents with disabilities. In 1974, federal legislation mandated public education, equal to their nondisabled peers, for all students with disabilities. As a result, a greater number of individuals with disabilities remain in the school system through middle and high school. However, a larger percentage of students with disabilities fail to graduate than do their nondisabled peers.

Outcome research indicates that many students with disabilities are not obtaining the same quality of life as their nondisabled peers. They are more likely to
leave school before completing high school, be socially isolated, live with their parents, and be unemployed. Research shows that 22 percent of students with disabilities do not complete high school, compared to 9 percent of students without disabilities. Between the ages of 18 and 64, individuals with disability experience a 32 percent employment rate while their nondisabled peers experience an 81 percent employment rate. Sixteen percent of students with disabilities who enroll in postsecondary education earn bachelor’s degrees, while 27 percent of their nondisabled peers earn bachelor’s degrees. Approximately 60,000 individuals with disabilities ages 18–24 annually qualify for Supplemental Security Income (SSI) or Social Security Disability Income (SSDI). Once enrolled, fewer than 1 percent ever leaves. These statistics illustrate that many individuals with disabilities lead a dependent life rather than a life as an independent, engaged, and contributing member of society.

**Defining Transition Living**

Responding to these poor outcomes, federal legislation mandated schools to provide transition planning to students with disabilities beginning no later than their 16th birthdays. The law defines transition as a results-oriented process focused on improving the functional and academic achievement of students with disabilities. Transition planning focuses on assisting students who are leaving school to move successfully into vocational education, integrated employment, postsecondary education, adult services, continuing and adult education, independent living, and community participation. Transition planning and services rest on individual student needs, strengths, preferences, and interests. The range of services includes instruction, related services, community experiences, employment, and other adult living objectives, and daily living skills and functional vocational evaluation, when appropriate. Each student’s interests and needs on an individual basis through the Individualized Education Program (IEP) determine development of transition services. A team that meets on an annual basis develops this document. Through IEP meetings, the team determines the student’s desired postschool outcomes (where the student wants to live, work, and play), determines the student’s present levels of educational performance and priority educational needs, evaluates progress toward meeting previous measurable annual goals and short-term objectives or benchmarks, and develops new measurable annual goals and short-term objectives or benchmarks for the coming year. The content of the IEP determines the transition programming and services provided.

As the field of transition developed, so did transition service delivery models. The initial transition model depicts high school with three bridges crossing to employment. These bridges represent the levels of services that students need to transition successfully from high school into employment. The three levels are (1) no services, (2) time-limited services, and (3) ongoing services. This first model since expanded to incorporate competencies learned prior to and throughout high school, such as self-determination, communication, academics, health and fitness, and relationship building. Expansions of the first model also include additional outcomes such as postsecondary education, residential living, social and interpersonal networks, leisure and recreation, and community membership. In addition, the expanded models address the needed systems change to support transition services and programs, including interagency collaboration, integrated community participation, and transition planning and services.

**Best Practices**

Identified best practices addressing skills needed by students include competencies in self-determination, academic and vocational education, relationship building, consumerism, and self-maintenance. Best practices in processes needed to support transition programming include community experiences, individualized planning, family involvement, and interagency coordination. One example of a curriculum addressing skills needed for transition and life is comprised of 22 competencies grouped under the three headings: daily living skills, personal and social skills, and occupational guidance and preparation skills. The competencies include such skills as maintaining personal relationships, obtaining specific occupational skills, making adequate decisions, getting around the community, managing personal finances, and exhibiting responsible citizenship. Another curriculum for life skills instruction lists six domains: employment and education, home and family, leisure pursuits, community involvement, physical and emotional health, and personal responsibility and relationships. Examples of competencies listed within these domains are the ability to seek and secure a job, maintain a budget, prepare
to go on a trip, understand legal rights, plan a nutritional diet, and establish and maintain friendships. Although both these curricula were developed for use with students with diverse learning needs, they are appropriate and easily adapted for all learners.

Transition and life skills are taught through infusion into existing curriculum as well as in separate career-related classes and lessons. Learning takes place in schools, in the community, and on work sites. Students receive individualized transition services based on their interests and needs as outlined in their IEP. Some students will require minimal transition supports and services. Their programs occur in fully integrated high school settings with a college preparation course of study leading to entrance into a 4-year university. These students graduate with standard diplomas, are able to function in the community, and hold jobs without supports. In school they may need limited academic or behavioral supports. Other students will need a higher level of supports and services, receive more intensive specialized services focusing on daily living skills and community-based instruction, and are less likely to enter general high school programs. Upon leaving school they receive nonstandard diplomas or certificates. In both work and the community, they are able to function independently or semi-independently with ongoing necessary supports. Between these two ends of the continuum are programs with various levels of independence and supports within the school, community, and employment settings.

School-based and community-based supports and services are crucial to successful transition programming. Within the school system teachers, transition specialists, and related personnel work with the students to provide academic and vocational education, transition assessment, life skills education, and on- and off-campus job training. Community-based personnel from agencies such as vocational rehabilitation and children’s medical services provide services to eligible students as designated by the mission of the agency. These might include support to clientele in integrated employment, vocational evaluation, living arrangements, physical or mental health, and adaptive equipment. Linking students with these agencies while they are still in school aids in a smooth transition into these services when they are adults.

As students with disabilities reach the age of majority, changes occur in their legal rights and the provision of agency and postsecondary educational services. Changes include, in part, issues related to guardianship, lessening of services received as a child, provision of services based on eligibility, not entitlement, and self-identification of disability in order to receive accommodations in employment or education. It is important for young adults with disabilities and their families to be aware of these changes before they occur to ensure a smooth transition. An interagency council comprised of individuals with disabilities, family members, secondary and postsecondary educators, employers, community-based organizations, and agency representatives help facilitate the provisions of these services.

Evaluation of transition programming and services is ongoing. One method of identifying best practices is looking at student outcomes and evaluating the impact of the services and programs students received on these outcomes. As the field grows, it is crucial to use these evaluations to identify and support needed changes.

Transnational Activism

In an era of accelerating globalization, social and political activists increasingly operate beyond and across state borders. Their activities, commonly referred to as “transnational activism,” reflect broader changes in the global political economy. New communication technologies play an important role in fueling this type of activism and expanding it across
diverse institutional realms. Social problems scholars increasingly focus on the prominent role that transnational activists play in the emergence of global social movements and their importance in understanding the larger dynamics of contemporary social change.

Confrontations with the existing order posed by such movements, depending on the nature of changes sought and the degree of militancy, eventually draw a response by state agencies and other private forms of organized social control. For social problems specialists, a daunting set of analytical issues results from the increasingly transnational character of this social process. As the theater of operations of social activism expands, its complexity deepens in a directly proportional manner. This makes transnational activism both challenging and exciting for critical analysts who must direct their attention to local, national, and global arenas of protest and response.

**Types of Transnational Activism**

Transnational activism spans a broad range of social movements, including labor internationalism, youth group federations, international feminist networks, pan-indigenous movements, global environmental coalitions, religious social activism, and alter-globalization forums. Their ideological orientation crosses the entire political spectrum from fundamentalist conservative to radical revolutionary, with no inherent link to any particular one of the numerous strategies available. From politicized consumer activities such as boycotts to mass protest, direct action, and even armed struggle, the forms that such activism can assume seem to expand continually.

Just like other kinds of activist activity, however, transnational activism tends to fall into some general behavioral patterns. Determining its relationship with social movements as an organized expression of resistance are responses to local, national, regional, and global social forces and to unacceptable institutionalized practices. At the same time, the broader political economy substantially conditions the landscape of transnational social movements and tends to structure or delimit their fields of operation. For example, a global trend toward energy and natural resource shortages can result in a global tendency to relax environmental protection standards. This in turn can generate transnational activism by global alliances of environmental groups in protest of the ecological consequences.

The dynamic of opposition and resistance is both a product of existing social forces and an active shaper of future institutionalized practices. Given the uneven character of social mobilization, structural upturns and downturns of the global economy, and political swings in the social control strategies of state and supra-state authorities, transnational activist activities tend to ebb and flow at uneven rhythms. At any given moment, however, transactional activism possesses the potential for unity and effectively coordinated actions, making it an essential focus for studying social change.

For example, in the less-developed regions of the global South, the world superpowers implemented policies in the 1970s as a response to a global recession, seeking to restore previous rates of growth and profit through greater liberalization and penetration of transnational corporations into developing economies. Emphasis on free trade agreements, opening up new markets, and expanding investment from the North adversely affected the most vulnerable sectors of the developing South. This in turn yielded a dramatic increase in poverty, unemployment, and numerous social inequalities, resulting in an inevitable crescendo of protest by those so affected.

Soon the resurgent demands of organized social movements transformed into a groundswell of support for demanding greater global justice. Beginning from loosely knit transnational coalitions of protest groups, the movement gradually coalesced into an ever-more-consolidated clamor for social justice under the umbrella of a global mobilization. This transnational activist movement manifested a diverse social composition of many feeling the brunt of neoliberal-style globalization, including public sector workers, peasant farmers, students, oppressed national minorities, women, and even portions of a newly impoverished middle class.

As the global, elite-dominated media establishment sought to label the movement an expression of “global-alphobia,” transnational social justice activists proved resilient in developing their own label of “alter-globalization,” showing that its struggle aimed to confront a specific kind of globalization; that is, a neoliberal project designed in the interests of certain national elites in collusion with foreign hegemonic powers.

Transnational global justice activists developed new slogans and distinctive forms of protest, taking advantage of new communications technologies to construct increasingly more complex networks and
alternative media networks. Their visibility quickly expanded with the consolidation of the World Social Forum, whose central unifying slogan, “Another World Is Possible,” took hold. An important part of this struggle consisted in leading protests against a new generation of commercial schemes designed to make neoliberal policies self-perpetuating through their enshrinement in international trade laws. The World Trade Organization (WTO), created in 1995, is the best example, just as the 1999 protests in Seattle against the WTO marked intensification of popular resistance against it.

Sociological Approaches

To capture fully the dynamics of transnational activism, social problems research must confront the theoretical challenges of conceptualizing social movements in relation to nation-states and the transnational legal order developing within a larger and historically evolving political economy. To this end, two broad bands of methodological approaches toward transnational activism presently do so. Social constructionism (with its more subjectivistic roots in critical labeling theory), symbolic interactionism, and postmodernist critical theory focus on the “claims” that activists make in “framing” the overarching social problem fueling their protest and the various social forces shaping the life cycle or “rise and fall” of their activist activities. In contrast, structural approaches (with their more objectivistic roots in political sociology), resource mobilization, and political economy emphasize national, regional, and global trends that affect material social conditions, political power relations, and social class inequalities, all of which fuel dynamics of resistance against the existing distribution of wealth and power, prevailing social control agencies, and an emerging transnational legal order.

Modest attempts to bridge these two camps mostly emphasize the uneven manner in which transnational activism emerged, making it decisive in some areas while more nation-based social movements continue to predominate in others. This favors a more eclectic approach by looking both at political opportunity structures and framing processes as potentially key components of transnational activist activity. A more integrated, dialectical approach will eventually need to root transnational activism in the global political economy, the dynamic logic of social movements, and the expanding role of the legal order as a mediator of local, national, and supra-national power relations.

TRANSNATIONAL FAMILIES

Transnationalism refers to the web of cultural, social, economic, and political relationships, practices, and identities built by immigrants between their country of origin and their country of settlement. Contrary to conventional wisdom, many immigrants do not sever their ties to their homeland but rather deepen them over time. Immigrant transnationalism is not a new phenomenon, but contemporary transnationalism involves more rapid and denser linkages between immigrants and the countries of origin than the experience of immigrants at the beginning of the 20th century. The intensity of transnational connections is made possible by the emergence of new communication and transportation technologies, including air transport, long distance telephone, facsimile communication, and electronic mail.

Transnational ties involve different levels of transaction and interaction with the country of origin. Transnational families often engage in a high rate of repeat or return migration to the country of origin. Families travel there regularly to visit with relatives or
attend to an emergency such as illness or death in the family. The frequency of these travels may depend on the distance between the countries and the cost of travel. Sustained transnational connections also result in the constant flow of goods and money, as transnational families send food and money back home to provide both material and financial support for relatives: their cash remittances amount to billions of dollars annually. Remittances provide financial support for parents, siblings, and relatives in the country of origin, paying for medical care, funerals, home improvement, tuition for siblings, or other family needs.

In addition, transnational families tend to maintain local business interests in their country of origin or even transnational entrepreneurship. Indeed, abundant evidence shows that cash remittances to the country of origin finance a variety of economic activities. In many cases the primary motivation for the migration itself may be the need to accumulate capital for investment in the country of origin. Often, that investment may be to build or buy a house, as many transnational families harbor plans to return permanently to the home country.

Transnational families may create not only social and economic ties but also political links with their country of origin. They may establish institutions and organizations that transcend the political boundaries of the countries of origin and settlement and seek to participate in the political landscape of their homelands. They may even demand the right to hold dual citizenship as well as the right to exercise all political rights that citizenship implies, including the right to vote and the right of representation, even while living abroad.

One of the main institutions shaping transnational ties and connections is the government of the country of origin. In many cases, the government of the sending country has created policies that encourage immigrants to maintain long-term attachments to their country of origin. The governments of the sending countries attempt to tap into the loyalty of the immigrant community in order to access their socioeconomic resources, guarantee the continuous flows of remittances, and promote or accommodate diasporan capitalism (the transfer of financial resources and other forms of capital by the diasporan population [i.e., immigrants] to their homeland for investment in economic activities). In an effort to promote or strengthen transnational ties, many governments either allow or are considering allowing dual citizenship.

TRANSNATIONAL SOCIAL MOVEMENT

Transnational social movements are movements whose members, organizations, or actions involve more than one nation. Some examples of contemporary transnational social movements are the global justice movement, the women’s movements, the human rights movement, and the indigenous people’s movements. Many social movement scholars link the emergence of transnational social movements to the contemporary processes of globalization, in particular the spread of information and communication technologies that enable people, ideas, finance, corporations, and organizations to move across borders with great ease. Transnational social movements actually hark back to the 19th century and even earlier. Anti-abolitionist, women’s suffrage, anti-colonial, and socialist movements are some earlier examples.

Four different kinds of transnational movements exist. The first are those that spread through diffusion as movement ideas, frames, and issues move from one country to another. Second are transnational movements resulting from external issues playing out on the
domestic level, such as protests in specific European countries against European Union policies. Another type involves supra-national bodies responding to local issues, such as trying former Chilean dictator Augusto Pinochet in the International Criminal Court as he could not be tried in his own country. The fourth type is collective actions, such as simultaneously staged protests in different countries, for example, the protest marches that took place in many countries against the U.S. war in Iraq in 2003. In all four kinds of transnational movements, local states and political opportunity structures, as well as local activists and their local networks, are equally important. In addition, international bodies and resources can facilitate the spread of transnational social movements, such as the UN World conferences in the 1990s.

What is characteristic of contemporary transnational social movements is that even social movements based in one nation (local movements) are aware of how their issues, identities, strategies, methods, targets of protest, and worldviews can become transnational and how other transnational movements shape their own agenda. Thus, in contemporary transnational social movements, the identities, networks, and communities are as likely to be global as local and global dynamics and audiences constrain and facilitate movements.

The dominant organizational form of transnational social movements is the network or coalition of groups from several different countries. Often, these networks do not have a physical presence but exist solely in cyberspace. Members of networks might meet face to face at international protest events or conferences, but they accomplish most of their work through the Internet. Hence, the dominant protest repertoire of transnational social movements includes education and mobilization, symbolic framing, and strategic use of information. Advocacy, lobbying, support, and direct action are secondary, though increasingly becoming more important. Furthermore, the major targets of most transnational movements are policy mechanisms of local, national, regional, and multilateral international institutions. Such strategies favor educated, middle-class activists or “knowledge experts.”

While there are transnational grassroots social movements as well, such as the Slum and Shack Dwellers International or Women in the Informal Economy Globalizing and Organizing, middle-class knowledge experts comprise most transnational social movements. This has led to transnational social movement skeptics who focus on the uneven geography of such movements. For example, in most transnational social movements, activists and organizations of northern countries are over-represented, with few collaborative relationships among social movements across geographic divides. In addition to geographic unevenness, most southern movements are financially dependent on northern movements. Furthermore, education is a necessary cultural capital and this sometimes leads to friction between those with formal education and those without, reproducing other inequalities within and across countries. Finally, working in transnational social movements sometimes takes away from local organizing and issues, thus creating fragmentation between those who are funded by global agencies and can work transnationally and those who work locally with local resources.

In contrast to these skeptics are transnational social movement boosters who focus on the advantages of transnational organizing. These include international attention to issues, pooling of resources and expertise across nations, and transnational solidarity, which makes a stronger, wider opposition to injustices that are global in scale. The boosters also focus on how the flow of information and resources is no longer just from the privileged North to the underprivileged South, but from South to North as well as from South to South, as activists work across many different borders. Transnational social movement boosters also point to the increasing transnational collective action and its potential for global-level changes.

Many scholars today see transnational social movements as permanent, but the past teaches us that transnational movements are neither inevitable nor irreversible. For example, the international labor movement had its heyday in the late 19th and early 20th centuries but received major setbacks after World War II. Also, while the global and local shape each other, tensions between local needs and international concerns are often difficult to reconcile. Despite their uncertain future, contemporary transnational social movements have been successful in multiple ways. For example, the transnational women’s movement led to legislative and policy changes for gender justice in many countries, including a global gender equality regime via the United Nations. Similarly, the transnational environmental movements succeeded in bringing world attention to global warming and through the UN system to pass the Kyoto Protocol. The global justice movement highlighted the contradictions of corporate globalization and the growing inequalities that resulted from it and the need for
alternatives, as epitomized by the World Social Forum motto: “Another World Is Possible.”

TRICKLE-DOWN ECONOMICS

Trickle-down is a political-economic term used to describe certain economic theories and policies. It implies that policies to help the wealthy directly will also have a positive impact on the middle and lower classes and the poor, with a trickle of the original largesse.

The intent of so-called trickle-down policies is to help the wealthy; it is fine if benefits trickle down to the poor, but the point is to help the wealthy. Hence, these theories are criticized by opponents as trickle-down; it is a negative label and one that no one would use for their own theory. The proponents of these theories and policies insist that “trickle-down” is simply not an accurate description of what is going on. They would argue, for example, that Reagan’s supply-side tax cuts, an oft-cited instance of trickle-down economics, expanded the economy, benefiting all economic classes. Rather than a trickle to lower economic classes, steady economic growth occurred in which everyone significantly participated.

The supposed impact of a tax cut for a wealthy corporation is the classic example of trickle-down economics. If the government lowers taxes for a wealthy corporation, then this corporation receives immediate, direct benefits in the form of higher profits. “Trickling-down” occurs when this business then expands output and hires more workers who then receive monetary benefits in the form of wages; the tax cut dollars thus “trickled-down” to the workers in an analogy to water trickling down a series of steps to finally arrive at the bottom.

In an interesting disavowal of views that he had earlier championed, Reagan-era director of the Office of Management and Budget, David Stockman, described Reagan’s supply-side policies as trickle-down. Reagan’s idea was to cut tax rates significantly for wealthy individuals while also cutting the capital gains tax. The idea behind this was to increase the wealthy’s incentive for investment, which would then lead to greater economic growth. Rather than a trickle ending at the lower economic classes, there would be a torrent of goods and services for everyone. Stockman, however, derided these policies, saying that the real intent was to lower the top marginal income tax rates (i.e., benefit the wealthy directly) and that pointing to whatever may trickle down to the lower income classes was only a crude attempt at justifying these essentially pro-wealthy policies.

President George W. Bush’s 2003 tax cuts on investments have also been called trickle-down economics, with the majority of the savings going to those whose annual income was greater than $1 million. Similarly to Reagan, Bush justified these cuts by saying that they would boost investment spending and economic growth. Critics, however, simply saw this as a cynical effort to garner widespread support for what was essentially a pro-wealthy policy by claiming that it would benefit those at the other end of the income distribution.

Further Readings

Twelve-step programs include the namesake organization, Alcoholics Anonymous (AA), and other mutual help programs that are modeled on the 12 steps of AA. Their unifying assumption is that the most effective and efficient path to recovery from alcoholism, addiction, and other problems is the dynamic of mutual help—one addict helping another. AA's primacy and influence make detailed knowledge of its approach essential to understanding twelve-step programs in general.

Since the founding and development of Alcoholics Anonymous in the United States during the late 1930s, numerous programs representing a broad range of maladies have utilized the general principles of AA, the 12 steps. Initially concentrated in North America, AA and its spin-offs have progressively been adapted and implemented in significant areas of the world.

Alcoholics Anonymous

History

On May 11, 1935, a failed, middle-aged New York City stockbroker, William Griffith Wilson, was in the lobby of the Mayflower Hotel in Akron, Ohio, facing a decision of whether to drink or maintain his 5 months of sobriety. Drawing upon knowledge of what would later be called “12 stepping,” the recovering alcoholic decided to reach out and try to remain sober by working with another alcoholic. Through a series of telephone contacts, ending with Henrietta Siberling, he was put in touch with Robert Holbrook Smith, an alcoholic and a practicing surgeon. Although not immediately successful, Dr. Smith did achieve sobriety a month later, thus laying the cornerstone upon which an association of alcoholics premised their recovery on the concept that one alcoholic working with another was an effective method of becoming sober and maintaining sobriety.

The moral tone and fundamental traditions from which Alcoholics Anonymous evolved were prevalent in American and European religious and philosophical thought in the 1800s in organizational forerunners, including the Washingtonian Society and the Oxford Groups. Bill Wilson, in particular, was strongly influenced by the philosophy and theology of William James and by currents of popular psychoanalytic thought that led AA to combine a spiritual, scientific, and medical approach to the treatment of alcoholism.

Description

A brief description of AA is provided each month in the Grapevine, AA’s international journal. Typically, this description is read at the beginning of AA meetings:

Alcoholics Anonymous is a fellowship of men and women who share their experience, strength, and hope with each other that they may solve their common problem and help others to recover from alcoholism. The only requirement for membership is a desire to stop drinking. There are no dues or fees for A.A. membership; we are self-supporting through our own contributions. A.A. is not allied with any sect, denomination, politics, organization or institution; does not wish to engage in any controversy; neither endorses nor opposes any causes. Our primary purpose is to stay sober and help other alcoholics to achieve sobriety.

The core of the AA program and the basic dynamics of recovery are best conveyed through the organization’s 12 steps:

1. We admitted we were powerless over alcohol—that our lives had become unmanageable.
2. Came to believe that a Power greater than ourselves could restore us to sanity.
3. Made a decision to turn our will and our lives over to the care of God, as we understood Him.
4. Made a searching and fearless moral inventory of ourselves.
5. Admitted to God, to ourselves, and to another human being the exact nature of our wrongs.
6. Were entirely ready to have God remove all these defects of character.
7. Humbly asked Him to remove our shortcomings.
8. Made a list of all persons we had harmed, and became willing to make amends to them all.
9. Made direct amends to such people wherever possible, except when to do so would injure them or others.
10. Continued to take personal inventory and when we were wrong promptly admitted it.

11. Sought through prayer and meditation to improve our conscious contact with God as we understood Him, praying only for knowledge of His will for us and the power to carry that out.

12. Having had a spiritual awakening as the result of these steps, we tried to carry this message to alcoholics, and to practice these principles in all our affairs.

The 12 steps provide a systematic and pragmatic regimen as well as a broad philosophy of life. Members of AA and other twelve-step programs use phrases like “working the steps” or “working the program.” Whatever the malady (alcoholism, drug addiction, gambling), the beginning of recovery starts with admission of the problem and the commitment to cease the behavior “one day at a time.” Group participants strive to “transcend” their problems and themselves by becoming other-centered rather than self-centered. Specifically, they come to trust and depend on others—whether it be God or a Higher Power, the group itself, a sponsor, or other addicts. In group jargon, “In order to keep it, you have to give it away.” Dependence on others and the belief that by helping others one helps oneself defines twelve-step programs as mutual-help rather than self-help groups.

The basic activity of twelve-step programs takes place in meetings at which participants share their experience, strength, and hope. In some meetings, participants provide personal testimonials; in other meetings participants discuss aspects of the program (e.g., one of the steps) or topics of interest or issue for specific members. In all meetings, the central dynamic is to highlight the value and the benefit of the new or sober life versus the old, addicted life and to attribute these changes to successfully working the program. In addition to meetings, working the program takes place in informal settings (open houses or club houses), in relationships between members and sponsors, and through helping others (twelve-step work).

**Membership and Growth**

AA initially grew slowly through personal contact and word of mouth in Akron/Cleveland, Ohio, and in New York City. With the publication in 1939 of the “Big Book” (Alcoholics Anonymous: The Story of How Many Thousands of Men and Women Have Recovered from Alcoholism), an article in the Saturday Evening Post by Jack Alexander in 1941, and endorsement by influential people, membership reached 100,000 by 1950. Membership climbed to a million by the late 1970s and stands at more than 2 million today. These figures are estimates—probably conservative—since the organization maintains no official membership list or files.

**Other Twelve-Step Programs**

The AA program has spawned satellite, copycat, and spin-off organizations. Al-Anon and Alateen, both satellite organizations founded in the 1950s, focus their attention on family and friends. Copycat organizations include Narcotics Anonymous and Gamblers Anonymous, founded in the 1950s, and Co-Dependents Anonymous, founded in the late 1970s. More recently formed and less well-known groups include Debtors Anonymous, Spenders Anonymous, Emotions Anonymous, and Sexual Compulsives Anonymous. Spin-off organizations take selected aspects of AA ideology and practice and specifically reject others. For example, Rational Recovery and Secular Organization for Sobriety, founded in the 1980s, and the Society of Links in Sweden, founded in the 1940s, reject the spiritual and religious implications of AA while accepting repentance, restitution, and transcendence.

**Popularity and Effectiveness**

Anecdotal and popular data abound, but definitive empirical data remain limited. The 1990 U.S. National Alcohol Survey indicates that 13 percent of adults ages 18 and older, approximately 24 million, reported having attended a twelve-step meeting. While many of these were seeking help, some were likely supporting family members and others attending as part of an educational experience or requirement. The 2000 National Longitudinal Alcohol Epidemiologic Survey (NLAES) found that of individuals who had sought help because of drinking, nearly 76 percent also reported having attended a twelve-step meeting. Research generally shows that these programs are as effective as, and sometimes more so than, professional treatment. Twelve-step programs have other advantages. Among others, they are anonymous, usually free and voluntary, with the added benefit of 24-hour-a-day guidance and support as needed from group members and a personal sponsor.
From a humble beginning, two men, Bill Wilson and the aforementioned Robert Smith, became the founding fathers of the Fellowship of Alcoholics Anonymous and began a revolution in alcoholic recovery, which, in turn, has been applied to many walks of life. As a consequence, AA principles and philosophy have gained widespread, if not universal, acceptance, and their program of recovery has been adapted for usage in nearly every category within the world of addiction treatment.

UNDERCLASS DEBATE

The underclass debate refers to a scholarly and public debate during the 1970s through the 1990s about the origins, character, and appropriate response to the problems of concentrated urban poverty in the United States, particularly among African Americans. The sociologist William Julius Wilson brought attention to this issue in the 1970s and became a central figure in the debate that ensued between those who emphasized the values and choices of low-income people and those who emphasized economic conditions and government policy. This debate helped shape three major policy changes in the United States: the cutback in funding for federal social programs in 1984, the 1996 reform of welfare policy, and the initiation of the HOPE VI mixed-income housing policy by the Department of Housing and Urban Development in 1992. This debate also spurred a substantial body of empirical research that showed how national and metropolitan-wide processes affect the lives of inner-city residents.

Origins of the Underclass Debate

The word underclass first appeared in English in a 1963 book by Gunnar Myrdal, who adapted the Swedish term for lower class (underklass) to loosely describe people who were underprivileged and poor. At the time, the term was largely ignored in the U.S. press, in favor of language from a report written by New York Senator Daniel Patrick Moynihan about the “tangle of pathologies” associated with the conditions of urban “female-headed black families,” as well as language about the “culture of poverty” from the writings of Oscar Lewis about families in Mexico and Puerto Rico. Although Lewis only presented case studies, he made strong claims that children growing up in slums become psychologically incapable of taking advantage of opportunities for upward mobility that might occur later in life.

Meanwhile, the achievements of the civil rights movement and the federal War on Poverty in the 1960s led many Americans to expect that racial inequities would decline substantially and rapidly. They did not anticipate that class inequalities might simultaneously increase. In 1978, Wilson argued that middle-class blacks benefited more from the new opportunities than did underclass blacks, who remained persistently poor. His use of the word underclass touched off controversy. Some people felt that it deflected attention from an unfinished agenda of institutional reform, whereas others felt that it brought needed attention to a new agenda of personal responsibility. Nonetheless, the term quickly gained currency. For instance, in August 1977, Time magazine featured a cover story on poor urban blacks titled, “The American Underclass: Destitute and Desperate in the Land of Plenty.”

Intensification of Underclass Debate

Following the election of Ronald Reagan to the presidency, author Charles Murray crystallized a conservative critique of federal social programs. He argued that public assistance to single mothers had undermined traditional norms about work and marriage, and largely created the problems of the urban poor. His book, used to justify deep cuts in anti-poverty programs in the 1984 Omnibus Budget Reconciliation Act, was called “the Reagan budget-cutter Bible” in
a *New York Times* editorial. In a similar critique, Lawrence Mead compared the experience of immigrants, women, and native-born blacks in the labor market. He reasoned that blacks were more likely to be unemployed because they were more likely to refuse the available, low-wage jobs accepted by others.

In 1987, Wilson sought to explain the rise in joblessness and single-parent families in black urban communities, which were located mainly in the Northeast and Midwest. He argued that black male joblessness had increased because deindustrialization had resulted in fewer blue-collar jobs that could support a family. Consequently, Wilson argued that race-specific remedies could not address the underlying problems of economic dislocation, and he advocated for universal federal programs to promote tight labor markets and support child well-being.

Throughout the 1980s, the popular press frequently used the term *underclass* without definition or analysis. As a result, in his 1990 presidential address to the American Sociological Association, Wilson announced that he was dropping the term *underclass* and replacing it with *ghetto poor* in order to differentiate his analysis from ideas he did not espouse. Although the story appeared in all three newswEEKlies and major national newspapers, the term *ghetto poor* did not become widespread.

**Subsequent Research and Public Policy**

Christopher Jencks put social trends in poor neighborhoods in context by examining national trends from 1970 to the late 1980s. He noted that worsening poverty was not linked in a simple and direct way to other social problems and that sexual mores had changed across U.S. society, not just in the inner city. Whereas wages and employment had declined for workers without higher education and single-parent families had become more common, welfare dependency had not increased since the early 1970s, and illiteracy, teenage motherhood, and violence had declined somewhat. Jencks urged researchers to distinguish the particularities of each social problem rather than to assume that they are all symptoms of a single, distinct, homogeneous underclass.

Other researchers examined the intersections of race, poverty, and place on a metropolitan or national scale. Douglas S. Massey and Nancy A. Denton showed that continued racial segregation in metropolitan housing markets maintained neighborhoods that were majority black; Massey and Denton advocated integrated housing as a fundamental way to improve the life chances of African Americans. Paul A. Jargowsky investigated the distribution and spread of poor people in poor places nationwide from 1970 to 1990. Overall, he found that the number of poor people in high-poverty neighborhoods almost doubled from 1.9 to 3.7 million, largely because more places became poor. However, economic booms in the Southwest in the 1970s and in the Northwest in the 1980s sharply reduced concentrated poverty in those regions. Jargowsky concluded that neighborhood poverty resulted from metropolitan-wide processes, not from the character of the residents. He recommended metropolitan and national policies to increase productivity, lower inequality, and reduce segregation.

Despite research findings like these, public opinion still tended to fault deficient personal motivation and debilitating public assistance for the social ills represented by the idea of an underclass. In 1996 the Clinton administration passed the 1996 Welfare Reform Act, replacing Aid to Families with Dependent Children with Temporary Assistance for Needy Families. This legislation abolished federally guaranteed support to low-income families, set a 5-year lifetime limit on the receipt of such assistance, and mandated that mothers move into the paid labor force as quickly as possible. Consequently, many mothers entered the labor force, and the number of families receiving public assistance dropped dramatically, although many had only entered the ranks of the working poor. At the same time, public policy began to shift toward support of working families through the Earned Income Tax Credit. What began as a very small program in 1975 expanded, with bipartisan support, with each major tax bill in the 1990s and has become an important federal anti-poverty policy, although it does not address job creation or support for unemployed persons.

In 1992, partly in response to concerns about concentrated poverty, the Department of Housing and Urban Development began the HOPE VI Program, promoting the demolition of public housing for low-income residents and the construction of some mixed-income housing. During the buoyant economy of the 1990s, many U.S. cities prospered, and the number of poor urban neighborhoods declined nationwide. A few cities, such as Portland and Minneapolis–St. Paul, harnessed these market forces to link suburban and urban development and promote mixed-income development.
In the wake of September 11, 2001, public attention shifted to national security and immigration issues, although the term underclass was used in connection with the victims of Hurricane Katrina in New Orleans in 2005. In the future, the term may continue as a modern synonym for the “undeserving poor,” just as it has in the past, or perhaps it may be dropped as an outmoded way of framing race, poverty, and urban issues.

Underemployment

Underemployment refers to employment that is inadequate, inferior, or of low quality, relative to some standard. Researchers—mostly economists, industrial-organizational psychologists, and sociologists—agree that there are several distinct types of underemployment, although there is less agreement on exactly what counts as underemployment or how many types there are. Nevertheless, the following experiences are regularly classified as underemployment:

Overqualification: These workers possess surplus (a) formal education, (b) work experience, and/or (c) knowledge, skills, and abilities (KSAs), relative to the job demands or requirements.

Involuntary Part-Time and/or Temporary Employment: These workers are employed in part-time and/or temporary jobs because they cannot find full-time and/or permanent positions.

Underpayment: The worker’s wages are significantly less than a certain standard. Standards include (a) the worker’s wages from a previous job, (b) typical wages for someone with the worker’s educational background, and (c) a livable wage.

Other types of work experiences occasionally identified as underemployment include unemployment, intermittent (un)employment (workers who either have experienced recent periods of both employment and unemployment or work on jobs that are seasonal or otherwise sporadic), sub-employment (workers who are not currently employed and have ceased the job search process because they do not believe that jobs are available), involuntary educational mismatch (workers employed in a field outside their area of education), status underemployment (workers who receive less occupational prestige from their jobs than expected based upon their background), and jobs providing few opportunities for skill development.

Involuntary Mismatch

In general, a key prerequisite for defining a work situation as underemployment is that it be involuntary. For example, an individual who moves from full-time work to part-time work as part of a transition to retirement is not underemployed, whereas someone who would prefer a full-time job but can only find a part-time job is underemployed. This is an important distinction, as researchers have begun to show that employees who voluntarily choose a given work situation (e.g., part-time work) experience more positive job attitudes than employees who find themselves in the same work situation despite preferring something more (e.g., full-time work).

Each type of underemployment, by definition, represents a discrepancy between the actual work situation and an alternative situation that is preferred by
the employee. Recognizing this, researchers are beginning to utilize person–job fit and related models to frame underemployment research and generate hypotheses. In essence, each type of underemployment can be viewed as an instance of poor person–job fit. For example, overqualification reflects poor fit between worker abilities and job demands, whereas underpayment reflects poor fit between worker needs and job supplies.

Measurement
Researchers may measure underemployment by using either personnel data or self-report measures. For example, overqualification may be assessed by comparing one’s level of education and experience (as stated on a resume or job application) to a job description. Alternatively, the employee could be asked to complete a questionnaire with items designed to tap perceptions of overqualification. In addition to these strategies, some researchers measure underemployment by culling data from databases containing labor statistics, such as the National Longitudinal Survey of Youth. Importantly, self-report measures have the advantage of accounting for whether one’s current work situation is voluntary or involuntary. Unfortunately, measurement of underemployment is currently idiosyncratic to each research project; no valid self-report measures have yet gained widespread use.

Prevalence and Demographic Correlates
Estimates vary, but it appears that at least one in five U.S. workers currently experiences underemployment in one form or another. This rate is significantly higher than the typical unemployment rate, which has remained below 8 percent in the United States for the past 2 decades. Other developed nations seem to have similar levels of underemployment. Not surprisingly, the proportion of individuals who may be classified as underemployed fluctuates along with the status of the economy, with the experience being more common in times of economic recession. However, some have argued that, even in more prosperous times, most newly created jobs are low-paying, low-skill positions that effectively keep unemployment rates low (the rate typically used as an index of labor market health) while channeling job seekers into employment situations that are inadequate for most of them.

Several groups of workers are particularly likely to experience underemployment. Researchers consistently find that females are underemployed at higher rates than males. Cultural norms place the primary responsibility for child care and elder care upon women. This results in geographic and time restrictions, forcing some women to choose jobs that are flexible over ones that may best utilize their education or offer the greatest career opportunities.

Ethnic minorities are also prone to underemployment. In the United States, underemployment is especially prevalent among African Americans and Latin Americans. Discrimination, lower educational attainment, and cultural differences may contribute to underemployment of minorities. For minority immigrants, language problems and limited social networks create additional barriers to adequate employment.

Several other personal characteristics may also put a person at risk for particular types of underemployment. Those with low levels of education tend to be involuntarily employed in temporary or part-time positions, whereas highly educated workers are more likely to experience overqualification. Research findings are inconsistent about age, although recent college graduates (who are highly educated but often have little work experience) and older white-collar workers (who are among the most common victims of downsizing) commonly experience underemployment. Finally, underemployment may be more prevalent in some job sectors (e.g., manufacturing) and regions (e.g., rural) than in others.

Consequences
Researchers consistently hypothesize a variety of negative consequences associated with underemployment, from dissatisfaction with one’s job, to higher rates of absenteeism and turnover, to poor physical and psychological health. Managers tend to avoid hiring applicants who appear overqualified because of similar predictions.

Underemployed individuals report lower levels of job satisfaction than non-underemployed individuals, particularly for facets of satisfaction that are relevant to the type of underemployment. For example, overqualified workers seem most unhappy with the work itself but are not necessarily dissatisfied with their coworkers or supervisor. Some have argued that higher education promotes lofty expectations for one’s career, making underemployment even less
satisfying. Some evidence also exists that underemployment may also be associated with a relatively weak emotional attachment to the organization (called “affective commitment”).

Researchers posit that, because of a lack of motivation or commitment, underemployed workers may perform their tasks at a lower level and engage less in organizational citizenship behavior (such as working late to help a coworker finish a project). In some cases, however, the reverse could be true. For example, temporary workers who prefer a permanent work arrangement with the organization may be highly motivated to perform at a higher level and/or engage in citizenship behaviors to maximize the chances that they will be offered a permanent position. Unfortunately, practically no data exist on the relation between underemployment and either type of job performance.

Some early evidence suggests that underemployment correlates with higher rates of absenteeism, intentions to quit one’s job, and job search behavior. Other research has found that local levels of underemployment may discourage some groups from seeking work or changing jobs. However, at this time, the proposition that underemployment will predict actual turnover behavior remains untested. This is surprising, as researchers and managers commonly predict that the underemployed (particularly overqualified workers) are particularly likely to search for more adequate employment and leave their present jobs.

Research shows that underemployment, whether it is involuntary part-time employment, underpayment, or intermittent employment, has negative psychological and behavioral effects, including low self-esteem, stress, substance abuse, health problems, and depression. In fact, being underemployed may be as traumatic and damaging as being out of work entirely. Also, in some cases, the relationship between underemployment and mental health may be bi-directional, with factors such as low self-esteem placing the individual at greater risk for underemployment, which then may produce further negative psychological effects.

**Potential Solutions**

Underemployment is a complex phenomenon, prevalent across the globe and influenced by myriad factors at the personal, organizational, and societal levels. Many researchers argue that the problem is due largely to the lack of skilled, full-time, and permanent jobs, rather than an underskilled workforce. Organizational practices, such as regular layoffs and the shipping of manufacturing jobs to countries where labor is less expensive, may play a role, as might industry restructuring toward service-sector jobs. The many potential causes of underemployment require solutions at every level, from vocational programs, which aid job seekers in identifying appropriate positions, to government initiatives, which promote the creation of high-quality jobs.

**Underground Economy**

The term *underground economy* refers to economic activities that circumvent the formal system of rules and regulations that organize the processes of production and exchange. Underground economies are classified depending on either the particular set of rules that such activities violate or the nature of production, distribution, and the final product.
Within the first classification, four types of underground economies can be distinguished: the illegal economy, the unreported economy, the unrecorded economy, and the informal economy. Illegal economy refers to the production and exchange of prohibited goods and services, such as drugs or the sex trade. Unreported economy denotes activities that evade tax laws. The unrecorded economy consists of all activities that, under existing rules and regulations, should be recorded in national accounting systems (national income and product accounts) but are not. Finally, the informal economy comprises economic activities that circumvent the administrative rules covering property relationships, commercial licensing, labor contracts, social security systems, and so forth.

Within the second classification, the underground economy consists of “informal” economic activities carried out through illicit means of production and distribution but leading to a licit final product (e.g., a textile firm producing T-shirts and jeans by using informal labor) and “criminal” economic activities, carried out by either licit or illicit means (usually the latter) but necessarily leading to an illicit final product (e.g., drug trafficking).

Methods of Measurement

Because activities in an underground economy defy the law in one way or another, they do not easily lend themselves to observation, so any attempt to study, measure, and classify them remains fraught with problems. The measurement problem becomes even more pronounced when attempting to make cross-national comparisons. Because nations differ in political, legal, and economic structures, nations’ underground economies are organized differently and are composed of different activities; all of these factors pose a comparability problem for the researcher.

Despite these problems, scholars capture underground economies’ composition, size, and growth rates by one of three methods: the survey approach (also known as direct micro observation methods), the discrepancy approach (also known as the indirect macroeconomic methods), and the qualitative approach. Each of these methods has different strengths and weaknesses.

Direct micro observation approaches involve amassing data on underground activities through conducting surveys, auditing tax returns, or reviewing census reports. Although these methods yield detailed and firsthand information about the underground economy, they have several weaknesses. First of all, they lead to point estimates and fail to capture the big picture, giving little information about the underground economy and its historical development at large. Second, these methods remain costly and time consuming. Third, the lack of uniformity between surveys conducted at different points in time often makes it impossible to draw comparisons, thus decreasing their usefulness in uncovering temporal causes and consequences of underground economic growth. Moreover, because parts of these activities are illegal, survey response rates often remain low, leading to the problem of biased sampling.

Economists generally use indirect macroeconomic methods, also known as discrepancy approaches, to measure the underground economy’s size and development over time and across nations. These methods follow the traces that the underground economy leaves behind in the labor, money, and product markets. The difference between spending and savings accounts, the dissonance between official labor participation rates and the general growth trend, or the amount of currency in circulation above and beyond what is used in official transactions form the indicators of the underground economy. Among the macro approaches’ explicit benefits are their low costs, their objectivity (i.e., their insusceptibility to deliberate misrepresentation on the part of respondents), and their ability to provide temporal estimates of the size and growth of underground economic activities. On the downside, these methods do not provide information on the underground economies’ inner mechanisms, and because they are based on some a priori assumptions regarding the relationship between macroeconomic indicators (such as labor market or monetary market measures) and underground economic activity, their robustness depends on the reasonableness of the assumptions that underlie them.

The third major method, the qualitative approach, is preferred by anthropologists or ethnographically oriented sociologists interested in uncovering the mechanisms and the norms of exchange, trust, social capital, and reciprocal relations that underlie the underground economy. It entails assembling information on underground economic activities through ethnographic research and participant observation. Like the micro observation methods, the qualitative approach yields detailed information about the underground economy but fails to capture its overall trends.
Theories of the Underground Economy

Three major schools of theories explain the development of underground economies. These are the modernization/development approach, the structural approach, and the institutional economics approach.

The modernization/development approach, which became prominent in the 1960s and 1970s, viewed the underground economy’s development as a symptom of a traditional, backward economy. In this view, the underground economy consisted of marginal activities not linked to the official sector or to modern capitalist development. A central assumption was that the underground economy would become extinct once underdeveloped nations attained sufficient levels of economic growth via the advance of modern capitalist development.

The structural view of the underground economy, which emerged in the 1980s, challenges the mainstream view of the informal sector as primarily a third world phenomenon and sees the rise in underground economic activities in highly developed and institutionalized European and North American economies as indicative of a reconfiguration of production and employment relationships under advanced capitalism. According to this view, by providing firms with flexible production and cost reductions, the underground economy constitutes a permanent feature of capitalist development, most likely to expand due to profit squeeze, increased labor costs, or increased competition from cheaper foreign goods.

The institutional economics approach attributes underground economies’ development to the state’s over-regulation of the economy. In this view, the underground economy provides the economic actors with the possibility of escaping the high bureaucratic and legal costs of operating in the formal economy. This view sees that underground economic growth can be limited or eliminated if a state reduces the bureaucratic requirements and the costs associated with operating in the official economy.

Policy Implications

The underground economy has significant implications for a wide range of policy issues. First of all, without a profound understanding of the underground economy, governments lack a reliable estimate of overall economic conditions, and key economic indicators such as unemployment rates, saving rates, productivity, and price levels may well be biased, leading to suboptimal outcomes. This harms governments’ ability to make informed policy decisions, leading to less than desirable outcomes.

Another oft-cited result of underground economic growth concerns the loss of tax revenue. Taxes are how states finance their services to citizens. When people or enterprises do not pay taxes, the state loses some of its tax base and hence its ability to effectively provide its citizens with services.

A third concern is the emergence of unfair market competition. Because businesses that operate underground avoid some or all regulations, such as taxes and labor benefits, they enjoy cost advantages over enterprises that operate formally. This leads to unfair competition between formal and underground businesses. Unless the state addresses this unfair competition, over the long run more and more businesses will go underground, leading to an increasingly informalized economy.

A fourth concern is the degree of exploitation that prevails in the underground economy. Workers in the underground economy do not enjoy the rights, benefits, and protections that their counterparts in the official economy have. This exploitation in underground economy remains a profit mechanism for companies operating in it. Also, more exploitation of female labor occurs than of male labor, further contributing to society’s gender inequality.

Furthermore, the underground economy illustrates an unhealthy relationship between citizens and government. At the core of this relationship in a modern democratic polity rests a system of rights and duties recognized and upheld by laws. The underground economy functions by, and thrives upon, undermining this institutional relationship. Over the long run, this might lead to an erosion of trust between states and citizens and to a further extension of law-evading behavior into other realms.

In response to these oft-cited drawbacks, some scholars note the underground economy’s positive implications. They argue that the underground economy can be beneficial because it responds to the economy’s demand for urban services and small-scale manufacturing. The underground economy thus provides a dynamic and entrepreneurial spirit and can lead to more competition and higher growth; it also may help create markets, increase financial resources, and help transform the legal, economic, and social
institutions necessary for wealth accumulation. Moreover, some scholars have found that large portions of the money earned by informal means return to the formal first economy. They also note that during an economic crisis, the underground economy can serve as a buffer zone that allows enterprises to operate with low costs to help meet people’s needs.

**Undocumented Immigrants**

The term *undocumented immigrants* is one that amnesty advocates prefer instead of the term *illegal aliens*, which is used by those who oppose both their presence and any official approval such as amnesty. Both terms refer to foreigners who either enter a country without authorization to do so or enter on temporary visas but remain after the time limit. Such actions are most often matters of choice but may also include victims of sexual or labor exploitation, smuggled into countries to work as prostitutes or in factories, on sugar plantations, or elsewhere.

Usually, the push–pull factors that drive legal immigration are the same ones spurring people to bypass the prescribed processes for entry. Among the common push factors are negative elements such as persecution, repression, poverty, and war. Conversely, the most common pull factors are positive elements such as freedom, opportunity, higher living standards, and/or joining family members already there.

**Europe**

Although the democratic nations of Western Europe have long experienced undocumented immigrants in their midst, the situation evolved into a social problem in recent decades with the fall of communism to the east and quality-of-life issues resulting from burgeoning populations to the south. With the collapse of an artificial economic interdependence system under communism, the resulting factory shutdowns, lost jobs, and the sudden opportunity to cross borders no longer guarded to prevent emigration, tens of thousands sought a better life without bothering to obtain any formal approval to do so.

England, France, and Germany attracted many of these clandestine migrants. Italy, though, became the main conduit into the European Union. Italy still attracts more illegal immigration than other European countries because its long coastline and close proximity to other countries make it especially vulnerable. The most popular clandestine sea route for Africans is from Libya or Tunisia to the Italian island of Lampedusa (closer to Africa than to Italy) or to Sicily. A second underground gateway is a 60-mile speedboat ride by smugglers from Albania across the Adriatic Sea. Albanians, Afghans, Kurds, Turks, and Chinese are the most frequent arrivals this way. A third route is by truck over the Slovenian border into Milan.

Because of Italy’s limit of 20,000 to 30,000 legal immigrants per year and an estimated 2 million others waiting for transit to enter, the “back door” of illegal entry has become the only viable choice for many. About 2.5 million (4.3 percent) of Italy’s 58 million people in 2007 were foreign born, about half of them beneficiaries of four amnesties between 1986 and 1998. Rather than solving the problem, however, these amnesties attracted even more illegal migrants. Each year hundreds drown in unsafe, overcrowded boats in attempts to reach Italy.

**United States**

Nativist reaction against the entry of unprocessed immigrants is practically as old as the United States itself. Late 18th-century Americans bristled at English ships approaching U.S. shores and dumping Irish rebels into the water to swim ashore. Late 19th-century Americans, who had barred Chinese laborers with passage of the Chinese Exclusion Act of 1882, resented their illegal entry through the unguarded northern border with British Columbia. Late 20th-century Americans sought to stop the flow of
undocumented immigrants from Mexico, still a problem in the 21st century.

What fuels public debate about immigration is the rising number of unauthorized foreign-born people in the United States. Some critics claim that more immigrants arrive illegally than through legal means. The Pew Hispanic Center, a nonpartisan research organization, estimates a growing influx each decade, from about 8.4 million unauthorized migrants in 2000 to about 12 million in 2006. About two thirds have been in the United States for less than 10 years, with the largest share (40 percent of the total) for less than 5 years.

Mexicans comprise the largest segment of undocumented migrants (about 56 percent), a proportion that has remained steady for a decade. Other Latin Americans constitute an additional 22 percent. About 13 percent come from Asia, 6 percent from Europe and Canada, and 3 percent from other parts of the world. Most of these arrivals are people from foreign lands slipping across U.S. borders, but others (about 165,000 annually) first arrive legally as visitors (tourists, students, or businesspeople) and then overstay their allotted time and become visa violators.

Benefit or Burden?
The more developed countries are the ones most likely to have an issue with undocumented immigrants and to take countermeasures, particularly when the native population perceives the growing numbers of immigrants to be a threat to their own economic welfare or to societal cohesion and national identity. They fear lower-wage workers will take away their jobs, not pay their fair share of taxes, and thus place an unfair financial burden on tax-paying citizens who must provide education, health, and other social services for them and their families. In addition, they fear that too many foreigners—not motivated to assimilate because their legal status prevents them from full participation in society—will lead to ethnic tribalism and undermine the core culture. Furthermore, the horrific terrorist actions of the 21st century—in New York City and Washington, D.C., in 2001; in Madrid in 2004; and in London in 2005—raised the concerns of many about their safety and security if potential terrorists can slip across their country’s borders without detection.

Issues of security aside, Americans remain divided over whether undocumented immigrants are a boon or drain to the economy. Reliable studies on the financial impact of illegal immigrants do not exist. In fact, most studies on this topic do not differentiate between illegal and legal immigrants. Whereas critics charge that illegal immigrants are a drain on public coffers, supporters claim that they pay more in taxes than they receive in services. Usually, the findings depend on the accounting methods used.

Many undocumented immigrants, for example, pay social security taxes but never collect benefits. However, most work in low-wage occupations, so they do not generate large tax revenues. Still, their illegal status makes them ineligible for many government services anyway. Although some argue that the expense of educating the children of undocumented immigrants is a substantial drain on public funds, others contend that most of these children are U.S. born, and as U.S. citizens, they are entitled to a public school education. Even most U.S. native families with children typically receive more in publicly funded services (especially education) than they pay in taxes. One large public expense area would be if undocumented immigrants’ U.S.-born children became eligible for social programs, including welfare (Temporary Assistance for Needy Families).

Pressure for Reform
Public Agenda, a nonpartisan opinion research center, reported in 2006 that three quarters of Americans said they worried that it is too easy for illegal immigrants to enter the United States, and half said making their entry tougher should be a top priority for Congress. In the Southwest, the problem draws the greatest amount of public attention and generates the most apprehensions of undocumented aliens (about 1.2 million in 2006). Mexicans dominated the list of those apprehended, at 88 percent of the total. Other major source countries of those apprehended are El Salvador, Honduras, Guatemala, Cuba, Dominican Republic, Brazil, Colombia, and Jamaica.

Public pressure mounted in 2006–07 to do something about securing U.S. borders and dealing with those undocumented migrants already in the country. Political debates—over legislative proposals for amnesty as granted in 1986; calls for a crackdown on illegals, even a 700-mile wall along the border; cantankerous congressional hearings; and mass demonstrations in many U.S. cities—illustrated the fundamental disagreements about how to deal with the situation. A divided Congress has been unable to pass any immigration reform bill and, as of this writing, any resolution remains elusive.
Calls for reform come at a time when parts of the U.S. economy are dependent on the labor of undocumented migrants. Mostly Latinos/as, these unskilled workers have spread to a wide range of industries. Experts estimate the number of undocumented workers in the U.S. economy at about 1 in 25. Working mostly in low-skill occupations, they are heavily concentrated in agriculture, construction, manufacturing (especially textiles and animal processing), retail trade (especially restaurants), and services (especially landscaping). Moreover, about 10 percent of the labor force of Mexico—as well as of several other Central American and Caribbean countries—are now working in the United States, and their sending monies to their families back home is a major source of financial support there.

Unemployment

Economists reserve the concept of unemployment for people who are involuntarily unemployed. That is to say, people are unemployed if they are actively seeking jobs but unable to find them, as opposed to people who have voluntarily opted out of the labor market to pursue activities like raising children, going to school, or traveling.

Some economists follow A. C. Pigou and his 1933 argument that unemployment does not exist. Their argument rests on the following two premises: (1) There is a real wage low enough to make it profitable for employers to hire every person actively seeking a job, and (2) people are in a position to offer to work at that real wage.

If these two premises are valid, then unemployment does not exist. For everyone could have a job if only they were willing to work at a real wage low enough to make it profitable for employers to hire them. Instead, people who appear to be unemployed voluntarily opt out of the labor market by deciding that the utility they derive from activities like raising children is greater than the utility they would derive from the consumption of the goods and services that could be purchased with such a low real wage.

In 1936, J. M. Keynes and his followers undermined Pigou’s argument against the existence of unemployment on both theoretical and empirical grounds. The theoretical reason for rejecting Pigou’s argument is that its second premise is invalid. Rather than being in a position to offer to work at the real wage low enough to make it profitable for employers to hire them, people are only in a position to offer to work at a lower money wage. As equation 1 shows, the relationship between the money wage ($W_m$) and the real wage ($W_r$) is mediated by the price level ($P$):

$$W_r = W_m / P$$

(1)

For the second premise of the argument against the existence of unemployment to be valid, it must be the case that people who offer to work at a lower money wage ($W_m$) are also invariably offering to work at a lower real wage ($W_r$). But equation 1 shows that a lower money wage ($W_m$) only results in a lower real wage ($W_r$) if the price level ($P$) does not fall proportionately with the fall in the money wage ($W_m$).

The second premise of Pigou’s argument is invalid, because once the macroeconomic effects of a lower money wage ($W_m$) are taken into account, it is most likely that the price level ($P$) does fall proportionately with the fall in the money wage ($W_m$), so that the real wage ($W_r$) is not affected. The money wage ($W_m$) is the major determinate of aggregate demand. By offering to work for a lower money wage ($W_m$), people...
reduce aggregate demand. As a result, inventories pile up, causing firms to lower prices ($P$), so that the price level ($P$) falls as part of the effort of firms to get rid of unplanned inventory accumulations. In short, the price level ($P$) tends to fall in tandem with a falling money wage ($W_m$), with the result that it is not likely that the real wage ($W_r$) will be affected.

Social scientists have developed two empirical methods for measuring the adverse effects of unemployment. One method estimates the output forgone because people actively seeking jobs were unable to find them, and the other method estimates the deleterious effects of unemployment on the psychological well-being of the unemployed. As an example of the former, A. M. Okun estimated in 1970 that every percentage-point increase of unemployment above the full-employment level causes total output to fall 3 percentage points below the amount that could have been produced with full employment.

Until quite recently, the methods used by social scientists to estimate the deleterious effects of unemployment on the psychological well-being of the unemployed led to more ambiguous results than their methods for estimating the output forgone because of unemployment. The ambiguity resulted from two design flaws in their empirical methods. One design flaw was overly narrow definitions of psychological well-being. The other design flaw was the effort to distinguish between the two relevant sets of jobless people—those who are involuntarily unemployed and those who have voluntarily opted out of the labor market—by comparing their psychological well-being with the psychological well-being of a set of people that included all of the employed. For example, in 1979, K. B. Clark and L. H. Summers followed Pigou in arguing that there is no meaningful distinction between the psychological well-being of these two sets of jobless people, and in 1983 C. J. Flinn and J. J. Heckman followed Keynes in arguing that a meaningful distinction can be made between their psychological well-being, as compared with the psychological well-being of the set of all employed people.

More recent studies have corrected these two design flaws and, consequently, come down unambiguously on the side of Keynes. For example, in 1998 I. Theodossiou developed a comprehensive measure of psychological well-being that includes indices of anxiety, depression, self-confidence, self-control, and self-esteem. He also segregates, out of the set of employed, the subset of employed people with comparable skills and experience to those who are jobless, either because of involuntary unemployment or voluntary opting out of the labor market. Theodossiou then demonstrates that the set of people who have voluntarily opted out of the labor market do not have statistically significant differences in psychological well-being from the subset of employed people with comparable skills and experience, as compared with the psychological well-being of the set of employed people with greater skills and experience. But the set of people who are involuntarily unemployed have significantly less psychological well-being than the subset of employed people with comparable skills and experience, as compared with the same control group of employed people with greater skills and experience.

In short, there are both theoretical and empirical grounds for the argument that unemployment not only exists but is a fundamental social problem in wealthy modern societies. Because people actively seeking employment can do no more than offer to work at a lower money wage, and a lower money wage tends to cause a lower price level, it is of no help to the unemployed that there is a real wage low enough to make it profitable for employers to hire every person actively seeking a job. To the degree that there is unemployment, there are monetary costs to society as a whole in terms of output forgone, and there are also deleterious effects on the psychological well-being of the people who cannot find jobs, as compared with the psychological well-being these people would enjoy if they were able to find employment.

**Uniform Crime Report**

The Uniform Crime Report (UCR) is the basis for the Federal Bureau of Investigation’s (FBI’s) annual publication *Crime in the United States*. The UCR is the only official, standardized, police-based crime reporting program in the United States. The report measures the level and distribution of both serious and less serious crimes (including felonies and nonfelonies) as well as the responses by local law enforcement agencies. Three major types of data include crimes reported to the police, arrest data, and clearance statistics for more than 25 different types of offenses.

UCR data are considered more reliable from the mid-1970s onward, but there remain a significant number of problems currently plaguing the system. These include poor coverage of rape offenses, low reporting rates for arson, lack of full details on incidents, and undercounting offenses due to the hierarchy rule (i.e., the practice of only the most serious crimes being recorded, even with multiple-offense incidents). The FBI is promoting the National Incident Based Reporting System (NIBRS) because of its ability to overcome these limitations, but cost constraints have limited its adoption. The annual UCR publication mostly presents aggregate data on offense categories and ignores the richness of data available on subcategories of offenses through NIBRS.

The police are heavily dependent on the reporting of crimes by victims and witnesses, which limits the ability of the UCR program to provide an accurate and complete count of all crimes. Crime counts are also selectively created in a nonrandom manner as a result of police discretion in recording. Considerable controversy exists about the ability of the UCR program to report less-serious offenses. Arrest data are available only for offenses that include incidents of simple assaults, vandalism, and gambling; yet the number of arrests far exceeds offense counts of felonies.

The program is unlikely to mismeasure serious offenses, with the exception of rapes and related sexual offenses; many experts consider the reporting and coverage for serious violent offenses as relatively good. Despite the historical issue of manipulation of UCR crime statistics by local agencies, the reporting to police for more serious crimes, involving severe injuries, use of lethal weapons, and high-value stolen property, is mostly valid and reliable.

Most definitions of crime as a social problem rely on these reports as media, policymakers, and academic analysts of crime and violence incorporate UCR data, whose official status gives these reports more legitimacy than other sources. Although the social dimensions of crime and violence are not directly captured, any meaningful use by analysts invariably involves linking UCR data to social factors to be able to explain patterns and distributions of these offenses. UCR statistics include policing actions, which allows for the analysis of law enforcement behavior and the influence of police in labeling individuals and events as criminal. Police are the primary formalized social control agency that may be critical in determining the visibility of crimes and related social problems. Police have considerable discretion in enforcement and response, especially at the municipal and county levels, in how incidents are treated and processed.

The geographical, temporal, and offense coverage of the UCR program is the most comprehensive of any crime data set. One of the major advantages of the UCR is reporting by local law enforcement agencies, which allows for more focused understanding of crime problems and their diversity. Victimization surveys, in contrast, are at the national level, with limited information on the spatial distribution of crime. The process of compiling data has been facilitated and improved by the establishment of state UCR programs. At this time, the UCR remains the most comprehensive and practical source for crime data despite identified weaknesses, and reliance on UCR data will no doubt continue.

Urban Decline

Urban decline refers to a process that includes population loss and the concentration in cities of major social, economic, and environmental problems, such as high levels of unemployment and poverty and the deterioration of housing and public infrastructure. Sometimes used interchangeably with the terms urban decay and urban distress, urban decline is frequently measured by changes in population (particularly in relation to middle- and upper-income residents), unemployment, and poverty rates; changes in median household income; and changes in property values, housing tenure, and vacancy rates.

While many metropolitan areas in the United States experienced significant population increases in the second half of the 20th century, the growth was not even, either across or within regions of the country. In general, cities in the South and West experienced significant growth, whereas older, industrialized cities in the Northeast, Mid-Atlantic, and Midwest experienced significant declines in population. Part of the decline in the Rustbelt cities reflects the migration of people from these regions to the Sunbelt, but more generally, much of the decline in the older city reflects the decentralization of the population from central cities to suburbs. In 1950, 63 percent of the total U.S. population lived in metropolitan areas. Of this population, 57 percent lived in the central city and 43 percent lived in suburban areas. By 2000, 80 percent of the total U.S. population lived in metropolitan areas, but only 38 percent of those people lived in the central city.

Many of the older cities reached their population peaks in 1950 or 1960 and have shrunk considerably since then. For example, the population of Baltimore was 31 percent smaller in 2000 than it was in 1950. Other major cities in the East and Midwest also had significant declines: Cleveland, 46 percent; Boston, 26 percent; Chicago, 20 percent; Detroit, 49 percent; and Philadelphia, 27 percent. New York City, the largest city in the United States, is an exception in that its population has increased slightly over this time. The demographic characteristics of the central city populations also changed significantly during this time. The large numbers of residents who left the city were disproportionately white, middle and upper classes.

The growth of suburban developments tends to draw middle- and upper-income residents because only they can afford the housing in these areas. Many of the suburbs adopt zoning regulations that prevent the construction of low-cost housing, particularly multifamily housing. At the same time, African Americans continued their migration from the rural South to the cities of the North and Midwest. By 2000 African Americans had become the majority of city residents in Baltimore, Detroit, Newark, and Gary (Indiana) and over one third of the population in Philadelphia, Washington, D.C., Cleveland, Chicago, and numerous other cities.

Along with the decline of residents, older cities also experienced significant job losses. There has been a major decline in the basic manufacturing industries, including steel and automobiles, which dominated the local economies of these cities. These industries, which offered thousands of well-paid jobs to city residents, underwent major transformations due to changes in technology and the expanding global economy. Since the 1970s, New York City, Chicago, Philadelphia, Detroit, Cleveland, and Baltimore all lost more than 70 percent of their manufacturing jobs. Although the economy also created new jobs, in most of these cities, the transformation to a service economy did not replace the number of jobs or the pay of these manufacturing positions. This is due to at least two factors: the location of the new jobs and the skill requirements for the service jobs. Many businesses that were formerly located in the central city relocated to the suburban communities. Most new businesses, including offices and retail stores, were established in the suburban fringe. Many of the service jobs that remained or were created in the central city require advanced skills, training, and education, which many of the city residents do not possess. This is referred to as a “spatial mismatch.” While unemployment rates vary across areas and time periods, urban unemployment rates are generally higher than suburban rates. For example, the unemployment rate for large cities in the United States in 2000 was 35 percent higher than that of their suburbs. Without jobs that pay good wages, urban residents experience much higher poverty rates than do suburban dwellers. While the ratio of urban-to-suburban poverty rates varies over time, in 2000 the poverty rate in central cities was more than double the rate in suburban areas.
The loss of population and jobs has significant consequences on cities. The tax base of central cities declines as people and jobs leave. Revenue from both property taxes and income taxes drops for central city governments. This lessens the ability of the city government to serve the needs of the remaining residents and to develop strategies to reverse the processes of urban decline. Economic problems and the struggle to address human needs affect the overall quality of life in urban areas. School systems that rely heavily on local taxes in trying to maintain quality educational programs and staff for their students face serious shortfalls. While crime rates in many cities have declined in recent years, the likelihood of being a victim of crime is still 37 percent higher for city residents than for suburban residents. The older housing stock of the central cities requires more upkeep and repair than does the newer suburban housing.

Numerous efforts have been, and are being, made at several levels to rejuvenate central cities. These range from efforts of the federal government to the efforts of local grassroots groups. As early as the 1950s, the federal government sponsored urban renewal programs that cleared away slums and blighted areas of central cities. In the 1960s, federal efforts turned to promoting economic development through support for downtown office buildings; hotel, convention, and tourist enterprises; and upscale housing units. Many state governments seek to improve job opportunities in urban areas by enacting legislation relating to urban enterprise zones. These programs offer grants and tax incentives to private businesses that locate in certain areas. The federal government endorsed and expanded this concept in the 1990s with its empowerment zones. This program encouraged local communities to develop plans to focus on not only job creation but also better coordination of social services and educational programs. Local governments, strained by the lack of resources, seek to develop plans that are consistent with federal and state priorities. They also seek to recruit new businesses to their communities by offering whatever limited resources are available to them. Other cities have adopted living wage ordinances tied to the actual cost of living in that city as opposed to the federal minimum wage. Other cities require companies receiving government contracts or any kind of city support to hire a certain number or percentage of city residents. Finally, nongovernmental organizations are also involved in city rejuvenation efforts. Community and neighborhood development corporations are local groups that seek to address community needs. Community development corporations (CDCs) are typically not-for-profit organizations that try to raise capital and outside assistance to provide for a range of activities and programs. CDCs are locally controlled organizations that may draw resources from foundations, hospitals, universities, and other private and public institutions. They are frequently involved in establishing home construction and rehabilitation programs, credit unions to offer low-interest loans to neighborhood residents, job training programs for residents, and other educational and social programs. Many local groups also form neighborhood associations that most often focus on the specific needs of their particular communities that may include housing, crime, or youth programs.

Efforts to address urban decline are constrained by the inability of the various actors and groups to control the factors that precipitate the decline. The transformation of the global economy continues to be a primary source of many urban problems. Many cities that were in decline in the 1960s and 1970s continue to show signs of distress. Yet, many cities have marshaled their local resources and assets to adapt to the broader social forces to bring about some successes. In cities across the United States, there are numerous success stories of both downtown and neighborhood revitalization.

Urban Infrastructure

Urban infrastructure is a broad term used to describe the civil engineering, architectural, and urban-planning projects undertaken in cities to provide inhabitants with the structures that are necessary for sustainable life. These interconnected structures
provide the framework to sustain an entire urban area. They include transportation and communications systems; educational and health facilities; water, gas, and electrical supplies; waste removal; and diverse systems such as prisons, asylums, housing structures, and additional urban undertakings. Poor urban infrastructure directly affects city inhabitants and often contributes to distressing societal problems. Further, urban growth without the proper infrastructure in place results in countless social problems.

Social science literature focusing specifically on urban infrastructure is sparse but growing. The term infrastructure originated in France during the 1800s and was later used in the United States in reference to military facilities. By the 1920s infrastructure described public works required for an industrial economy. The term gained popularity in the mid-1970s and emerged as an area of academic interest during the 1980s, after works such as America in Ruins of 1983 and Rebuilding America’s Infrastructure of 1984 sparked public-policy discussions about America’s decaying urban infrastructure.

Today, more than half the world’s population lives in rapidly growing cities. The UN Population Division forecasts that by 2025 more than two thirds of humanity will reside in urban areas. About 90 percent of this population boom is largely the result of the rural-to-urban migration and high birth rates in developing countries. Most of these urban areas cannot keep pace with population growth. City budgets are inadequate to expand the needed infrastructure, and consequently the majority of world poverty has also shifted from the country to the city.

Many of society’s most pressing issues are now in urban areas. However, because the means available for building and financing housing and urban infrastructure in many cities are too limited to meet basic needs, more than 1 billion people worldwide live in urban slums. Most slum dwellers have neither sufficient nor consistent access to the basic infrastructures and services, creating the potential for disillusionment and hopelessness among slum dwellers, especially youth. Urban slums risk becoming spaces void of influence when neglected by governments. Increasingly filling these power vacuums are organized gangs and other criminal/terrorist factions that dominate daily life within these impoverished communities.

Water and sewage are also urgent infrastructural concerns. Forty percent of urban dwellers worldwide have no access to safe drinking water or adequate sanitation, and the proportion increases to over 50 percent when considering only developing countries. In Brazil, 51 percent of city residents have no connection to sewerage networks and 90 percent of the sewage collected receives no treatment whatsoever. Similarly, in Shanghai, China, 86 percent of household waste goes untreated. In these two cities, and hundreds more globally, human waste ends up in oceans, rivers, and lakes, severely harming the natural environment and increasing human health risks. Not surprisingly, water-related diseases kill hundreds of thousands every year.

Transportation is another pivotal concern for today’s cities. Many roads in and around poor cities are dangerous, particularly at night. Large cities often lack properly maintained roads with sufficient lighting. Busy roads are usually too narrow and only serve one lane of traffic in each direction. To pass slow-moving vehicles, drivers often must enter oncoming lanes of traffic. This inevitably leads to soaring traffic congestion and high rates of serious and often fatal traffic accidents. This is evident in Brazil, plagued by one of the world’s highest vehicle mortality rates. Transportation infrastructure is also a challenging issue for rich cities. Frequently, financing of enormous superhighways for private motor vehicle transit rather than for efficient means of public transportation leads to traffic congestion, air pollution, and road rage, among other problems.

Until recently, funding for urban infrastructure was through the public or private sector. Now, a growing “third sector” of civil society—that is, public-private partnerships—increasingly shares the costs and risks involved in such funding. However, this financing can be a contentious topic. For example, some suggest that powerful international institutions, governments of rich countries, and multinational corporations have disproportionate influence on local level urban infrastructure projects and priorities in developing countries.

Cities in wealthy countries are not without their share of challenges. In prosperous urban areas when infrastructure projects are not planned well, the poor often suffer the consequences. Robert Moses, New York’s master builder during the mid-20th century, was criticized for developing infrastructure projects that were careless and intentionally discriminatory. For example, on the highways leading to middle-class beaches he designed overpasses too low for public buses to pass underneath. This blocked working-class bus riders’ access to the beaches. Critics also blame Moses for contributing to urban decay by tearing down housing and separating large swaths of neighborhoods with large highways.
Many social and environment problems can be avoided if urban infrastructure projects are properly implemented and nondiscriminatory. Good infrastructure often provides the framework for positive and sustainable economic growth in urban areas. The problems of urban infrastructure are very complex, however, and directly linked to larger processes of urbanization, globalization, and the global economy.

Urbanization

Urbanization is the process by which a large number of people over time become concentrated in cities. However, cities, as permanent settlements where heterogeneous groups of people live, have existed since time immemorial. The existence of cities is extensively interrelated to the expansion of an efficient agricultural system and technology that makes possible surplus products beyond the immediate requirements of survival. This condition, together with the existence of complex social organization and favorable geographical environment, plays a critical role in the continued existence of cities. Yet due to, among other things, inadequate technology and agricultural and transportation systems, premodern cities were relatively undersized and few in number compared to modern cities. Hence, the true development of urbanization is a recent phenomenon. Just 200 years ago, the number of people living in urban areas throughout the world was under 4 percent. Currently, that number is 47 percent; soon it will hit the 50 percent mark. By the year 2025, demographers predict that two thirds of the world’s population will live in metropolitan areas.

Modern Urbanism and Beyond

The industrial revolution made a marked difference in the development of modern cities. The revolution played an important role in drawing people to cities, where diverse nonagricultural occupations were available. Most importantly, however, the industrial revolution laid the infrastructural basis for the expansion of communication between distant areas and the transportation of people and resources from one place to another. Hence, preindustrial cities and modern cities were dissimilar from one another not only quantitatively but also qualitatively. Economically modern cities allowed elaborate specialization together with an open system in which achievement rather than ascription played an important role in social mobility. Politically, modern cities became social spaces wherein the notion of citizenship, replacing premodern subjecthood, found full-fledged expression. Culturally, modern cities not only served as centers of cultural intermixing but acted as places wherein diverse subcultures flourished. These processes allowed modern cities to grow exponentially. Some modern cities evolved into metropolises, central cities surrounded by towns and suburban areas with relatively integrated economies. Sometimes continued urbanization created a megalopolis, a continuous stretch of urban area forming a cluster of metropolises, such as from Boston to Washington, D.C.

Modern cities are also distinct from their premodern counterparts because of a unique form of social behavior that emerged within them. Urban sociologist Louis Wirth designated this emergent behavior as urbanism, a distinctive way of life eventuated by the social patterns of modernity. Because urbanites are
exposed to an increasing social differentiation of the urban environment, they tend to be anonymous, superficial, and selectively sensitive to social matters while at the same time exhibiting strong ties with their primary groups. Before Wirth, Georg Simmel also remarked on the inimitable features of the urbanite. Unlike some modern social thinkers who lamented the disappearance of community life, Simmel underscored the positive dimensions of the urban experience without glossing over its problems. In place of excessive parochialism and surveillance characteristics of the traditional way of life a good deal of freedom is provided by urban centers to urban dwellers. Anticipating David Harvey’s notion of “time-space compression,” Simmel was able to describe the intense feeling that urbanites experience. According to Simmel, to the extent that they develop a unique attitude that protects them from the overstimulations of urban life, urbanites experience an intense crash of people and events hitherto unimagined. In their blasé attitude, an indifference to manifold but selective situations, urbanites might sound cold and calculating. Yet, the blasé mind-set is nothing but a survival mechanism through which urbanites focus on what is indispensable to the process of coping with the encounters of city life.

Recently social scientists extended the process of overstimulation that takes place in urban settings to its ultimate conclusion that a new type of self, the postmodern self, has emerged as a result. Postmodernists assert that this new self is markedly different from the selves that preceded it. Unlike the romantic and the modern selves—whose fundamental nature centered on passion and reason, respectively—the postmodern self, despite the residues that it inherited from the past, lacks essence and is decentered. To the extent that the self is at the verge of dissolution, social structures have lost their constraining impact on the individual. However, the self has not disappeared; it has become relational instead, augmented by the opportunity for social connectedness. The proximate cause of this development is technological. In a postindustrial age in which communication technologies dominate, the self is constantly bombarded by signs, images, and varied experiences that knock at its door with no end in sight. Consequently, individuals have a hard time committing themselves to a single master identity. With social saturation undermining “coherent circles of accord,” as Kenneth J. Gergen calls them in The Saturated Self, individuals have no option but to be skeptical of prevailing viewpoints. Ironically, according to some analysts, the process of social saturation—far from enfeebling communalism—reinforces amicable relationships among members of society.

**Urbanization and Social Problems**

Despite cities acting as platforms for the notable accomplishments of modernity, urbanization’s picture is not all rosy. Urban centers are plagued by many social problems. These problems are most vivid in the developing world, where millions of people are concentrated in few cities. Unprecedented urban growth in these countries is caused by natural population increase and the migration of people from rural to urban areas. In the developing world, more than 70 percent of the urban population lives in poverty; yet rural residents flock to metropolitan areas, attempting to flee from the pulverizing impact of poverty in their own areas. The migration is also, in part, the function of an uneven policy of development that buttresses urban growth at the expense of the agricultural sector. As a result, cities in the developing world must deal with daunting social problems that become increasingly difficult to overcome. Most of these problems are associated with employment, pollution, and housing, just to mention a few. Due to the availability of “surplus labor,” many people in the cities of the developing world are not only unemployed but underemployed and “misemployed” (engaged in undignified activities such as prostitution) as well.

Where attempts to resolve the problems of urban unemployment take place, the result has been the unintended consequences of industrialization and urbanization, with pollution the most salient one. Cities of the developing world are noisier and more polluted than cities of the developed world. Despite the fact that quality of life in urban areas has qualitatively improved compared with quality of life in rural areas, inadequate housing is one of the chronic problems in developing world cities. More than 75 percent of the urban population in these cities lives in overcrowded slums, squatter settlements, and shantytowns where life is extremely precarious. Consequently, as the problem of cities of the developing world is the presence of too many problems without the accompanying social means of prevailing over them, many social scientists fear that the breakdown of urban giants of the developing world may take place unless a social miracle of sorts comes to pass.
In spite of the colossal number of resources at their disposal, highly industrialized nations have not spared themselves from urban problems either. Although the types of chronic problems that Friedrich Engels described in his ethnographic work on Manchester do not exist today, cities of the highly industrialized nations still suffer from “old” (poverty, violence) and “new” (pollution, traffic congestion) social problems. In the United States, for instance, poverty—mainly caused by the loss of manufacturing jobs due to globalization processes, the migration of white-collar corporations and manufacturing firms to the suburbs, and the retraction of investment from inner cities—is one of the “old” problems that afflict urban dwellers, especially inhabitants of the inner city, a significant number of whom fall under the social category of the underclass. Members of the underclass are not just at the bottom of social hierarchy, but they are beneath the class structure. Consisting of single mothers on welfare, teenagers, and the homeless, the underclass have virtually no social and economic capital and are trapped in a cycle of poverty from which they are incapable of escaping.

Urban Renewal

In theory, urban renewal is any effort to direct city planning toward the improvement of the physical infrastructure. In practice, in the United States it has often meant the seizing of “blighted” property by the federal government and its redevelopment by private enterprise, underwritten by federal grants or loans. Many of the largest public works that shape urban landscapes are urban renewal initiatives, including expressways, bridges, parks, stadiums, and housing projects. While urban renewal promised better low-income housing and citywide improvements to slow “white flight” to the suburbs, its execution remains controversial. Critics charge that renewal projects further marginalize the poor and minorities and destroy communities while subsidizing facilities for the upper classes. Public housing projects—a keystone of urban renewal—are today almost universally seen as a failure and are being torn down. Their destruction symbolizes changes in approach to urban renewal, where structural rehabilitation and selective demolition are now favored over wholesale “slum clearance.”

The Early Stages
By the mid-1800s many Western cities that expanded rapidly during the industrial revolution were replete with dilapidated and dangerous buildings. Entire neighborhoods had become slums, with overcrowded and deteriorating homes lacking basic facilities such as plumbing. These predominantly immigrant and minority areas were epicenters of crime and delinquency. Narrow streets made garbage collection difficult and were a fire hazard. In the first modern instance of what would later be called “slum clearance,” between the 1850s and 1870s, Baron Haussmann destroyed many poor neighborhoods in Paris and replaced them with wide boulevards, parks, plazas, and new houses. He also installed sewage systems, streetlights, and other modern amenities.

In late 19th-century America, social reformers like Jacob Riis argued that the immorality of slum inhabitants resulted from the physical degradation of their environment. Thus, reformers promoted improved living conditions and the creation of settlement houses, which would act as the social and recreational center of a neighborhood and provide social services. Riis argued that such improvements would compel slum dwellers to become responsible citizens. Although some settlements and housing laws were initiated as a result, a 1929 government survey of 64 cities found that 15.6 percent of all dwellings needed major structural repairs and only 37.7 percent were in “good” condition. By the time of Franklin D. Roosevelt’s depression-era presidential inauguration, conditions
had worsened. Roosevelt declared that one third of the nation lacked proper nourishment, clothing, and housing. His establishment of the Federal Housing Authority marked the nation’s first foray into government-sponsored slum clearance and low-rent public housing.

The Housing Act of 1949 allocated federal loans and grants for slum clearance and redevelopment; utilizing a wide interpretation of “public interest,” the government authorized property seizure for private redevelopment under eminent domain. Often, the land was resold to developers who constructed higher-priced housing. The money designated for finding satisfactory housing for those evicted was minimal, with the frequent result that slum dwellers were merely relocated to other slums. Additionally, slum-razing left a dearth of low-rent units, instigating a housing crisis for the poor.

Projects

In an effort to eradicate slums, the government embarked on a massive program to construct public housing projects for the poor across urban America. A low-income ceiling was enforced for admission; those with a higher income were refused or evicted. These “projects,” usually placed in depressed areas where private developers were unwilling to invest, concentrated large numbers of buildings and people in a “superblock” that disrupted the street grid. This application of Le Corbusier’s modernist “garden city” plan resulted in giant concrete and brick towers placed on large tracts of land left otherwise undeveloped ostensibly to provide open space for recreation. One of the biggest such projects was Chicago’s Robert Taylor Homes. Completed in 1962, the complex contained 27,000 people in 28 high-rise buildings that collectively occupied only 7 percent of the land. Projects funneled some of the city’s poorest residents—usually minorities—into buildings that were often surrounded by ghettoes, barren land, or highways.

Large-Scale Urban Renewal

The scope of urban renewal projects reached its broadest during the era of Robert Moses in New York City. From the 1930s to the 1960s, Moses—as the city park commissioner, construction coordinator, and planning commissioner—seized on the opportunities made possible by the Housing Act of 1949 more than any other entity in the country, spending twice as much federal money as all other U.S. cities combined in 1957. Every expressway in New York but one was built by Moses, in addition to seven major bridges, 416 miles of parkways, venues such as the Lincoln Center and Shea Stadium, and large-scale middle-income housing developments like Stuyvesant Town. He increased the number of playgrounds from 119 to 777 and also developed a network of state parks. By 1968 the total cost of urban renewal projects personally conceived and executed by Moses had reached $27 billion.

The Human Toll

Moses’s projects required slum clearance on an unprecedented scale, including the eviction of 500,000 people and the erasure of dozens of neighborhoods. As is the case around the country, many of the evicted were minorities, and the new housing was beyond their means. Thus the benefits of such projects went disproportionately to nonpoor whites, while institutionalized discrimination practically forced minorities and the poor into other slums or, increasingly, into projects.

One infamous slum clearance was the leveling of Boston’s West End in 1959–60, which evicted over 20,000 poor residents. Hoping to revitalize downtown, luxury apartments were built, along with a shopping center and a new government complex. Few resources were provided for those displaced by the bulldozer. In the razing of the West End, critics saw the destruction not only of homes but also of a social system that left psychological scars and grief reactions for years after displacement. Many West Enders landed in areas later slated for slum clearance, the majority wound up paying significantly more rent for their new dwellings, and the community dissolved as its members were dispersed throughout the city.

Public housing, saddled with the most disadvantaged Americans, isolated from white and middle-class areas of the city, and faced with constant funding cuts that ran especially deep during the Reagan era, was in crisis. Within only a few decades of their construction, most projects were over-run with crime and gang violence and were in such disrepair that they were deemed dangerous and even uninhabitable. Those living in projects seemed doomed to an environment of fear and despair, and activists argued that public housing was never given a chance to succeed, as it was given low priority and little funding.
Resistance and the End of an Era

Jane Jacobs spearheaded opposition to a downtown highway proposed by Moses in the 1960s and put forth her philosophical justification in *The Death and Life of Great American Cities*. Jacobs and others contended that the “towers in the sky” and “superblocks,” so central to urban renewal, destroy the social fabric and vitality of the city and thus are designed to fail. Increased protests against such public works, and the race riots and civil rights protests of the 1960–70s that were partially a reaction to segregation and slum clearance, forced the government to rethink urban renewal.

In 1995 the Chicago Housing Authority declared that the Robert Taylor Homes were uninhabitable and would be demolished. Across the United States, the towers that once symbolized hope and a promise to the underprivileged were now seen as failures and eyesores, and most cities began rapidly pulling them down. As cities relocated those displaced from the projects and the federal government contemplated a new approach for housing the poor, there evolved a near-consensus that large-scale, concentrated housing projects should never be built again. Many in Boston lament the vibrant West End that was lost, and city planners seem to have learned from failed experiments with large-scale slum clearance and public housing projects to focus instead on redevelopment and rehabilitation, selective demolition, and vouchers to subsidize the relocation of the poor to middle-class areas.

Many recent urban renewal schemes focus on commercial development and sports arenas. Baltimore’s downtown baseball stadium—built over a railyard in 1992—is credited with revitalizing the area. Other cities have scrambled to construct downtown arenas, often couching them in larger mixed-use projects that broaden their appeal. One of the most ambitious examples is Brooklyn’s proposed Atlantic Yards. The $3.5 billion plan calls for building a basketball arena, yet it also includes affordable and market-rate housing, a park, hotel, retail shops, and office buildings. As with urban renewal in decades past, the project’s backers argue that it will revitalize a downtrodden area, while opponents claim thousands of lives will be destroyed by the bulldozer. The rebuilding of New Orleans after Hurricane Katrina in 2005 is also testing the government’s commitment to more equitable urban renewal, as debates rage over what to do with the many displaced poor black residents and whether to rebuild their lost neighborhoods.

Urban Sprawl

In the early 21st century, urban sprawl continues to be a source of considerable controversy and political debate, yet many Americans quietly accept sprawl. They express their acceptance by moving farther away from central cities into housing and business developments on land that was formerly rural and undeveloped. While a significant number of suburban communities have existed in the United States since the late 19th century, the greatest growth in suburbs occurred after World War II. At the dawn of the 20th century, the suburban population represented less than 12 percent of the total U.S. population. By 1950, that figure doubled, and it doubled again by 2000, so that 52 percent lived in suburban communities. While the U.S. Census does not officially define *suburban area*, the term generally refers to the territory within metropolitan areas that is outside of the central city.

The term *sprawl* refers to a pattern of metropolitan growth characterized by low-density, primarily single-family residential development, low-density commercial and employment establishments, and the resulting heavy dependence on the automobile for travel. These developments occur on the periphery of the metropolitan area. In the early 20th century, many affluent and middle-class families moved out to the
suburbs deliberately to escape the large and dense city populations. Following the Great Depression and World War II, several U.S. government programs further encouraged and facilitated this exodus. These included the Federal Housing Administration and the Veterans Administration GI Bill, which provided low-cost mortgages for more than 11 million new single-family homes. With many central cities already developed and thus with little land available for large, new housing developments, most new construction occurred in suburban areas. Strongly supported by the automobile industry, the federal government also established the Interstate Highway System in 1956. The federal government paid up to 90 percent of the cost of the new highway system, which resulted in over 40,000 miles of new highways. The highways enabled people to travel more easily, including traveling from suburban homes to jobs in the city. The growing economy and more widespread prosperity of the period provided more Americans with the means to purchase their homes and automobiles. Retail businesses followed the populations to the new areas, and by the 1970s, many corporations were closing their city offices to move to business parks in the suburbs.

The sprawl phenomenon continued as most metropolitan areas expanded their land areas at rates that far surpassed their population increases. Between 1982 and 1997, the amount of urbanized land in the United States increased by 47 percent while the nation’s population increased by only 17 percent. The population density of metropolitan areas, which is one quantitative measure of sprawl, declined by 15.7 percent during the same period. Sprawl generates several problems, including environmental damage, cost inefficiency, quality-of-life changes, city decline, and economic and racial segregation.

Sprawl significantly affects the natural environment, each year claiming more than 2 million additional acres of land for development. Over half of this land is farmland, with the rest divided between forests and other undeveloped land. The loss of this land disrupts small town and family farming operations, threatens wetlands that protect residents from damaging floods, and threatens wildlife by destroying their natural habitats.

The automobile makes sprawl possible, and in turn, sprawl makes us increasingly dependent on the automobile to get to work, school, stores, and other numerous destinations. The low-density developments make walking or public transportation inefficient methods of transit. Between 1980 and 2003, an 11 percent increase in the number of private and commercial automobiles occurred, as well as a 187 percent increase in private and commercial trucks registered in the United States. Between 1970 and 2003, there was a 22 percent increase in the average number of miles traveled each year by each of those automobiles and a 100 percent increase in annual miles per truck.

Despite efforts to make automobiles more energy efficient and to use cleaner, less polluting gasoline, the increased use of motor vehicles reduces the benefits of these efforts. Motor vehicles are a major source of air pollution, particularly in the sprawling metropolitan communities. They account for most of the carbon monoxide and many of the hydrocarbons and nitrogen oxides in major urban areas. These pollutants have serious effects on human health. Among the diseases known to be related to motor vehicle pollution are asthma, bronchitis, upper respiratory tract infections, and various types of cancer. Automobiles and light trucks are responsible for about 20 percent of the nation’s carbon dioxide emissions, the gas that causes global warming.

The dependency on the automobile also affects people’s quality of life. The length of time that people must travel to get to work has increased from 22 minutes in 1980 to 25 minutes in 2000. This increase adds 25 hours a year to the average commuter’s travel time, raising the total time spent commuting to about 208 hours per year. Because other services, including schools, shopping, and recreational centers, tend to be more spread out in sprawl communities, families spend more time in cars than do families in more densely developed areas. The increased use of the automobile leads to further traffic congestion, which exacerbates environmental damage.

Considerable research documents the increased cost of service in sprawled communities. When sprawl occurs, new schools, roads, water and sewer lines, and other physical infrastructure must be added. The sprawling communities must add police, fire, and other personnel to provide the necessary services. The distance between developments in these communities makes providing these services more costly than in higher density areas. While the private developers of these new areas frequently pay a fee to cover some of these new expenses, the fees do not cover the full costs of the projects. Residents in the new areas, both the new and long-term residents, frequently experience...
significant tax increases to cover these costs. Because much of the infrastructural support is paid by state and federal agencies, taxpayers outside the area also support these sprawled developments.

It is ironic that city residents are among those who pay state and federal taxes that support the development of sprawling communities. As cities lose residents to the new communities, the cities are left with a smaller tax base. The vitality of downtown areas is diminished as cities lose their population and jobs as well as their retail, entertainment, and corporate presence to the new suburbs and their malls and office parks. Houses and buildings in the city are abandoned and public services decline.

Cities are also harmed by sprawl because those who move from the city to these new developments tend to be from upper- and middle-class households. City residents who are left behind are disproportionately poor and minority. Thus, cities are left to serve needier populations with less revenue than in earlier decades when they had more revenues and wealthier populations. The degree of economic segregation has increased because the sprawling communities tend to offer housing that is accessible only to wealthier households. The economic segregation is now reinforced by the physical separation of the social classes. The withdrawal of the wealthier groups from the city saps the neighborhood and civic groups, churches, community centers, and other cultural, social, and recreational organizations of the social and financial capital that once maintained them.

Broader changes in the economy combine with the phenomenon of sprawl to aggravate the challenges of the inner-city poor. The significant loss of manufacturing jobs in cities after 1960 and the increase of jobs in the higher-end service sector, including the information exchange and high technology areas, have had a dramatic effect on those without higher levels of education. A spatial mismatch developed, such that the less-educated populations live in the less expensive housing of the central city while the growth of lower-end service sector jobs, including retail, restaurants, maintenance, and landscaping that service the middle and upper classes, has occurred in the outer suburbs. Many city residents have difficulty reaching the suburban jobs because they do not own cars and public transportation systems are absent or inadequate.

Across the nation and in particular cities, numerous efforts are under way to address urban sprawl and it related problems. The smart growth movement consists of planners, developers, community and environmental activists, nonprofit groups, and political leaders. The movement encourages a range of development and design patterns, including a mix of land uses, viable public transportation systems, preservation of open space and farmland, the creation of walkable communities and communities with a strong sense of place, greater regional cooperation in planning and revenue sharing, the revitalization of central cities to make them more desirable places to live and work, and policies to ensure that development decisions are fair to all parties and cost-effective.

Urban Underclass

Over the past 2 decades, the urban underclass has become one of the most controversial topics in the social sciences. As a sociological construct, the notion of an underclass can be traced to Marx’s lumpenproletariat, which he identified as occupying the lowest rung of the social hierarchy, beneath the working class. However, journalist Ken Auletta first popularized the term underclass in the early 1980s in writing about criminals, hustlers, and welfare dependents. This modern conceptualization involved two interlocking elements of the underclass: poverty and self-defeating or pathological behavior.

One of the more controversial aspects of the “underclass debate” is whether the existence of this group was a new phenomenon or simply another term to describe the persistently poor. For William Julius
Wilson, the underclass was the ideal way to characterize the emergence of a disenfranchised class of individuals resulting from changing labor market conditions in the late 1970s and early 1980s. According to Wilson, the sociologist who has advanced the clearest articulation of the underclass, U.S. cities experienced an economic transformation characterized by the disappearance of jobs that paid well but required little education (i.e., manufacturing), the division of the economy into high- and low-wage sectors, and the shift from a goods-producing to a service-producing economy. The tenuous position of central-city blacks in the labor market, he argued, made them particularly vulnerable to these changes. The new economy, heavily reliant on technology and information processing, created a “skills mismatch,” whereby poor blacks did not meet the educational criteria for well-paid work. The decentralization of jobs into nonurban areas also generated a “spatial mismatch,” whereby inner-city blacks were further disadvantaged by losing their proximity to jobs.

Moreover, as the black middle class flowed out into the suburbs, they removed an important social buffer that may have lessened the effects of these transformations. Their absence further concentrated the effects of poverty as the ghetto poor became socially isolated, losing the social ties needed to hook them into job networks. Finally, without working role models, a milieu developed in which joblessness prevails and work is no longer a defining feature of life. This environment fosters behavior, such as tardiness or absenteeism, which hinders success in the formal economy, making the underground economy a more attractive alternative for many inner-city men of color. In this way, the concentrated disadvantage that characterizes poor black and Hispanic neighborhoods tends to reinforce pathological behavior.

A secondary concern of Wilson’s work addressed changes to family structure that grew out of these economic shifts, particularly a dramatic increase in female-headed families and the related tendency of the ghetto poor not to marry. For example, between 1960 and 1980, marriage rates among black women ages 14 to 24 declined by half (26 percent to 13 percent), and among those ages 25 to 44 it declined from 65 percent to 45 percent. Wilson attributed these changes to the labor market, arguing that the marriageable pool of employed black men had shrunk. In sum, Wilson’s conceptualization of the underclass is primarily structural, but one that contains a cultural component. Joblessness is the key to understanding urban poverty, but he also seeks to explain ghetto-specific behavior that reinforces poverty. His treatment of the topic re-appropriated both culture and family as legitimate avenues of theory and research by liberal scholars.

Wilson’s work spurred a tremendous volume of literature documenting the size and cultural features of the underclass, including the work of his former student, Elijah Anderson. Over time, however, the meaning of the concept became more diffuse and so conflated with race that black and underclass were often used interchangeably. Wilson and others were criticized for perpetuating an image of poor blacks as a monolithic group completely cut off from mainstream society. Liberals quickly critiqued the cultural aspect of Wilson’s argument as victim-blaming and reacted harshly to his assertion that, for the first time, class more than race structured the life chances of inner-city blacks. In 1991, Wilson abandoned the use of the term underclass in favor of ghetto poor, largely because the concept had lost its meaning in the political debate surrounding it.

From the 1990s onward, the labor market continued its transformation. Jobs continued to move out of cities and increasingly relocated to other countries where labor was a fraction of the cost. Advanced technology widened the gap between unskilled laborers and available jobs. Immigration patterns present a new challenge for the urban poor who are seeking work, as employers who employ racial stereotypes often prefer undocumented workers who work for lower wages. Ultimately, greater numbers of people are failing to make an effective adjustment to these transitions. U.S. society is increasingly moving toward two societies marked by dramatic cleavages in wealth. As the middle class shrinks, urban areas experience a polarization of the upper class and the ghetto poor, who have limited human and social capital. Crime and violence, drug use, and other social problems are the outgrowth of their inability to find a place in the new global economy.

This new ghetto poverty is particularly structural, and it is increasingly difficult to blame the group most affected for its plight. As the weakest element of the social structure, poor black and Hispanic men are disproportionately marginalized. With few economic resources to effectively sustain relationships with women and establish stable roles as husbands and fathers, the gap between women and men of color
continues to grow. Black women’s labor market participation, educational attainment, and earnings have begun to outpace those of their male counterparts, deepening already profound changes in family formation patterns. Moreover, while the system has received former welfare recipients and the elderly through universal anti-poverty policies and welfare-to-work programs, the prison-industrial complex is the primary institution addressing the problems of poor men of color. As incarceration rates continue to skyrocket, more find themselves separated from the labor market, alienated from mainstream institutions, and among the growing ranks of the ghetto poor. In the tradition of Marx, Weber, and Durkheim, who struggled with the lasting significance of industrialization, today’s students of social problems must now address deindustrialization and globalization, uncovering the configuration of social classes in this new social order.

VALUES

Values are constructs that guide human behavior, helping people distinguish between the desirable and undesirable. On the individual level, they are conceptions that motivate personal action. On the aggregate level, they reflect collective experience and provide general orientation to a society. Values have emotional connotations. We feel when something is unacceptable and undesirable even when we don’t know what is wrong with a situation. Values cannot be simply empty axioms. To have directive force, they must be embodied in concrete individual and social practice. We can talk of “family values,” but these are meaningless unless actualized in living experience. Researchers cannot observe values, but they can study their behavioral impact.

Virtually all disciplines concerning human affairs use and propose definitions for values because evaluative standards are fundamental to human existence. Homo sapiens are evaluative animals that exhibit few innate, invariant, complex behavioral patterns. Our species has a very open biogram (the biological substrate that supports/sustains our humanity; i.e., what is essentially shared by all humans) and is able to override basic biological predispositions and capacities. We may be predisposed to eat, reproduce, and protect our lives, activities that make perfect sense from an evolutionary angle, but we can also choose to starve ourselves, not procreate, and seek martyrdom. Equally important, our words or deeds have arbitrary and multiple significances because the human brain supports symbolic thought and action. Symbols allow us to refer to the nonimmediate and nonexistent and to propose imaginary scenarios. Biology thus predisposes us to make judgments of what is, what could be, and what ought to be in the realms of both ideas and actions. The evaluation and transformation of the conditions of existence is the main adaptive strategy of Homo sapiens.

Social scientists have debated extensively the nature of value systems and what value systems contribute to individuals and societies. Because all human societies hold standards concerning what is acceptable, good, and desirable, many have postulated functional explanations that emphasize behavioral or mental aspects. Those favoring the phenomenal (behavioral) viewpoint tend to focus on the problems of choice. Values reduce the ambivalence of choice by suggesting preferred states of affairs. When individuals confront decision-making situations, preferential standards limit the possibilities for action, reduce the cognitive load created by diverse alternatives, and possibly make the individuals more efficient actors. For example, if a woman feels that honesty is important, she will be less hesitant to report there is some uncharged item left in the shopping cart. If honesty is not an issue, the decision-making process will be more prolonged and complex. Values can reduce the burden of choice frequently experienced in ordinary living.

Values can also promote a general collective order by increasing behavioral predictability. Human plasticity at the ideational and phenomenal levels can create chaos on the organizational plane. When individuals share few fixed patterns of action, their coordination potential diminishes substantially. Values motivate individuals to choose certain options over
others and to pursue the most acceptable path in a particular context. Furthermore, they offer standards by which to judge the actions of others and provoke sanctions that help induce conformity and promote order. The best way to understand the relevance of a value is to observe closely its transgressions and their corresponding responses.

Researchers stressing the functions of values from the mental viewpoint implicitly focus on the elusive quality of symbols. Our symbolic capacity creates a chasm between self and other: We cannot know what others are doing until we know what others are thinking. Values help bridge the gap between “what is” and “what could be” by fostering shared sentiments and postulating “what ought to be” in a situation. Common standards of preference and appreciation help uphold reciprocal expectations and reduce the ambivalence of significance that characterizes human relations. For example, if one accepts aid from a stranger, it is because one feels goodness in the situation and believes there is mutual understanding and coincidence of expectations. Values help forge and lubricate the bonds of trust required to establish enduring interpersonal relations.

Because societies display a certain level of coherence in the arena of values, researchers occasionally use the terms value system and value orientation. Values tend to appear in association, possibly in configurations that involve ranking orders. Some values seem to prevail over others and permeate most aspects of social life (core values); others seem to relate to specific domains of activity (focal values) or have idiosyncratic roots and private influence (personal values). In the United States, for example, regard for individual rights pervades nearly every facet of life (core value); the appropriateness of competitive achievement, however, may be questioned in the family context (focal value). Notwithstanding postulated rankings, it is crucial to remember that values must be linked to contexts of practice and that values guide us even when we are unable to perceive them or articulate them (implicit values).

When scholars draw attention to the functions of values, they overlook myriad problems associated with values and value-oriented research. Values may reduce ambivalence of choice and significance and promote collective order, but they also amplify differences between groups. Humans learn to understand and respond according to the preferential standards shared by members of their group; they acquire values transmitted and enacted in their socialization contexts.

Variations in preferential standards create opportunities for misunderstanding and conflict. When we visit an exotic culture, for example, we are likely to experience disorientation and discomfort. And when unfamiliar groups come in contact, dominant groups are likely to impose their values on subordinates. Whereas some disciplines lay emphasis on absolute, panhuman (universal) standards, others stress the diversity of evaluative patterns and obstacles to cross-cultural analyses. To compare, we must de-contextualize values and disregard the patterning of different value systems. Equally important, we must assume that the mental constructs, relations, and activities of distinct systems of values have identical significance.

Albeit apparent integrative functions, value systems are not perfectly congruent or coherent. Standards of preference may come into conflict in particular contexts. When values clash in actual instances, individuals tend to invoke core values to justify their claims and to challenge opposing views. Although these moral axioms permeate all domains of activity, they never eliminate the possibility of disagreements. For example, if a man robs a woman to secure better comfort, few Americans would hesitate to condemn his action because respect for others stands above personal satisfaction. If, on the other hand, a career-oriented woman decides to end an early pregnancy, the verdict would be less conclusive because the rights of the fetus and the woman stand in direct opposition. Coercive measures might be used to settle conflicts when core values cannot be reconciled.

Standards of preference may be enduring, but they are not eternal. Values and value orientations change as cultures change, with transformations in social productions and the conditions of living. All values, however, do not change at the same rate, and values cannot be imported from another social system. The Japanese strongly prefer teamwork, yet Americans who recognize its utility face colossal difficulties to promote such views and ways. Because systems of values (like cultures) are generally integrated and coherent and intimately linked to action, societies resist value change. Those who attempt to import or export values ignore a fundamental human reality: Values must be embodied and enacted through lived experience; they cannot exist apart from contexts of action even though they are easily articulated as ideals or ideologies.

In the domain of values, doing is as important as, or possibly more important than, verbalizing standards. Thanks to our symbolic capacity and behavioral flexibility, we can easily become masters of deceit. We can
say what we don’t mean and mean what we don’t say. We can fool others into believing what is not, and we can even believe such pretenses ourselves. In *Homo sapiens*, only embodied standards of preference close the gap between word and deed and the chasm between what is, what could be, and what ought to be.

**VANDALISM**

Vandalism is the purposeful defacement or destruction of public or private property without permission. Because it does not usually materially profit the perpetrator or physically harm the victim, it is generally considered to be a crime of anger, alienation, protest, or statement. The term *vandalism* can refer to everything from carving initials in school desks; breaking windows; scrawling threats on churches, synagogues, and mosques; painting graffiti on buildings and subway cars; to overturning tombstones or ruining school or business property. Accordingly, reactions to vandalism vary widely.

Although often connected to today’s cities and to gang territoriality or even computer hacking and the spreading of viruses, vandalism goes back to early civilizations. For example, what is thought to be graffiti can be found on ancient Greek ruins. Throughout the 20th century, opinions on vandalism have ranged from seeing it as art, a hate crime, or inevitable juvenile mischief. Recently, arrest-driven policing policies have caused more police actions against vandalism.

Vandalism is inevitably linked to the concept of private property and the control and ownership over things and spaces. Therefore, some scholars question the validity of vandalism as a crime and focus on the social construction of vandalism as criminality. For example, food riots in England or France in the early modern period often combined with the destruction of private property and the theft of flour or other food. While this may be considered vandalism, it obviously occupies a more complicated emotional and political terrain than other kinds of crime.

Graffiti, in particular, has been subject to as much valorization as concern by scholars. Indeed, many art historians and social scientists alike consider graffiti to be an important conduit of public art. At the same time, others have recognized the pivotal role of destruction of property and hateful language painted on homes and businesses of those integrating neighborhoods or in other ways transgressing racial hierarchies. Thus, a crime like vandalism is very much in the eye of the beholder and varies widely by the type of marking or destruction, the victim, and the message of the vandal.

Since the 1990s, police officers in many U.S. cities have been pressured, through the dictates of zero-tolerance policing, to arrest suspects of vandalism along with other nuisance offenders. Vandal, who at one point may have been sent home (particularly if juvenile) even if police officers caught them in the act, are now more likely to be arrested and thus conceptualized and labeled as criminals. As well, the popularity of zero-tolerance ideas has made it seem that what once may have been seen as an inevitable product of neighborhood use is now seen as a symptom of a neighborhood in disarray.

VEGETARIAN MOVEMENT

The vegetarian movement in the United States and Canada encompasses local, national, and international organizations that promote vegetarian practices and lifestyles. These organizations identify meat as a social problem for a variety of reasons, including threats to personal health, destruction to the environment, and the pain and suffering caused to animals in the factory farming industry. The concerns of the vegetarian movement overlap with those of the environmental and animal rights movements.

Vegetarians are individuals who do not consume any meat, poultry, or seafood; vegans extend these prohibitions to all animal products (including leather, wool, and sometimes honey). Efforts to count the actual number of vegetarians in the United States have been daunting, particularly because many people who identify as vegetarians do not exactly follow the vegetarian definition. For example, some vegetarians might occasionally eat fish or sometimes eat turkey on Thanksgiving. According to a 2003 Harris Poll, about 2.8 percent of the U.S. population does not eat meat, poultry, or seafood. However, due to the statistical margin of error, the actual percentage could be lower or higher.

While it is difficult to determine the actual number of vegetarians, only a small percentage participates in the vegetarian movement by joining and participating in vegetarian organizations. Some join national and international organizations, such as the Vegetarian Resource Group, the North American Vegetarian Society, and the International Vegetarian Union, while others participate in one of the dozens of state and local vegetarian groups. Such groups are found in all major U.S. and Canadian cities, as well as in such smaller cities and towns as El Paso, Texas (the Vegetarian Society of El Paso); Canton, Ohio (the Vegetarian Club of Canton); and Salem, Massachusetts (the Salem Vegan Society).

Local vegetarian groups typically hold meetings that feature potluck vegetarian meals, dine-outs at area restaurants, recipe sharing, and educational speakers; many of these groups center on providing social support to people making the transition to vegetarianism or veganism. Most of the national groups engage in efforts to make the culture more “vegetarian-friendly,” for example, by working with the restaurant and food industries to make more vegetarian options available. Some also work to enact more structural changes, for example, by changing the U.S. guidelines for school lunch programs to increase vegetarian options and by working with nutrition and medical professional organizations to increase public acceptance of vegetarian diets as healthy.

Over the past decade, there has been an increase in the size and visibility of action-oriented groups, such as Vegan Action and Vegan Outreach, which engage in leafleting and other activities to increase awareness of meat as a social and personal problem, particularly among college students.

VICTIMIZATION

The term victimization refers to a process whereby an external force comes in contact with a person, causing that person to feel pain, sometimes causing injury, either of which can be short-lived or which might cause extended suffering and sometimes death. That force can be legal or illegal, natural or human caused, biological or chemical, expected or unexpected, social or individual, civil or uncivil, intended or unintended; the list of possibilities is endless.

Those persons who are the direct recipients of the external force are the primary victims, the ones who suffer first, feel pain the most severely, and are usually injured the worst. Other persons who are related to, or acquainted with, the primary victims and are negatively affected (usually emotionally) are the secondary victims. This group can feel an intense sense of sympathetic suffering in proportion to the severity of the injury and the nature of their relationship to the primary victim. Both primary and secondary victims
can become traumatized by the original victimization and consequently need some degree of psychological treatment to diminish their pain and to recover.

Persons familiar with the original victimization but not related or acquainted to the primary victim (usually neighbors or members of the same community or in the broader social audience) are tertiary victims. They can be influenced emotionally, financially, or socially. These persons can be those who received news of the original victimization via conversations, via the news media, or as witnesses to the event. In some cases even these tertiary victims will become traumatized and will need treatment.

The study of victimization and its victims is part of a relatively new science. A Romanian lawyer, Beniamin Mendelsohn, first coined the word victimology in 1947 and promoted its concept as the science of “victimity,” the study of all victims. He referred to his concept as “general victimology” to distinguish it from “crime victimology,” which is concerned only with crime victimization. He also proposed the establishment of a society of general victimology, the establishment of victimological research institutes, victim departments in all national governments, a journal of general victimology, the creation of victim clinics, and national societies in each country.

All of these proposals came to fruition. The World Society of Victimology, founded in 1979, is open to all forms of victimization (although most of its activities focus on crime victimization). At least six victimology institutes exist worldwide, some limited to crime victimization and others to general victimization. Many governments have established special offices dedicated to victims of crime and concern themselves with distributing information about victims, monitoring a wide range of victim support activities. In the United States, this office is the Office for Victims of Crime located within the Department of Justice. At least five international journals dedicated to victims actively publish works about all aspects of victimology. Tens of thousands of victim assistance centers function across the globe, especially in most of the developed countries but also in many of the developing countries as well. Finally, there are about 20 national victim societies across the globe. Consequently, it is understandable that Mendelsohn is called the “Father of Victimology.”

In the United States, the first official measurement tool on the extent of crime and victimization was the Uniform Crime Report (UCR), created by the International Association of Chiefs of Police in 1927. Compiled by the Federal Bureau of Investigation with data submitted voluntarily by police departments from all over the United States, these statistics unfortunately gave information mostly about the offenders, focusing on eight index crimes, but had little information about victims.

Because of the growing evidence about a sizable “dark figure” of victims (those who do not report their victimization) and the recognition that the UCR had been providing insufficient information about victims, a new national survey on victims appeared in 1966. This survey, now known as the National Crime Victimization Survey, confirmed that actual victimization rates exceeded UCR data, roughly double the number reported to the police. The survey provided a wealth of new information about victims and victimizations that has, for almost the past 4 decades, given victimologists details about victims and their behaviors never before available. In recent years, both of these surveys have become more expansive and sophisticated sources of statistics and information about victimization.

Beyond collecting survey data about crime victims, victimologists also conduct research to measure the cause-and-effect relationships that surround victimizations. These studies explore topics such as victim vulnerability, victim–offender interactions, victim impacts, victim trauma, victim blaming, victim needs, victim recovery, and many other topics that help victimologists better understand victim behaviors.

The last general category of research used in conjunction with victims is evaluative research used to measure the efficiency and efficacy of victim service programs. These studies focus primarily on victim services for such programs as those dealing with child abuse, sexual assault, elder abuse, victim advocacy, victim/witnesses, spouse abuse, burglary victims, accident victims, and victims of drunk drivers. The results of these studies help determine what aspects of services are valuable to keep, so as to better reduce victims’ suffering and facilitate their recovery.

The main concerns of contemporary victimology are crime victims (persons injured as a result of an illegal act), disaster victims (persons injured as a result of either natural or human-caused catastrophes), and a special category referred to as “abuses of power victims” (persons injured as a result of genocide, apartheid, racketeering, inquisitions, torture, or ethnic cleansing).
The response to victimization has become a permanent part of 21st-century culture, especially in the United States. Currently, there are victim’s rights in all states; service programs that help all types of victims; victimization research studies, which are major components of many scientific endeavors; universities that offer related academic degrees at the bachelor’s, master’s, and doctorate levels; professional victim advocates; and major parts of national and state budgets dedicated to providing assistance to a wide range of victims. Today, the concepts of victimization, victim rights, and victim assistance are familiar to most Americans, and sociologists believe that these changes have made a significant contribution to the improvement of the human condition.

Victimless Crimes

The term victimless crimes and its alternative phrasing crimes without victims refer to illegal acts that involve behavior that the participants engage in voluntarily. For example, the prostitute and the prostitute’s customer both view their interaction as a business transaction in which, as in other commercial arrangements, both parties achieve what they desire. The prostitute obtains money and the customer has the desired sexual experience. Though the behavior is criminal, neither party will file a police report, unless, perhaps, the transaction involves theft or physical violence.

Similarly, narcotic dealers and their patrons voluntarily agree to a transaction much the same as that involving the purchase of alcohol or shopping for groceries. Abortion, which was illegal in the United States until 1973, poses a more complicated situation. Both the person performing the abortion and the woman undergoing it do so voluntarily. But the burning issue is whether the aborted fetus is a person, a victim deserving legal protection. No scientific evidence can adequately support whatever position is taken on this question; thus pro-life and pro-choice campaigns become, as does so much in the realm of victimless crimes, a matter of ideology, theology, and the exercise of political power.

The term crimes without victims entered the realm of social science when Edwin Schur of Tufts University employed it in 1965 as the title of a monograph. Schur, a Yale Law School graduate with a doctorate from the London School of Economics, had conceived the idea of victimless crimes when writing his dissertation on British drug policies. The term had precedents in Anglo-American law, including “sumptuary laws,” which forbade people of lesser social standing to dress themselves in elegant clothing. There also were “inchoate crimes,” such as loitering, catch-all statutes typically enacted to provide the police with the power to arrest persons they deemed to be suspicious. Similarly, the crime of drunk driving (driving under the influence) does not always involve a victim, but the behavior is outlawed on the presumption that the likelihood of an accident increases when a driver is intoxicated.

Consensual acts also exist that are forbidden by law because of religious principles, social abhorrence, or both. Polygamy, entered into willingly by all parties, and physician-induced suicide exemplify the first category, while riding a motorcycle without a helmet fits into the second category.

A fundamental issue about so-called crimes without victims is whether, though consensual in regard to the participants, they inflict harm upon others, such as spouses and families of compulsive gamblers and residents in a drug-trading neighborhood, or whether they injure society in regard to its moral traditions. Proponents argue that for its well-being, a society has to uphold standards of decency, as generally defined, or risk disorganization and disintegration. Victimless crimes also involve financial costs that must be borne by innocent taxpayers, for instance, when an uninsured motorcyclist not wearing a helmet suffers severe injuries and incurs medical costs that he or she cannot afford. Or when a motorcyclist without a helmet is struck on the head by a stone in the roadway
and loses control of the vehicle, killing or maiming motorists on the same highway.

Critics maintain that the idea of victimless crimes essentially is a political and ideological construct, embraced as a rallying cry in an effort to eliminate a variety of controversial behaviors. In its heyday, the idea of victimless crime was joined with the theoretical construct of labeling. Some argued that, say, marijuana users who are prosecuted are thereby defined and come to define themselves as outcasts and as a result may enter into a career of crime. Both labeling theory and the concept of crimes without victims have largely gone out of favor today, the former because evidence shows that the consequences of labeling can be manifold, some enabling, others unfortunate.

Many feminists are among the more prominent forces aligned against the idea of victimless crime. They maintain, for instance, that the typical street-walking prostitute is herself the victim of her calling because she is the product of an exploitative patriarchal society. On the other hand, pornography tends to split the feminist movement, with some arguing that it insults all women and others insisting that the First Amendment right of free speech should take precedence over the speculative idea that women in general are endangered by pornographic depictions of such things as sex degradation.

The most pronounced development over the past decades with regard to crimes without victims has been the success of campaigns to remove many of them from the statute books. Gambling, once outlawed throughout the United States because of religious doctrine and fraud in the operation of lotteries, is now a prominent fixture on the U.S. scene, with a proliferating array of slot machines and lottery tickets marketed even at convenience stories. Homosexuality, now buried in the criminal law closet, today centers on the dispute over whether couples of the same sex can legally marry. Once outlawed, abortion became permissible in the first trimester of pregnancy, though intense controversy continues to divide people on the issue. And some states and countries have moderated drug laws, particularly in regard to marijuana.

Only prostitution remains absolutely interdicted, very likely because prostitutes do not have the political power that was brought to bear to overturn laws against other so-called victimless activities. One could argue that in the cases of abortion and drug legalization, for example, prominent women campaigned for legal abortions, young drug users moved into positions of power, and elite parents refused to see their pot-smoking children risk long prison terms. Likewise, it could be argued that gambling became acceptable when states found themselves desperate for revenue, and legislators dared not risk political suicide by increasing taxes.

Victim–Offender Mediation Model

Victim–offender mediation is a process that provides interested victims of primarily property crimes and minor assaults the opportunity to meet the juvenile or adult offenders, in a safe and structured setting, with the goal of holding the offenders directly accountable for their behavior while providing assistance and compensation to the victim. With the assistance of a trained mediator, the victims are able to let the offenders know how the crime affected them, receive answers to questions they may have, and be directly involved in developing a restitution plan for the offenders to be accountable for the losses they incurred. The offenders are able to take direct responsibility for their behavior, learn of the full impact of what they did, and develop a plan for making amends to the person(s) they violated.

Although certain procedural differences and differences in terminology exist in implementing
victim–offender mediation in juvenile versus adult courts, the overall approach and procedure is quite similar in both settings. In some programs, cases are referred to victim–offender mediation as a diversion from prosecution, assuming the agreement is successfully completed. In other programs, cases are referred after the court accepts a formal admission of guilt, with the mediation as a condition of probation (if the victim is interested). Some programs receive case referrals at both the diversion and the post-adjudication levels. Officials involved in the juvenile justice system refer most cases, although some programs also receive referrals from the adult criminal justice system. Judges, probation officers, victim advocates, prosecutors, defense attorneys, or police can make referrals to victim–offender mediation programs.

Victim–offender mediation programs were initially referred to as “victim–offender reconciliation programs (VORPs)” in the mid-1970s and 1980s. Some programs still go by the name of VORP. Today, most programs throughout the world identify themselves as victim–offender mediation (VOM). In the United States some programs are also called “victim–offender meetings” or “victim–offender conferences.” Recently, an increasing number of VOM programs have periodically worked with cases involving severe violence, including homicide. This requires advanced training and far more preparation of the parties over many months prior to ever meeting face-to-face. Most programs that focus on victims of severe violence are called “victim offender mediation/dialogue” or simply “victim offender dialogue.” By far the most widespread application of VOM is in property crimes and minor assaults, in thousands of cases in numerous countries throughout the world.

Whereas many other types of mediation are largely settlement driven, victim–offender mediation is primarily dialogue driven, with the emphasis on victim healing, offender accountability, and resolution of losses. Contrary to many other applications of mediation in which the mediator would first meet the parties during the joint mediation session, in most victim–offender mediation programs a very different process occurs, based on a humanistic model of mediation. This model involves re Framing the role of the mediator from being settlement driven to facilitating dialogue and mutual aid; scheduling separate pre-mediation sessions with each party; connecting with the parties through building rapport and trust, while not taking sides; identifying the strengths of each party; using a nondirective style of mediation that creates a safe space for dialogue and accessing the strengths of participants; and recognizing and using the power of silence.

Most victim–offender mediation sessions do, in fact, result in a signed restitution agreement. This agreement, however, is secondary to the importance of the initial dialogue between the parties that addresses the emotional and informational needs of victims that are central to their healing and to development of victim empathy in the offender, which can lead to less criminal behavior in the future. Studies consistently find that the restitution agreement is less important to crime victims than the opportunity to talk directly with the offender about how they felt about the crime.

Since its inception in Kitchener, Ontario, with the first victim–offender reconciliation program in 1974, many criminal justice officials have been quite skeptical about victim interest in meeting the offender. Victim–offender mediation is clearly not appropriate for all crime victims. Trained practitioners present it as a voluntary choice to the victim and as voluntary as possible for the offender. Victim–offender mediation now works with many thousands of cases throughout North America, Europe, and other parts of the world. Experience shows that the majority of victims presented with the option of mediation choose to enter the process. A statewide public opinion poll in Minnesota found that 82 percent of a random sample of citizens throughout the state would consider participating in a victim–offender program if they were the victims of a property crime. A multistate study found that, of 280 victims who participated in victim–offender mediation programs in four states, 91 percent felt their participation was totally voluntary.

Victim–offender mediation is the oldest, most widely developed and empirically grounded expression of restorative justice. Restorative justice is a movement that is promoting active involvement of individual victims, victimized communities, families, and offenders in the justice system in ways such that offenders are actively involved in repairing the emotional and physical harm they caused; victims receive far more support, assistance, and input; and positive relationships within communities are strengthened. While restorative justice consists of a wide range of policies and practices and is ultimately a very different
way of understanding and responding to the real human impact of crime, the core of restorative justice is anchored in processes that allow for direct dialogue between those affected by crime and those who committed the offense. Examples of the more widely known restorative justice dialogue interventions include victim–offender mediation, family group conferencing, and peacemaking circles.

After a quarter of a century of VOM experience, more than 50 empirical studies in several countries have consistently found it to have a positive impact upon victim and offender satisfaction and perceptions of fairness, higher rates of restitution completion, and significantly lower rates of recidivism. Victim–offender mediation and dialogue programs currently work with many thousands of cases annually through several hundred programs throughout the United States and Canada and more than a thousand programs in other parts of the world, including throughout Europe, and in Australia, New Zealand, Israel, Japan, Russia, South Korea, South Africa, South America, and Ukraine. A recent national survey examining to what degree formal public policy in the United States supported victim–offender mediation found a considerable amount of legislative backing. A total of 29 states had legislation, in one form or another, that addressed victim–offender mediation. Of these, 14 states had specific legislation that spoke to various issues related to the use and development of victim–offender mediation and 15 states had a briefer reference to victim–offender mediation.

The American Bar Association (ABA) has addressed restorative justice through the practice of victim–offender mediation, its most widely used and empirically validated practice. The ABA has played a leadership role over many years in promoting the use of mediation and other forms of alternative dispute resolution in civil court–related conflicts, yet for most of that time remained skeptical and often critical of mediation in criminal court settings. That changed in 1994 when, after a yearlong study, the ABA fully endorsed the practice of victim–offender mediation and dialogue. The association recommended its use in courts throughout the country and provided guidelines for its use and development.

The United Nations, the Council of Europe, and the European Union have been addressing restorative justice issues for a number of years. In 2002, the United Nations adopted the UN Basic Principles on the Use of Restorative Justice Programs in Criminal Matters. These principles encourage the use of restorative justice programming by member states at all stages of the criminal justice process, underscore the voluntary nature of participation in restorative justice procedures, and recommend establishment of standards and safeguards for the practice of restorative justice. The Council of Europe focused more specifically on the restorative use of mediation procedures in criminal matters and adopted a set of recommendations in 1999 to guide member states in using mediation in criminal cases. In 2001, the European Union adopted a policy in support of “penal mediation,” otherwise known as victim–offender mediation, asking its member states (nations) to promote mediation in criminal cases and integrate this practice into their laws.

Another clear expression of the growing U.S. support for restorative justice is the National Organization for Victim Assistance endorsement of “restorative community justice.” During the early years of this movement, most victim advocacy groups were quite skeptical, and some still are; however, a growing number of victim support organizations are actively participating in the restorative justice movement.

VIGILANTISM

Vigilantes are those who take enforcement of the law or moral code into their own hands. The term developed in ancient Rome, and today it applies to citizens carrying out frontier justice when they perceive established authorities as weak, corrupt, and/or insufficient. The word vigilante originated in Spain. Where no established law exists, private citizens may find it necessary to impose the values of their group. Lawyers call vigilantism “extra-judicial self-help,” and many often equate it with vengeance. However, vigilantism becomes vilified when it leads to such criminal behavior as lynching.

Historical Background

Although a worldwide activity, vigilantism found fertile ground in the United States, beginning in colonial times and extending into the early federal period. By the late 1700s into the 1800s, groups that took matters into their own hands formed committees to identify and punish immigrants suspected of crimes. After fading for a while, its renaissance as an urban phenomenon began in California in the mid-1850s when members of the community started a vigilante movement for law and order. Such vigilantism led to situations where large crowds took prisoners from authorities and beat them severely before lynching them. Postcards recording lynchings showed proud participants, as well as residents (including children) dressed up to watch. The event became a cause for celebration.

Interestingly, local officials seldom revealed the identities of mob leaders because they viewed lynching as acceptable, necessary, and understandable. The violence reached an all-time high in the period from 1890 to 1902. Though the trend slowed after 1909, it continued into the 1930s. Vigilantism later resurfaced with the Guardian Angels (a New York City volunteer group founded in 1979 to combat subway crime), anti-abortionists, border security groups, and bounty hunters. One notable controversial case of vigilantism occurred in 1984, when Bernard Goetz—dubbed the subway vigilante—shot four young black men on a subway in anticipation of their intending to rob him. In the 1980s, vigilantism took the form of death squads in Central America, and in the 1990s, cyber hackers went after sexual predators, terrorists, and spammers on the Internet.

Characteristics

Other criminal acts often accompany crimes of vigilantism. Depending on the severity of these other acts, the sentence for vigilante behavior will vary. Most offenders get probation for their actions, after a negotiated plea bargain.

Although characteristics vary, the typical vigilante is a middle-class male. Unlike self-defense (which is spontaneous), vigilantism is usually premeditated. It most often occurs as a group act by concerned citizens who share a common goal. Participation is voluntary, and offenders are most likely to be private citizens. Vigilantes are not just members of the community; many are retired police and military personnel. Some of these groups are quite organized and violent. Others only threaten to use force. There are two main types of vigilantes. Lone wolves are disorganized and easily caught, sometimes deliberately so, such as “suicide by cop.” Conversely, instigators are well organized and tend to involve others (a close associate or small group) in their plans. A distinction also exists between crime control vigilantes (e.g., bounty hunters) and social control vigilantes (e.g., community members or concerned residents).

Vigilantism is a subtype of political violence. Unlike domestic terrorism, vigilantism seeks to help the social order. For example, a widely tolerated vigilante activity in Islamic societies is the practice of “honor killing,” when female members of the household shame the family name. Similarly, many Western nations and some U.S. states had laws justifying the homicide of a spouse if caught in the act of adultery in the conjugal home.

Recent Examples

Since 2000, hate crimes and murders have occurred against Mexican immigrants along and near the southern U.S. border. Members of the Minutemen vigilantes, the Ku Klux Klan, Ranch Rescue, and certain Mexican-hating elements of the Jewish Defense League have been accused of committing these unsolved murders. Violent activities by these similar groups are unacceptable but continue to occur. The Minutemen vigilantes, in particular, like to portray themselves as neighborhood watch groups assisting Border Patrol agents.

movie is *V for Vendetta* of 2006. Literature, comic books, and television series (e.g., “Dog: The Bounty Hunter”) have also portrayed vigilantes, who see themselves as friends of society. Indeed, some websites depict vigilantes as necessary and positive forces in the community.

Some laws support vigilante justice. For example, Good Samaritan laws provide protection to those who intervene when someone needs emergency assistance. The “right to resist arrest” law grants citizens freedom from restraint or control, and the self-defense doctrine allows citizens to shoot another person to protect their lives, property, or the lives of their loved ones. In fact, allowing law-abiding citizens to carry a concealed handgun is another example of a law that supports vigilantism. Some research demonstrates that carrying a concealed weapon deters criminals.

Road rage is another form of vigilantism, as many drivers try to make traffic violators pay when they break the rules. A newer example of vigilantism includes those who attempt to get back at Internet deviants. They are called “digital vigilantes.” Further, some vigilantes fight criminals via the Internet (called “cyber vigilantes”).

The aforementioned Guardian Angels, formed as an unauthorized anti-crime patrol, epitomized vigilantism. Interestingly, as they became more visible (wearing red berets) and more respected, the police began to resent them. Currently, a vigilante group patrols a Colorado highway for litterers, and in one neighborhood, a vigilante committee forcibly evicted a neighbor. A more recent example of vigilantism involves members of the community attacking former sex offenders. Because they are able to use the Internet to track down offenders, who are required to register their addresses, these vigilantes can locate and attack their victims. Vigilantism remains a serious problem that needs to be dealt with strongly, but it is important to look at the causes. Vigilantes usually act after a period of simmering frustration over lack of protection. Minutemen, who claim to be protecting our borders, and sex offender attackers, who claim to be protecting our community, might have good intentions, but they are still acting without legal authority. Vigilantes want punishment, or just deserts, swiftly. If they continue to believe that current law enforcement efforts are ineffective, their behavior will likely continue, however unacceptable it may be.

Today, more action is being taken against certain types of vigilantes, especially anti-immigration offenders. Public pressure is building on governments to deter this behavior, especially with more public awareness of vigilantism. In addition, a focus on the needs of those victimized by vigilantes is developing. Recommendations have been made to develop case intake and assessment forms that can record all necessary information to evaluate what services victims of vigilantism require. Recommendations have also been made for an access-secure Internet database to capture complete information about vigilantism. Further, suggestions have been made for the development of training manuals on procedure for the prosecution of vigilantes.

VIOLENCE

Violence is an injurious force exerted to cause damage to people or things. Shaped by a multitude of social, political, and economic forces within families, neighborhoods, nation-states, and the broader international community, violence is a complex problem related to patterns of thinking and behavior. It embodies an expression of power often used to demonstrate authority or repression, or to persuade others to behave in particular ways. Also characterizing violence is an element of intent by its perpetrator. Intention is obvious in physical forms of violence but is minimally evident or even nonexistent in its structural or symbolic
forms. Finally, discussions about violence often take on a moral tone, classifying it as just or unjust.

Violence, therefore, is an amorphous phenomenon that defies easy categorization as it surfaces in numerous shapes. Still, it is useful to consider three broad forms: physical, structural, and symbolic. This entry describes all three formations of violence but focuses upon physical violence as a social problem.

Three Forms of Violence

Physical violence is the material manifestation of harmful aggression with the intent to injure others. Examples include beating, burning, bombing, torturing, raping, or shooting. Violent occurrences characterized as social problems include wars, homicides, suicides, school shootings, production and sale of weapons, capital punishment, terrorism, sexual assault, and domestic violence such as child abuse and wife beating. Under the umbrella of physical violence, three nuanced typologies exist: self-directed, interpersonal, and collective violence. Self-directed violence includes self-mutilation and suicide. Interpersonal violence is violence manifested between individuals or communities, whether known to one another or not. Collective violence is the instrumental use of force by people who self-identify as members of a particular group who oppose another group. In such a case, they engage in violence to achieve political, economic, or social objectives. Examples include armed conflicts between states, genocides, and terrorism.

Structural violence refers to economic and political structures that constrain human capabilities. This type of violence is often called the violence of hunger, poverty, or humiliation. While not directly imposing manifestations of physical force, structural violence involves policies and institutions that indirectly cause harm and constrain opportunities for individuals or groups. An example of structural violence is a World Bank/International Monetary Fund policy called “structural adjustment,” which did not directly mandate physical force against people but did impose regulations on governments. These policies constrained access to lifesaving social services for millions of civilians living in developing countries.

Symbolic violence is the imposition of perceptions and groupings of thought upon a marginalized social agent who accepts this social order as just, thereby perpetuating the dominant structures. An example of symbolic violence is gender inequity. Specifically, symbolic violence is at play when a woman sees it as her role to take on an unequal share of burdensome work. Yet in her actions, she is also upholding an economy that men dominate.

Violence as a Social Problem

As a social problem, violence is pervasive globally. More than 1.6 million people die every year from violence. In addition, the wake of violence causes injury to millions more and has numerous health, social, and economic consequences. The harmful effects of violence on health include physical symptoms such as bruises and serious brain injuries, psychological consequences such as depression and post-traumatic stress disorder, and behavioral consequences such as alcohol and drug abuse. Social consequences of violence include strained relationships and social isolation, which can impact school performance and employment opportunities. Violence also places a sizeable burden on economies through exorbitant health care and legal costs as well as lost productivity.

Increasingly, people perceive violence as a public health concern because of its related physical, sexual, reproductive, and mental health ramifications. In some countries, health care expenditures due to violence have accounted for up to 5 percent of the gross domestic product. Yet violence cannot be understood solely in terms of its physical and material scars. It also involves serious assaults on the dignity of people and has the potential to create a pervasive sense of insecurity and fear.

According to the World Health Organization, of the more than 1.6 million fatal victims of violence worldwide in 2000, nearly one third (520,000) were homicides, about half (815,000) were suicides, and an estimated 310,000 (19 percent) died as a direct result of war. The highest rates of homicide exist among men ages 15 to 44 years, mostly from low- and middle-income countries, and the highest suicide rates are among men age 60 years and over.

Often associated with its liberal gun policies, U.S. homicide rates are particularly high when compared with homicide rates in other industrialized countries. Every day, more than 80 Americans die from gun violence. Nevertheless, the U.S. homicide rate is still lower than in most developing nations.

Violence and Conflict

When a conflict arises—whether between individuals or groups—a social actor can choose to avoid or
engage in the conflict nonviolently or violently. A social actor may choose to take up arms to defeat his or her opponent. In this sense, violence is an offensive strategy for asserting and gaining power. Violence can also be a defensive strategy, a behavior conducted to protect oneself, allies, and/or property in the face of acute aggression. In this manner, violence is utilized to neutralize the encroaching enemy. Overall, violence has led to an estimated 191 million lives lost directly or indirectly as a result of conflict in the 20th century, over half of them civilians.

The Importance of Understanding Violence

Violence has been central to defining and characterizing the social world. Max Weber defined a nation-state as the legitimate monopolization on the use of physical force or violence within a given territory. Thomas Hobbes argued that humans in a state of nature had a right to everything in the world, which justified the use of violence against everybody else. Yet, in the interest of personal survival, humans renounced this right to use violence and instead respected the authority of a state (with its monopoly on violence) to maintain peace.

The role of violence in the record of human history is disputed. Some scholars assert that humans are innately violent and violence has always been part of the human condition. Others point to archaeological evidence that suggests that violence is a more novel aspect of humanity, taking a prominent role only when war became a regular practice after the transition to sedentary existence (around 6000 BCE).

Experts maintain that violence is regenerative, that it can give birth to itself. Perpetrators of violence such as child abusers often were victims of violence themselves. Revolutionary militants who overthrow repressive dictators often exercise violence later to command obedience of the populace. This notion that “violence begets violence” is critical to effectively planning and implementing various violence prevention programs and policies.

Violence Prevention

Individuals and collectives invest in violence prevention to reduce both the likelihood of violent occurrences and their harmful ramifications. Unfortunately, these efforts often only become a concern after the violence has already occurred. The Carnegie Commission on Preventing Deadly Conflict identified several factors that put states at risk of violent conflict: (a) lack of democratic processes, (b) gross social inequalities, (c) control of valuable natural resources by a single group, and (d) rapid demographic changes that surpass a state’s capacity to provide services to the populace. Monitoring states for these factors and taking action to curb them if they arise are helpful contributions to diminishing the prevalence of violence.

Other forms of violence prevention include encouraging healthy behaviors and attitudes in individuals through therapy programs and psychological support. Violence prevention can also be part of training on conflict resolution, active communication, and relationship building. Finally, some seek to prevent violence by instituting various policies that address the social and economic forces leading to violence. The 2002 World Health Organization report on violence and health offered the following succinct recommendations for violence prevention: (1) create, implement, and monitor a national action plan for violence prevention; (2) enhance capacity for collecting data on violence; (3) define priorities for, and support research on, the causes, consequences, costs, and prevention of violence; (4) promote primary prevention responses; (5) strengthen responses for victims of violence; (6) integrate violence prevention into social and educational policies, and thereby promote gender and social equality; (7) increase collaboration and exchange of information on violence prevention; (8) promote and monitor adherence to international treaties, laws, and other mechanisms to protect human rights; and (9) seek practical, internationally agreed responses to the global drug trade and the global arms trade.

Further Readings

Collective violence is the handling of a grievance by group aggression against persons or property. Although states engage in violence in wars, police operations, and the punishment of criminals, most social scientists regard collective violence as aggression by civilians.

**Forms of Violence**

The universe of collective violence is large and diverse and includes such major forms as warfare, feuding, rioting, lynching, vigilantism, and terrorism. These phenomena are often loosely defined, but fundamental differences distinguish them from one another. First, violence may occur between groups or between groups and individuals. It may be a unilateral (one-sided) attack by one group against another, as when an ethnic majority attacks an outnumbered and possibly defenseless minority. Examples would include anti-Catholic, anti-black, and anti-Chinese riots in the 19th-century United States, as well as more recent riots aimed at ethnic minorities in places such as South Asia and Africa. Although covert rather than public, terrorist attacks usually are unilateral attacks by one group against another as well. Reciprocal, tit-for-tat violence also occurs between groups, typically when the parties are largely equal in status, numbers, and other resources. Warfare in simpler, tribal societies is one example of reciprocal group-on-group violence, as is feuding between modern street gangs. All of these forms of violence involve a logic of collective liability by which a group holds everyone in a social category accountable for the conduct of everyone else. Groups subject to violence because of the behavior of one member might include such categories as families, clans, tribes, racial and ethnic groups, nationalities, and political or religious organizations.

Collective violence might also involve the aggression of a group against an individual without implicating or involving other members of his or her social category. The avenging group may be small and covert in its attacks, or large and highly visible. It is possible to distinguish forms of collective violence according to their pattern of liability (whether collective or individual) and their degree of organization (whether high or low).

**Rioting**

Rioting involves collective liability and little organization. It is an informally organized unilateral attack on members of a social category in retaliation for the offense of one or more of its members. In cities in the northern United States in the 19th and 20th centuries, for example, alleged misconduct by a single African American resulted, on numerous occasions, in mass violence by whites against entire black neighborhoods. Historically, minorities such as Jews in Europe or Muslims in India likewise faced similar attacks. Each riot typically lasts no more than a day or two, however, and participants disperse immediately afterward.

**Lynching**

Lynching also is informally organized group violence, but unlike rioting, only the alleged offender is punished or killed. During the years of the relatively frequent lynching of African Americans by whites in the American South, for instance, white crowds would rarely beat or kill more than a single black offender. Crowd violence seldom, if ever, spreads to the larger black community in the form of rioting.

**Vigilantism**

Vigilantes are formally organized groups that punish a series of offenders. Whether vigilantes operate swiftly and secretly or deliberately and openly, the guilt of each offender is weighed, and each is punished as an individual. In 19th-century American frontier areas, for example, vigilantes tracked down and punished cattle thieves and other deviants beyond the reach of
legal officials. In the American South, the Ku Klux Klan once operated as a vigilante organization as well.

**Terrorism**

Terrorists also have formal organization, but their adversaries are usually large and powerful groups with superior resources. Moreover, unlike vigilantes, terrorists employ a logic of collective liability: They launch covert attacks on civilian populations, such as bombings of restaurants or airplanes and indiscriminate shooting in public places. Guerilla warfare also involves organized civilians who may operate covertly, but guerillas typically limit their attacks to governmental targets, such as the military and police.

**Explanations of Collective Violence**

Some social scientists trace collective violence to social tensions such as those resulting from competition for scarce resources, poverty, or real or threatened domination by one group over another. Others focus instead on the social characteristics of the parties involved in a specific incident of conflict, such as the amount of closeness between those in conflict, the number of cultural differences between them, the extent of status differences between them, or the degree to which they depend on one another economically or otherwise. Regardless of historical period or particular setting, more collective violence can be expected when those in a particular conflict are strangers, culturally different, and highly unequal in status. The ultimate goal of collective violence theory is to predict and explain when a conflict will result in group violence, in what form, and with what level of severity.

**VIOLENCE, SEXUAL**

No universal definition of sexual violence exists because cultural and social norms and laws define the act; however, many professionals agree on several underlying concepts of sexual violence. Sexual violence includes any unwanted or unlawful behavior perpetrated with the use of coercion and/or force against one’s sexuality by a person either known or unknown to the victim. Sexual violence is a global problem with many consequences for the individual(s) involved, the larger community, and society as a whole.

Although sexual violence is often perceived as an extreme form of violence, a wide range of behaviors constitutes sexual violence, from harassing verbal comments and gestures to physical touching and penetration. While the act of sexual violence is often characterized by physical and verbal behaviors, a large component of sexual violence is mental. Sexual violence is a display of subordination whereby an asymmetrical balance of power and control is present between the perpetrator and the victim. Power may be attributed to one’s physical properties, such as a person’s body size and strength, or it may be attributed to social, financial, or political properties. The perpetrator uses this imbalance of power to coerce or force the victim to surrender to the perpetrator’s control.

A majority of sexually violent incidents occur between acquaintances, contrary to the common belief that strangers often perpetrate sexual violence. Sexual violence is one of the most under-reported incidents for a number of reasons, depending on individual factors, belief systems, and cultural expectations. Many victims may fear retaliation from the perpetrator, may be too embarrassed or humiliated by the episode(s) to report the incident(s), may not feel the authorities can ameliorate the situation, may not perceive themselves to be victims of sexual violence, or it may be socially and culturally unacceptable to inform others about the incident(s), potentially bringing shame to their families. Because sexual violence is grossly under-reported and has no single definition, it is a difficult subject on which to compile accurate statistics.
Women and children are at greatest risk for sexual violence victimization, but other groups are vulnerable, such as the elderly, the disabled, and inmate populations. Other vulnerability factors have been correlated with sexual violence victimization, including a prior history of sexual violence, drug and alcohol use, high-risk sexual behaviors, and poverty. Individuals with lower socioeconomic status typically lack economic and educational resources for survival and for responding to sexual violence, thus placing them at greater risk for victimization. Women living in poverty are also at risk for intimate partner violence, in which sexual violence is a component. Many such vulnerability factors are often consequences of sexual violence, too.

Males are at greater risk for perpetrating sexual violence. No single explanation for the cause of sexual violence exists, but there are many factors associated with the perpetration of sexual violence. Individual factors placing a male at risk for perpetration include drug and alcohol use, hostility toward women, and childhood sexual and physical abuse. Relationship factors placing a male at risk for perpetrating sexual violence include association with delinquent and aggressive peers, unstable and violent family environments, and patriarchal family and community structures.

Other community factors that increase the likelihood of sexual violence include weak sanctions against, and tolerance for, perpetrators of sexual violence; a lack of economic means, such as employment; and a lack of support from law enforcement. Larger social factors affect the likelihood that males will sexually violate others, including poverty and a lack of policy addressing gender inequality. A tolerance for the subjugation of women and male superiority and sexual entitlement continue to influence sexual violence perpetration in many countries.

The consequences of sexual violence for victims are widespread, including immediate and long-term costs for the victim, the community, and society. Consequences may be physical, psychological, social, and health related, depending on the victim and perpetrator relationship and the type, frequency, and severity of violence endured.

Physical injuries may be sustained during the incident of sexual violence. For example, bruising and lacerations may result from the perpetrator’s use of force or use of weapons. Injuries to the victim’s sexual organs may also result from forced penetration. Sexually transmitted diseases and unwanted pregnancies are also potential physical repercussions of sexual violence.

Psychological injuries will vary among victims depending on various factors. Short-term problems include shock, denial, anxiety, and a loss of trust of others. Long-term consequences include posttraumatic stress disorder, depression, and a fear of revictimization. Health-related consequences, including engaging in risky sexual behaviors and drug use and abuse, not only are potential short-term and long-term consequences of sexual violence but also place the victim at risk for being revictimized.

Many other crimes, such as prostitution and sex trafficking, entail the potential for sexual violence to occur, particularly rape. Increased use of technology, particularly the use of the Internet, provides new domains for sexual violence and propaganda to occur, such as pedophilia and stalking. Female genital mutilation is a cultural practice that has been outlawed or restricted in several countries. Finally, rape has been used as a tool of warfare against women in countless wars spanning countless periods of time. All these implications entail a different perspective of a global problem.

Sexual violence is a complex phenomenon with a wide range of risk factors and consequences for all individuals involved, particularly the victim. Regardless of the victim’s culture and background, the consequences of sexual violence lend insight into why such violence is a social problem on numerous levels, leaving a host of problems to be mitigated and overcome.

Further Readings
Violent crime is a crime involving force or the threat of force against a person or persons. It includes crimes such as robbery, murder, rape, and assault. Crimes of violence account for slightly more than 20 percent of all crime. According to both the Uniform Crime Report (UCR), which tallies the crimes known to the police, as well as the National Crime Victimization Survey (NCVS), which reports victimization rates from surveys of victims who may or may not have reported the crime, violent crime rates have been decreasing for over a decade. Since 2000 the rate of crime has decreased more than 8 percent. Murder rates in 2005 were down more than 25 percent compared with 1995 figures.

Different regions of the United States experienced somewhat different trends, with the greatest reduction in the Northeast and the smallest reduction in violent crime rates overall in the South, a region with historically high crime rates and, more specifically, higher violent crime rates. In 2004, 90 percent of violent crimes occurred in metropolitan statistical areas. In 2004, according to the NCVS, most victims of violence were between the ages of 12 and 24. Moreover, males are much more likely to be victims of violent crime and also much more likely to be the perpetrators. African Americans have the highest rates of violent victimization as do individuals living in households with the lowest incomes.

Media Misperceptions and Violent Crime

Many Americans believe that violent crime is becoming more of a social problem despite the decline in violent crime rates. In fact, violent crime rates in the past 2 decades peaked in 1994 and have been steadily declining ever since then. One of the main reasons for this misperception is that the media focus on violent crimes, in both television crime dramas and news coverage. Crime is the fourth largest category of news coverage, after sports, business, and general interest/entertainment categories. Some studies show that about one fourth of crimes that are reported in the news are murders, although its percentage of total crime is quite low (generally under 0.1 percent) and it constitutes only 1 percent of all violent crime.

The UCR Crime Clock in 2006 revealed that every 30.9 minutes a murder occurred, every 5.7 minutes a forcible rape, a robbery every 1.2 minutes, and an aggravated assault every 37 seconds. Clearly, murder is the least common of the aforementioned crimes. Although murder grabs the newsmakers’ attention, not all murders are equally likely to show up in the news. Rather, homicides involving unusual victims, like children or the elderly, or homicides involving celebrities are more likely to make the news. Additionally, even though about 90 percent of all homicides are intraracial, the media are more likely to report on a homicide wherein an African American kills a Caucasian.

Generally, when people think of violent crimes, they think of crimes committed by strangers. Again, this is based on media portrayals of crime in which the media focus on the rarer, more sensational crimes involving strangers. Yet crimes like child abuse, sibling abuse, elder abuse, and intimate partner abuse are much more common than assaults by strangers, and the violence committed by a loved one is often more likely to have a longer-lasting negative effect on the victim. Further, even in the most violent of crimes—murder—perpetrator and victim are more likely to have known one another.

The Politics of Violent Crime

The social construction of crime leads to changes in policies that are not necessarily focused on reducing violent crime. Rather, the perception of violent crime as a significant social problem can lead to policies that increase governmental control over certain subpopulations for the manifest purpose of fighting crime but with the latent intent on keeping certain population segments in greater check by increasing surveillance. For example, many people assume that the primary aim of the USA PATRIOT Act was to reduce terrorism, but some of its applications have dealt with numerous types of crimes and criminals.

The definition and interpretation of violent crime are also at issue. For example, corporate crimes resulting in a conscious decision to do something (or not do something) that leads to numerous deaths does not constitute murder under any statutes. White-collar crime that causes a great deal of devastation usually results in shorter prison sentences than do street crimes. Additionally, the politics of violent crime often include treating violent crimes
differently, depending on the victim–offender relationship. For example, marital rape is often taken less seriously in the criminal justice system than is stranger rape. Even robbery, where the victim and offender had some kind of prior relationship, receives less serious treatment than if the victim and offender are strangers.

Voter Apathy

Voter apathy is a lack of interest on the part of individuals in the electoral process generally or in political campaigns during an election period. Apathy is an abstract concept and is therefore difficult to measure. Individual-level measures of voter apathy usually assess the level of interest individuals have in politics, in a contemporary political campaign, or in both. Although findings vary in describing recent trends in voter apathy in the United States, experts agree that voter apathy has increased (while voter turnout has decreased) over the course of the past 100 years. For example, 74 percent of the voting age population in the United States turned out, on average, for presidential elections between 1888 and 1904. Between 1988 and 2004, that number dropped to 52 percent. Voter apathy is a concern in democratic nations because establishing a democracy’s legitimacy requires that citizens consent to the political leaders who make policy, or to policies directly, by participating in elections. Therefore, citizen interest in those who govern and in the options available in the voting booth is a necessary first step in securing the consent of the governed.

Causes of Voter Apathy

To establish a democracy’s legitimate claim to govern, some form of citizen engagement in the political processes is necessary. Fundamentally, citizens’ participation is a civic obligation (i.e., citizens understand that they have a civic responsibility to vote). However, scholars note that in the absence of other forces, civic obligation by itself is not an effective mechanism for drawing citizens into the political process. Factors such as the complexity of politics, the lack of political efficacy on the part of citizens, the increase in negative campaigning, and problems with many popular party systems contribute to high levels of voter apathy in many democracies. To have an interest in politics (at least one that goes beyond the entertainment value that politics sometimes offers), one must have a feeling of political efficacy; that is, one should believe that he or she understands politics effectively and that government and other political institutions are responsive to citizen demands. Yet many potential voters perceive politics as a complex process that they cannot understand and believe that government officials are not influenced by what individual citizens think. Thus, it is difficult for them to participate in politics and difficult to feel that their participation matters. In turn, they become alienated and decline to be a part of political society.

Some blame negative campaigning in elections for increases in apathy among potential voters. Negative campaigns serve to discourage citizens from feeling positively about any of the candidates from whom they must choose, and they can lead many to conclude that engagement and participation are not worth the effort. Countries with multiparty systems, which provide more options when voting, have decidedly higher citizen participation rates. This suggests that engagement in the election process increases when voters feel that they have a wider variety of options in the voting booth. It thus stands to reason that in a country with a two-party system, voters are likely to feel less enthusiastic about the options they are offered. They are more likely to have the perception that it does not make any difference which one of the two parties is in power. In multiparty systems, voters—offered an array of policy positions—are more likely to find
a party with policy positions that more closely match their interests.

**Apathetic Nonvoting**

Perhaps the most important consequence of voter apathy is nonvoting. In fact, when many people propose reforms to address the problem of voter apathy, they really intend to address the problem of nonvoting. However, nonvoting is not the same thing as voter apathy, because although nonvoting often results from voter apathy, nonvoting can also be the result of other, unrelated factors such as anger with the political system, the failure to find a suitable candidate for whom to vote, or even contentment. Engaged, informed, and politically interested citizens may therefore decide not to vote and hence should not be labeled as “apathetic.”

Of all the causes of nonvoting, however, apathetic nonvoting is perhaps the most troubling form because in most other cases the act of nonvoting is a real statement of a citizen’s preferences. Not voting because there is not a satisfying option on the ballot, for example, is a sensible expression of a citizen’s preferences. Those nonvoters provide interested candidates and political parties with information, and those parties have the incentive to adjust to accommodate those nonvoters’ unmet preferences. Apathetic nonvoters, however, reveal nothing about their preferences, providing no useful information to parties and candidates and therefore are not in a position to react to party proposals and appeals. The difficulty in telling the difference between apathetic nonvoters and other nonvoters has led some to advocate the use of a “none of the above” option on ballots. This would give politically interested citizens a way to express their lack of preference for the available options, and it would distinguish that group from the apathetic who do not participate because of a lack of interest.

Apathetic nonvoting does, indeed, have the potential to distort election outcomes. If the apathetic are systematically alike in terms of their (unrealized) candidate or policy preferences, then those preferences find expression in a disproportionately low voter turnout. On the other hand, if the apathetic are diverse enough to not alter the outcomes of elections, then their nonvoting has no impact on election outcomes. Though most commentators are critical of voter apathy, one might argue that voter apathy actually has positive consequences. Apathetic voters are those who do not invest the necessary time and effort to participate meaningfully in the political process. People who do not gather and process the information required to participate meaningfully in politics, some maintain, should disengage from the process and leave decision making to those who do make the effort. The removal of apathetic voters from the elections might, as a result, lead to better collective choices.

**Reforms Aimed at Reducing Voter Apathy**

Most reforms aimed at nonvoters focus on improving the main symptom of voter apathy: low voter turnout. Many of these reforms seek to make the process of registering to vote and the act of voting itself easier or more convenient. Examples include new “motor voter” procedures, which offer to register citizens to vote when they apply for or renew a driver’s license. Another innovation is early voting, which opens the polls before Election Day, allowing voters to cast a vote several days before the official day. Many of these reforms have been less effective than hoped. For example, voters who registered as part of a motor voter process were unlikely to cast a vote; this reform increased the rolls of registered voters but did not increase engagement or voter turnout on Election Day. Some reformers even proposed a mandatory voting system, which would issue fines to nonvoters, a system currently used with much success in Australia. However, because none of these reforms address the unwillingness to engage in the political process on the part of citizens, they do not address the problem of voter apathy.

Other attempts seek to alter the electoral environment with the goal of drawing in voters who might not otherwise participate. Several media campaigns run by interest groups package political information and advocacy in more exciting or popularly accessible forms (which often have dramatic, eye-catching slogans such as “Rock the Vote” or “VOTE or DIE”). Another recent attempt to package political information in a more palatable form is the introduction of the “town meeting” debate format in presidential elections. Rather than have candidates address questions formulated and posed by professional journalists, town meeting–style debates involve an audience of citizens asking questions of the candidates directly. The idea is that the questions and questioners will be of more interest to those watching the debate and will increase the level of interest in the debate and the
election. Similarly, candidates now regularly appear in less traditional, and more popular, media outlets. Presidential candidates, for example, now typically appear on daytime and night-time talk shows during the course of an election campaign. Presumably this is an attempt to reach an audience that may not follow the normal channels for political information and thus is an attempt to engage difficult-to-reach, apathetic potential voters.

**WAGE GAP**

Women, on average, make less than men, a differential commonly known as the wage gap. Although significant changes in the status of women in society occurred since the phenomenon was identified, the gap still persists in the 21st century. Currently, women earn about 77 cents for a man’s dollar.

Causes for the continuing gap include continuing discrimination on the part of employers (and schools and training programs); differential socialization patterns leading to constrained choices of occupations by men and by women; differential, patriarchal family responsibilities of men and women; and, to a waning degree, different human capital.

Social and individual consequences to this continuing inequality can be grave. Women may not be able to support themselves and any children they have, and so may be dependent on men (who may be abusive) or dependent on the state. Women and their children are the largest proportion of the poor, including the working poor.

In 1979, the ratio of women’s earnings to men’s was 62.1 (median weekly earnings of full-time workers 25 years and older). Presently, it is 81.0. In dollar terms, that is a gain of 19 cents in 27 years, closing about half the gap. The wage gap also shows itself by race. African American women earn about 88 percent of what African American men earn, but only about 70 percent of what all men earn. Union members typically have a smaller male–female wage gap than do non-union members.

Some scholars point to differences in human capital as an explanation of the wage gap. Although women significantly increased their education and employment experience in recent decades, even for college-educated women, the gap remains although it too has improved. In 1979, female college graduates earned about 67 cents for every dollar a male earned; that figure is now approximately 81 cents. For those with only a high school education, the figures respectively are about 60 cents and 74 cents. Ironically, female high school graduates gained more relative to men than female college graduates, so increased education appears not to reduce the gap. Some analysts suggest that much of the decrease in the wage gap is due to the decreasing real wages of men, especially high school–educated men. Well-paid jobs for male high school graduates in manufacturing are disappearing.

In 1963, the federal Equal Pay Act became law, forbidding employers to pay different wages to men and to women doing the same job. However, by and large, men and women did not then, and do not today, do the same job. High levels of occupational sex segregation persist. Women still work largely with other women doing “women’s work,” whether professional-level work or unskilled labor. Men still work largely with other men. Even where there has been significant gender integration, ghettoization often occurs within the occupation. For example, female physicians are more likely to be pediatricians than surgeons, and pediatricians make less.

Women's work pays less, regardless of who is doing the work. Men doing women’s work, although paid less than men doing “men’s work,” are paid
more, on average, than women in the same occupation. This lower pay exists even when holding constant the skills, responsibilities, and adverse working conditions that the job requires. Considerable research exists showing that comparable jobs pay less if they are dominated by women workers.

What accounts for occupational sex segregation? Women learn what work is appropriate for them, partly by observing what women do in the world. So, existing segregation feeds segregated expectations and occupational aspirations. Stereotypes of gender-appropriate work remain strong, and women hold them as well as men. Further, school guidance counselors and employers also hold these stereotypes. Women employed in male-dominated occupations frequently experience sexual harassment by supervisors and peers. Women are often not mentored to the same degree as men. Thus, women tend to leave male-dominated occupations even when they initially gain access.

Women and men—and employers—still have expectations about women’s family responsibilities; women still have the greatest burden for child care, thereby limiting their occupational choices by that responsibility. Mothers may look for part-time work, may have their work careers interrupted by childbearing, and may look for work that coincides with the school day or school year. Even if women do not “choose” such work, it may be chosen for them. Women may not be offered training or promotion opportunities if employers perceive them to be more attuned to the needs of the children/family than the needs of their careers. This phenomenon has been termed “the mommy track.”

The existence of a “glass ceiling” is well documented. Much research shows that employers (and other citizens) value male over female applicants for many positions, particularly those that require leadership skills. Discrimination against women at work may be more subtle than it was in the 1960s and before, but it persists.

Both the 1963 Equal Pay Act and Title VII of the 1964 Equal Rights Act have been successfully used to sue specific employers for discrimination and wage disparities. However, this is a costly and time-consuming effort. Such legal remedies have not been entirely effective in changing the social structure of gender inequalities that led to the wage gap in the first place.

Much of the work on this issue, both scholarly and political, was done in the 1980s and 1990s when U.S. activists initiated pay equity studies in cities and states across the country. However, the implementation of such studies and the remedy of discovered inequality were often incomplete. In Canada, a stronger labor movement and richer history of social reform led to more proactive efforts to address the wage gap. There, too, results were mixed and often incomplete. At the present time, that reform fervor of the past has largely waned.

War

War is a form of social conflict between two or more collective political actors, involving the organized use of physical violence, with the central aim of coercing one political actor to comply with the will of another. In broader terms, war is a complex and highly contingent set of events and processes requiring the mobilization of power, human beings, resources, and technologies of production and communication, which dramatically interrupts routine social life and generates a new social dynamic. When political disputes over territory, resources, sovereignty, or ideology cannot be settled by negotiations, threat, hegemony, or compromise, they often lead to violent attempts to establish political will—that is, in warfare. At the most general level, war is a socially recognized violent intergroup conflict that profoundly transforms social life.

Anthropological research corroborates that, with the possible exceptions of a few tribal groupings such
as the Semai of Malaysia, Andaman Islanders of India, Copper Eskimos of north Canada, and Mbutis of Congo, all known societies have been involved in warfare. Although war is a near-universal process, a consensus exists among most sociologists and anthropologists that this has little to do with the biological or psychological makeup of human beings and a great deal to do with their social and political relations. Although some primates seem capable of engaging in organized and protracted lethal conflicts, they lack collective intentionality, systematic use of weapons, sophisticated linguistic coordination, and the ritualism that characterizes human warfare. In this respect war is a distinctly human activity.

Such a view was already familiar to classical philosophers of warfare such as Sun Tzu, Machiavelli, and Clausewitz, for whom war was a predominantly political instrument, by which distinctly human-made, political goals could be pursued. These early studies focused on strategic and logistical matters—the ability of leaders to be successful on the battlefield and the practical arts of combat—without questioning the logic or necessity of war. In contrast, contemporary social science examines war as a particular social and sociological problem, attempting to explain its social origins, political functions, and historical transformations. Above all, this research focuses on the intrinsic relationships between war, state, and modernity.

**The Transformation of Warfare**

With modern history of warfare so tightly bound up with the development of the state, it is no accident that some researchers argue that small tribal societies were unable to fight real wars, as this allegedly requires large-scale organization and pitched battles with more than 1,000 fatal casualties. Furthermore, influenced by Rousseau’s myth of the noble peaceful savage, traditional views tended to agree that primitive warfare was sporadic, mostly ritualistic, rarely lethal, and limited to small groups of tribemen. However, recent research challenges such perceptions, demonstrating not only that primitive warfare was extremely frequent but also that it was highly violent and particularly homicidal, entailing the recruitment of proportionally more combatants than most mobilized modern states such as Germany in World War II or France in World War I. What distinguishes primitive war from its modern counterpart is the birth of the state and its gradual monopolization of violence, which radically transformed the nature and scale of warfare.

As the availability of food set limits on military expansion—both the size of the armed population and the maintenance of substantial army—war in antiquity was dependent on periodic pillages and hence was often no more than organized robbery. In this context, a small technological discovery, such as the invention of war chariots, or an organizational innovation, such as the emergence of an orderly and loyal cavalry, as in the case of the nomadic tribes led by Genghis Khan, provided an overwhelming advantage in conquering large swaths of land. Notwithstanding military inventions such as crossbows and heavy armored cavalry, medieval warfare remained technologically static, essentially continuous since the time of ancient Greece or Rome. However, the newly found strength of ideology compensated for the lack of technology, as common religious beliefs became a potent source of group mobilization for Christian and Muslim warlords. Whereas Islam provided unity and social discipline for Arabian tribes, the Roman Church granted spiritual legitimacy to the European warrior caste to fight the crusades. However, in both cases war remained the preserve of a wealthy, hereditary nobility and involved lifelong specialist training.

The radical transformation of warfare began with the gunpowder revolution in the 16th century, which gave a clear advantage to the armed infantry over cavalry, as improved cannons and newly invented muskets easily overpowered pikes, swords, and crossbows. More importantly, these military changes significantly increased the cost of war, which in turn led to the centralization of power by giving birth to the modern sovereign territorial state. The gradual development of fiscal systems of effective taxation and the growth and professionalization of state bureaucracy, together with the 1648 Westphalian principle of noninterference in the domestic affairs of other states, brought the military under the control of a centralized authority. In Charles Tilly’s famous phrase, this was the period when states made war and war made states. The 17th, 18th, and early 19th centuries saw the state thoroughly transformed from being the sole property of royal dynasties with little popular support to acquiring a semi-divine status for the great majority of its inhabitants. It was nationalism that proved the most potent glue of state legitimacy, and it was nationalism that
mobilized large armies of conscripts to confront the remnants of aristocratic militias. Though the armies of Napoleon and Frederick the Great had almost identical armaments, it was the nationalist zeal of France’s revolutionary army that proved to be the tipping point that ultimately won the war between them that ended with the Treaty of Basel in 1795.

**War and Modernity**

Beginning in the mid-19th century, the second military revolution industrialized warfare and cemented its institutional bond with the nation-state, thus penetrating even further into society. The rapid development of science, technology, and industry radically transformed the conditions of warfare. The invention and mass production of steamships, telegraphs, canned food, railways, and automatic weapons made armies well fed, well equipped, well organized, and highly mobile. The nation-state emerged as a powerful territorially compact machine, reinforced by technological and industrial developments and capable of sustaining massive conscript armies. World Wars I and II were the epitome of industrialized total wars where the resources of the nation-state, including all healthy men and women, transport, trade, industrial production, and communications, were at the disposal of the nation-state at war. The war became a conflict not just between two armies but between entire populations. Mass production, mass politics, and mass communications mobilized for mass destruction, as total war eliminated the distinction between state and society, military and civilian, and public and private spheres. Nevertheless, not only did the nation-state and mass armies appear together but also mass participation in total wars had a direct impact on the development of citizenship rights. It is no accident that a more inclusive society, together with the extension of suffrage and the development of the welfare state, emerged after two total wars, with military obligations intrinsically linked to citizenship rights.

Although nuclear weapons and the Soviet and American hegemonic geopolitical balance made war more or less safely cold for most of the latter half of 20th century, the collapse of communism triggered structural instability, creating conditions for the new forms of warfare. These new wars, linked to the processes of globalization, are two dominant types: predatory warfare and risk transfer war. Predatory war emerges in the context of failing post–cold war nation-states where new political elites rely on identity politics to mobilize ethnic and religious sentiments among the population. Employing paramilitaries and remnants of the collapsing state structure, these nation-states politicize cultural difference and wage genocidal wars on civilians while at the same time acquiring personal wealth and maintaining a hold on power. Wars based on the transfer of risk are waged by the most technologically advanced countries such as the United States and the United Kingdom. Their focus is on minimizing life risks to Western military personnel and consequently on minimizing electoral and political risks to the state leadership by transferring these risks directly to the weaker enemy. From the Falkland war of 1982, to the Gulf, Kosovo, Afghanistan, and Iraq wars, the reliance on technologically sophisticated weapons helps create the systematic transfer of risks from elected politicians to the military personnel and from them to the enemy combatants and their civilians. When the choice is between (foreign) civilian lives and the lives of Western soldiers, soldiers always have priority. These two forms of warfare are deeply interlinked by the forces of globalization as they erupt in the empty space that separates the coordinated machinery of global markets from the incoherent and disconnected forms of localized politics.

**War Crimes**

War crimes are serious violations of international humanitarian law during an armed conflict. Armed conflicts may be either international or internal (noninternational). International armed conflicts are
between two or more states, whereas internal armed conflicts occur within one state (e.g., a civil war). International humanitarian law, which is also referred to as the law of war, developed over many centuries through customary international law (i.e., law established from customs) rather than conventional international law (i.e., law established by international treaties ratified by states).

Historically, international humanitarian law is based on three principles that govern the conduct of military personnel during armed conflicts. The first principle is necessity, which states that what is necessary to achieve a military objective may be done. The second principle is humanity, which states that acts that cause unnecessary harm and suffering are unlawful. Whereas the principle of necessity states what may be done to achieve a military objective, the principle of humanity states what may not be done unless otherwise done by necessity. For example, it may be necessary to kill the enemy who is firing his weapon at you; however, it is unnecessary and inhumane to kill a prisoner of war or a person who has surrendered and is no longer a threat. The third principle is chivalry, which requires military personnel to fight honorably and respect each other during combat (e.g., respecting military and religious symbols as well as signs of neutrality). For example, if military personnel use the white flag, which means surrender, to draw their enemies closer to attack them, chivalry has been violated. Chivalry is also violated when religious symbols such as the star, crucifix, biblical text, or church are attacked or used to gain a military advantage. A sign of neutrality signifies nonparticipation in the armed conflict, therefore, not favoring one side over the other. The Red Cross is a universal symbol of neutrality, which is not to be attacked or used in favor of or against participants to achieve a military objective.

The first codification of international humanitarian law was the Lieber Code, named after its codifier Francis Lieber, in 1863, which was authorized by the U.S. War Department under President Abraham Lincoln in response to reports of atrocities committed during the American Civil War. The Lieber Code consisted of 157 articles defining how military personnel were to conduct themselves in the field.

Since the Lieber Code, there have been many international conventions that drafted treaties defining unlawful conduct and use of weapons during armed conflict. Most notably are the 1899 and 1907 Hague Conventions, which are referred to as Hague Law, and the four 1949 Geneva Conventions, which confirmed Hague Law, in addition to formulating many other rules and principles based on or expanding upon customary international law.

The 1949 Geneva Conventions were one result of the historic International Military Tribunal and its subsequent trials—the Nuremberg Trials—that prosecuted Nazi war criminals for their unlawful conduct during World War II. At Nuremberg the defendants were charged with war crimes defined as “namely, violations of the laws or customs of war...” At this time in 1945, there was only Hague Law and customary law to consider in determining if war crimes were committed. After the success of the Nuremberg Trials, the Trials for the Far East were established to prosecute Japanese war criminals for their egregious acts during World War II. Subsequent to the Nuremberg and Tokyo trials, the 1949 Geneva Conventions updated and modified the law of war, which if violated was considered to be a war crime.

The first international criminal tribunal to prosecute war crimes since the 1949 Geneva Conventions was the International Criminal Tribunal for the former Yugoslavia in 1993, which was established by the UN Security Council for the prosecution of genocide, crimes against humanity, and war crimes.

In 1994, the UN Security Council established the International Criminal Tribunal for Rwanda for the prosecution of genocide, crimes against humanity, and war crimes by applying Common Article 3. Article 3 of all four Geneva Conventions of 1949 applies certain offenses to internal armed conflicts. The conflict in Rwanda was internal, and therefore Common Article 3 was necessary to prosecute certain violations of the Geneva Conventions of 1949.

The International Criminal Tribunals for the former Yugoslavia and Rwanda were temporary courts established in response to particular conflicts. The International Criminal Court, established on July 1, 2002, is a permanent court that prosecutes individuals for genocide, crimes against humanity, war crimes, and the crime of aggression.

The two basic elements of war crimes are that the violation is serious and that it occurs during an armed conflict. The latter is to include that the serious violation has a connection to the armed conflict. No war, no war crime. For example, if a murder is committed in a state that is at war with another state, but the murder has no connection to the war itself, then a war
crime has not been committed; thus, the result is a murder that is to be prosecuted by the state with jurisdiction of crimes as such. Conversely, if a crime is committed in connection to a war but does not constitute a serious violation (e.g., a military personnel taking a loaf of bread from a village that has much food), then a war crime has not been committed, as the offense is not considered serious.

Water Organization

When water moves from rivers and reservoirs through canals and pipelines to fulfill crop consumptive needs, when it moves through urban water treatment plants to serve household and industrial requirements, when it is left in-stream for recreational and ecological purposes, it is because people have socially organized to make such things happen. How water organizations are socially constructed to capture, distribute, and dispose of any given society’s water resources has everything to do with human productivity, distributional equity, and environmental sustainability. Various forms of water organization critically impact a wide range of social problems, most obviously those in the domains of food, energy, health, land use, environmental quality, concentration of social power, and citizen participation in—or exclusion from—civic life. Careless water management has been associated with everything from disease transmission in a neighborhood to the demise of entire civilizations.

Water and Organized Collective Action

The organized control over water that has sustained all civilizations has been a product of various combinations of central state bureaucracies and local water providers that empowered individual citizens to do things collectively that could not be accomplished by individual producers and consumers in private marketplace exchange. Water organizations are necessitated in any state-level society and culture (as distinguished from a clan/folk level society) by a most fundamental need to manage human interdependence across large landscapes. Individual self-seeking rationality must somehow be reconciled with encompassing community requirements that can be fulfilled only by well-designed organizational effort.

Consider an example. Two individually rational farmers ponder the possibility of building an improved water course for channeling irrigation water to their adjacent fields. The total cost of improvement is $600. However, the benefits to farmer A equal only $400, whereas those to farmer B amount to $500. From the standpoint of their private rationalities, as disconnected unorganized social atoms, neither will build the improvement. Each individual does better not contributing while hoping that the other—in an economically irrational move—will build the improvement and thereby allow the noncontributing member to enjoy benefits of increased water supply and control; that is, take a “free ride” on the investment of the other party. They will fall into an equilibrium with each other that is much worse when compared to what they could gain together by organized cooperative action. From the standpoint of their collective joint benefit, the watercourse improvement should be made because together they will enjoy benefits worth $900, well in excess of the $600 cost.

The study of water organization, therefore, brings into sharp relief an age-old problem confronted by people in all cultures; that is, although people possess and act upon their private rationalities, they live not as disconnected social atoms but in continuous interdependence. People, in interaction, modify each other’s prospects. What one does, or is expected to do, conditions the actions of another. Social science research on water organizations permits systematic study of alternative ways in which human beings representing many water cultures manage their interdependence. If farmers A and B can devise organizational means of
holding each other accountable for making a “fair-share” contribution, if they can mutually ensure that the other will not defect from agreed-upon cooperative action, they can collectively transcend their private self-seeking rationality and empower themselves to do things together on behalf of themselves and the community of which they are a part.

**Themes**

There is a vast social science literature on the uses and limits of alternative ways human beings have organized their water resources. It may be roughly sorted into five categories: (1) water policy, (2) law, (3) large central bureaucratic organizations for capture and administration of water across large landscapes, (4) local organizations that take water wholesale from the large state-funded and -operated supply systems and then retail it to (5) individuals, farms, and firms. Of the many hypotheses that have been examined, some of the most important have had to do with the configuration of, and linkages among, local water organizations (category 4) that function between large supply-side state bureaucracies (category 3) and demand-side water users (category 5). Some specific forms of local water control organizations are seen as having the potential to provide the social and political space where people can blend principles of generalized science and technology with local site-specific circumstances, where people can be most effectively empowered to rapidly respond to local changes (e.g., climate and weather, shifting marketplace demands, facility breakdowns). Furthermore, such local water organizations have been found to be most effective at enforcing policy, law, and regulations essential to controlling would-be “free riders” to sustain cooperative actions. In at least some systems around the world, local water organizations have been cradles of participatory democratic civic life.

However, analysts have also been witness to many cases where local water organizations are not well designed and operated, where generalized science is not fitted to local site-specific realities, where locals are not enabled to be rapidly adaptive to challenges, where “free riding” runs rampant, and where there has been little effective citizen participation in water governance. The social science question becomes: “What factors explain the difference between productive, equitable, and ecologically sustainable water organizational systems and those which fail in these respects?” Such inquiry has led analysts to better comprehend a critical facet of the human social development project. There is nothing more social and political than water molecules in bulk because human beings in all cultural traditions have had to cope with the problem of how to manage their interdependence in and around water.

**WATER QUALITY**

Water quality is a general term to describe the purity of water, usually in a natural setting. Water that contains low concentrations of impurities or pollutants is generally said to be of high quality; water with many impurities or high concentrations of impurities is considered to be of low quality. Evaluation of water quality most often considers its suitability for a particular use. As a result, a body of water may be considered high quality for an industrial application, yet at the same time, be of too low a quality to serve as a drinking water source.

**What Are the Sources of Water Pollution?**

Degradation of the quality of a body of water most often results from pollution, defined here as an undesirable
change in the physical, chemical, or biological state of a system. Sources of pollution can be human-made or natural and are classified as either point sources or nonpoint sources. A point source is one that discharges pollution from specific locations, such as industrial discharge pipes, drainage ditches, and sewer outfalls. Because they are discrete and easily identified, point sources are relatively easy to monitor and regulate.

Nonpoint pollution sources, however, are much more problematic. They are diffuse sources, having no discrete discharge location into a specific body of water; some of them are also intermittent, discharging only after a major precipitation event. Because of their diffuse nature, they are much more difficult to identify. This makes them much more difficult to monitor and regulate. Nonpoint sources include farm fields, golf courses, construction areas, parking lots, and the atmosphere.

**How Are Water Pollutants Classified?**

In general, the lowered quality of water can have two major, often overlapping, effects: (1) disruption in the functioning of a natural ecosystem and (2) health problems for humans. The U.S. Environmental Protection Agency (EPA) has identified eight major categories of water pollutants based, in part, on their effects. The first category, oxygen-demanding wastes, includes materials such as animal manure and plant materials. The most common sources of these are agricultural runoff, food processing, paper manufacturing, and sewage.

Plant nutrients such as nitrates, phosphates, and ammonium are most often from fertilizers and manure used for agricultural purposes, urban use of fertilizers, and sewage. Sediment washed into water as a result of land erosion can also degrade the quality of water. Although erosion is a naturally occurring process, the rate of erosion can be greatly increased by human activities like construction. Heat, specifically hot water, can also seriously degrade the quality of water bodies into which it is discharged. The source of this hot water is the cooling water from power plants and other industrial facilities.

The remaining four categories of water pollutants can cause health problems for humans as well as disrupting natural ecosystems. The first group, pathogens, includes bacteria, viruses, and parasites. Usually introduced into water from human and animal waste, they have caused numerous outbreaks of serious illness throughout human history. Inorganic chemical pollution is most often the result of industrial discharges, surface runoff from developed areas, and improper disposal of household cleaners. This category includes materials such as salts, acids, caustics, and metal compounds.

In industrial societies, organic compounds are a major source of pollution to natural waters and are probably the single group with which people are most familiar. They can be discharged industrial and household sources as well as released as a result of agricultural use. This very large group includes pesticides, plastics, detergents, and petroleum products (oils, gasoline). Radioactive materials such as radon, iodine, cesium, and uranium can be discharged from a number of sources, including ore mining and processing, power plants, and natural sources.

**How Is Water Quality Regulated?**

At the federal level, water quality is regulated by the Clean Water Act and by the Safe Drinking Water Act. The Clean Water Act and its amendments regulate discharges from point sources through an enforceable permit system. The National Pollutant Discharge Elimination System (NPDES) established a way to control and eventually eliminate discharges of pollutants from point sources into U.S. surface waters. In many states, the state agency has taken over the day-to-day administration of the NPDES program, but EPA retains oversight authority and maintains the database of submitted water quality data. Nonpoint sources remain unregulated.

The Safe Drinking Water Act was passed to protect public water systems from chemical, physical, and biological contaminants. It does not address discharges but rather regulates the quality of the water provided by public water systems, defined as at least 15 connections, or greater than or equal to 25 people, or one that supplies water for more than 60 days per year. The development of drinking water standards is an ongoing project at EPA.

**What Are the Effects on Humans from Decreased Water Quality?**

A reliable source of high-quality water is a basic human need. When that source is destroyed or compromised in some way, the results can be devastating...
to individuals and to society as a whole. Perhaps the best-known recent U.S. example is Love Canal in upstate New York. The canal, originally built in the 1890s, was used during the 1940s and 1950s to dispose of tons of hazardous chemicals. After the landfill was closed, the area was covered over and the property sold and developed. By the 1970s, many homes were having problems with chemical odors and residues in the basements. More importantly, residents reported high incidents of miscarriages, birth defects, and chronic illnesses. In 1978, the New York State Department of Health evacuated residents in the area. Several hundred homes were demolished and cleanup activities begun. Although the area is now considered safe, few of the original residents have returned there. Because many of the chemicals found at Love Canal are carcinogens, many former residents live in fear of long-term health effects, even today.

Water Resources

Water is an essential resource. It is also a nonrenewable or finite resource: While water supplies can be regenerated by creating new water molecules from their elemental beginnings (hydrogen and oxygen), the energy required to create large usable pools of water is currently too energy costly to be feasible. Threatening water resources are scarcity, overuse, and pollution. Variations in weather oscillations between wet and dry periods can result in periods of drought, increasing population demands can result in overuse, and continued multiple uses of water resources for industry, irrigation, drinking water, and wastewater can reduce the usability of the water resource for one or many of its needed uses. As we are inherently dependent upon our water resources, protecting and maintaining usable water supplies are critical to sustaining our ecological, cultural, social, and economic well-being.

The value of water as a resource is dependent upon the water’s intended use (function), supply, demand, and cost.

Use

Off-stream use occurs when water is diverted away from its natural source (e.g., irrigation, thermolectric power, industry, and public drinking water), while in-stream is the use of water in its place (e.g., boating and transportation, hydroelectric power, and recreation). In 2000, the generation of thermolectric power accounted for 48 percent of off-stream water usage, followed by irrigation (34 percent); public water supply (11 percent); industry (5 percent); and domestic, livestock, aquaculture, and mining (3 percent). For most off-stream uses, water is consumed or not returned to the natural source. U.S. water consumption amounts to approximately 100 billion gallons daily.

Supply

Water exists in two forms: seawater (97.5 percent) and freshwater (2.5 percent of the world’s water supply). Of the 2.5 percent of freshwater, 1.5 percent is in the polar ice sheets, 0.65 percent is in groundwater, and 0.35 percent is surface water (streams and lakes). U.S. water supplies include seawater, surface water (streams and lakes), and groundwater. Because seawater requires desalination before most of its off-stream uses, only Texas, Florida, and California consider seawater a viable water resource. The major sources of U.S. surface water are five major watersheds: the Columbia River Watershed (Northwest), the Mississippi River Watershed (Great Plains and Midwest), the Colorado River Watershed (Southwest), the Rio Grande Watershed (Southwest and Texas), and
the St. Lawrence River Watershed (Great Lakes and Northeast). U.S. lakes and reservoirs hold approximately 26,550 cubic kilometers of water, with 22,573 cubic kilometers just in the Great Lakes. U.S. rivers hold approximately 250 cubic kilometers of water. U.S. groundwater comes from the many aquifers that underlie the landscape. The most heavily used aquifers are the High Plains or Ogallala Aquifer (Great Plains), the Central Valley aquifer system (California), the Mississippi River Valley alluvial aquifer (Mississippi River Valley), the Basin and Range basin-fill aquifers (West and Southwest), and the Floridan aquifer system (Florida).

**Demand**

The demand for water continues to grow along with the population: In 1960 in the United States, total withdrawals were an estimated 175 billion gallons daily when the population was 179 million; in 2000, total withdrawals were an estimated 408 billion gallons daily for a population of 281 million. In the past 30 years, the U.S. population has grown 52 percent while total water usage has tripled. On average, Americans use 100 gallons per day for everything from drinking, bathing, laundry, and watering lawns. Water demand is greatest in the western United States where per capita use is roughly 50 percent greater than in eastern states. This disparity is due mostly to the large volume of water used for crop irrigation in California. Crop irrigation in California, Idaho, Colorado, and Nebraska accounted for more than half the total withdrawals for irrigation in 2000.

**Cost**

With increasing demand, the cost of using and maintaining the nation’s water resources has increased. From the enactment of the Clean Water Act in 1972 to the year 1998, estimates from the U.S. Department of Commerce show that federal and local government expenditures for wastewater control increased from approximately $5 billion per year to $13 billion per year (in 1996 adjusted dollars). Overall, estimates place federal and private expenditures at over $540 billion on end-of-pipe water pollution control since 1972. The U.S. Environmental Protection Agency (EPA) also spent over $1 billion (1990–2000) to address nonpoint source pollution.

While these expenditures protect water resources, additional costs affect water usage. For instance, drinking water providers must constantly upgrade their plants with new technologies to remove a growing list of water contaminants regulated by the Safe Drinking Water Act. Advanced analytical methods make detection of other contaminants possible, such as pathogenic *E. coli*, human and veterinary medicines (e.g., antibiotics, steroids, and birth control hormones), personal care products, caffeine, pesticides, and herbicides—all found in both surface water and groundwater. Water treatment techniques such as ozonation, ultraviolet light treatment, activated carbon, or any combination of the three become exponentially costly as these systems also require upgrading to handle larger and larger demands. Plant upgrades can cost hundreds of millions of dollars. To assist with this need, EPA began the Drinking Water State Revolving Fund in 1997, which has since provided more than $9.5 billion worth of assistance to sustain the nation’s drinking water infrastructure. However, this is only a fraction of what is needed: EPA’s 1997 Drinking Water Infrastructure Needs Survey projected the necessity of a $138.4 billion investment over the next 20 years to ensure the continued source development, storage, treatment, and distribution of safe drinking water. Additionally, not only are our source waters threatened by scarcity and pollution, but distribution systems for clean and safe water are under growing security threats (e.g., terrorism). In 2006, EPA had a budget of $33 million to protect drinking water from terrorist attacks. The cumulative effect of these costs is reflected in the national per gallon cost of water. On average, U.S. consumers pay $2.00 for every 1,000 gallons of water. On the whole, 4 percent of the nation’s energy goes to treating and moving drinking water and wastewater.

*Denise Lani Pascual*

**Further Readings**

Consumer wealth is simply the value of assets less the debt that consumers owe. Major wealth categories are real estate, consumer durable goods, and financial assets such as checking and savings accounts, bonds, stocks, and the equity in noncorporate businesses.

Every 3 months the Board of Governors of the Federal Reserve System publishes the "Z.1" release, the Flow of Funds. These tables contain balance sheet and income data for all major parts of the U.S. economy.

Figure 1 shows how the total assets of the "Household and Nonprofit Organizations" have grown over the past 54 years. In their December 7, 2006, release, the Board reported that these assets had reached a record $67.1 trillion on September 30, 2006.

Figure 2 shows the pattern of liabilities of the segment. Total liabilities were not quite $13.0 trillion on September 30, 2006.

Figure 3 shows the net worth (assets less liabilities) of the sector. The stagnation in 2000–02 represents the impact of the crash of the stock market in 2000, which wiped out some $6 trillion of wealth. That has been more than made up with the increased value of residential real estate, which was worth $20.5 trillion as of September 30, 2006.

Total net worth of consumers on September 30, 2006, was a record $54.1 trillion. This is about 4 times the gross domestic product (GDP), the total value of goods and services produced for final demand with the borders of the United States. Total GDP was running at a seasonally adjusted annual rate of $13.3 trillion in the third quarter of 2006.

Figure 4 shows consumer wealth as a percentage of disposable personal income. Once again the impact of the big swings in stock prices in 1999 and the subsequent crash is obvious. Still, on September 30, 2006, Americans had a net worth 563.8 percent or 5.6 times greater than incomes after taxes.

The huge issue for the next 40 years or so is how will U.S. owners dispose of this wealth? Will it go to charities and universities, to the children of the wealth owners, to the government in taxes, or where? The only thing we know for certain is that the amounts transferred will be the largest in history.

The two richest people in the United States and the world are Bill Gates, who made his money as the cofounder of Microsoft, and Warren Buffett, who made his fortune through very astute investing. Both have announced they plan to give away most of their billions.

The Bill and Melinda Gates Foundation is now the largest foundation in the world, with assets of $31.7 billion. In 2006, Warren Buffett announced he was giving the bulk of his fortune to that foundation as well, because he thought its goals were admirable and that it
very efficiently funded good causes. His first installment of $1.6 billion was paid on August 24, 2006.

Wealth Disparities

Wealth disparities exist both within and across societies. The distribution of income and wealth within any given society is a reflection of its class structure. Individual wealth is the total accumulated value of people’s assets or property, commonly referred to as their “net worth.” Specifically, net worth is the value of all cash-convertible assets minus the value of all debts. Wealth is distinguished from income in that it includes assets that have a market value and that can generate income, such as dividends from stocks, bonds, or real estate. In contrast to income, which tends to be spent on living expenses, wealth generates more wealth via interest and dividends and is a phenomenon that endures over generations. Thus, wealth allows the rich to get richer. Even though income and wealth are clearly related, the distribution of wealth reflects more inequality than that of income.

In the United States, more so than in any other industrial democracy, wealth is concentrated in the hands of a very small segment of society. Statistics on wealth disparities show how much of the total wealth in a society accrues to each quintile of the population, ranked from highest to lowest wealth. Complete equality would exist if each population quintile owned 20 percent of wealth. According to recent U.S. government statistics, the wealthiest fifth of the population held about 85 percent of all wealth while the lowest fifth held −1.5 percent; in other words, the lowest fifth were in debt. The second richest quintile held 12 percent, the next lower one about 5 percent, and the one below that 1 percent of total wealth. The gap between

Figure 3  Net Worth: Households and Nonprofit Organizations
Source: Federal Reserve Board.

Figure 4  Net Worth as a Percentage of Disposable Income
Source: Federal Reserve Board.
the wealthiest segment of the population, measured as the top 1 percent, and everyone else has grown tremendously since the 1980s. Official statistics reflect that until 1972, the top 1 percent held about 24 percent of total U.S. wealth and that by 1998 that proportion had risen to 38 percent. The wealth gap appears to be increasing in times of economic growth, mainly because most of the benefits of a booming economy accrue to the top quintile of the wealth distribution.

The redistribution of income and wealth via the tax system is not as dramatic in the United States as it is in other advanced nations. The tax rates for both the highest and the lowest income group have declined in the past few decades, through a strategy intended to reduce poverty and increase investment from the top. Nevertheless, sales taxes are regressive, which means those with lower incomes spend relatively more of their income on necessities than do the rich. Overall trend data show that the average U.S. family is in increasingly large debt relative to their assets, mainly due to mortgage and credit card debt. The Federal Reserve reported the median net worth of U.S. families in 2004 at $93,100, that of white families at $140,700, that of nonwhite families at $24,800, and that of African American families at $20,400. Since 1995, white net worth has increased by 50 percent but nonwhite wealth, especially that of African Americans, has stagnated and remained at only about 14 to 18 percent of white wealth.

The United States currently has 269 billionaires, compared with the next highest of 29 in Japan and 28 in Germany. Five of the ten richest people in the world are U.S. citizens, and none are women. Among the top 20 billionaires, most are educated white men, who accumulated their wealth from technology, banking, and retailing. According to Forbes, in 2006 the top billionaires in the United States were Bill Gates ($50 billion, Microsoft), Warren Edward Buffett ($42 billion, investment banking), Paul Gardner Allen ($22 billion, Microsoft), followed by the five Waltons of Wal-Mart. The advantages of wealth clearly go beyond gaining economic leverage. Social scientists have documented that wealth also generates social status and political power. The wealthy are part of an elite able to convert wealth into political decision-making power via lobbying, campaign financing, funding of various causes, and gaining political office. In fact, a high proportion of U.S. senators and members of Congress come from wealthy families, and almost all presidents were born into wealth. In addition, wealth can buy other benefits associated with a privileged lifestyle, including living in a safe neighborhood and enjoying superior health care, leisure activities, and education for the children.

Social science theories explaining the persistence of wealth inequality in Western democracies focus mainly on social stratification systems and cultural processes legitimizing the unequal distribution of resources. Both the norms of distributive justice (fairness principles) and increasingly individualistic Western values, combined with global free enterprise economics, reinforce the perception that the wealth distribution is just—the rich have earned their wealth and the poor are to blame for their poverty.

The degree of wealth disparities within societies varies across nations. Cultural norms about what constitutes acceptable levels of inequality and poverty also vary among the nations. Compared with European countries, the gap between the richest segment and the rest of the population is much larger in the United States. The Scandinavian countries have the lowest wealth disparities, mainly due to their welfare states’ strong redistribution efforts. Inequality is greatest in the least economically developed regions of South America, South Asia, and sub-Saharan Africa.

In addition to varying cross-nationally within countries, wealth disparities also exist at the global level. The United Nations estimated that in 2001 the combined wealth of the three richest billionaires in the world exceeded the combined gross domestic product of the 48 least developed countries. When comparing countries according to their national wealth, the poorest nations are East Timor, Sierra Leone, and Somalia with a gross domestic product per capita of only $500 each; the richest nation is Luxembourg with $55,100, and Norway ties with the United States at $37,800. Although there is evidence that the globalization of industrial technology has helped the economic development of some Asian nations, transnational corporations, trade liberalization, and international debt relations often affect developing economies negatively. Depending on how globalization is defined and measured, social scientists conclude that globalization processes have had a mixed impact on global wealth inequalities.

WELFARE

Welfare policy in the United States is controversial. Given the country’s ethos of individualism and self-reliance, the public often blames the poor for their misfortunes and views those who receive public aid with distrust. Historically, both cash aid and publicly supported poorhouses reflected the philosophy that aid was meant mainly for widows with children and the indigent. The government’s approach to aid rests on a delineation of those who are worthy and unworthy.

The first welfare programs emerged following widespread unemployment during the economic downturn of the 1930s. Triggered by the stock market crash of 1929, the Great Depression was an era of rampant poverty; working-class families and the elderly were the hardest hit. President Franklin Roosevelt’s New Deal programs sought to provide relief to unemployed workers and their families. One of these was the Social Security Act of 1935, which marked the beginning of sustained U.S. welfare programs. This act created three programs: Old Age Assistance, Aid to the Blind, and Aid to Dependent Children, providing means-tested entitlements to low-income elderly, the blind, and poor children with absent fathers, respectively.

Other welfare programs were subsequently added since the 1935 Social Security Act. Between 1939 and 1943, the U.S. Department of Agriculture administered the first food stamps program. The U.S. food stamps program expanded throughout the 1960s and 1970s. By 1974, 15 million Americans were participating in this program. In 1965, Title XIX of the Social Security Act was passed, allowing low-income individuals access to a health insurance program now known as Medicaid.

Changes to the welfare system have occurred since these programs were enacted. For example, the Old Age Assistance and Aid to the Blind in 1974 later became known as Supplemental Security Income. Aid to Dependent Children later became known as Aid to Families with Dependent Children (AFDC), which was a federal program administered to provide financial assistance to needy families. AFDC later expanded its services through the 1964 Economic Opportunity Act by providing services around community development, job training, and housing. AFDC and other programs expanded in the 1970s due to increased activism among the poor and to changes in household composition. The program significantly reduced the number of poor Americans, especially among the elderly. The poverty rate dropped to a low of 11 percent in the 1970s, from a high of over 25 percent before the War on Poverty began in the 1960s. AFDC was subject to state-level funding and gave discretion to local service providers. The program continued the tradition of subjecting U.S. welfare aid recipients to public controls through means-tested measures.

Why Is Welfare Controversial?

The values and beliefs held by Americans often influence their opposition to welfare. Thus passage of welfare reform in the mid-1990s was due in part to the unpopularity of welfare and the feeling that those on welfare should become self-reliant. In the 1980s, during Ronald Reagan’s presidency, myths of welfare queens (those who misuse the system) driving Cadillacs helped to drum up support for welfare cutbacks. During the first Reagan administration, between 1981 and 1985, federal spending on welfare dropped 19 percent. With opponents socially constructing welfare recipients in a negative fashion, policymakers argued that public assistance contributed to multiple generations relying on cash assistance. They charged that AFDC eroded recipients’ work ethic, causing family breakups and discouraging fathers from providing for their families. During the 1996 welfare reform debate, politicians of varying perspectives echoed these sentiments.

On August 22, 1996, President Bill Clinton signed into law the Personal Responsibility and Work Opportunity Reconciliation Act, also known as welfare reform. President Clinton’s electoral campaign was to “end welfare as we know it.” With the new legislation, no longer are poor families entitled to a federal safety net, as the program switched benefits from an entitlement
to temporary assistance. Overall, this act saved $70 billion over the following 5 years. Welfare reform brought changes to the food stamps program and Supplemental Security Income and barred all legal immigrants from eligibility to receive federal means-tested programs until they became U.S. citizens.

Under welfare reform, AFDC no longer became a federal entitlement but a block grant, called Temporary Assistance for Needy Families (TANF). Federal law limits eligibility to TANF to a lifetime limit of 5 years and bars cash assistance to unwed minor mothers or children born to mothers on welfare. Because of welfare reform, state and local officials are now accountable for meeting work participation rates and ensuring that recipients are in work activities within several years of their initial receipt of assistance. Federal rules limit to 12 months the amount of vocational education that can be used toward work requirements. TANF requires that recipients must work as soon as they are job ready or no later than 2 years after coming on assistance. Single parents must participate in work activities for at least 30 hours per week, and two-parent families must participate in work activities 35 or 55 hours a week, depending upon circumstances. Failure to participate in work requirements can result in a reduction or termination of benefits to the family. However, states cannot penalize single parents with a child under 6 for failing to meet work requirements if they cannot find adequate child care. The program requires that states must ensure that 50 percent of all families and 90 percent of two-parent families are participating in work activities. States may extend assistance beyond 60 months to not more than 20 percent of their caseload.

States may use their federal TANF funds for the following: (a) to provide assistance to families so children can be cared for at home, (b) to provide job training, (c) to encourage formation of two-parent families, and (d) to reduce out-of-wedlock pregnancies. Furthermore, TANF requirements include not only work but also paternity disclosure.

**Challenges of Welfare Reform**

Since the passage of federal welfare reform, the welfare rolls have dropped dramatically. The challenge of welfare reform now rests with the states, which focus on moving welfare recipients to work. The 60-month time limits in TANF have major implications for low-income U.S. families. Because the design of TANF is to move recipients from welfare to work creating self-sufficiency, those who face time limits without employment can encounter homelessness and other hardships. These time limits were put into effect so that recipients would not become dependent and would instead seek employment and become self-reliant. Despite the intent of welfare reform to move individuals off welfare, the Administration for Children and Families has documented that moving recipients from welfare to work also involves working with personal and family challenges of welfare recipients, such as low levels of social and human capital, low education attainment, few work skills, lack of work experience, poor access to transportation, health problems, drug dependence, major depression, incarceration, and experiences of perceived workplace discrimination.

Overall, welfare rolls declined 57 percent for families and 64 percent for individuals from 1996 to 2005. According to the Administration for Children and Families, the four barriers to employment are substance abuse problems, mental health problems, learning disabilities, and domestic violence situations. Studies reveal that one out of three people drawing welfare are unable to find sustainable jobs or make enough to leave welfare dependency. Studies reveal that average wages for former recipients are less than $8 an hour and only one in three had health insurance in 2002. By 2000, a number of poorer states extended the 5-year limit as people were unable to find work. During the recent economic downturn, rolls began to rise again. In addition, advocates point out that as many as two thirds of welfare-eligible women experience abuse from a partner during their lifetime.

Structural and institutional barriers, such as the lack of access to job training programs, long-term employment, health care benefits, quality child care, and transportation assistance, prevent self-sufficiency. Child care is the largest state expenditure after cash assistance. Because TANF and the Personal Responsibility and Work Opportunity Reconciliation Act are subject to state budget crises, the funding of child care and transportation varies from state to state and budget to budget.

Studies reveal that most recipients are on welfare for less than 2 years and that 90 percent of TANF recipients are women with an average age of 31.1 years. The early success of TANF directly related to the booming economy of the Clinton era. More recent TANF changes include attempts to decrease spending on TANF through the Deficit Reduction Act of 2005, which requires states to engage more TANF cases in productive work activities leading to self-sufficiency.
Subsequent initiatives by the George W. Bush administration included the Healthy Marriages Initiative, which focused on early intervention, helping young adult couples establish stable and healthy relationships before the conception and birth of a child.

Critics of welfare reform point out that the conditions many women and families experience after exiting the welfare rolls are detrimental to their success and even survival—specifically, women’s vulnerability to low-wage, dead-end jobs, domestic violence, and poverty. They often continue to lack child care, health care, and other benefits most often missing among those in the low-wage labor market. Concerns also arise around domestic violence and welfare reform. Although TANF has measures for battered women (the Family Violence Option), advocates for victims of domestic violence suggest this policy has not been effectively implemented and does not address domestic violence. Overall, those who focus on getting individuals and their families off welfare rolls see TANF as a success. However, for those interested in the long-term success and mobility of those families, TANF has failed to pull many of them out of working poverty. Critics also point to TANF’s spotty record on child care, job training, and transportation.

Besides the reduction in case loads, supporters of the program also emphasize the slowing unwed birth rate, reduction in child poverty, and increased employment of young single mothers. Trends in public policy since the Reagan administration reflect legislation cutting back on public investments and the resorting to private and volunteer approaches to welfare. Welfare policy in the near future is likely to maintain the same course. Approaches to welfare under the George W. Bush administration were to increase work requirements. Further research needs to explore the institutional barriers that hinder low-income individuals from finding meaningful employment as well as a discussion on how to facilitate aiding hard-to-reach populations. In addition, more research needs to examine whether those who are working are able, or not able, to achieve economic self-sufficiency.

WELFARE CAPITALISM

Welfare capitalism is a term that social scientists employ to define a specific form of regulating industrial relations and of controlling class struggles. With the onset of industrialization, advanced economies faced several problems and restrictions. At a more general level, constant revolutionizing of production and increasing degrees of urbanization and proletarianization undermined the previous socioeconomic foundations of these societies and led to social unrest, uncertainty, and poverty. Proletarianization refers to a social process by which an increasing number of the population, who were previously small producers or self-employed, lose their control over the means of production and become absorbed into the working class; that is, they have to sell their labor power to an employer. Deteriorating work conditions, increasing exploitation, and alienation caused dissatisfaction at work; these things in turn resulted in high turnover rates, absenteeism, indifference, drunkenness, violence, strikes, militancy among workers, and unionization,
followed by a significant decline in productivity. While the Western European response to these consequences of industrialization was to develop government-operated welfare programs and to establish a corporatist form of collective bargaining, in the United States the private sector took the lead. The main motive behind the American approach was to regulate social problems, and thus industrial conflict, without any state intervention and without the mediation of trade unions. In this regard, welfare capitalism evolved as a generic label for the liberal U.S. welfare system; more concretely, it refers to a collection of ideas and methods designed to improve capital-labor relations in the United States at a particular period, extending from the 1880s until the 1930s.

Welfare capitalism had five main components. At first, it aimed at maximizing surplus value production through reducing the reproduction cost of labor power. During a period when reproduction conditions were scarce, welfare capitalists employed various tools, ranging from company-sponsored housing, well-lit cafeterias, and company stores to schools, theaters, churches, libraries, recreational facilities, and musical groups; from profit sharing and stock ownership plans, to insurance programs, medical care, pensions, and social work. Companies also supported interaction between workers and village-level administrators (i.e., teachers, welfare workers, medical personnel) and encouraged religious ties in worker communities. The classic example of this is the first company-town led by Pullman Palace Car Company. Built within the city limits of Chicago in 1880, Pullman Village hosted 6,000 company employees and their dependents. The residents were required to live along the lines set by the company, which rested on thrift, neatness, cleanliness, family values, sobriety, good morals, and the like. This model town survived until 1894 when a bitter strike ended its existence.

On the other hand, company-led residences also facilitated the transformation of a rural population into an urban industrial workforce. In this relation, the existence of a high number of agrarian and craft-oriented workers within the labor force allowed employers to utilize various motifs such as noblesse oblige, paternalism, and moral individualism. In other words, they emphasized that every individual has a responsibility toward the needy and the poor, so that the large corporation could become a home of solidarity. Then, it was the moral duty of employers to share some of the profits with workers in the pursuit of common goals. Stripped of its dominant paternalistic veneer, these provisions extensively addressed the organization of the workers’ lives outside as well as inside the workplace. These measures also dealt with the second and third problems; that is, how to bind workers to the jobs in order to increase efficiency and how to socialize and integrate foreign workers—many of whom had only recently immigrated from Southern and Eastern Europe—into the disciplined and Americanized labor force.

The problem of underconsumption in the U.S. economy at that period led to the fourth concern. In response to this, Henry Ford (Ford Motor Company) announced a Five Dollar a Day program in 1914. The program was a combination of a cut in the workweek from 6 to 5 days, a reduction in the length of the workday from 9 to 8 hours, and a raise in minimum daily pay from $2.34 to $5. To be eligible for this program, however, workers had to meet certain conditions. To control and direct the needs and habits of workers, Ford set up a “social department” in his company. Indeed, inspectors went to workers’ houses to observe how they conducted their lives and to teach them how to budget their money. For the latter, a special Ford bank was set up to encourage savings and loans for workers. Ford assumed that higher wages and cheapening of wage goods would raise the standards of living of the industrial worker and, in turn, would increase the levels of social consumption. The company recorded a success. Indeed, the rate of turnover fell down, absenteeism and incidents of disease decreased, and productivity increased. Although the program was cancelled after a few years, its basic principles became a part of a macro-social regime of accumulation usually called Fordism. This involved specific forms of production, as well as social consumption norms, and became a dominant paradigm for social and economic development in Western industrial countries at a later period.

Last but not least, welfare capitalists were strongly intent on keeping workers away from unionization. To this end, they established company unions and distributed most welfare programs through them. Hence, the employee representation system became a core mechanism for airing workers’ grievances and negotiating labor contracts. In spite of a relatively union-free environment, however, spy networks, blacklists, and strikebreakers prevailed, even in the heyday of welfare capitalism. Controlled unionism helped employers to build employee loyalty and inhibited the right of
workers to organize and strike and to demand higher wages, shorter hours, and better working conditions. Moreover, despite its all-encompassing discourse, welfare capitalism widened the gap between the skilled and the unskilled worker. To illustrate, in company towns while mass workers contended with mean row houses, skilled employees benefited with better residential conditions. Far from alleviating racial, ethnic, and/or gender inequalities, those programs actually aggravated them. Studies of Pullman and some other industries showed that allocation of jobs on the basis of these differences during the period strategically undermined the collective strength of labor.

During the interwar period, welfare capitalism took hold as the railroads and the largest industrial corporations such as Standard Oil, International Harvester, United States Steel, and Western Electric Company adopted it, in addition to Pullman and Ford. A 1926 survey revealed that 80 percent of the 1,500 largest companies had adopted at least one type of welfarism, and almost 50 percent of them established comprehensive welfare schemes. Some corporations even considered providing unemployment benefits. Nevertheless, it was still a practice limited to a number of large corporations and, at most, 14 percent of workers were covered by these pension plans according to a 1929 survey. More importantly, these programs, once adopted, were not implemented without interruptions. During crisis periods such as 1893–94 and 1921, most companies cut back or postponed their welfare schemes, although the U.S. Bureau of Labor statistics recorded that the total cost of these programs never went beyond 2 percent of the total wage costs of these companies.

Despite widespread agreement that the Great Depression led to the end of welfare capitalism, some analysts state otherwise. One argument is that the New Deal of the 1930s did not replace welfarism, but instead welfarism evolved and survived in the post-depression era. The explosive growth of private pensions or health and disability insurance program in the United States is simply the continuation of private welfarism. Furthermore, studies also differ in their interpretation of its decline. Whereas some argue that welfarism was waning even before the Great Depression, others hold the Great Depression as mainly responsible for the demise of welfarism.

Another perspective is that its collapse was due to its inability to include workers successfully in the decision-making process; that is, the terms of industrial relations. Broader analysis, however, focuses on economic, political, and social developments that irrevocably altered the relationship between capital and labor in the late 1920s. On the one hand, destruction of craft work and increasing mechanization altered the patterns of labor control over the production process. On the other hand, the end of the overinvestment boom, unused industrial capacity, and debt obligations led to insecurity, uncertainty, and high unemployment. As a result, workers turned to trade unions in search for solidarity and to the government for a different paradigm that would go beyond company-level solutions. Hence, transformation from competitive to monopoly capitalism gave rise to a new stable system of industrial relations in the United States. The New Deal, in general, and the Wagner Act (National Labor Relations Act) of 1935, in particular, brought a virtual end to welfare capitalism and laid down the foundations for unionization, collective bargaining, and the right to strike.

WELFARE STATES

The term welfare state is strongly associated with socioeconomic policies adopted in advanced capitalist economies particularly after 1945, which rested on the conviction that societies can be shaped by conscious policies designed by state institutions to eliminate abuses resulting from the market process within a capitalist economy. Nevertheless, both the idea and
various welfare practices existed before the postwar period. The oldest of these traces back to social insurance programs in Germany in the 1880s. While the French government set up similar pension plans in 1910, the British government introduced a national insurance system, old-age pensions, and health and compulsory unemployment insurance systems in 1911, and the Swedes initiated the first compulsory and universal pension system in 1913. The only national program in the United States was the old-age insurance program initiated by the Social Security Act in 1935, leaving implementation of other welfare plans to individual states. However, these early programs were limited in scope, and after World War II the government transformed them into more comprehensive programs of universal benefits.

A growing literature examines why welfare states expanded after 1945, and the most comprehensive variations of these studies begin with a theory of advanced capitalism. Prior to this period, the leading capitalist countries experienced high unemployment levels, severe inflation rates, government deficits, productivity declines, and increasing inequality. Although various combinations of public and private solutions attempted to prevent social unrest, broader developments irrevocably altered the economic, political, and social environment after World War II. Therefore, these countries reconsidered their idolization of the market and put greater emphasis on state intervention in the economy. On the one hand, the welfare state was to ensure the reproduction of all conditions of production. State regulation, then, emerged as an essential basis of economic process as well as the precondition for the maintenance of an adequate labor force for new patterns of production. On the other hand, the idea behind the welfare state depended heavily on a compromise between social actors in the face of a powerful material and ideological competitor, socialism, which threatened the very existence of the capitalist system. The state’s role, then, would be to mitigate class conflict and to balance the asymmetric power relation between labor and capital. Labor unions were recognized as the legitimate economic and political representatives of working class both in collective bargaining process and public policy formulation.

Within this context, ideas of John Maynard Keynes (1883–1946) provided the ideological justification and theoretical basis of welfare states at a time when the Great Depression still had its hold on industrialized economies, and neoclassical economics offered no clear solutions. Keynes argued that public expenditures could maintain a certain demand level without affecting profits and smooth out the fluctuations of the market. Moreover, he claimed that monetary expansion, by controlling the level of interest rates, would result in investments that would create new jobs. With the widespread acceptance of Keynesian assumptions after 1945, government fiscal and monetary policies ensured an environment for a nonhostile labor force and favored the growth of mass markets and standardized patterns of consumption. Indeed, the period between 1945 and 1960s is generally referred to as the “Golden Age” of capitalism.

Welfare expenditures in Western democracies included various practices such as labor protection legislation, minimum wages, unemployment benefits, and other comprehensive compulsory insurance programs. The growth of the welfare state also contributed to increases in other public expenditures such as education, health, state-subsidized housing, and so on. The public sector undertook necessary infrastructure investments; that is, railways, telecommunications, water, coal, gas, and electricity supply. Moreover, because the idea of the welfare state rested on the principles of equal opportunity, adequate distribution of wealth, and public responsibility, it also aimed at constituting a broader safety net that would protect its subjects from risks such as lifelong disability following a workplace accident and/or risk of loss of spouse or parent and being left without support.

Although most modern industrial societies instituted at least some of these measures, countries developed their own national versions. This led analysts to distinguish these variations. Most influential and widely used is Gøsta Esping-Andersen’s threefold categorization: the social democratic model (Scandinavian countries); the liberal model (United States, Canada, Australia, and United Kingdom); and the conservative model (Germany, France, Austria, and Italy). The main criteria behind these different welfare regimes were their degree of de-commodification; that is, the relative independence of the system from the compulsion and risks of the market. These differences emerged from the nature of class mobilization, class-political coalition structures, and regime institutionalization in each country and decisively affected the articulation of political demands, class cohesion, and the scope for labor-party action. Recently, a fourth, “familialistic” type evolved for late-developing; peripheral southern European or Mediterranean
economies, since similar social-demographic trends, economic constraints, and patterns of public policy exist among these countries, such as large agrarian sectors, traditional social structures, and family capitalism. However, after the 1970s, the world economy experienced serious challenges: Productivity slowed down, inflation rates rose, the international monetary system broke down, competition among national economies increased, and foreign debt ratios exploded. Although debate continues, some experts called the welfare state a major drain on economic growth and competitiveness. Critics contended that the high involvement of government with welfare expenditures was a misallocation of resources that might otherwise have gone into more productive investments. These arguments found their intellectual culmination in neoliberal and monetarist doctrines and their political support from New Right governments, such as those of Margaret Thatcher in the United Kingdom and Ronald Reagan in the United States. Since then, governments in many countries have implemented significant reductions in welfare state expenditures. Nevertheless, their pace and degree depend heavily upon which of the three welfare regimes existed in the previous period.

**White-Collar Crime**

White-collar crime encompasses overt and hidden misconduct and transgressions by corporations, professionals, and political officials who engage in a wide variety of regulatory, civil, and criminal wrongdoing. The broad categorization of white-collar crime may involve anti-trust conspiracies, insider trading, defective products, insurance fraud, dangerous medical devices, unwanted surgeries, or political bribery. In the late 1970s, for example, the Ford Motor Company released the Pinto, a car that the company knew might explode upon impact because of a defective part. Ultimately, company officials were charged with reckless homicide. The savings and loans scandal that erupted in the 1980s, a time period referred to the “decade of greed,” resulted in widespread fraud and embezzlement after the U.S. Congress deregulated the industry to promote a more competitive marketplace. Religious leader Jim Bakker created a Ponzi scheme under the auspices of Christianity and bilked followers of millions of dollars in bogus real estate deals. In 1995, a serious case of medical fraud emerged when doctors were accused of stealing eggs and embryos from patients at a fertility clinic in California. More recently, the implosion of Enron and WorldCom resulted in intense scrutiny over corporate crimes, with investigations and indictments pursued against chief executive officers who had played fast and loose in their business practices.

**Historical Perspectives**

Edwin H. Sutherland first called attention to “crime-in-the-suites” versus “crime-in-the-streets” in his 1939 presidential address at the then-named American Sociological Society meeting in Philadelphia. He followed up with the publication of the first scholarly book devoted to the subject, *White Collar Crime*, in 1949. Sutherland believed that scholars and officials had long overlooked crimes of the elite and that existing criminological theories on the nature and causes of such crimes were woefully inadequate to explain white-collar misconduct. His theory of differential association posited that the causes of crime were closely tied to involvement with deviant peer groups and the acceptance of an excess of definitions favorable to law-breaking. Sutherland’s early research examined criminal convictions, civil judgments, and regulatory violations against major corporations in the United States, finding that all 70 entities he researched had engaged in one or more illegal activity.

Other early influential scholars in the field include Marshall B. Clinard and Donald Cressey. Clinard’s 1980 book, *Corporate Crime*, revealed that the 582 largest corporations in the United States had engaged in 1,553 violations of federal law, averaging 4 per
company. Cressey’s in-depth interviews with convicted embezzlers found that offenders tended to have a nonsharable financial problem and, when presented with the opportunity, rationalized their illegal behavior as borrowing. Current research shows that, like other varieties of criminal behavior, certain large companies could easily be labeled habitual offenders or career criminals.

Gilbert Geis, a prominent criminologist, has championed the continued exploration of white-collar crime in his extensive writings and research. His work “Heavy Electrical Equipment Antitrust Case of 1961” is heralded as a classic in the field. The case involved extensive violations of the Sherman Antitrust Act of 1890 that prohibited price-fixing. General Electric and Westinghouse Electric executives engaged in criminal offenses that restrained free trade by conspiring to fix prices that would undermine or eliminate competition. The case resulted in a 20-count grand jury indictment that included 45 individual actors and 29 corporations. A guilty plea resulted in fines of almost $2 million and 7 convictions with jail terms of 30 days with time off for good behavior. Some, however, viewed the punishment as extraordinarily lenient, as General Electric easily could consider a $500,000 loss as no more punitive than a man with an annual income of $175,000 might consider a $3 parking fine. Geis’s analysis thus offered many insights into the specific nature, techniques, and offender characteristics involved in corporate deviance.

**Definitions: Offense or Offender?**

Initial debates between Sutherland and legal scholar Paul Tappan set the stage for controversies over definitions of white-collar crime that remain unresolved. Sutherland’s definition of white-collar crime emphasized the respectability and social status of the offender who, abetted by occupational position, engaged in illegal or unethical acts. In contrast, Tappan argued that conviction of a crime denoted the real criminal. Offense-based definitions emphasize the criminal act or specific regulatory violation, leading to the development of numerous typologies delineating elite crime. A primary distinction is the difference between corporate and occupational crime. Corporate crimes include illegal acts committed on behalf of the organization, whereas occupational crimes denote an individual level involvement, such as doctors or lawyers who engage in fraud for personal gain or embezzlers who take advantage of their employers.

Gendered varieties of white-collar crime have emerged as an increasing number of women move into positions that afford them the opportunity to engage in large-scale embezzlement and fraud. Martha Stewart, for example, became enmeshed in a stock trading scandal that included accusations of insider trading and, ultimately, her imprisonment for lying to federal investigators, engaging in a conspiracy, and obstructing justice. The Stewart case called attention to the misdeeds of women in the corporate and professional realms who have moved from pink-collar crimes, such as check kiting, shoplifting, and small-scale embezzlement, to major acts of fraud. Historically, their limited opportunity resulted in fewer women involved in white-collar crime, but, with the elimination of the traditional boundaries between the private and public spheres, gendered varieties of white-collar have become more common.

**Motive and Opportunity**

White-collar crimes often go undetected and, if they are detected, offenders are likely to have enough financial and political clout to circumvent arrest, conviction, and punishment. The difficulties of detecting and investigating often relate to the complexity of the accounting schemes, the lack of a substantial paper trail, and the victim’s reluctance to step forward. In many cases, a whistle-blower is responsible for calling attention to the wrongdoing and providing evidence against an organization or individual, despite the serious reprisals and labels such as “tattle-tale” or “ratfink.” Frank Serpico, a former New York police detective, reported deep-seated corruption in the agency and became an enemy among his peers because of his role as a whistle-blower. In contrast, Sherron Watkins, Cynthia Cooper, and Coleen Rowley were named *Time* magazine persons of the year in 2002 for their roles in reporting accounting problems and cover-ups by Enron, WorldCom, and the Federal Bureau of Investigation.

One reason why trusted, well-paid employees jeopardize their livelihoods and reputation by committing white-collar crime, more often than not, develops from the need or desire for money. In many known cases, gambling, extravagant living, and costly personal problems or the mere desire for more money and material possessions serve as strong motivators. The pursuit of the American Dream (the acquisition of success, wealth, and material goods) and the “culture of competition” (win at all costs) play important roles.
in helping explain why prominent companies and executives engage in wrongdoing.

**Costs and Consequences**

Estimates of the costs of white-collar crime exceed those of street crime and, though difficult to determine, reach as much as $250 billion annually. Taxpayers suffer many of the losses and pay hundreds of billions of dollars to cover the costs of white-collar crimes. The estimated bailout for the savings and loan scandal cost taxpayers hundreds of billions of dollars. The cost of insurance fraud against private and government providers is estimated to be $100 billion a year. In addition to the financial costs, white-collar crime presents physical dangers that result from toxic chemical dumping, unsafe products, or workplace hazards. Unsafe working conditions at a North Carolina chicken processing plant killed 25 employees after a fire erupted because managers ignored government safety regulations. So widespread is this form of white-collar crime that experts place the number of deaths above the number of actual homicides.

Past convictions resulted in lenient treatment of offenders, often hindered by the inability to incarcerate a corporation. In fact, executives once viewed fines for misconduct as just another cost of doing business. In the 21st century, however, greater public awareness has resulted in increased concern, less tolerance for white-collar crime, and more vigorous state and federal prosecution of elite deviance, leading to more convictions, larger fines, and imprisonment.

**WHITE FLIGHT**

The term *white flight* refers to the phenomenon of whites, usually upper and middle class, rapidly moving out of cities and into suburbs as blacks and other minorities move in. The result is residential segregation that leaves cities poorer and minority residents stranded in the city center. This demographic change strains the fiscal resources of central city governments, leaving inner-city residents with the prospect of increased taxes, diminished public services, and higher levels of unemployment.

While white flight may also occur when the newcomers are Latinos/as, other immigrants, and on rare occasions, Asians, white flight happens more often, more rapidly, and more completely when the incoming group is black. First used to describe the massive demographic shifts that took place in the period just after World War II, white flight has also occurred since then, particularly in cities throughout the northeastern, midwestern, and western United States.

From 1914 to 1960, millions of blacks left the U.S. South in search of better job opportunities and greater racial tolerance in other parts of the country. Many settled in cities such as Chicago, and the overcrowded conditions created by the influx of blacks prompted many whites to seek housing elsewhere. A post–World War II housing boom made it possible for many whites to move into newly constructed homes in the suburbs, leading to what has been called “suburbanization.” Suburbanization peaked during the period from 1950 to 1960, when the total suburban populations increased by well over 60 percent. During the same period, according to data from the U.S. Census Bureau, central city populations rose by only 3 percent.

Residential change in Chicago during the postwar era offers a classic case of white flight, as whites
moved beyond the city limits in a pattern of concentric circles, resulting in population loss and economic decline in the central areas. In a few short years, the population of vast areas of Chicago became virtually all black. Other cities, including Detroit, Memphis, St. Louis, Cleveland, Philadelphia, New York, Washington, D.C., and Los Angeles, also experienced noticeable population shifts, with the first three losing more than half of their white populations to white flight. Residential segregation thus became a prominent feature of the spatial organization of U.S. cities in the years after World War II.

The factors contributing to white flight have been hotly debated, but the effectiveness with which the color line remained in many cities despite massive population shifts led many to cite racism and discrimination as important factors. African Americans were routinely and systematically barred from purchasing homes in predominantly white neighborhoods by practices such as blockbusting, redlining, racial steering, and racist real-estate covenants. Whereas blacks faced such restrictions, whites wishing to make the transition to the suburbs benefited from such incentives as federally subsidized home mortgages.

Some researchers also claim that the increase of blacks and other minorities in public schools contributes to white flight. In 1954, Brown v. Board of Education called for the desegregation of public schools. Many whites who had remained in the city decided to move to the virtually all-white suburbs to ensure that their children would not have to go to school with black children. Racial tensions and riots were also a key factor influencing white flight, and the outbreak of race riots in many major cities during the 1960s confirmed for many that cities were increasingly hostile places to live. In the summer of 1967, President Johnson created the National Advisory Commission on Civil Disorders, also known as the Kerner Commission, which warned that the nation was moving toward two societies: “one black, one white—separate and unequal.” The assassination of Martin Luther King Jr. on April 4, 1968, set off another wave of riots nationwide, resulting in even greater white flight to the suburbs.

Some researchers question the role that racism and discrimination play in white flight and propose that this process may not have occurred because of prejudice toward blacks but because of “unpleasant” conditions in cities, ranging from noise and congestion to a lack of job opportunities. Others claim that whites (just as other racial groups) simply prefer to live among those who are racially similar and that the observed changes in residential patterns are due to simple neighborhood succession. These explanations, though, do not account for the rapid rate of change or for the racial disparity between those who live in cities and those who live in the suburbs. Other researchers determined that although suburban whites did not cite racist feelings toward blacks as reasons for moving out of cities, many of the reasons that they did cite—including decreased land values, higher crime levels, lower-quality public schools, and a decline in the prestige of a neighborhood—are rooted in racism and its consequences.

Recently, interesting cases of what some are calling “black flight” have occurred in cities such as Detroit and St. Louis, with middle-class blacks leaving the cities in search of better social and educational opportunities in suburbs and parts of the U.S. South. Traditional cases of white flight occur internationally as well, with British cities such as London, Manchester, and Birmingham experiencing a decline in their black populations and an increase in their black and South Asian populations. Domestically, white flight from public schools in cities such as Boulder, Milwaukee, and Chicago continues to create challenges for policymakers. These examples, in addition to the persistence of racial segregation in many U.S. neighborhoods, affirm the need for ongoing evaluations of racial prejudice, economic trends, and social policies and their impact on residential preferences and mobility.

WHITE SUPREMACY

White supremacy has two different overlapping meanings, resulting in somewhat distinct literatures. The more all-encompassing literature deals with “cultural studies” and “critical race theory” and views white supremacy as an endemic part of Western culture and society. The other, more traditional approach narrowly focuses on white supremacy as primarily an activist phenomenon, a social movement and/or ideology; its studies focus on organized groups such as the Ku Klux Klan.

Endemic White Supremacy

In this perspective white supremacy is so historically infused into Western culture and embedded into social structure that to speak of “society” in the U.S., European, or postcolonial context is, practically, to speak of white supremacy, as well as “racism,” “white privilege,” and “Eurocentric domination” on a global scale. All are parts of the whole, sometimes called “racialized social structures”—political and cultural systems that perpetuate inequality across racialized groups of people.

Proponents hold that to understand white supremacy, one must understand, or at least acknowledge, the roots of these social structures in European (white) colonialism. “Race” itself was invented through colonizers’ efforts to understand and rationalize the differences between themselves and the people they subjugated. Thus, “race” explains and maintains inequality, and to this day we live in a fundamentally unjust world built by race.

Individual attitudes, utterances, or discriminatory acts are rarely at issue in this literature, except in reinforcing assumptions that “white is right,” or that whites’ cultural ways are normative and proper. For example, whites often see their styles of social interaction as “normal” (rather than culturally white), and nonwhite Christians sometimes uncritically absorb images of a white (Europeanized) Jesus.

Scholars say white supremacy has changed over time, evolving particularly in terms of strategies for its self-preservation. As domination by repression and terror ended in the mid-20th century, white supremacy metamorphosed into “domination by seduction.” Thus, many recent scholars focus on how it continues without overtly racist whites, often invoking the term color-blind racism to characterize political ideologies that ahistorically champion property and individual rights yet deny the racial history of collective repression, thereby ensuring policies that do not threaten white control over most of the power and wealth in the world.

Activist White Supremacy

The second approach to white supremacy involves active white supremacists who overtly proclaim, in one way or another, that there exists a distinct race of people (“whites”) who have a special place in humanity, are in many ways superior to nonwhites, and require segregation to avoid social, cultural, and biological contamination by nonwhites. These include a diverse set of groups who maintain that white interests must be actively protected and advanced: the Ku Klux Klan, neo-Nazis, Aryan Brotherhood, Christian Identity, Skinheads, and some militia groups, for example.

Researchers study these organizations and subcultures, also focusing on a burgeoning cyberculture. Similarities include almost universal antipathy toward Jews, blacks, and homosexuals. Nevertheless, white supremacists remain ideologically fractured, with many differences in ideology regarding religion, the use of violence, or even who is “white.”

White supremacists instill fear not only because of their past terrorism but also because of recent hate crimes and proclamations ranging from dismantling welfare programs to terrorist “racial holy war” (“RAHOWA”). Weakened after World War II and again in the wake of the 1960s civil rights movement, organized white supremacists have since rejuvenated, according to watchdog organizations, such as the Intelligence Project and the Anti-Defamation League, who monitor white supremacist activities and harbor concerns that these groups might successfully tap into incipient racial hatred, especially among impressionable white youths.

Keenly aware of their socially marginal status as cognitive deviants, white supremacists try to overcome their stigma. Rarely do they refer to themselves as racists or as white supremacists; they are more likely to use more nebulous terms like racialist or white separatist or, in the U.S. context, patriots. Their public rhetoric places less emphasis on genetic superiority (while never denying it) and more on white cultural and individual rights, especially rights to live
separately from nonwhites (in “white” countries). They present themselves as less rabid and more rational, less ignorant and more sophisticated. Impression management also involves portraying whites as victims of a government supposedly manipulated by Jews with black assistance, feeding into a defensive rhetoric of preserving both a cultural heritage and the white race itself. They vilify whites who disagree as “race-traitors,” their racial consciousness subverted by “multicultural” propaganda, often traced to the media and Hollywood, both allegedly run by Jews for this very purpose of mind control.

While highly diverse, white supremacists tend to come from the lower or working classes, rural areas, and low educational backgrounds. However, their situations may simply result in racially homogeneous social networks, and therefore they may have little ordinary social interaction with blacks, Jews, or gays. Similarly, as with religious cults, most join as a result of ordinary social networks in which they find themselves, not through formal recruitment. Those who remain involved do so in part because the subculture provides them with a sense of identity and meaning. Of course, some members also grew up in white supremacist families. Some researchers argue that members’ racial hatred is often more an outgrowth from these social settings than a cause.

White supremacists consistently oppose immigration (of nonwhites), and their rhetoric—once concerned with “states’ rights” and communism—now focuses more on opposing affirmative action, welfare, and foreign aid (especially to Israel). Although women have long been actively involved in white supremacist organizations and never merely passive and uninvolved followers of their men into the movement, white supremacist subcultures have tended to be strongly patriarchal and anti-feminist. White supremacist men are as concerned with white masculinity as with whiteness. They often express particular concern about racial miscegenation, coupled (verbally or in print) with images of black males as violent sexual predators seeking white women.

Marginalized, activist white supremacists have created parallel institutions within which they can interact without nonwhites, such as at annual conferences and racist music concerts. They have also been very active on the Internet, using it to create social networks that are increasingly international in scope.

Widowhood

Widowhood is the common term for the loss of a spouse, either male or female. This altered marital status requires life adjustments by the surviving partner to maintain a meaningful and fulfilled life after the loss. According to the 2000 U.S. Census, 11.3 million widows overshadow the 2.6 million widowers and 50 to 70 percent of women over the age of 65 are widowed, while their male counterparts constitute only 12 to 20 percent.

Whereas widowhood issues were once dominated by the elderly, due to rising population rates and world instability (i.e., accidents, war, illness, civil unrest) widowhood rates are significantly increasing in all age and gender cohorts. No matter the age, widowhood represents a life transition to singlehood, including managing life’s complexities and unfamiliar responsibilities formerly borne by two individuals but now delegated to the sole survivor.

Although both widows and widowers may experience grieving equally in depth, gender issues in grief studies suggest diverse areas of differentiation. In general, women seem to grieve more publicly and intensely, whereas males bear grief more passively...
and privately, thus resulting in slower emotional recoveries. Contributing factors of age, familial responsibilities, finances, and familial support, along with the strength of social and emotional connections, become important elements of the intensity and the duration of widowhood bereavement.

Grieving factors are distinctive and individualistic in practice. Generally, women tend to perceive the loss with greater emotional anxiety. In contrast to the emotional significance of the funeral for a widow, for example, widowers often desire to make peace with the loss and move on, thus placing less emphasis on the milestone that this rite represents. Men tend to be control and reality oriented, displaying less tendency toward sharing, perhaps due to a lifelong pattern of restraining their emotions, contrasted with women, who seek out support, camaraderie, and channels of communication, thereby connecting therapeutically with other widows experiencing the same circumstances. The aftermath of spousal bereavement includes many psychological, emotional, and social upheavals for both genders. Grief symptoms may include eating and sleep disorders, preoccupation, malaise, physical ailments, confusion, communication difficulties, social ineptitude, depression, and loneliness. Combining these already existing symptoms with difficult external influences could heighten grief and often require medical attention.

Widowhood encompasses more than just the death of a partner. The aftermath effects extend to the lives of all surviving familial members. The welfare of the family unit now rests on the newly widowed person. Responsibilities once shouldered by both partners, such as daily living issues and tasks, finances, and social demands, now require the sole survivor to make major decisions. In many cases role reversal responsibilities become overwhelming for the grieving spouse.

Younger widows and widowers have initially shown stronger psychological distress due to the unanticipated death of their spouses. However, it appears that younger cohorts reinvest in life’s activities faster and move on to other marital relationships. Older persons may display less grief due to their experiences with other devastating losses, thereby being armed with coping skills accumulated over the years. Marital relationships may no longer hold the importance to the older widow or widower, and many choose to remain single.

In addressing the personal and distinctive needs of widowhood, support groups become advantageous for encouraging acceptance of a loss, maintaining sociability, and commiserating with widowed peers who have already experienced the multiple dynamics of sorrow and loss. Acceptance of one’s involuntary role as a single person may be the first step in recovery. The availability of a flexible yet stable social network can be crucial in how bereaved spouses adjust. Recuperation, effective coping, and reinvestment in life become important goals as well as resiliency and positive morale for a successful transition to self-sufficiency and personal efficacy.

**Women’s Rights Movement**

The women’s rights movement (WRM) seeks women’s equality with men in all aspects of society, with full access to the same rights and opportunities that men enjoy. Mary Wollstonecraft’s *A Vindication of the Rights of Woman* of 1792 first introduced the concept of rights for women. Previously focused on abstract notions of women’s equality, women slowly progressed to battle for constitutional and legal rights, like property rights and suffrage. Early 19th-century intellectual leaders of the American WRM were Lydia Maria Child (1802–80), who wrote the *Ladies Family Library*, 1832–1835, a history of women; Margaret Fuller (1810–50) and her seminal work, *Woman in the Nineteenth Century* of 1845; and Elizabeth Ellet (1818–77) who wrote *The Women of the American Revolution* of 1848.

**Women’s Status in Colonial America**

Ninety women came to the Virginia colony in 1619, followed by 18 women and 11 girls who landed in Plymouth, Massachusetts, in 1620. The first women...
colonists were often indentured servants kidnapped from cities or sold from prisons in Europe. Later, African women, forced to endure the Middle Passage, came to America as slaves. In contrast, the Quakers, who brought the principle of women’s equality to America, were singular in their support of women’s rights, allowing women to preach and enter into the government of the church. Quaker women frequently suffered religious persecution; Mary Dyer refused to recant her religion to the Massachusetts authorities and was hanged in Boston in 1660. Undeniably, women in the colonial period had many duties but not many rights.

**The Seneca Falls Convention, 1848**

In the early 1800s, U.S. women organized politically on their own behalf. Interested in social problems and their reform, women advocated temperance and gave aid to prisoners, prostitutes, unwed mothers, and widows. Female factory workers went on strike alone for the first time in Dover, New Hampshire, in 1828, but these first attempts to unionize failed. Similarly, Maria W. Stewart, a black woman who spoke out from 1831 to 1833 on the necessity for girls’ education and the abolition of slavery, finally gave up in frustration.

Lacking organizational experience and not permitted to speak in public, women gained experience in political organizing through their activism in the anti-slavery movement. Through this abolitionist work they gained awareness of their inequality and began to change their organizational focus from anti-slavery to women’s rights. Lucretia Mott, an ordained Quaker minister, helped establish the Philadelphia Anti-Slavery Society in 1833 and organized the first Anti-Slavery Convention of American Women in 1837. An important catalyst for the WRM occurred when Lucretia Mott met Elizabeth Cady Stanton at the World Anti-Slavery Convention in 1840. Lamenting that as women they were not allowed to be delegates, they vowed to organize a convention on women’s rights.

In 1848, the Married Women’s Property Bill became law in New York State, and on July 19–20 of that year, a convention held in the Methodist Church in Seneca Falls signified the beginning of the WRM in the United States. Resolutions passed unanimously were appeals for women’s rights to equality in divorce, child custody, inheritance, property rights, and the right to an education, but some opposed the call for women’s right to vote. State conventions and grassroots organizing on women’s rights continued until the outbreak of the Civil War in 1861.

**The Women’s Suffrage Movement**

Close association of the abolitionist cause and the suffrage movement, as well as divisions within the suffrage movement itself on strategies, complicated the achievement of suffrage for women. From its first mention at the Seneca Falls Convention, women’s suffrage took 72 years to accomplish and involved voting rights drives at the state level, battles to persuade state parties to include women’s suffrage in their platforms, congressional fights, and the final movement to ratify the bill in 1919–20.

Ratification of the 13th Amendment in 1865 outlawing slavery quickly led to a proposed 14th Amendment giving former slaves citizenship rights and, by implication, the right to vote, leaving the two movements—abolition and women’s suffrage—in competition with each other. Its ratification in 1868 in turn led to the 15th Amendment to give black males the right to vote. A division of the women’s suffrage movement followed, and Susan B. Anthony and Elizabeth Cady Stanton established the National Woman Suffrage Association in May 1869, arguing for women’s inclusion in the 15th Amendment. That November the newly established American Woman Suffrage Association worked for its ratification and suggested a 16th Amendment for women’s suffrage. While the schism existed, women’s suffrage made few political gains, but in 1890 the two groups joined to form the National American Women’s Suffrage Association. In 1920, Tennessee ratified the 19th Amendment, named after Susan Brownwell Anthony, and it became federal law.

**American Feminism**

**From 1955 to 1965**

After 1920, the public profile of women’s rights diminished over the next 3 decades until Simone de Beauvoir published *The Second Sex* in 1949. Her book was considered “too radical for America in the fifties,” and she was suspected of Marxist tendencies. Published during the McCarthy era, *The Second Sex* had difficulty gaining acceptance; feminists like Betty Friedan were not willing to acknowledge its influence.

The second wave of women’s rights, or the women’s liberation movement, was the outgrowth of
women's activism that persisted from the early to mid-1950s. The rebelliousness of the “Beat Madonnas” in the 1950s, the example of black women in the civil rights movement, the resistance of middle-class white women against the oppressiveness of domestic labor, the activism of working-class women in Ohio during the Un-American Activities Commission hearings, and the welfare rights movement in the early 1960s combined to shape a more powerful, widespread, and factionalized women’s movement.

The Second Wave of Feminism

By the mid-1960s, women’s rights once again came to the forefront, enabled by three events. First, in 1961, John F. Kennedy established the President’s Commission on the Status of Women, at the urging of Esther Peterson, Director of the Women’s Bureau. Second, in 1963, Betty Friedan published *The Feminine Mystique* and validated the everyday experience of women by identifying their situation as “the problem that has no name.” Third, the National Organization for Women (NOW) formed in 1966, petitioned to stop sex segregation of want ads, and by 1968 had initiated the fight for legalized abortion. In 1968, the Women’s Liberation Front protested the Miss America Pageant, by crowning a live sheep as Miss America and setting up a “freedom trashcan” to dispose of oppressive symbols, such as bras, girdles, and false eyelashes. Although there was no fire, the media transformed it into the infamous “bra burning” incident, which never occurred, creating a fictitious stereotype of women’s liberation.

The women’s liberation movement quickly achieved remarkable success. Following nearly half a century of struggle, Congress passed the Equal Rights Amendment (ERA), and on January 22, 1973, the Supreme Court upheld the *Roe v. Wade* decision, making the right to an abortion a legal alternative to an undesired pregnancy. However, a coalition of anti-feminist, New Right groups—in particular, Phyllis Shafly’s STOP ERA and later the Eagle Forum—undermined ratification of the ERA. That campaign had a unifying effect on feminist organizing and, led by NOW, gained unprecedented financial and political support. Under the leadership of Ellie Smeal, NOW successfully lobbied Congress to approve an extension of the deadline for ratification of the ERA. In 1982, despite last-minute militant efforts of women chaining themselves inside the Capitol building in Springfield, Ohio, the ERA failed to win the two-thirds majority necessary, and its defeat signaled the emblematic ruin of a unified women’s movement and a decline in popular support for women’s rights. Other crises further weakened the movement: political infighting, factional divisions, trashing, and accusations of exclusionary practices such as racism, homophobia, classicism, and elitism.

The New Feminism

Since the early 1990s, the term *third wave of feminism* has gained currency. This new group of young feminist thinkers and activists, defined loosely as women born since 1970, resist the “victim feminisms” of the second wave. Naomi Wolf, in *Fire with Fire* of 1994, coined the term *power feminism* to refer to middle-of-the-road politics rather than militancy. Wolf argued that women should use their leverage as shoppers, voters, and taxpayers to achieve equality. Those who advocate do-it-yourself/grrrlpower use a less conventional approach, making extensive use of the Internet to disseminate their message. They view anger as a feminist mechanism, espouse independence and confident sexuality, and are often depicted as overly assertive. Those who adopt the term *third wave* are perceived as less rigid than second-wave feminists around issues of dress and sexuality and are concerned with diversity and cultural expression. The new feminisms are less likely to focus on activism around women’s rights per se than on the larger spectrum of human rights in a globalized context.

WORKING POOR

According to the U.S. Census Bureau, the categories most associated with the working poor are (a) people who work, but who nevertheless fall under the official definition of poverty; (b) people who are in poverty and have at least one working family member; or (c) people who may not necessarily be “in poverty,” according to the official measure of poverty, but who fall below some percentage of the poverty level (e.g., 200 percent of poverty). The working poor are defined as those who have spent at least 27 weeks in the labor force during a year. To be classified as working, individuals must be employed or actively searching for work. The number of individuals under the poverty line was 37 million, or 12.7 percent, of the population in 2004. Of this population the U.S. Department of Labor estimates that 7.8 million individuals were classified as working poor, which represents an increase of 1.8 million since 2000. Three out of five individuals classified as working poor work full-time. Overall, 5.6 percent of individuals in the workforce were classified as working poor in 2004.

Dropping out of high school increases the likelihood that an individual will be classified as working poor. For high school dropouts, 15.2 percent, as opposed to 1.7 percent of college graduates, fell into the category in 2004. Women are more likely than men to be defined as the working poor. The census shows that 6.2 percent of women and 5.0 percent of men are working and still under the poverty line. Race is also an indicator of working poverty. While 7 in 10 of the working poor are white, blacks and Latinos/as are twice as likely to fall into that category. Black working women are almost twice as likely to be working poor (12.5 percent) as black working men (7.2 percent). Family composition is also important in defining the working poor, with 8.8 percent of married couples, 13.1 percent of single men, and 22.6 percent of single women so classified.

Labor Market Problems

The plight of U.S. families under the poverty line became a policy focus in the 1960s. The War on Poverty reduced the number of people in poverty significantly, along with providing poor families means-tested assistance. Since that time the term working poor more often has been associated with low-wage workers. Economic, social, and labor market changes in the past 30 years have left unskilled, low-wage workers vulnerable, as average wages have declined and welfare reform has reduced supplemental resources. Concurrent trends negatively affecting the working poor include the growth of wealth and income inequality, deindustrialization, and increasing technology and educational requirements in the workforce.

In the past 30 years, real wages for workers who do not have a high school degree declined 19 percent and increased 16 percent for workers who have a college degree. Low wages are the most common problem of the working poor, with 62 percent not making sufficient income to raise them above the working poor threshold. Overall, 24 million jobs, or 20 percent of the total, cannot keep a family of four above the poverty level. The working poor are the most affected by wage stagnation. Stagnant average wages and a low minimum wage are causes of working poverty in the United States. The nation’s minimum wage remained unchanged at $5.15 an hour from 1997 to 2006. In 2007, Congress passed legislation to increase it to $5.85, with provisions for further increases to $6.55 in July 2008 and $7.25 in July 2009. Some fields of labor, such as tipped labor, remain exempt.

Other important changes affecting work include the relative decline of unions. Many of the working poor are in jobs with historically low levels of unionization. These trends reduce the value of unskilled and less-educated workers. In addition, automation, deindustrialization, and outsourcing have reduced the need for low-skilled industrial workers. This decline in unionized industrial jobs negatively affects less-educated and low-skilled workers particularly. Unskilled workers also fare worse in the temporary labor market, which has grown to almost one in three new jobs.

Prominent characteristics of the working poor include underemployment and involuntary part-time employment. The labor market segment most often classified as working poor are service industry workers, although two out of three individuals classified as working poor fall into three occupational categories: services, production, and transportation. The nation’s farmworkers also are more likely to be working poor. With the count limited to documented workers, there are an estimated 4 million farmworkers.

Other societal-level factors shaping the working poor include a lack of health insurance, benefits, and child care. The 1996 Temporary Assistance for Needy
Families (TANF) legislation limited lifetime benefits to 5 years for cash assistance for welfare recipients. TANF has increased the number of working poor families who are struggling with child and health care. Welfare reform reduced the number of families on welfare from 5.1 million in 1996 to less than 2 million in 2004, but the average wage of individuals who have left welfare is $8 an hour.

Problems related to the access of sustainable employment, such as working poverty, are most acute in certain areas. Overall, poverty in rural areas is characterized by a greater concentration of working poor families than is poverty in other areas. While the working poor are dispersed throughout the United States, regions characterized by historical pockets of poverty such as Appalachia, the South, and Native reservations are more likely to contain concentrations of poverty and working poor households. Constricted opportunity structures and multiple social problems partially explain this situation. Generally, rural areas exhibit lower levels of educational attainment and chronic underemployment than other areas. The percentage of families classified as low income ranges from 35 percent in Mississippi to 15 percent in Massachusetts.

Working Poor Households

Studies chronicling the lives and conditions of the nation’s working poor reveal a diverse population exhibiting numerous social problems ranging from bad personal choices to low levels of educational attainment, poor health, disability, substandard housing, and limited opportunities. Many families classified as working poor exhibit a constellation of problems that have far-reaching impacts on families and children. Social problems faced by the working poor include domestic and sexual abuse. Social theorists point out that sexism and racism play a prominent role in those characterized as the working poor, especially for female-headed households. Most evident are concentrations of women and minorities in low-wage service jobs.

More than half of low-income working families pay more than a third of their income for housing. Nearly six of ten working poor families lack decent, affordable rental housing. Still, social observers are proclaiming the decline of the underclass as the concentration of poverty has changed because of a stronger economy, abortion and the reduction in unwanted pregnancies for poor women, welfare reforms reducing dependency, and greater dispersal of low-income housing. All of these causes have reduced the concentration of poverty in certain areas but have not offset low wages as a significant cause of poverty.

World-Systems Analysis

The world-systems perspective is a strategy for explaining social change that focuses on whole intersocietal systems rather than single societies. The main insight is that important interaction networks (trade, information flows, alliances, and fighting) have woven polities and cultures together since the beginning of human social evolution. Thus explanations of social change need to take intersocietal systems (world-systems) as the units that evolve. But intersocietal interaction networks were rather small when transportation was mainly a matter of humans carrying loads on foot. Globalization, in the sense of the expansion and intensification of larger interaction networks, has been increasing for millennia, albeit unevenly and in waves.

The intellectual history of world-systems theory has roots in classical sociology and Marxian political
economy. But in explicit form, the world-systems perspective emerged only in the 1970s when Samir Amin, Andre Gunder Frank, and Immanuel Wallerstein began to formulate the concepts and narrate the analytic history of the modern world-system.

The idea of the whole system means that all the human interaction networks small and large, from the household to global trade, constitute the world-system. It is not just a matter of “international relations” or global-scale institutions such as the World Bank. Rather, at the present time, the world-system is all of the people of the Earth and all of their cultural, economic, and political institutions and the interactions and connections among them. The world-systems perspective looks at human institutions over long periods of time and employs the spatial scales required for comprehending these whole interaction systems.

Structurally, the modern world-system is an intersocietal hierarchy composed of economically, culturally, and militarily dominant core societies (themselves in competition with one another) and dependent peripheral and semiperipheral regions, a few of which successfully improved their positions in the larger core/periphery hierarchy, while most have simply maintained their relative positions. This structural perspective on world history allows the analysis of the cyclical features of social change and the long-term patterns of development in historical and comparative perspective. The development of the modern world-system can be seen as driven primarily by capitalist accumulation and geopolitics in which businesses and states compete with one another for power and wealth. Conditioning competition among states and capitals are the dynamics of struggle among classes and the resistance of peripheral and semiperipheral peoples to domination and exploitation from the core.

In this perspective many of the phenomena that have been called “globalization” correspond to recently expanded international trade, financial flows, and foreign investment by transnational corporations and banks. Much of the globalization discourse assumes that recent, separate national societies and economies have now been superseded by an expansion of international integration driven by information and transportation technologies. Rather than a wholly unique and new phenomenon, globalization is primarily international economic integration, and as such, it is a feature of the world-system oscillating as well as increasing for centuries. Recent research comparing the 19th and 20th centuries shows that trade globalization is both a cycle and an upward trend.

The Great Chartered Companies of the 17th century were already playing an important role in shaping the development of world regions. Certainly the transnational corporations of the present are much more important players, but the point is that “foreign investment” is not an institution that only became important since 1970 (nor since World War II). Finance capital has been a central component of the commanding heights of the world-system since the
14th century. The current ebb and flow of world money are typical of the late phase of very long “systemic cycles of accumulation.”

World-systems scholars contend that leaving out the core/periphery dimension or treating the periphery as inert is a grave mistake, not only for reasons of completeness but also because the ability of core capitalists and their states to exploit peripheral resources and labor has been a major factor in deciding the winners of the competition among core contenders. And the resistance to exploitation and domination mounted by peripheral peoples has played a powerful role in shaping the historical development of world orders. Thus world history cannot be properly understood without attention to the core/periphery hierarchy.

The abandoning of Keynesian models of national development led to a new (or renewed) emphasis on deregulation and opening national commodity and financial markets to foreign trade and investment. The term many prefer for this turn in global discourse is neoliberalism, but it has also been called “Reaganism/Thatcherism” and the “Washington Consensus.” The structural basis of the rise of the globalization project is the new level of integration reached by the global capitalist class and the crisis of overaccumulation that emerged in the 1970s when Germany and Japan had caught up with the United States in the production of high-technology commodities.

The world-system has now reached a point at which both the old interstate system, based on separate national capitalist classes and states, and new institutions, representing the global interests of capital, exist and are powerful simultaneously. In this light each country has an important ruling class fraction allied with the transnational capitalist class. The big question is whether or not this new level of transnational integration will be strong enough to prevent competition among states for world hegemony from turning into warfare as in the past, during a period in which a hegemon (now the United States) is declining.

The insight that capitalist globalization is a cycle as well as an upward trend and that periods of deglobalization follow these waves of integration has important implications for the future. Capitalist globalization increased both intranational and international inequalities in the 19th century and did the same thing in the late 20th century. Those countries and groups left out of the “beautiful époque” either mobilize to challenge the hegemony of the powerful or retreat into self-reliance, or both.

Globalization protests emerged in the non-core with the anti–International Monetary Fund riots of the 1980s. The several transnational social movements that participated in the 1999 protest in Seattle brought globalization protest to the attention of observers in the core, and this resistance to capitalist globalization continued and grew despite the setback that occurred in response to the terrorist attacks on New York and Washington, D.C., in 2001.

An apparent tension exists between those who advocate deglobalization and delinking from the global capitalist economy and the building of stronger, more cooperative and self-reliant social relations in the periphery and semiperiphery, on the one hand, and those who seek to mobilize support for new (or reformed) institutions of democratic global governance. Self-reliance by itself, though an understandable reaction to exploitation, is not likely to solve the problems of humanity in the long run. The great challenge of the 21st century will be the building of a democratic and collectively rational global commonwealth. World-systems theory can be an important contributor to this effort.

Further Readings
The term xenophobia derives from the Greek words xénos (“foreign”) and phobos (“fear”), literally meaning a fear of foreigners. This origin is reflected in dictionary definitions, which almost inevitably describe it as a fear or hatred of strangers or foreigners. Despite a clear parallel between xenophobia and prejudice, the former refers solely to an emotional reaction to the other, while the latter is typically defined in ways that suggest both cognitive and emotional components. To the extent that this is the case, xenophobia has a more restrictive usage than prejudice. On the other hand, xenophobia and ethnocentrism are essentially two sides of the same coin, the latter referring to an excessive love of one’s own “people”—be they defined in ethnic, racial, religious, national, or civilizational terms.

Given the word’s origin, in the premodern world certain visceral reactions to the “other” appeared to be, if not typical or universal, at least very common. Contact with strangers within and foreigners from outside accelerated with the advent of the modern age, and a considerable literature developed in Europe that addressed this reality. In the case of strangers within, the classic example was Jews on a predominantly Christian continent. From a relatively early point in time, intellectuals were divided between those who harbored virulently anti-Semitic views and those who promoted tolerance. Anti-Semitism had deep roots in Roman Catholicism, and in this regard there was a remarkable continuity between Catholicism and Protestantism. Indeed, many experts consider Luther’s notorious screed against the Jews, after it became apparent that they did not plan to convert to Christianity, as one of the foundational statements of European anti-Semitism. The Jews he despised, forced to reside in segregated ghettos, were physically close but socially distant. Given that their religion constituted the formative grounding of Christianity, it would be reasonable to assume that they would not be perceived as the stranger within, but clearly this was the predominant sentiment among both intellectuals responsible for the ideological basis of anti-Semitism and ordinary people.

At the same time as Europeans began to venture into heretofore uncharted areas of the globe, thus beginning the era of colonialism, a fateful encounter with the other commenced. The image that emerged to characterize the other was to contrast civilized Europeans to savage or barbarian others. When Montaigne published his famous essay “Of Cannibals” in 1577, his contention was that Europeans offered evidence that they, and not the exotic outsider, were more capable of barbaric acts. His argument clearly presented a position that ran against the current of opinion in Europe. Likewise, in the famous Valladolid debate that pitted Bartolomé de Las Casas against Juan Ginés de Sepúlveda, the former argued that the indigenous people of the Americas indeed possessed souls and thus shared with Europeans a common humanity. His was a minority position at that time.

Since the 19th century and the emergence of mass immigration, the newcomers came to represent the other. This was evident during the earliest wave of immigration in the United States, when the Irish were singled out for contempt. Hostility, fueled by anti-Catholicism, shaped the belief that the Irish represented
both a social problem and a threat to democracy due to their presumed willingness to obey the authoritarian dictates of the Vatican. In the following wave of immigration, all Eastern and Southern European immigrants were the victims of xenophobia, but none was hated and feared more than Jews. Accused of being both ruthless capitalist exploiters and, paradoxically, as responsible for fomenting a communist revolution, they were depicted as being intent on world domination. Nowhere was this more on display than in the circulation of the infamous Protocols of the Elders of Zion.

In the current wave of migration from the world’s poor nations to the rich ones, the closest counterpart to this earlier instance of xenophobia is what has become known as Islamophobia, a phenomenon more in evidence in the nations of Western Europe than in North America, in no small part because the former nations have absorbed far larger numbers of Muslim immigrants. Shaping the animosity directed at Muslims is the claim that the cultures they bring to their new setting are antithetical to liberal democracies and pluralist societies, and therefore they are both incapable of, and uninterested in, becoming incorporated into the larger society. Such views have been exacerbated since the terrorist attacks of September 11, 2001, and the subsequent attacks in Madrid and London intensify the fear factor, according to public opinion research.

Given that the evidence suggests xenophobia extends throughout recorded history, some scholars argue that it is a universal feature of the human condition. This thesis has been especially evident among those who seek to locate in human biology the key causal factors producing it. This was apparent in the past in eugenics and more recently in sociobiology and evolutionary psychology. However, if hostility to outsiders is a universal condition, it would lead to the maladaptive situation in which individuals were limited to interacting only with ingroup members. Moreover, the record indicates that attitudes toward the stranger vary depending on time and circumstance. Nowhere is this more vividly and tragically on display than in the genocide campaigns in the former Yugoslavia and Rwanda. In both cases, the deeply rooted tensions between groups—Serbs and Muslims in the former case, Hutus and Tutsis in the latter—did not lead to persistent conflict and violence. On the contrary, for extended periods of time these groups peacefully coexisted and in fact often interacted in positive ways (including intermarriage). The potential for xenophobia increases during times of societal crisis, which appears to be a necessary but not sufficient reason for xenophobia to lead to violence. The additional essential ingredients include a leadership committed to inciting mass hatred and a mass media prepared to serve the interests of those elites.

The reverse is also true. Political leaders committed to multiculturalism, with Canada being the most successful example at present, have managed to reduce levels of xenophobia. Thus, new immigrants in Canada confront considerably less hostility and fear than in many other immigrant-receiving nations. Moreover, although tensions between separatist nationalists in Quebec and the rest of Canada are a reality, they do not manifest themselves in terms of hatred or fear. The result is that intergroup conflict has the potential of being managed in constructive ways. Xenophobia, in short, should be viewed as socially constructed and not as an inevitable feature of the human condition.

The concept of zero population growth (ZPG), first used by Kingsley Davis (1908–97), is a condition in which the number of children born, combined with the number of people who immigrate, is equivalent to the number of people who die, combined with the number of people who emigrate. Under this condition, the population neither expands nor contracts. It is more simplistic, but less accurate, to calculate the ZPG using a country’s total fertility rate (TFR) of 2.1 or lower as a benchmark. The TFR, or number of children a woman has in her lifetime, however, is only one indicator of population growth. Demographers, environmentalists, and ecologists often advocate policies that promote zero population growth at a global level to avoid problematic conditions associated with uncontrolled global population increase, such as pollution, drought, and famine.

Many industrial and postindustrial nations experience a gradual increase of their populations due to both low birth rates and low death rates. At the same time, less developed countries experience high birth and death rates, and their population increases outpace their food and water production capabilities. For example, China, a country with an estimated 2006 population of more than 1.3 billion, has instituted policies that favor single-child families with the eventual goal of substantially reducing its total population.

During the industrial revolution, a period of great social and economic change in the late 18th and early 19th centuries, economist Thomas Malthus predicted that population would grow faster than its food production capabilities, resulting in widespread famine, war, and disease, as nature itself culled the population to a sustainable amount. Paul Ehrlich, a neo-Malthusian, suggested that zero population growth might avert the kind of environmental disaster that uncontrolled population control is likely to cause.

The best-known organization promoting policies that support population control leading to zero population growth is the Population Connection, founded in 1968 as Zero Population Growth. The goal of this organization is to decrease birth rates by educating the population of less developed countries while simultaneously empowering and providing family planning information to women of those countries.

However, zero population growth is not a universally accepted approach to population control. Greatly reducing the birth rate to achieve zero population growth would result in a disproportionate number of elderly citizens. Economists and other researchers argue that a state of zero population growth would result in a stagnant economy as well as an unfavorably low ratio of working to dependent members in the population. Additionally, demographers suggest that continued economic development in less developed countries and continued improvement in the status of women worldwide will result in slower world population growth, a trend already underway. For example, the rate of global population increase slowed from 2.04 percent in the late 1960s to 1.24 percent in 2000.

ZERO-TOLERANCE POLICIES

The term zero tolerance refers to a government or private employer’s nondiscretionary enforcement policy that requires fixed penalties to be imposed on any violators regardless of extenuating circumstances. Zero-tolerance policies emerged from several federal- and state-level drug enforcement initiatives in the 1980s and 1990s. They have been applied in public schools, the military, and the private sector.

During the Reagan and Bush administrations (1981–93), the War on Drugs campaign utilized a zero-tolerance policy to prohibit the illegal sale of drugs across U.S. borders. U.S. Customs and the U.S. Attorney’s office in San Diego initiated the policy for this “war.” Any individual crossing the United States–Mexico border arrested for possession of drugs received a mandatory prison sentence upon conviction. The U.S. Customs Service found this policy so effective in deterring future drug trafficking across the border that it recommended its national adoption. By 1988, the National Drug Policy Board and the White House Conference on a Drug-Free America required that all federal drug enforcement agencies, including the U.S. Coast Guard, adopt and enforce zero-tolerance policies. From this point onward, zero tolerance became a criminal justice approach to the war on drugs, given the rigid punishments and penalties accompanying the policies.

In the late 1980s, zero-tolerance policies expanded to encompass school-based violence in response to several school shootings across the country. In 1989, schools in Orange County, California, and Louisville, Kentucky, were the first to adopt zero-tolerance policies for any students violating rules on drug possession and/or involved in gang activity. A 1991 study found that 1 in every 18 students carried a gun to school at some time during his or her high school years. Furthermore, studies showed that, across the country, approximately 100,000 guns are brought to school each day. By 1993, many states were adopting school zero-tolerance policies. In 1994, Congress passed the Gun Free Schools Act, bringing zero-tolerance policies to the national level. The Gun Free Schools Act required every school that received government funding to expel students bringing to school any object that could be considered a weapon or any illegal drugs or prescription drugs. This mandatory expulsion for one calendar year also required the school administrators to send a referral regarding the student’s behavior to the juvenile justice system.

In addition to the zero-tolerance policies on drugs and school violence, zero-tolerance policies have been adopted in a wide array of public and private sectors, including among most Fortune 500 companies. Perhaps the most stringent of such policies are those on sexual harassment and racial extremists as addressed in the Uniform Code of Military Justice. The military policy on sexual harassment requires the immediate response to any incident of sexual harassment through the appropriate chain of command. The zero-tolerance policy on racial extremists gives U.S. military officials the authority to adopt zero tolerance of racial extremists’ speech and/or activities, even though such action is unconstitutional in civilian life.

Although zero-tolerance policies have been adopted nationally in many areas of public and private life, much controversy still remains surrounding these policies. Many critics compare zero-tolerance policies to mandatory minimum sentencing in the criminal justice system, stating that in many instances such policies are too harsh for the crimes. Critics argue that the zero-tolerance policies on drugs deplete much-needed resources of federal agencies because they are too concerned with identifying individual drug traffickers rather than focusing on the massive flow of drugs into the United States. Even with zero-tolerance policies in effect in the military, a 1995 study released by the Department of Defense indicates that nearly 52 percent of female personnel and 9 percent of male personnel experienced some type of sexual harassment.

Perhaps the most significant controversy surrounding zero tolerance is in schools. Many critics believe that too many children are unfairly punished for minor offenses. Statistics show that the number of school suspensions nearly doubled from 3.7 percent of students (1.7 million students) in 1974 to 6.8 percent of students (3.2 million students) in 1998, with an additional 100,000 expelled. Critics argue that the
vast majority of these suspensions and expulsions were for minor offenses that did not warrant such harsh punishment.

Recent trends of zero-tolerance policies indicate that crimes of all types are down, by as much as 30 percent, in public schools across the country. Furthermore, less than 1 percent of all violent crimes involving juveniles occur on school grounds. According to the National Center for Education Statistics, the number of school homicides, suicides, and nonfatal crimes decreased significantly during the years 1992–2002. Another trend is the many alternatives to zero-tolerance policies proposed as more appropriate methods of enforcement. Such alternatives favor prevention rather than punishment and focus on known risk factors to address and overcome.
